Title: METHODS AND COMPOSITIONS FOR INCREASING THE POTENCY OF ANTIFUNGAL AGENTS

Abstract: Embodiments provided herein include methods, compositions, and uses of aromatic alcohols to increase the potency of antifungal agents. Methods and compositions provided herein include a method of increasing the sensitivity of a fungal cell to an antifungal agent comprising: contacting the cell with phenyl ethanol in combination with the antifungal agent. The sensitivity of the cell is increased at least 2-fold, compared to a cell not contacted with phenyl ethanol.
METHODS AND COMPOSITIONS FOR INCREASING THE POTENCY OF ANTIFUNGAL AGENTS

CROSS REFERENCE TO RELATED APPLICATIONS

FIELD OF THE INVENTION

[0002] Embodiments provided herein include methods, compositions, and uses of aromatic alcohols to increase the potency of antifungal agents.

BACKGROUND OF THE INVENTION

Opinion on Drug Discovery 8:1117-1126). Indeed, antifungal therapy is limited by the small arsenal of drugs, toxicity, and the emergence of resistance. Moreover, the antifungal drug pipeline is mostly dry, so that no new antifungal drugs are expected to reach the market anytime soon. Accordingly, there is a need for additional antifungal therapies.

SUMMARY OF THE INVENTION

[0004] Some embodiments of the methods and compositions provided herein include a method of increasing the sensitivity of a fungal cell to an antifungal agent comprising:

contacting the cell with phenyl ethanol in combination with the antifungal agent.

[0005] Some embodiments of the methods and compositions provided herein include a method of increasing the sensitivity of a fungal cell to an antifungal agent comprising: contacting the cell with a compound of Formula I in combination with the antifungal agent, wherein Formula I is:

![Formula I](image)

wherein, X is selected from C, N, S and O; R₁ – R₅ is each independently selected from hydrogen, C₁ to C₆ alkyl, C₁ to C₆ substituted alkyl, C₁ to C₆ alkenyl, C₁ to C₆ substituted alkenyl; aryl, heteroaryl, alkoxy, and aryloxy; and n is 0, 1, 2, 3, 4, 5 or 6.

[0006] In some embodiments, the sensitivity of the cell is increased at least about 2-fold compared to a cell not contacted with phenyl ethanol. In some embodiments, the sensitivity of the cell is increased at least about 5-fold compared to a cell not contacted with phenyl ethanol. In some embodiments, the sensitivity of the cell is increased at least about 20-fold compared to a cell not contacted with phenyl ethanol.

[0007] In some embodiments, the cell is selected from the group consisting of Candida spp, Epidermophyton spp, Histoplasma spp, Trichophyton spp, Microsporum spp,
Blastomyces spp, Histoplasma spp, Cryptococcus spp, Coccidioides spp Pneumocystis spp, Saccharomyces spp, Aspergillus spp, Khuyveromyces spp, Schizosaccharomyces spp, and Streptomyces spp. In some embodiments, the Candida spp is selected from the group consisting of C. albicans, C. glabrata, C. rugosa, C. parapsilosis, C. tropicalis, and C. dubliniensis. In some embodiments, the Epidermophyton spp is E. floccosum.

[0008] In some embodiments, the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, Sordarin, Flucytosine and an echinocandin. In some embodiments, the polyene is selected from the group consisting of Amphotericin B, Candididin, Filipin, Hamycin, Natamycin and Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments, the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavucinazole, Itraconazole, Posaconazole, Ravuconazole, Terconazole, and Voriconazole. In some embodiments, the thiazole comprises Abafungin. In some embodiments, the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine. In some embodiments, the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

[0009] Some embodiments of the methods and compositions provided herein include a method of treating and preventing a fungal infection comprising: administering an effective amount of phenyl ethanol in combination with an antifungal agent to a subject in need thereof.

[0010] In some embodiments, the subject is mammalian. In some embodiments, the subject is human.

[0011] In some embodiments, the subject is suffering from an autoimmune disorder. In some embodiments, the autoimmune disorder is a result of chemotherapy. In some embodiments, the autoimmune disorder is a result of an organ transplant.

[0012] In some embodiments, the fungal infection is selected from the group consisting of Candida spp, Epidermophyton spp, Histoplasma spp, Trichophyton spp, Microsporum spp, Blastomyces spp, Histoplasma spp, Cryptococcus spp, Coccidioides spp Pneumocystis spp, Saccharomyces spp, Aspergillus spp, Khuyveromyces spp,
Schizosaccharomyces spp. and Streptomyces spp. In some embodiments, the Candida spp is selected from the group consisting of C. albicans, C. glabrata, C. rugosa, C. parapsilosis, C. tropicalis, and C. dubliniensis. In some embodiments, the Epidermophyton spp is E. floccosum.

[0013] In some embodiments, the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin. In some embodiments, the polyene is selected from the group consisting of Amphotericin B, Candin, Filipin, Hamycin, Natamycin, and Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments, the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Raveconazole, Terconazole, and Voriconazole. In some embodiments, the thiazole comprises Abafungin. In some embodiments, the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Telbinafine. In some embodiments, the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

[0014] Some embodiments of the methods and compositions provided herein include a pharmaceutical composition comprising: phenyl ethanol; an antifungal agent; and a pharmaceutical acceptable carrier. In some embodiments, the phenyl ethanol comprises a concentration of 625 μM to 10 mM.

[0015] In some embodiments, the pharmaceutical composition is suitable for topical administration. In some embodiments, the composition is selected from the group consisting of an aerosol, powder, cream, paste, solution, suspension, and gel.

[0016] In some embodiments, the pharmaceutical composition is suitable for intravenous administration.

[0017] In some embodiments, the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin. In some embodiments, the polyene is selected from the group consisting of Amphotericin B, Candin, Filipin, Hamycin, Natamycin, and Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bifonazole,
Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments, the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ratuconazole, Terconazole, and Voriconazole. In some embodiments, the thiazole comprises Abafungin. In some embodiments, the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine. In some embodiments, the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

[0018] Some embodiments of the methods and compositions provided herein include a medical device comprising an antifungal coating, wherein the antifungal coating comprises phenyl ethanol. In some embodiments, the antifungal coating further comprises an antifungal agent.

[0019] Some embodiments of the methods and compositions provided herein include a method of manufacturing a medical device comprising: coating the medical device with a coating comprising phenyl ethanol and an antifungal agent. In some embodiments, the medical device is selected from the group consisting of a catheter, an endoscope, a laryngoscope, a tube for feeding, a tube for drainage, a tube for endotracheal use, a guide wire, a condom, a glove, a wound dressing, a contact lens, an implant, an extracorporeal blood conduit, a membrane for dialysis, a blood filter, and a device for circulatory assistance.

[0020] In some embodiments, the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin. In some embodiments, the polyene is selected from the group consisting of Amphotericin B, Candididin, Filipin, Hamycin, Natamycin, and Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bitonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments, the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ratuconazole, Terconazole, and Voriconazole. In some embodiments, the thiazole comprises Abafungin. In some embodiments, the allylamine is selected from the group consisting of Amorolfin,
Butenafine, Naftifine, and Terbinafine. In some embodiments, the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

[0021] Some embodiments of the methods and compositions provided herein include a method of screening or testing a composition for fungal targets, the method comprising providing a concentration of phenyl ethanol; providing a concentration of an antifungal agent; and culturing fungal cells under conditions wherein the fungal cells are in contact with the concentration of antifungal agent and the concentration of phenyl ethanol and wherein the fungal cells comprise modified alleles of a gene.

[0022] In some embodiments, the gene contributes to the virulence and/or pathogenicity of the fungal cells to a host organism.

[0023] In some embodiments, the fungal cells are selected from the group consisting of Candida spp, Epidermophyton spp, Histoplasma spp, Trichophyton spp, Microsporum spp, Blastomyces spp, Histoplasma spp, Cryptococcus spp, Coccioidoides spp, Pneumocystis spp, Saccharomyces spp, Aspergillus spp, Kluyveromyces spp, Schizosaccharomyces spp, and Streptomyces spp. In some embodiments, the Candida spp is selected from the group consisting of C. albicans, C. glabrata, C. rugosa, C. parapsilosis, C. tropicalis, and C. dubliniensis. In some embodiments, the Epidermophyton spp is E. floccosum.

[0024] In some embodiments, the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin. In some embodiments, the polyene is selected from the group consisting of Amphotericin B, Cándidin, Filipin, Hamycin, Natamycin, and Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments, the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravaconazole, Terconazole, and Voriconazole. In some embodiments, the thiazole comprises Abafungin. In some embodiments, the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine. In some embodiments, the echinocandin is selected from the group consisting of Anidulafungin, and Micafungin.
In some embodiments, a method of increasing the sensitivity of a fungal cell to an antifungal agent is provided wherein the method comprises contacting the cell with an enamine in combination with the antifungal agent. In some embodiments, the sensitivity of the cell is increased at least about 2-fold compared to a cell not contacted with the enamine. In some embodiments, the sensitivity of the cell is increased at least about 5-fold compared to a cell not contacted with the enamine. In some embodiments, the sensitivity of the cell is increased at least about 20-fold compared to a cell not contacted with the enamine. In some embodiments, the cell is selected from the group consisting of Candida spp, Epidermophyton spp, Histoplasma spp, Trichophyton spp, Microsporum spp, Blastomyces spp, Histoplasma spp, Cryptococcus spp, Coccidioides spp Pneumocystis spp, Saccharomyces spp, Aspergillus spp, Kluveromyces spp, Schizosaccharomyces spp, and Streptomyces spp. In some embodiments, the Candida spp is selected from the group consisting of C. albicans, C. glabrata, C. rugosa, C. parapsilosis, C. tropicalis, and C. dubliniensis. In some embodiments, the Epidermophyton spp is E. floccosum. In some embodiments, the antifungal agent is selected from the group consisting of a polynye, an imidazole, a triazole, a thiazole, an allylamine, Sordarin, Flucytosine and an echinocandin. In some embodiments, the polynye is selected from the group consisting of Amphotericin B, Candididin, Filipin, Hamycin, Natamycin and Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments, the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravuconazole, Terconazole, and Voriconazole. In some embodiments, the thiazole comprises Abafungin. In some embodiments, the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine. In some embodiments, the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

In some embodiments, a method of treating and preventing a fungal infection is provided, wherein the method comprises administering an effective amount of an enamine in combination with an antifungal agent to a subject in need thereof. In some embodiments, the subject is mammalian. In some embodiments, the subject is human. In
some embodiments, the subject is suffering from an autoimmune disorder. In some embodiments, the autoimmune disorder is a result of chemotherapy. In some embodiments, the autoimmune disorder is a result of an organ transplant. In some embodiments, the fungal infection is selected from the group consisting of Candida spp, Epidermophyton spp, Histoplasma spp, Trichophyton spp, Microsporum spp, Blastomyces spp, Histoplasma spp, Cryptococcus spp, Coccidioides spp, Pneumocystis spp, Saccharomyces spp, Aspergillus spp, Kluveromyces spp, Schizosaccharomyces spp, and Streptomyces spp. In some embodiments, the Candida spp is selected from the group consisting of C. albicans, C. glabrata, C. rugosa, C. parapsilosis, C. tropicalis, and C. dubliniensis. In some embodiments, the Epidermophyton spp is E. floccosum. In some embodiments, the antifungal agent is selected from the group consisting of a polylene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin. In some embodiments, the polylene is selected from the group consisting of Amphotericin B, Candididin, Filipin, Hamycin, Natamycin and Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Idoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments, the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ratuconazole, Terconazole, and Voriconazole. In some embodiments, the thiazole comprises Abafungin. In some embodiments, the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine. In some embodiments, the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

