UNITED STATES PATENT OFFICE.

LEVI REESE H. DICK, OF CHICAGO, ILLINOIS.

WATER-CLOSET SEAT.

1,293,364. Specification of Letters Patent. Patented Feb. 4, 1919.

Application filed January 16, 1915. Serial No. 2,630.

To all whom it may concern:

Be it known that I, LEVI REESE H. DICK, a citizen of the United States, residing at Chicago, in the county of Cook and the State of Illinois, have invented a new and useful Improvement in Water-Closet Seats, of which the following is a specification.

My invention relates to improvements in water closet seats in connection with which a commode or receptacle is to be used. The objects of my improvement are:

1st: To provide a holder for a commode or receptacle, that will firmly hold a commode or receptacle to the underside of a toilet or water-closet seat;

2nd: To afford facilities for adjusting a commode or receptacle to the underside of a toilet or water-closet seat;

3rd: To construct a metal holder that may be readily attached to a toilet or water-closet seat.

I attain these objects by the mechanism illustrated in the accompanying drawing, in which—

Figure 1 is an elevation of the toilet or water-closet seat, partly in section and side elevation of the metal holder, with a commode or receptacle in place.

Fig. 2 is a view of the underside of the water-closet or toilet seat, with the metal holder attached, as appears without the commode or receptacle.

Similar letters refer to similar parts throughout the several views.

The seat A (Fig. 1) is a toilet or water-closet seat such as is used for infant chairs and other toilet or water-closets.

The metal holder B is secured to the underside of the seat by means of screws C and washers D. The screws C are of sufficient length that by leaving a portion of the same protruding from the seat A, the holder B through which the screws C pass will have enough play to permit the placing and removing of the commode or receptacle E, the commode or receptacle E being held in place by its rim F and the metal holder B.

I am aware that prior to my invention toilet or water-closet seats have been made with attachments such as hinges for raising and lowering, but I am not aware that my metal holder for commodes or receptacles has been used.

What I claim as new, and desire to secure by Letters Patent is:

The combination with a board having a circular opening therethrough of a clamp on the under side of said board, comprising a rod curved into a circular form and forming more than a semi-circle, the middle part of said rod being coiled to form a spring and said rod having another part between such coil and its free end bent to form a closed loop.

L. REESE H. DICK.