[0027] In some embodiments, a pharmaceutical composition is provided, wherein the composition comprises an enamine, an antifungal agent and a pharmaceutical acceptable carrier. In some embodiments, the enamine comprises a concentration of 625 μM to 10mM. In some embodiments, the pharmaceutical composition is suitable for topical administration. In some embodiments, the composition is selected from the group consisting of an aerosol, powder, cream, paste, solution, suspension, and gel. In some embodiments, the pharmaceutical composition is suitable for intravenous administration. In some embodiments, the antifungal agent is selected from the group consisting of a polylene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin. In some embodiments,
the polyene is selected from the group consisting of Amphotericin B, Cacididin, Filipin, Hamycin, Natamycin and Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments, the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ruvuconazole, Terconazole, and Voriconazole. In some embodiments, the thiazole comprises Abafungin. In some embodiments, the allylamine is selected from the group consisting of Amorolfine, Butenafine, Naftifine, and Terbinafine. In some embodiments, the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

[0028] In some embodiments, a medical device comprising an antifungal coating is provided, wherein the antifungal coating comprises an enamine. In some embodiments, the antifungal coating further comprises an antifungal agent. In some embodiments, a method of manufacturing a medical device is provided, wherein the method comprises coating the medical device with a coating comprising an enamine and an antifungal agent. In some embodiments, of the medical device or method of manufacturing a medical device, the medical device is selected from the group consisting of a catheter, an endoscope, a laryngoscope, a tube for feeding, a tube for drainage, a tube for endotracheal use, a guide wire, a condom, a glove, a wound dressing, a contact lens, an implant, an extracorporeal blood conduit, a membrane for dialysis, a blood filter, and a device for circulatory assistance. In some embodiments, of the medical device or method of manufacturing a medical device, the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin. In some embodiments, of the medical device or method of manufacturing a medical device, the polyene is selected from the group consisting of Amphotericin B, Cacididin, Filipin, Hamycin, Natamycin and Rimocidin. In some embodiments, of the medical device or method of manufacturing a medical device, the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments, of the medical device or method of manufacturing a medical device, the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ruvuconazole, Terconazole, and Voriconazole.
medical device, the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravaconazole, Terconazole, and Voriconazole. In some embodiments, of the medical device or method of manufacturing a medical device, the thiazole comprises Abafungin. In some embodiments, of the medical device or method of manufacturing a medical device, the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine. In some embodiments, of the medical device or method of manufacturing a medical device, the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

[0029] In some embodiments, a method of screening or testing a composition for fungal targets is provided, the method comprising providing a concentration of an enamine, providing a concentration of an antifungal agent, and culturing fungal cells under conditions wherein the fungal cells are in contact with the concentration of antifungal agent and the concentration of an enamine and wherein the fungal cells comprise modified alleles of a gene. In some embodiments, the gene contributes to the virulence and/or pathogenicity of the fungal cells to a host organism. In some embodiments, the fungal cells are selected from the group consisting of Candida spp, Epidermophyton spp, Histoplasma spp, Trichophyton spp, Microsporum spp, Blastomyces spp, Histoplasma spp, Cryptococcus spp, Coccidioides spp, Pneumocystis spp, Saccharomyces spp, Aspergillus spp, Kluveromyces spp, Schizosaccharomyces spp, and Streptomyces spp. In some embodiments, the Candida spp is selected from the group consisting of C. albicans, C. glabrata, C. rugosa, C. parapsilosis, C. tropicalis, and C. dubliniensis. In some embodiments, the Epidermophyton spp is E. floccosum. In some embodiments, the antifungal agent is selected from the group consisting of a polycene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin. In some embodiments, the polycene is selected from the group consisting of Amphotericin B, Candididin, Filipin, Hamycin, Natamycin and Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments, the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravaconazole, Terconazole, and Voriconazole. In some embodiments, the thiazole comprises Abafungin. In some
embodiments, the allylamine is selected from the group consisting of Amorolfin, Butenafine, Natifine, and Terbinfine. In some embodiments, the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

BRIEF DESCRIPTION OF THE DRAWINGS

[0030] Figures 1 (panels A-D) shows photographs of a plate assay showing the effects of PE and an antifungal drug on the yeast, Saccharomyces cerevisiae. Each panel (panel A-D) shows 2 YPD plates spread with a lawn of S. cerevisiae (F45). In each panel, the left plate is YPD alone and the right plate is YPD plus 10 mM PE (a concentration that inhibits the fluffy colony morphology). Each plate also contains a paper disk containing the DMSO vehicle (Figure 1, panel A), 25 μg fluconazole (Figure 1, panel B), 50 μg fluconazole (Figure 1, panel C), or 100 μg fluconazole (Figure 1, panel D).

[0031] Figure 2 shows that PE-Fluconazole interaction not explained by its effect on biofilm formation. PE sensitizes S. cerevisiae to fluconazole (FLU) in a mutant (flo11Δ) that is unable to form biofilm structures. In each panel, the left plate is YPD alone and the right plate is YPD plus 10 mM PE (a concentration that inhibits biofilm formation); (Figure 2, panel A) Wild-type F45 shows a level of sensitivity to FLU and that sensitivity is increased (larger zone of growth inhibition) in the presence of 10 mM PE. (Figure 2, panel B) The F45 flo11Δ mutant displays the same levels of FLU sensitivity, i.e. the same sized growth inhibition zones, as wild-type for both the FLU alone and FLU + PE condition.

[0032] Figure 3 is a photograph of a series of plate assays showing PE’s ability to increase the sensitivity of yeast to fluconazole. As shown, fluconazole was kept at a constant concentration of 50 μM, while the concentrations of PE varied from 10 mM PE to 0.312 mM PE. All plates in all panels are spread with F45 and also contain disks with 50 μg FLU. In each panel, the left plate is YPD alone and the right plate is YPD plus 10 mM PE (Figure 3, panel A), 5 mM PE (Figure 3, panel B), 2.5 mM PE (Figure 3, panel C), 1.25 mM PE (Figure 3, panel D), 625 μM PE (Figure 3, panel E), or 312 μM PE (Figure 3, panel F).

[0033] Figure 4 shows the effects of antifungals in the presence of PE.

[0034] Figure 5. shows that PE enhances the sensitivity of S. cerevisiae to Voriconazole. In each panel, the left plate is YPD alone and the right plate is YPD plus 10
mM PE. Each plate is spread with F45 and also contains a filter disk with 10 µg voriconazole (Figure 5, panel A) and 25 µg voriconazole (Figure 5, panel B).

[0035] Figure 6. PE enhances the sensitivity of S. cerevisiae to Itraconazole although Itraconazole solubility is a confounding factor. In each panel, the left plate is YPD alone and the right plate is YPD plus 10 mM PE. Each plate is spread with F45 and also contains a filter disk with the chloroform vehicle (Figure 6, panel A), 100 µg Itraconazole (Figure 6, panel B), 50 µg Itraconazole (Figure 6, panel C), 25 µg Itraconazole (Figure 6, panel D), or 12.5 µg Itraconazole (Figure 6, panel E).

[0036] Figure 7. PE enhances the sensitivity of S. cerevisiae to Sordarin. In each panel, the left plate is YPD alone and the right plate is YPD plus 10 mM PE. Each plate is spread with F45 and also contains a filter disk with 50 µg Sordarin (Figure 7, panel A), 10 µg Sordarin (Figure 7, panel B), 1 µg Sordarin (Figure 7, panel C), or 500 ng Sordarin (Figure 7, panel D).

[0037] Figure 8 shows that PE has no effect on the sensitivity of S. cerevisiae to Caspofungin, an echinocandin that targets the fungal cell wall by inhibiting β-glycan synthase. In each panel, the left plate is YPD alone and the right plate is YPD plus 10 mM PE. Each plate is spread with F45 and also contains a filter disk with the water vehicle (Figure 8, panel A), 50 µg Caspofungin (Figure 8, panel B), 5 µg Caspofungin (Figure 8, panel C), 1 µg Caspofungin (Figure 8, panel D), or 200 ng Caspofungin (Figure 8, panel E).

[0038] Figure 9 shows that PE does not increase the sensitivity to Nystatin, a polyene that binds ergosterol thereby weakening the plasma membrane. In each panel, the top plate is YPD alone with a disc that contains DMSO, the bottom left plate is YPD alone with a disc that contains 50 µg Nystatin and the bottom right plate is YPD plus 10 mM PE with a disc that contains 50 µg Nystatin. The plates in Figure 9, panel A are spread with the F45 strain. The plates in Figure 9, panel B are spread with the BY4741 lab strain.

[0039] Figure 10 shows that PE increases the efficacy of fluconazole against C. albicans. In each panel, the left plate is YPD plus 1% DMSO and the right plate is YPD plus 10 mM PE in 1% DMSO. Each panel plate also contains a filter disk with 50 µg fluconazole. The plates in Figure 10, panel A are spread with a fluconazole sensitive strain of C. albicans.
The plates in Figure 10, panel B are spread with the same fluconazole resistant strain of C. albicans used in the Eurofins checkerboard assay (R357).

[0040] Figure 11 shows that PE increases the efficacy of fluconazole against several resistant C. albicans strains. In each panel, the left plate is YPD and the right plate is YPD plus 10 mM PE. Each panel plate also contains a filter disk with 50 µg fluconazole. The plates are spread with the S. cerevisiae strain F45 (Figure 11, panel A) or one of four fluconazole resistant strains of C. albicans (304 (ATCC 28121) Figure 11, panel B), (CATW 4/19 (ATCC 90819) Figure 11, panel C), 3147 (ATCC 10231) (Figure 11, panel D), and R357 (Figure 11, panel E).

[0041] Figure 12 shows that PE increases the efficacy of flucytosine against C. albicans. In each panel, the left plate is YPD plus 1% DMSO and the right plate is YPD plus 10 mM PE in 1% DMSO. Each panel plate also contains a filter disk with 100 µg flucytosine. The plates in panel are spread with C. albicans strain ATCC #18804 (Figure 12, panel A). The plates in Figure 12, panel B are spread with the R357 strain of C. albicans used in the Eurofins checkerboard assay. Although the boundaries of the flucytosine zones are more diffuse than for some of the other drugs, the zones are larger in the presence of PE and the results look similar to the results with fluconazole (Figure 10) in that there is a stronger effect on the more resistant strain (Figure 10, panel B).

[0042] Figure 13 shows that the PE-sordarin effect against C. albicans R357 appears additive. PE is not synergistic against the R357 strain in combination with all antifungal drugs. In each panel, the left plate is YPD alone and the right plate is YPD plus 10 mM PE. All plates are spread with the C. albicans strain R357. Each plate also contains a filter disk with 1 µg sordarin (Figure 13, panel A), 10 µg sordarin (Figure 13, panel B), or 50 µg sordarin (Figure 13, panel C). Although the zone sizes are larger in the presence of PE, the magnitude of the difference appears to be in the additive range.

[0043] Figure 14 shows a schematic of the degrees of clearance in a plate spread with fungal cells.

Definitions

[0044] As described herein, increasing the sensitivity of a drug or an antifungal refers to increasing the potency of a drug/antifungal, increasing the activity of the
drug/antifungal, decreasing the time of the drug/antifungal to perform the therapeutic effect, and/or increase the efficacy of the drug/antifungal.

[0045] “Antifungal agents” as described herein refers to an agent that can be used to treat, ameliorate and/or prevent a fungal growth. Without being limiting, examples of antifungal agents can include, for example, fluconazole, voriconazole, itraconazole, fluocytosine, sordarin, caspofungin and nystatin.

[0046] “Autoimmune disorder,” as described herein, refers to a disease that arises from an abnormal immune response of the body against substances and tissues normally present in the body. Without being limiting, autoimmune diseases can include myocarditis, postmyocardial infarction syndrome, Postpericardiectomy syndrome, Subacute bacterial endocarditis, Anti-Glomerular Basement Membrane nephritis, Interstitial cystitis, Lupus nephritis, Autoimmune hepatitis, Primary biliary cirrhosis, Primary sclerosing cholangitis, Antisynthetase syndrome, Antisynthetase syndrome, Alopeia Areata, Autoimmune Angioedema, Autoimmune Angioedema, Autoimmune progesterone dermatitis, Autoimmune urticarial, Bullous pemphigoid, Cicatricial pemphigoid, Dermatitis herpetiformis, Discoid lupus erythematosus, Epidermolysis bullosa acquisita, Erythema nodosum, Gestational pemphigoid, Hidradenitis suppurativa, Lichen planus, Lichen sclerosus, Linear IgA disease, Morphea, Pemphigus vulgaris, Pityriasis lichenoides et varioliformis acuta, Mucha-Habermann disease, Psoriasis, Systemic scleroderma, Vitiligo, Addison's disease, Autoimmune polyendocrine syndrome, Autoimmune polyendocrine syndrome type 2, Autoimmune polyendocrine syndrome type 3, Autoimmune pancreatitis, Diabetes mellitus type 1, Autoimmune thyroiditis, Or'd's thyroiditis, Graves' disease, Autoimmune oophoritis, Endometriosis, Autoimmune orchitis, Sjogren's syndrome, Autoimmune enteropathy, Celiac disease, Crohn's disease, Microscopic colitis, Ulcerative colitis, Antiphospholipid syndrome, Aplastic anemia, Autoimmune hemolytic anemia, Autoimmune lymphoproliferative syndrome, Autoimmune neutropenia, Autoimmune thrombocytopenic purpura, Cold agglutinin disease, Essential mixed cryoglobulinemia, Evans syndrome, IgG4-related systemic disease, Paroxysmal nocturnal hemoglobinuria, Pernicious anemia, Pure red cell aplasia, Thrombocytopenia, Adiposis dolorosa, Adult-onset Still's disease, Ankylosing Spondylitis, CREST syndrome, Drug-induced lupus, Enthesitis-related arthritis, Eosinophilic fasciitis, Felty syndrome, Juvenile Arthritis, Lyme disease (Chronic), Mixed connective

[0047] Chemotherapy can also lead to an increase in autoimmune disorder or can decrease the immune response. Additionally, an autoimmune disorder can result from an organ transplant or drugs for immune suppression.

[0048] Commonly used antifungal drugs target just two cellular components, ergosterol in the plasma membrane and 1,3-beta-D-glucan in the cell wall. Drugs that target ergosterol include the commonly used triazoles (e.g. fluconazole) and formulations of the polyene Amphotericin B, reserved as a last line of defense due to its toxicity (Ostrosky-Zeichner, L., et al., (2010) Nature Reviews Drug discovery 9: 719-727). Echinocandins have the advantage of attacking a fungal specific target, 1,3-beta-D-glucan synthase activity which weakens the fungal cell wall. However, drug resistant mutations in FKS1 that prevent echinocandin binding are an increasing problem (Alexander, B. D. et al. (2013) Clin Infect Dis. 56:1724-1732).
Benzyl alcohol is an aromatic alcohol with the formula C₆H₅CH₂OH and can be used for disrupting colonies of certain fungi. In some embodiments, the presence of a benzyl alcohol or its derivative can disrupt structured colony morphology of certain fungi. In some embodiments of the methods and compositions provided herein, the presence of phenyl ethanol (PE) or its derivatives can disrupt structured colony morphology of certain fungi, such as *Saccharomyces cerevisiae*. In some embodiments, PE or its derivatives can increase the sensitivity of yeast cells to antifungals. In some embodiments, PE or its derivatives can destroy biofilms. In some embodiments, a benzyl alcohol or its derivatives can increase the sensitivity of yeast cells to antifungals. In some embodiments, benzyl alcohol or its derivatives can destroy biofilms.

In some embodiments provided herein, PE or its derivatives can be used to increase the sensitivity of yeast to antifungal drugs, can increase the efficacy of antifungal drugs, can lower the dose of drugs needed, thereby decreasing adverse effects of drugs with significant toxicity), and the compound (or some chemical with similar properties or activities) can be used as a surface coating for medical devices. PE and its' derivatives can be used for treating and preventing fungal infections in subjects that are immunocompromised. In some embodiments, PE can be chemically linked to antifungal drugs. In some embodiments, PE increases the efficacy of antifungal drugs. In some embodiments, PE enhances the sensitivity of *S. cerevisiae* to Voriconazole. In some embodiments, PE enhances the sensitivity of yeast to Voriconazole. In some embodiments, PE enhances the sensitivity of *S. cerevisiae* to Itraconazole. In some embodiments, PE enhances the sensitivity of yeast to Itraconazole. In some embodiments, PE enhances the sensitivity of *S. cerevisiae* to Sordarin. In some embodiments, PE enhances the sensitivity of yeast to Sordarin. In some embodiments, PE increases the efficacy of specific antifungal drugs in pathogenic fungi. In some embodiments, PE increases the efficacy of triazoles against pathogenic fungi. In some embodiments, PE increases the efficacy of fluconazole against *C. albicans*. In some embodiments, PE increases the efficacy of fluconazole against yeast. In some embodiments, PE increases the efficacy of fluconazole against *C. albicans* strains. In some embodiments, PE increases the efficacy of flucytosine against *C. albicans*. In some embodiments, PE increases the efficacy of flucytosine against yeast. Additional embodiments regarding the PE to increase efficacy to antifungal drugs are provided herein.
Phenyl ethanol and derivatives

Some embodiments of the methods and compositions provide herein include the use of phenyl ethanol and derivatives thereof. In some embodiments, the phenyl ethanol derivative has the below structure of Formula I:

$$\text{R}_1 - \text{R}_5$$

wherein X is selected from C, N, S and O;

$$\text{R}_1 - \text{R}_5$$ is each independently selected from hydrogen, C\text{\textsubscript{1}} to C\text{\textsubscript{6}} alkyl, C\text{\textsubscript{1}} to C\text{\textsubscript{6}} substituted alkyl, C\text{\textsubscript{1}} to C\text{\textsubscript{6}} alkenyl, C\text{\textsubscript{1}} to C\text{\textsubscript{6}} substituted alkenyl, aryl, heteroaryl, alkoxy, and aryloxy; and

n is 0, 1, 2, 3, 4, 5 or 6.

Some embodiments relate to phenyl ethanol (PE) which has the following structure:

Antifungal agents

Some embodiments of the methods and compositions provide herein include an antifungal agent. In some embodiments, the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin. In some embodiments, the polyene is selected from the group consisting of Amphotericin B, Candididin, Filipin, Hymycin, Natamycin, Nystatin, Fluconosine, Sordarin and Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole,
Sulconazole, and Tioconazole. In some embodiments, the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravuconazole, Terconazole, and Voriconazole. In some embodiments, the thiazole comprises Abafungin. In some embodiments, the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine. In some embodiments, the echinocandin is selected from the group consisting of Anidulafungin, Caspofungin, and Micafungin.

Fungal cells and infections

[0054] Some embodiments of the methods and compositions provide herein include fungal cells, biofilms, filamentous forms of such cells, and multicellular forms of such cells. In some embodiments, the fungus can include a genus selected from Candida spp., Epidermophyton spp, Histoplasma spp, Trichophyton spp, Microsporum spp, Blastomyces spp, Histoplasma ssp, Cryptococcus ssp, Coccidioides ssp, Pneumocystis spp, Saccharomyces spp, Aspergillus spp, Kluvyeromyces spp, Schizosaccharomyces spp, and Streptomyces spp. In some embodiments, the Candida spp can include C. albicans, C. glabrata, C. rugosa, C. parapsilosis, C. tropicalis, and C. dubliniensis. In some embodiments, the Epidermophyton spp is E. floccosum.

Medical devices

[0055] Without being limiting, medical devices can include, for example, an instrument, apparatus, implant, in vitro reagent or similar article that can be used to diagnose, prevent or treat disease or other conditions in a subject in need. These can include, for example, tongue depressors, thermometers, gloves, needles, surgical instruments and other devices for medical testings, implants, and prosthetics. Some embodiments of the methods and compositions provide herein include a medical device comprising an antifungal coating, wherein the antifungal coating comprises phenyl ethanol and an antifungal agent. In some embodiments, the medical device can include a catheter, an endoscope, a laryngoscope, a tube for feeding, a tube for drainage, a tube for endotracheal use, a guide wire, a condom, a glove, a wound dressing, a contact lens, an implant, an extracorporeal blood conduit, a membrane for dialysis, a blood filter, a heart valve, pace makers, artificial joints (i.e., hips, knees, etc) and a device for circulatory assistance (i.e., pace maker, Dacron valve, etc).
Some embodiments of the methods and compositions provide herein include manufacturing a medical device comprising coating the medical device with a coating comprising phenyl ethanol and an antifungal agent.

Increasing the potency of antifungal agents

Some embodiments of the methods and compositions provide herein include treating and preventing a fungal infection with an antifungal agent in combination with phenyl ethanol. In some embodiments, the method further comprises administering an effective amount of phenyl ethanol in combination with an antifungal agent to a subject in need thereof. In some such embodiments, the antifungal agent and phenyl ethanol can be administered in a single composition, in separate compositions, simultaneously, or sequentially such that the antifungal agent and phenyl ethanol have a synergistic effect. Some embodiments of the methods and compositions provide herein include increasing the sensitivity of a fungal cell to an antifungal agent comprising contacting the cell with an antifungal agent in combination with phenyl ethanol. In some embodiments, a composition is provided. In the broadest sense, the composition can comprise PE and an antifungal agent. In some embodiments, the composition can comprise PE, wherein the PE is covalently linked to an antifungal agent. In some such embodiments, the cell can be contacted with the antifungal agent and phenyl ethanol in a single composition, in separate compositions, simultaneously, or sequentially such that the antifungal agent and phenyl ethanol have a synergistic effect. In some embodiments, a cream is provided. In the broadest sense, the cream can comprise a composition of any of the embodiments described herein.

Screening for new drug targets

Screening for drug targets can involve introducing fungal strains to a concentration of PE and an antifungal agent during culturing of the fungal cells. During a culture process susceptibility is performed on the fungi. The pathogenic fungi can be tested to determine the ability of an antifungal agent or a composition comprising an antifungal agent to inhibit its growth. As such as screen can be performed that can measure directly the effects of an antifungal agent or a composition thereof, by bringing the pathogenic fungal target and the antifungal agent together in a growing environment such as a nutrient media in
a test tube or an agar plate to observe the effects of the agent on the growth of the fungal target. Sensitivity to an anti-fungal agent can be observed by the lack of growth of the fungal target. In some embodiments, a method of screening or testing a composition for fungal targets is contemplated. In some embodiments, the method comprises providing a concentration of PE, providing a concentration of an antifungal agent, culturing fungal cells under conditions wherein the fungal cells are in contact with the concentration of antifungal agent and the concentration of PE and wherein the fungal cells comprise modified alleles of a gene, and screening for cells sensitive to the concentration of PE and the concentration of the antifungal agent, wherein screening comprises assaying the fungal cells for growth. In some embodiments, the gene is essential for the growth and/or survival of the fungal cells. In some embodiments, the gene contributes to the virulence and/or pathogenicity of the fungal cells to a host organism. In some embodiments, the genes are for echinocandin binding. In some embodiments, the fungal cells are selected from the group consisting of *Candida* spp, *Epidermophyton* spp, *Histoplasma* spp, *Trichophyton* spp, *Microsporum* spp, *Blastomyces* spp, *Histoplasma* spp, *Cryptococcus* spp, *Coccidioides* spp, *Pneumocystis* spp, *Saccharomyces* spp, *Aspergillus* spp, *Kluyveromyces* spp, *Schizosaccharomyces* spp, and *Streptomyces* spp. In some embodiments, the *Candida* spp is selected from the group consisting of *C. albicans*, *C. glabrata*, *C. rugosa*, *C. parapsilosis*, *C. tropicalis*, and *C. dubliniensis*. In some embodiments, the *Epidermophyton* spp is *E. floccosum*. In some embodiments, the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin. In some embodiments, the polyene is selected from the group consisting of Amphotericin B, Candidcidin, Filipin, Hamycin, Natamycin, Nystatin, and Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments, the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravuconazole, Terconazole, and Voriconazole. In some embodiments, the thiazole comprises Abafungin. In some embodiments, the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine.
some embodiments, the echinocandin is selected from the group consisting of Anidulafungin, Caspofungin, and Micafungin.

**Pharmaceutical compositions**

[0059] In some embodiments, compositions comprise an antifungal agent and phenyl ethanol or derivatives thereof. In some embodiments, the composition comprises an antifungal agent, wherein the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin. In some embodiments, the polyene is selected from the group consisting of Amphotericin B, Candozin, Filipin, Hamycin, Natamycin, Nystatin, and Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments, the triazole is selected from the group consisting of Albamiconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravuconazole, Terconazole, and Voriconazole. In some embodiments, the thiazole comprises Aflacin. In some embodiments, the allylamine is selected from the group consisting of Amorolfine, Butenafine, Naftifine, and Terbinafine. In some embodiments, the echinocandin is selected from the group consisting of Anidulafungin, Caspofungin, and Micafungin.

[0060] In some embodiments, the active ingredients and mixtures of active ingredients may be used, for example, in pharmaceutical compositions comprising a pharmaceutically acceptable carrier prepared for storage and subsequent administration. Also, some embodiments include use of the above-described active ingredients with a pharmaceutically acceptable carrier or diluent. Acceptable carriers or diluents for therapeutic use are well known in the pharmaceutical art, and are described, for example, in Remington’s Pharmaceutical Sciences, 18th Ed., Mack Publishing Co., Easton, Pa. (1990), which is incorporated herein by reference in its entirety. Preservatives, stabilizers, and dyes may be provided in the pharmaceutical composition. For example, sodium benzoate, ascorbic acid and esters of p-hydroxybenzoic acid may be added as preservatives. In addition, antioxidants and suspending agents may be used. In some embodiments the composition comprises preservatives, stabilizers and/or dyes. In some embodiments, the preservatives are selected
from a group consisting of sodium benzoate, ascorbic acid and esters of p-hydroxybenzoic acid. In some embodiments, the composition comprises antioxidants. In some embodiments, the composition comprises suspending agents.

[0061] Compositions of the active ingredients may be formulated and used as tablets, capsules, or elixirs for oral administration; suppositories for rectal administration; sterile solutions, suspensions for injectable administration; patches for transdermal administration, and sub-dermal deposits and the like. Injectables can be prepared in conventional forms, either as liquid solutions or suspensions, solid forms suitable for solution or suspension in liquid prior to injection, or as emulsions. Suitable excipients are, for example, water, saline, dextrose, mannitol, lactose, lecithin, albumin, sodium glutamate, cysteine hydrochloride, and the like. In addition, if desired, the injectable pharmaceutical compositions may contain minor amounts of nontoxic auxiliary substances, such as wetting agents, pH buffering agents, and the like. If desired, absorption enhancing preparations (for example, liposomes), may be utilized. In some embodiments the composition comprises an excipient. In some embodiments the excipient is selected from a group consisting of water, saline, dextrose, mannitol, lactose, lecithin, albumin, sodium glutamate, cysteine hydrochloride, and the like.

[0062] For injection, the agents of the invention may be formulated in aqueous solutions, preferably in physiologically compatible buffers such as Hanks’ solution, Ringer’s solution, or physiological saline buffer. For such transmucosal administration, penetrants appropriate to the barrier to be permeated are used in the formulation. Such penetrants are generally known in the art. Use of pharmaceutically acceptable carriers to formulate the ingredients herein disclosed for the practice of the invention into dosages suitable for systemic administration is within the scope of the invention. With proper choice of carrier and suitable manufacturing practice, the compositions disclosed herein, in particular, those formulated as solutions, may be administered parenterally, such as by intravenous injection. The active ingredients can be formulated readily using pharmaceutically acceptable carriers well known in the art into dosages suitable for oral administration. Such carriers enable the compounds of the invention to be formulated as tablets, pills, capsules, liquids, gels, syrups, slurries, suspensions and the like, for oral ingestion by a patient to be treated. In some
embodiments, the compositions are formulated as tablets, pills, capsules, liquids, gels, syrups, slurries or suspensions for oral ingestion by the patient in need.

[0063] Pharmaceutical formulations for parenteral administration include aqueous solutions of the active ingredients in water-soluble form. Additionally, suspensions of the active ingredients may be prepared as appropriate oily injection suspensions. Suitable lipophilic solvents or vehicles include fatty oils such as sesame oil, or other organic oils such as soybean, grapefruit or almond oils, or synthetic fatty acid esters, such as ethyl oleate or triglycerides, or liposomes. Aqueous injection suspensions may contain substances which increase the viscosity of the suspension, such as sodium carboxymethyl cellulose, sorbitol, or dextran. Optionally, the suspension may also contain suitable stabilizers or agents that increase the solubility of the ingredients to allow for the preparation of highly concentrated solutions. In some embodiments, the composition is formulated as a suspension. In some embodiments, the suspension is an oily suspension comprising lipophilic solvents or vehicles. In some embodiments, the lipophilic solvents or vehicles comprise fatty oils such as sesame oil, or other organic oils such as soybean, grapefruit or almond oils, or synthetic fatty acid esters, such as ethyl oleate or triglycerides, or liposomes.

[0064] Pharmaceutical preparations for oral use can be obtained by combining the active ingredients with solid excipient, optionally grinding a resulting mixture, and processing the mixture of granules, after adding suitable auxiliaries, if desired, to obtain tablets or dragee cores. Suitable excipients are, in particular, fillers such as sugars, including lactose, sucrose, mannitol, or sorbitol; cellulose preparations such as, for example, maize starch, wheat starch, rice starch, potato starch, gelatin, gum tragacanth, methyl cellulose, hydroxypropylmethyl-cellulose, sodium carboxymethylcellulose, and/or polyvinylpyrrolidone (PVP). If desired, disintegrating agents may be added, such as the cross-linked polyvinyl pyrrolidone, agar, or alginic acid or a salt thereof such as sodium alginate. Dragee cores are provided with suitable coatings. For this purpose, concentrated sugar solutions may be used, which may optionally contain gum arabic, talc, polyvinyl pyrrolidone, carbopol gel, polyethylene glycol, and/or titanium dioxide, lacquer solutions, and suitable organic solvents or solvent mixtures. Dyestuffs or pigments may be added to the tablets or dragee coatings for identification or to characterize different combinations of active ingredient doses. For this purpose, concentrated sugar solutions may be used, which may
optionally contain gum arabic, talc, polyvinyl pyrrolidone, carbopol gel, polyethylene glycol, and/or titanium dioxide, lacquer solutions, and suitable organic solvents or solvent mixtures. Dyestuffs or pigments may be added to the tablets or dragee coatings for identification or to characterize different combinations of active ingredient doses. Such formulations can be made using methods known in the art. See, for example, U.S. Pat. Nos. 5,733,888 (injectable compositions); 5,726,181 (poorly water soluble compounds); 5,707,641 (therapeutically active proteins or peptides); 5,667,809 (lipophilic agents); 5,576,012 (solubilizing polymeric agents); 5,707,615 (anti-viral formulations); 5,683,676 (particulate medicaments); 5,654,286 (topical formulations); 5,688,529 (oral suspensions); 5,445,829 (extended release formulations); 5,653,987 (liquid formulations); 5,641,515 (controlled release formulations) and 5,601,845 (spheroid formulations); all of which are incorporated herein by reference in their entireties. The pharmaceutical compositions may be manufactured in a manner that is itself known, for example, by means of conventional mixing, dissolving, granulating, dragee-making, levitating, emulsifying, encapsulating, entrapping, or lyophilizing processes.

[0065] In some embodiments herein the composition for oral use is provided. In some embodiments, the composition for oral use comprises excipients, wherein the excipients are selected from a group consisting of sugars, including lactose, sucrose, mannitol, or sorbitol; cellulose preparations such as, for example, maize starch, wheat starch, rice starch, potato starch, gelatin, gum tragacanth, methyl cellulose, hydroxypropylmethylcellulose, sodium carboxymethylcellulose, and polyvinylpyrrolidone (PVP). In some embodiments, the composition comprises concentrated sugar solutions, wherein the concentrated sugar solutions are selected from a group consisting of gum arabic, talc, polyvinyl pyrrolidone, carbopol gel, polyethylene glycol, and/or titanium dioxide, lacquer solutions, and suitable organic solvents and solvent mixtures.

[0066] To formulate the dosage including one or more active ingredients disclosed herein, known surface active agents, excipients, smoothing agents, suspension agents and pharmaceutically acceptable film-forming substances and coating assistants, and the like may be used. Preferably alcohols, esters, sulfated aliphatic alcohols, and the like may be used as surface active agents; sucrose, glucose, lactose, starch, crystallized cellulose, mannitol, light anhydrous silicate, magnesium aluminate, magnesium methasilicate aluminate, synthetic aluminum silicate, calcium carbonate, sodium acid carbonate, calcium
hydrogen phosphate, calcium carboxymethyl cellulose, and the like may be used as excipients; magnesium stearate, talc, hardened oil and the like may be used as smoothing agents; coconut oil, olive oil, sesame oil, peanut oil, soya may be used as suspension agents or lubricants; cellulose acetate phthalate as a derivative of a carbohydrate such as cellulose or sugar, or methylacacetate-methacrylate copolymer as a derivative of polyvinyl may be used as suspension agents; and plasticizers such as ester phthalates and the like may be used as suspension agents. In addition to the foregoing ingredients, sweeteners, fragrances, colorants, preservatives and the like may be added to the administered formulation of the compound of the invention, particularly when the compound is to be administered orally. In some embodiments, the composition comprises active ingredients. In some embodiments, the active ingredients are selected from a group consisting of alcohols, esters, and sulfated aliphatic alcohols. In some embodiments, the composition further comprises excipients. In some embodiments, the excipients comprise sucrose, glucose, lactose, starch, crystallized cellulose, mannitol, light anhydrous silicate, magnesium aluminate, magnesium methasilicate aluminate, synthetic aluminum silicate, calcium carbonate, sodium acid carbonate, calcium hydrogen phosphate, calcium carboxymethyl cellulose, and the like. In some embodiments, the composition comprises suspension agents and/or lubricants. In some embodiments, the suspension agents and/or lubricants comprise magnesium stearate, talc, hardened oil and the like may be used as smoothing agents; coconut oil, olive oil, sesame oil, peanut oil or soya. In some embodiments, the composition comprises suspension agents. In some embodiments, the suspension agent comprises cellulose acetate phthalate, derivatives of a carbohydrate such as cellulose or sugar, or methylacacetate-methacrylate copolymer as a derivative of polyvinyl. In some embodiments, the composition comprises plasticizers. In some embodiments, the plasticizers comprise ester phthalates.

[0067] Further disclosed herein are various pharmaceutical compositions well known in the pharmaceutical art for uses that include intraocular, intranasal, and intraauricular delivery. Pharmaceutical formulations include aqueous ophthalmic solutions of the active ingredients in water-soluble form, such as eyedrops, or in gelln gum (Sheeden et al., Clin. Ther., 23(3):440-50 (2001)) or hydrogels (Mayer et al., Ophthalmologica, 210(2):101-3 (1996)); ophthalmic ointments; ophthalmic suspensions, such as microparticulates, drug-containing small polymeric particles that are suspended in a liquid
carrier medium (Joshi, A., J. Ocul. Pharmacol., 10(1):29-45 (1994)), lipid-soluble formulations (Alm et al., Prog. Clin. Biol. Res., 312:447-58 (1989)), and microspheres (Mordenti, Toxicol. Sci., 52(1):101-6 (1999)); and ocular inserts. All of the above-mentioned references are incorporated herein by reference in their entireties. Such suitable pharmaceutical formulations are most often and preferably formulated to be sterile, isotonic and buffered for stability and comfort. Pharmaceutical compositions may also include drops and sprays often prepared to simulate in many respects nasal secretions to ensure maintenance of normal ciliary action. As disclosed in Remington’s Pharmaceutical Sciences, 18th Ed., Mack Publishing Co., Easton, Pa. (1990), which is incorporated herein by reference in its entirety, and well-known to those skilled in the art, suitable formulations are most often and preferably isotonic, slightly buffered to maintain a pH of 5.5 to 6.5, and most often and preferably include antimicrobial preservatives and appropriate drug stabilizers. Pharmaceutical formulations for intraauricular delivery include suspensions and ointments for topical application in the ear. Common solvents for such aural formulations include glycerin and water.

[0068] The compositions described herein may be administered by either oral or non-oral pathways. When administered orally, compositions can be administered in capsule, tablet, granule, spray, syrup, or other such form. Compositions also may be brewed, as with a tea, or formed by dissolving a powdered composition into a fluid, typically water, fruit or vegetable juice, or milk. When administered non-orally, it can be administered as an aqueous suspension, an oily preparation or the like or as a drip, suppository, salve, ointment or the like, when administered via injection, subcutaneously, intraperitoneally, intravenously, intramuscularly, or the like. Similarly, it may be administered topically, rectally, or vaginally, as deemed appropriate by those of skill in the art for bringing the ingredients of the invention into optimal contact with living tissue. In some embodiments, wherein the compositions are administered non-orally, the compositions are administered as an aqueous suspension, an oily preparation or the like or as a drip, suppository, salve or ointment. In some embodiments, wherein the composition is administered via injection, the composition is administered subcutaneously, intraperitoneally, intravenously or intramuscularly.

[0069] Agents intended to be administered intracellularly may be administered using techniques well known to those of ordinary skill in the art. For example, such agents
may be encapsulated into liposomes, then administered by any of the methods described herein. All molecules present in an aqueous solution at the time of liposome formation are incorporated into the aqueous interior. The liposomal contents are both protected from the external micro-environment and, because liposomes fuse with cell membranes, are efficiently delivered into the cell cytoplasm. Additionally, due to their hydrophobicity, small organic molecules may be directly administered intracellularly.

[0070] In some embodiments, the compositions described herein are formulated into a single pill or tablet. In some embodiments, the pill or tablet has a mass from 10 mg to 2000 mg. In some embodiments, the pill or tablet has a mass from 100 mg to 1500 mg. In some embodiments, the pill or tablet has a mass from 500 mg to 1200 mg. In some embodiments, the pill or tablet has a mass from 800 mg to 1100 mg.

Methods of Administration

[0071] Some embodiments also encompass methods for making and for administering the disclosed compositions. Such disclosed methods include, among others, (a) administration through oral pathways, which administration includes administration in capsule, tablet, granule, spray, syrup, or other such forms; (b) administration through non-oral pathways, which administration includes administration as an aqueous suspension, an oily preparation or the like or as a drip, suppository, salve, ointment or the like; administration via injection, subcutaneously, intraperitoneally, intravenously, intramuscularly, intradermally, or the like; as well as (c) administration topically, (d) administration rectally, or (e) administration vaginally, as deemed appropriate by those of skill in the art for bringing the compound of the invention into contact with living tissue; and (f) administration via controlled released formulations, depot formulations, and infusion pump delivery. As further examples of such modes of administration and as further disclosure of modes of administration, disclosed herein are various methods for administration of the disclosed compositions including modes of administration through intraocular, intranasal, and intraauricular pathways.

[0072] The pharmaceutically effective amount of the ingredients disclosed herein required as a dose will dependent on the route of administration and the physical characteristics of the specific human under consideration. The dose can be tailored to achieve
a desired effect, but will depend on such factors as weight, diet, concurrent medication and other factors, which those skilled in the medical arts will recognize.

[0073] In practicing the methods of the invention, the products or compositions can be used alone or in combination with one another or in combination with other therapeutic or diagnostic agents. These products can be utilized in vivo, ordinarily in a mammal, preferably in a human, or in vitro. In employing them in vivo, the products or compositions can be administered to the mammal in a variety of ways, including parenterally, intravenously, subcutaneously, intramuscularly, colonically, rectally, vaginally, nasally or intraperitoneally, employing a variety of dosage forms. Such methods may also be applied to testing chemical activity in vivo.

[0074] As will be readily apparent to one skilled in the art, the useful in vivo dosage to be administered, the particular mode of administration, and duration of treatment will vary depending upon the age, weight and mammalian species treated, the particular ingredients employed, and the specific use for which these ingredients are employed. The determination of effective dosage levels, that is the dosage levels necessary to achieve the desired result, can be accomplished by one skilled in the art using routine pharmacological methods. Typically, human clinical applications of products are commenced at lower dosage levels, with dosage level being increased until the desired effect is achieved. Alternatively, acceptable in vitro studies can be used to establish useful doses and routes of administration of the compositions identified by the present methods using established pharmacological methods. In non-human animal studies, applications of potential products are commenced at higher dosage levels, with dosage being decreased until the desired effect is no longer achieved or adverse side effects disappear.

[0075] The dosage of active ingredient(s) may range broadly, depending upon the desired affects and the therapeutic indication. Typically, dosages of active ingredient(s) may be between about 10 μg/kg and 100 mg/kg body weight, preferably between about 100 μg/kg and 10 mg/kg body weight. Alternatively dosages may be based and calculated upon the surface area of the patient, as understood by those of skill in the art. Administration is preferably oral on a daily or twice daily basis. In some embodiments, the dosage of the active ingredient is between about 10 μg/kg and 100 mg/kg body weight, or preferably between
about 100 μg/kg and 10 mg/kg body weight. In some embodiments, the dosage is administered orally once or twice a day.

[0076] The exact formulation, route of administration and dosage can be chosen in view of the consumer’s condition. See for example, Fingl et al., in The Pharmacological Basis of Therapeutics, 1975, which is incorporated herein by reference in its entirety. The magnitude of an administrated dose may vary with the severity of a particular medical or physical condition and the route of administration. The severity of a condition may, for example, be evaluated, in part, by standard prognostic evaluation methods. Further, the dose and perhaps dose frequency may also vary according to the age, body weight, and response of the individual. A program comparable to that discussed above may be used in veterinary medicine.

[0077] A variety of techniques for formulation and administration may be found in Remington’s Pharmaceutical Sciences, 18th Ed., Mack Publishing Co., Easton, Pa. (1990), which is incorporated herein by reference in its entirety. Suitable administration routes may include oral, rectal, intravenous, transdermal, vaginal, transmucosal, or intestinal administration; parenteral delivery, including intramuscular, subcutaneous, intramedullary injections, as well as intrathecal, direct intraventricular, intravenous, intraperitoneal, intranasal, intraocular injections or any other administration route known in the art. In some embodiments, the dosages of the composition is administered though administration routes which can include oral, rectal, intravenous, transdermal, vaginal, transmucosal, or intestinal administration; parenteral delivery, including intramuscular, subcutaneous, intramedullary injections, as well as intrathecal, direct intraventricular, intravenous, intraperitoneal, intranasal or intraocular injections.

[0078] The combined active ingredients in the compositions disclosed herein may be orally or non-orally administered to a human patient in the amount of about 0.0007 mg/day to about 7,000 mg/day of the total active ingredients, and more preferably about 0.07 mg/day to about 70 mg/day of the total active ingredients at, one time per day or in other embodiments, over two to about ten times per day. Alternatively, the active ingredients disclosed herein may be administered in the stated amounts continuously by, for example, an intravenous drip. Thus, for a patient weighing 70 kilograms, the preferred daily dose of the total active ingredients would be about 0.0007 mg/kg/day to about 35 mg/kg/day, and more
preferable, 0.007 mg/kg/day to about 15 mg/kg/day. Nonetheless, as will be understood by those of skill in the art, in certain situations it may be necessary to administer the active ingredients disclosed herein in amounts that exceed, or even far exceed, the above-stated, preferred dosage range to treat effectively and aggressively a desired condition or characteristic.

[0079] In some embodiments, the compositions can be orally or non-orally administered to a human patient in the amount of about 0.0007 mg/day to about 7,000 mg/day of the total active ingredients, and more preferably about 0.07 mg/day to about 70 mg/day of the total active ingredients at, one time per day or in other embodiments, over two to about ten times per day.

[0080] Ingredients disclosed herein can be evaluated for efficacy and toxicity using known methods. For example, the toxicology of a particular compound or ingredient, or of a subset of the compounds, sharing certain chemical moieties, may be established by determining in vitro toxicity towards a cell line, such as a mammalian, and preferably a human, cell line. The results of such studies are often predictive of toxicity in animals, such as mammals, or more specifically, humans. Alternatively, the toxicity of particular compounds or ingredients in an animal model, such as mice, rats, rabbits, or monkeys, may be determined using known methods. The efficacy of a particular compound may be established using several recognized methods, such as in vitro methods, animal models, or human clinical trials. Recognized in vitro models exist for nearly every class of condition, including the conditions abated by the compounds or ingredients disclosed herein, including obesity. Similarly, acceptable animal models may be used to establish efficacy of chemicals to treat such conditions. When selecting a model to determine efficacy, the skilled artisan can be guided by the state of the art to choose an appropriate model, dose, and route of administration, and regime. Of course, human clinical trials can also be used to determine the efficacy of a compound or ingredient in humans.

[0081] The active ingredients described above may be used alone or in combination with one another, or in combination with other therapeutic or diagnostic agents. These products can be utilized in vivo or in vitro. The useful dosages and the most useful modes of administration will vary depending upon the age and weight of the consumer, the
particular ingredients employed, and the specific use for which these ingredients are employed.

Synergistic effects of PE in combination with fluconazole

[0082] A strain of *S. cerevisiae* was cultured on plates with media with and without PE. As shown, PE enhances the antifungal activity of fluconazole. Filters containing 0 μg, 25 μg, 50 μg, 100 μg fluconazole were placed in the center of the plates. Inhibition of *S. cerevisiae* growth was observed as a clear zone around the filters. The results are shown in Figure 1. The combination of PE with fluconazole was observed to have a synergistic effect for the inhibition of *S. cerevisiae* growth. PE significantly enhanced the potency of fluconazole to inhibit growth of the *S. cerevisiae*. The larger zone of inhibition on the PE plates surrounding a filter disk with the same concentrations of fluconazole indicates increased fluconazole sensitivity.

The effects of PE to increase the sensitivity of yeast to fluconazole

[0083] Two different approaches to test whether PE’s ability to increase the sensitivity of yeast to fluconazole (i.e. to decrease the concentration of drug needed to inhibit cell growth) could be explained by its ability to disrupt biofilm formation. First a strain that harbors a genetic mutation (*flo11/D*) that prevents biofilm formation (i.e. smooth colonies) was tested for its sensitivity to fluconazole was examined. As PE increased the sensitivity of the *flo11/D* strain as much as it did the wild-type strain (Figure 2), it was expected that the effect of PE on drug sensitivity is independent of its effect on biofilm formation. The effects of biofilm formation by *Candida albicans* have been previously described by Zhihao et al, included in its entirety by reference.

[0084] As shown in Figure 1, PE enhances the PE enhances the antifungal activity of fluconazole. Each panel shows 2 YPD (yeast extract peptone dextrose) plates spread with a lawn of *S. cerevisiae* (F45). In each panel, the left plate is YPD alone and the right plate is YPD plus 10 mM PE (a concentration that inhibits the fluffy colony morphology). Each plate also contains a paper disk that contains a DMSO vehicle, 25 μg fluconazole, 50 μg fluconazole, or 100 μg fluconazole. The larger zone of inhibition on the
PE plates surrounding a filter disk with the same concentrations of fluconazole indicates increased fluconazole sensitivity.

[0085] However, previous experiments determined that biofilm formation was inhibited at PE concentrations of 10 mM or higher. Attention is drawn to Figure 2, in which concentrations of PE that were too low to inhibit biofilm formation (determined by colony morphology) were also shown to increase the sensitivity of the yeast strain _floc11D_ for the fluconazole which further support the hypothesis that the effect of PE on drug sensitivity is independent of its effect on biofilm formation. As such, there is a synergistic effect upon the combination of PE with fluconazole, in which the cells are more sensitive to fluconazole in the presence of PE at a higher concentration (10 mM PE). As shown in Figure 3, the concentration of fluconazole remained constant at 50 μM, and in combination with PE, the PE was evaluated at concentrations of 10 mM, 5 mM, 2.5 mM, 1.25 mM, 0.625 mM and 0.312 mM. It is noted that even at lower concentrations of PE (< 10 mM), in which the colonies are fluffy, indicating an intact cell wall or intact morphology, the PE at lower concentrations can still enhance killing by fluconazole. Increased sensitivity to FLU (larger growth inhibition zones) are seen with concentrations of PE (625 mM) PE 8-fold below the concentration that disrupts biofilm formation. As such, even at a lower concentration, PE in combination with fluconazole has a synergistic effect on inhibiting the growth of the fungal strain.

PE increases the efficacy of some but not all antifungal drugs

[0086] As shown in Figure 4, PE was used in conjunction with several antifungal drugs such as fluconazole, voroconazole, itraconazole, flucytosine, sordarin, caspofungin and nystatin. In several of the embodiments described herein, PE increased the sensitivity of the fungus to fluconazole, voroconazole, itraconazole, flucytosine and sordarin.

PE enhances the sensitivity of _S. cerevisiae_ to Voroconazole

[0087] As shown in Figure 5, PE was used in conjunction with the antifungal, Voriconazole. YPD plates were incubated with _S. cerevisiae_ in which the YPD plates included 10 mM PE. Each plate was spread with F45 strains and also contained a filter disk with 10 mg voriconazole (Figure 5, panel A) and 25 mg voriconazole (Figure 5, panel B).
As shown, there is an increase in cell clearance in the plates that include the highest concentration of voriconazole.

**PE enhances the sensitivity of *S. cerevisiae* to Itraconazole**

[0088] As shown in Figure 6, PE was used in conjunction with the antifungal, Itraconazole. YPD plates were incubated with *S. cerevisiae* in which the YPD plates included 10 mM PE. Despite its relative insolubility, as shown in Figure 6, there as a similar sized zone of inhibition in the presence of different amounts of drug. In each panel, the left plate is YPD alone and the right plate is YPD plus 10 mM PE. YPD plates were incubated with *S. cerevisiae* in which the YPD plates included 10 mM PE. Each plate was spread with F45 strains and also contained a filter disk with the chloroform vehicle (Figure 6, panel A), 100 mg Itraconazole (Figure 6, panel B), 50 mg Itraconazole (Figure 6, panel C), 25 mg Itraconazole (Figure 6, panel D), or 12.5 mg Itraconazole (Figure 6, panel E). The presence of a significant difference between +/- PE in the 12.5 mg Itraconazole panel suggests that PE will sensitise yeast to Itraconazole levels below this concentration.

**PE enhances the sensitivity of *S. cerevisiae* to Sordarin**

[0089] As shown in Figure 7, PE was used in conjunction with the antifungal, Sordarin. YPD plates were incubated with *S. cerevisiae* in which the YPD plates included 10 mM PE. Each plate was spread with F45 and also contained a filter disk with 50 mg Sordarin (Figure 7, panel A), 10 mg Sordarin (Figure 7, panel B), 1 mg Sordarin (Figure 7, panel C), or 500 ng Sordarin (Figure 7, panel D). As shown, PE sensitizes *S. cerevisiae* to Sordarin, a pre-clinical selective inhibitor of fungal protein synthesis that impairs translational elongation factor 2 (EF-2) function.

**PE has no effect on the caspofungin sensitivity of *S. cerevisiae***

[0090] As shown in Figure 8, PE was used in conjunction with the antifungal, Caspofungin, an echinocandin that targets the fungal cell wall by inhibiting b-glycan synthase. YPD plates were incubated with *S. cerevisiae* in which the YPD plates included 10 mM PE. In each panel, the left plate is YPD alone and the right plate is YPD plus 10 mM PE. Each plate was spread with F45 and also contained a filter disk with the water vehicle
(Figure 8, panel A), 50 µg Caspofungin (Figure 8, panel B), 5 µg Caspofungin (Figure 8, panel C), 1 µg Caspofungin (Figure 8, panel D), or 200 ng Caspofungin (Figure 8, panel E). There is no significant difference between the zone sizes +/- PE.

**PE has no effect on the Nystatin sensitivity of S. cerevisiae**

[0091] As shown in Figure 9, PE was used in conjunction with the antifungal, Nystatin, a polyene that binds ergosterol thereby weakening the plasma membrane. In each panel, the top plate is YPD alone with a disc that contains DMSO, the bottom left plate is YPD alone with a disc that contains 50 µg Nystatin and the bottom right plate is YPD plus 10 mM PE with a disc that contains 50 µg Nystatin. The plates in panel are spread with the F45 strain (Figure 9, panel A). The plates in Figure 9, panel B are spread with the BY4741 lab strain. There is no significant difference between the zone sizes +/- PE. As shown, there was no significant difference between the zone sizes +/- PE.

**PE increases the efficacy of specific antifungal drugs in pathogenic fungi**

[0092] PE was also shown to increase the efficacy of specific antifungal drugs in pathogenic fungi (Table 1). Furthermore, in several of the described embodiments, and as also shown in Table 1, experimentation have shown that that PE is able to increase the efficacy of the triazoles against a wide range of opportunistic fungal pathogens. In two cases, a fluconazole resistant strain of C. albicans and a fluconazole resistant strain of Apergillus fumigatus, the PE-triazole effect was synergistic, and there was a correlation between drug resistance and synergy with PE.

[0093] Method: the effects of PE on the efficacy of fluconazole and voriconazole were tested against 2 strains of *C. albicans* (sensitive= ATCC 90028 and resistant= 20186.025; R357) and one strain each of *Candida glabrata* (ATCC 36583), *Candida krusei* (ATCC 6258), *Candida parapsilosis* (ATCC 22019), *Candida tropicalis* (ATCC 200956), *Cryptococcus neoformans* (ATCC 24067), and *Aspergillus fumigatus* (ATCC 13073). The M.I.C.s of PE, fluconazole, and voriconazole for each strain were determined. Checkboard assays to determine the FICI values were performed. Values were close to or below the FICI value that is widely accepted as a synergistic interaction (FICI= 0.5).

PE can re-sensitize drug resistant strains of *C. albicans* to fluconazole with an effect that is even stronger than the effect on drug sensitive strains.

[0094] In the following embodiments, it was shown that PE can re-sensitize drug resistant strains of *C. albicans* to fluconazole with an effect that is even stronger than the effect on drug sensitive strains (Figures 10 and 11). A similar result was also seen with flucytosine (Figure 9). However, the effects with sordarin appear to be additive, at least for the one strain of *C. albicans* tested (Figure 10). A summary of the effects of PE in conjunction with several types of antifungals is shown in Tables 2A-J which show the degrees of clearance as described in Figure 14.

</table>
PE increases the efficacy of fluconazole against *C. albicans*

[0095] PE was used in conjunction with the antifungal, fluconazole as shown in Figure 10, and was shown to increase the antifungals efficacy. In each panel, the left plate is YPD plus 1% DMSO and the right plate is YPD plus 10 mM PE in 1% DMSO. Each panel plate also contains a filter disk with 50 mg fluconazole. The plates in Figure 10, panel A are spread with a fluconazole sensitive strain of *C. albicans* (ATCC 18804). The plates in Figure 10, panel B are spread with the same fluconazole resistant strain of *C. albicans* used in the Eurofins checkerboard assay (R357). While the zones of both strains are larger in the presence of PE, the zone of the resistant strain is substantially larger than the zone of the sensitive strain. These results with a different assay and a different drug sensitive strain of *C. albicans* supports the result of the C.R.O., that the PE-fluconazole combination is even more effective against this flu-resistant strain (R357).

PE increases the efficacy of fluconazole against several resistant *C. albicans* strains

[0096] PE was used in conjunction with the antifungal, fluconazole as shown in Figure 11, and was shown to increase the antifungals efficacy against several strains of *C. albicans*, such as *S. cerevisiae* strain F45 and four fluconazole resistant strains of *C. albicans* (304(ATCC 28121), CATW 4/19 (ATCC 90819), 3147 (ATCC 10231 and R357). In each panel, the left plate is YPD and the right plate is YPD plus 10 mM PE. Each panel plate also contains a filter disk with 50 mg fluconazole. The plates were spread with the *S. cerevisiae* strain F45 or one of four fluconazole resistant strains of *C. albicans* (Figure 11, panel A), 304 (ATCC 28121) (Figure 11, panel B), CATW 4/19 (ATCC 90819) (Figure 11, panel C), 3147 (ATCC 10231) (Figure 11, panel D), and R357 (Figure 11, panel E). All resistant *C. albicans* strains show large zones of inhibition in the presence of PE and fluconazole, despite being resistant to fluconazole alone. As such, it was concluded that several drug resistant *C. albicans* strains are highly sensitive to the PE-fluconazole combination.

PE increases the efficacy of flucytosine against *C. albicans*

[0097] PE was used in conjunction with the antifungal, flucytosine as shown in Figure 12. In each panel, the left plate is YPD plus 1% DMSO and the right plate is YPD plus 10 mM PE in 1% DMSO. Each panel plate also contains a filter disk with 100 mg
flucytosine. The plates in Figure 12, panel A are spread with C. albicans strain ATCC #18804. The plates in Figure 12, panel B are spread with the R357 strain of C. albicans used in the Eurofins checkerboard assay. Although the boundaries of the flucytosine zones are more diffuse than for some of the other drugs, the zones are larger in the presence of PE and the results look similar to the results with fluconazole (Figure 10) in that there is a stronger effect on the more resistant strain (panel B).

PE-sordarin effect against C. albicans R357 appears additive

[0098] As shown in Figure 13, PE is not synergistic against the R357 strain in combination with all antifungal drugs. In each panel, the left plate is YPD alone and the right plate is YPD plus 10 mM PE. All plates are spread with the C. albicans strain R357. Each plate also contained a filter disk with 1 µg sordarin (Figure 13, panel A), 10 µg sordarin (Figure 13, panel B), or 50 µg sordarin (Figure 13, panel C). Although the zone sizes are larger in the presence of PE, the magnitude of the difference appears to be in the additive range.

Zones of growth inhibition were measured for the S. cerevisiae strain F45 on YPD plates containing 10 mM of the Enamine compound with a 50 µg fluconazole disk applied

[0099] Zones of growth inhibition were also measured for strain F45 in which F45 strains were spread on YPD plates that contained 10mM of an Enamine compound which was poured into the plate, with a 50 µg fluconazole disk. Enamine is an unsaturated compound derived by the condensation of an aldehyde or ketone with a secondary amine. Some enamines have structures that are similar to PE, as such, they were tested to measure their efficacy in increasing sensitivity to an antifungal. As shown in Table 3, are the results of inhibiting the growth of the fungus in the presence of fluconazole and several listed Enamine compounds.

*Average of three plates

[0100] As shown in the control, PE with fluconazole had a high clearance of fungal cells on the plate. However, enamine compounds E, H, I and J also exhibit loss of growth. In some embodiments herein, enamine compounds can increase the sensitivity of a fungal cell to an antifungal agent. In some embodiments, the enamine compounds are E, H, I or J. The results demonstrate that there is a range of effects, with some compounds having no effect or effects less than that of PE and at least one molecule (E) with activity greater than PE. Because all of these molecules have similar chemical properties, especially with respect to non-specific effects on the plasma membrane, the range of activities supports the hypothesis that the synergistic effects that we see between PE and the triazole class of antifungal drugs has a molecular mechanism that is more specific than, for example, increasing membrane permeability.

[0101] In some embodiments, a method of increasing the sensitivity of a fungal cell to an antifungal agent is provided. The method can comprise contacting the cell with an enamine compound in combination with the antifungal agent. In some embodiments, the sensitivity of the cell is increased at least about 2-fold compared to a cell not contacted with enamine compound. In some embodiments, the sensitivity of the cell is increased at least about 5-fold compared to a cell not contacted with enamine compound. In some embodiments, the sensitivity of the cell is increased at least about 20-fold compared to a cell not contacted with enamine compound. In some embodiments, the cell is selected from the group consisting of *Candida* spp, *Epidermophyton* spp, *Histoplasma* spp, *Trichophyton* spp, *Microsporum* spp, *Blastomyces* spp, *Histoplasma* spp, *Cryptococcus* spp, *Coccidioides* spp.
Pneumocystis spp, Saccharomyces spp, Aspergillus spp, Kluyveromyces spp, Schizosaccharomyces spp, and Streptomyces spp. In some embodiments, the Candida spp is selected from the group consisting of C. albicans, C. glabrata, C. rugosa, C. parapsilosis, C. tropicalis, and C. dubliniensis. In some embodiments, the Epidermophyton spp is E. floccosum. In some embodiments, the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, Sordarin, Flucytosine and an echinocandin. In some embodiments, the polyene is selected from the group consisting of Amphotericin B, Candin, Filipin, Hamycin, Natamycin and Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments, the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravuconazole, Terconazole, and Voriconazole. In some embodiments, the thiazole comprises Abafungin. In some embodiments, the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine. In some embodiments, the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

Methods of increasing the sensitivity of fungal cells to antifungal agents

[0102] In some embodiments, a method of increasing the sensitivity of a fungal cell to an antifungal agent is provided. The method can comprise contacting the cell with phenyl ethanol in combination with the antifungal agent. In some embodiments, the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin. In some embodiments, the polyene is selected from the group consisting of Amphotericin B, Candin, Filipin, Hamycin, Natamycin, Nystatin, Flucytosine, Sordarin and Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments, the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravuconazole, Terconazole, and Voriconazole. In some
embodiments, the thiazole comprises Abafungin. In some embodiments, the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine. In some embodiments, the echinocandin is selected from the group consisting of Anidulafungin, Caspofungin, and Micafungin. In some embodiments, the fungus can include a genus selected from Candida spp, Epidermophyton spp, Histoplasma spp, Trichophyton spp, Microsporum spp, Blastomyces spp, Histoplasma spp, Cryptococcus spp, Coccidioides spp, Pneumocystis spp, Saccharomyces spp, Aspergillus spp, Kluveromyces spp, Schizosaccharomyces spp, and Streptomyces spp. In some embodiments, the Candida spp can include C. albicans, C. glabrata, C. rugosa, C. parapsilosis, C. tropicalis, and C. dubliniensis. In some embodiments, the Epidermophyton spp is E. floccosum. In some embodiments, the sensitivity of the cell is increased at least about 2-fold compared to a cell not contacted with phenyl ethanol. In some embodiments, the sensitivity of the cell is increased at least about 5-fold compared to a cell not contacted with phenyl ethanol. In some embodiments, the sensitivity of the cell is increased at least about 20-fold compared to a cell not contacted with phenyl ethanol. In some embodiments, the cell is selected from the group consisting of Candida spp, Epidermophyton spp, Histoplasma spp, Trichophyton spp, Microsporum spp, Blastomyces spp, Histoplasma spp, Cryptococcus spp, Coccidioides spp, Pneumocystis spp, Saccharomyces spp, Aspergillus spp, Kluveromyces spp, Schizosaccharomyces spp, and Streptomyces spp. In some embodiments, the Candida spp is selected from the group consisting of C. albicans, C. glabrata, C. rugosa, C. parapsilosis, C. tropicalis, and C. dubliniensis. In some embodiments, the Epidermophyton spp is E. floccosum. In some embodiments, the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, Sordarin, Flucytosine and an echinocandin. In some embodiments, the polyene is selected from the group consisting of Amphotericin B, Candididin, Filipin, Hamycin, Natamycin and Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments, the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravuconazole, Terconazole, and Voriconazole. In some embodiments, the thiazole comprises Abafungin. In
some embodiments, the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine. In some embodiments, the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

[0103] In some embodiments, a method of increasing the sensitivity of a fungal cell to an antifungal agent is provided wherein the method comprises contacting the cell with a compound of Formula I in combination with the antifungal agent

Candididin, Filipin, Hamycin, Natamycin and Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments, the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravuconazole, Terconazole, and Voriconazole. In some embodiments, the thiazole comprises Abafungin. In some embodiments, the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine. In some embodiments, the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

[0104] In some embodiments, a method of treating and preventing a fungal infection is provided, wherein the method comprises administering an effective amount of phenyl ethanol in combination with an antifungal agent to a subject in need thereof. In some embodiments, the subject is mammalian. In some embodiments, the subject is human. In some embodiments, the subject is suffering from an autoimmune disorder. In some embodiments, the autoimmune disorder is a result of chemotherapy. In some embodiments, the autoimmune disorder is a result of an organ transplant. In some embodiments, the fungal infection is selected from the group consisting of Candida spp, Epidermophyton spp, Histoplasma spp, Trichophyton spp, Microsporum spp, Blastomyces spp, Histoplasma spp, Cryptococcus spp, Coccidioides spp, Pneumocystis spp, Saccharomyces spp, Aspergillus spp, Kluyveromyces spp, Schizosaccharomyces spp, and Streptomyces spp. In some embodiments, the Candida spp is selected from the group consisting of C. albicans, C. glabrata, C. rugosa, C. parapsilosis, C. tropicalis, and C. dubliniensis. In some embodiments, the Epidermophyton spp is E. floccosum. In some embodiments, the antifungal agent is selected from the group consisting of a polypene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin. In some embodiments, the polypene is selected from the group consisting of Amphotericin B, Candididin, Filipin, Hamycin, Natamycin and Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments, the triazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole.
Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Rauconazole, Terconazole, and Voriconazole. In some embodiments, the thiazole comprises Abafungin. In some embodiments, the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine. In some embodiments, the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

[0105] In some embodiments, a pharmaceutical composition is provided, wherein the pharmaceutical composition comprises phenyl ethanol, an antifungal agent and a pharmaceutical acceptable carrier. In some embodiments, the phenyl ethanol comprises a concentration of 625 μM to 10mM. In some embodiments, the pharmaceutical composition is suitable for topical administration. In some embodiments, the composition is selected from the group consisting of an aerosol, powder, cream, paste, solution, suspension, and gel. In some embodiments, the pharmaceutical composition is suitable for intravenous administration. In some embodiments, the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin. In some embodiments, the polyene is selected from the group consisting of Amphotericin B, Candinidin, Filipin, Hamycin, Natamycinand Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments, the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Rauconazole, Terconazole, and Voriconazole. In some embodiments, the thiazole comprises Abafungin. In some embodiments, the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine. In some embodiments, the echinocandin is selected from the group consisting of Anidulafungin and Micafungin. In some embodiments, the antifungal coating comprises phenyl ethanol. In some embodiments, the antifungal coating further comprises an antifungal agent. In some embodiments the composition comprises preservatives, stabilizers and/or dyes. In some embodiments, the preservatives are selected from a group consisting of sodium benzoate, ascorbic acid and esters of p-hydroxybenzoic acid. In some embodiments, the composition comprises antioxidants. In some embodiments, the composition comprises suspending agents. In some embodiments the composition
comprises an excipient. In some embodiments the excipient is selected from a group consisting of water, saline, dextrose, mannitol, lactose, lecithin, albumin, sodium glutamate, cysteine hydrochloride, and the like. In some embodiments, the compositions are formulated as tablets, pills, capsules, liquids, gels, syrups, slurries or suspensions for oral ingestion by the patient in need. In some embodiments, the composition is formulated as a suspension. In some embodiments, the suspension is an oily suspension comprising lipophilic solvents or vehicles. In some embodiments, the lipophilic solvents or vehicles comprise fatty oils such as sesame oil, or other organic oils such as soybean, grapefruit or almond oils, or synthetic fatty acid esters, such as ethyl oleate or triglycerides, or liposomes. In some embodiments herein the composition for oral use is provided. In some embodiments, the composition for oral use comprises excipients, wherein the excipients are selected from a group consisting of sugars, including lactose, sucrose, mannitol, or sorbitol; cellulose preparations such as, for example, maize starch, wheat starch, rice starch, potato starch, gelatin, gum tragacanth, methyl cellulose, hydroxypropylmethyl-cellulose, sodium carboxymethylcellulose, and polyvinylpyrrolidone (PVP). In some embodiments, the composition comprises concentrated sugar solutions, wherein the concentrated sugar solutions are selected from a group consisting of gum arabic, talc, polyvinyl pyrrolidone, carbopol gel, polyethylene glycol, and/or titanium dioxide, lacquer solutions, and suitable organic solvents and solvent mixtures. In some embodiments, the composition comprises active ingredients. In some embodiments, the active ingredients are selected from a group consisting of alcohols, esters, and sulfated aliphatic alcohols. In some embodiments, the composition further comprises excipients. In some embodiments, the excipients comprise sucrose, glucose, lactose, starch, crystallized cellulose, mannitol, light anhydrous silicate, magnesium aluminate, magnesium methasilicate aluminate, synthetic aluminum silicate, calcium carbonate, sodium acid carbonate, calcium hydrogen phosphate, calcium carboxymethyl cellulose, and the like. In some embodiments, the composition comprises suspension agents and/or lubricants. In some embodiments, the suspension agents and/or lubricants comprise magnesium stearate, talc, hardened oil and the like may be used as smoothing agents; coconut oil, olive oil, sesame oil, peanut oil or soya. In some embodiments, the composition comprises suspension agents. In some embodiments, the suspension agent comprises cellulose acetate phthalate, derivatives of a carbohydrate such as cellulose or sugar, or methylacetate-methacrylate copolymer as a
derivative of polyvinyl. In some embodiments, the composition comprises plasticizers. In some embodiments, the plasticizers comprise ester phthalates. In some embodiments, wherein the compositions are administered non- orally, the compositions are administered as an aqueous suspension, an oily preparation or the like or as a drip, suppository, salve or ointment. In some embodiments, wherein the composition is administered via injection, the composition is administered subcutaneously, intraperitoneally, intravenously or intramuscularly. In some embodiments, the compositions described herein are formulated into a single pill or tablet. In some embodiments, the pill or tablet has a mass from 10 mg to 2000 mg. In some embodiments, the pill or tablet has a mass from 100 mg to 1500 mg. In some embodiments, the pill or tablet has a mass from 500 mg to 1200 mg. In some embodiments, the pill or tablet has a mass from 800 mg to 1100 mg.

[0106] In some embodiments, a medical device comprising an antifungal coating is provided, wherein the antifungal coating comprises phenyl ethanol. In some embodiments, the antifungal coating further comprises an antifungal agent. In some embodiments, the medical device is selected from the group consisting of a catheter, an endoscope, a laryngoscope, a tube for feeding, a tube for drainage, a tube for endotracheal use, a guide wire, a condom, a glove, a wound dressing, a contact lens, an implant, an extracorporeal blood conduit, a membrane for dialysis, a blood filter, and a device for circulatory assistance. In some embodiments, the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin. In some embodiments, the polyene is selected from the group consisting of Amphotericin B, Candidicidin, Filipin, Hamycin, Natamycin and Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments, the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Poseaconazole, Ravuconazole, Terconazole, and Voriconazole. In some embodiments, the thiazole comprises Abafungin. In some embodiments, the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine. In some embodiments, the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.
[0107] In some embodiments, a method of manufacturing a medical device is provided, wherein the method comprises coating the medical device with a coating comprising phenyl ethanol and an antifungal agent. In some embodiments, the medical device is selected from the group consisting of a catheter, an endoscope, a laryngoscope, a tube for feeding, a tube for drainage, a tube for endotracheal use, a guide wire, a condom, a glove, a wound dressing, a contact lens, an implant, an extracorporeal blood conduit, a membrane for dialysis, a blood filter, and a device for circulatory assistance. In some embodiments, the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin. In some embodiments, the polyene is selected from the group consisting of Amphotericin B, Candididin, Filipin, Hamycin, Natamycin, and Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bifonazole, Butaconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments, the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavconazole, Itraconazole, Posaconazole, Rayuconazole, Terconazole, and Voriconazole. In some embodiments, the thiazole comprises Abafungin. In some embodiments, the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine. In some embodiments, the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

[0108] In some embodiments, a method of screening or testing a composition for fungal targets is provided, wherein the method comprises providing a concentration of phenyl ethanol, providing a concentration of an antifungal agent and culturing fungal cells under conditions wherein the fungal cells are in contact with the concentration of antifungal agent and the concentration of phenyl ethanol and wherein the fungal cells comprise modified alleles of a gene. In some embodiments, the gene contributes to the virulence and/or pathogenicity of the fungal cells to a host organism. In some embodiments, the fungal cells are selected from the group consisting of Candida spp, Epidermophyton spp, Histoplasma spp, Trichophyton spp, Microsporum spp, Blastomyces spp, Histoplasma spp, Cryptococcus spp, Coccidioides spp Pneumocystis spp, Saccharomyces spp, Aspergillus spp, Kluyveromyces spp, Schizosaccharomyces spp, and Streptomyces spp. In some embodiments,
the *Candida* spp is selected from the group consisting of *C. albicans*, *C. glabrata*, *C. rugosa*, *C. parapsilosis*, *C. tropicalis*, and *C. dubliniensis*. In some embodiments, the *Epidermophyton* spp is *E. floccosum*. In some embodiments, the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin. In some embodiments, the polyene is selected from the group consisting of Amphotericin B, Candin, Filipin, Hamycin, Natamycin and Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments, the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Raveconazole, Terconazole, and Voriconazole. In some embodiments, the thiazole comprises Abafungin. In some embodiments, the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine. In some embodiments, the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

[0109] In some embodiments, a method of increasing the sensitivity of a fungal cell to an antifungal agent is provided, wherein the method comprises contacting the cell with an enamine in combination with the antifungal agent. In some embodiments, the sensitivity of the cell is increased at least about 2-fold compared to a cell not contacted with the enamine. In some embodiments, the sensitivity of the cell is increased at least about 5-fold compared to a cell not contacted with the enamine. In some embodiments, the sensitivity of the cell is increased at least about 20-fold compared to a cell not contacted with the enamine. In some embodiments, the cell is selected from the group consisting of *Candida* spp, *Epidermophyton* spp, *Histoplasma* spp, *Trichophyton* spp, *Microsporum* spp, *Blastomyces* spp, *Histoplasma* spp, *Cryptococcus* spp, *Coccidioides* spp *Pneumocystis* spp, *Saccharomyces* spp, *Aspergillus* spp, *Kluyveromyces* spp, *Schizosaccharomyces* spp, and *Streptomyces* spp. In some embodiments, the *Candida* spp is selected from the group consisting of *C. albicans*, *C. glabrata*, *C. rugosa*, *C. parapsilosis*, *C. tropicalis*, and *C. dubliniensis*. In some embodiments, the *Epidermophyton* spp is *E. floccosum*. In some embodiments, the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, Sordarin, Fluconosine and an echinocandin.
some embodiments, the polyene is selected from the group consisting of Amphotericin B, Candidin, Filipin, Hamycin, Natamycin and Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments, the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravaconazole, Terconazole, and Voriconazole. In some embodiments, the thiazole comprises Abafungin. In some embodiments, the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine. In some embodiments, the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

[0110] In some embodiments, a method of treating and preventing a fungal infection is provided, wherein the method comprises administering an effective amount of an enamine in combination with an antifungal agent to a subject in need thereof. In some embodiments, the subject is mammalian. In some embodiments, the subject is human. In some embodiments, the subject is suffering from an autoimmune disorder. In some embodiments, the autoimmune disorder is a result of chemotherapy. In some embodiments, the autoimmune disorder is a result of an organ transplant. In some embodiments, the fungal infection is selected from the group consisting of Candida spp, Epidermophyton spp, Histoplasma spp, Trichophyton spp, Microsporum spp, Blastomyces spp, Histoplasma spp, Cryptococcus spp, Coccidioides spp, Pneumocystis spp, Saccharomyces spp, Aspergillus spp, Kluveromyces spp, Schizosaccharomyces spp, and Streptomyces spp. In some embodiments, the Candida spp is selected from the group consisting of C. albicans, C. glabrata, C. rugosa, C. parapsilosis, C. tropicalis, and C. dubliniensis. In some embodiments, the Epidermophyton spp is E. floccosum. In some embodiments, the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin. In some embodiments, the polyene is selected from the group consisting of Amphotericin B, Candidin, Filipin, Hamycin, Natamycin and Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and
Tioconazole. In some embodiments, the triazole is selected from the group consisting of Albacazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravuconazole, Terconazole, and Voriconazole. In some embodiments, the thiazole comprises Abafungin. In some embodiments, the allylamine is selected from the group consisting of Amorolfin, Butenafine, Nafitifine, and Terbinafine. In some embodiments, the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

[0111] In some embodiments, a pharmaceutical composition is provided, wherein the composition comprises an enamine, an antifungal agent and a pharmaceutical acceptable carrier. In some embodiments, the enamine comprises a concentration of 625 uM to 10mM. In some embodiments, the pharmaceutical composition is suitable for topical administration. In some embodiments, the composition is selected from the group consisting of an aerosol, powder, cream, paste, solution, suspension, and gel. In some embodiments, the pharmaceutical composition is suitable for intravenous administration. In some embodiments, the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin. In some embodiments, the polyene is selected from the group consisting of Amphotericin B, Candidcidin, Filipin, Hamycin, Natamycin and Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments, the triazole is selected from the group consisting of Albacazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravuconazole, Terconazole, and Voriconazole. In some embodiments, the thiazole comprises Abafungin. In some embodiments, the allylamine is selected from the group consisting of Amorolfin, Butenafine, Nafitifine, and Terbinafine. In some embodiments, the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

[0112] In some embodiments, a medical device comprising an antifungal coating is provided, wherein the antifungal coating comprises an enamine. In some embodiments, the antifungal coating further comprises an antifungal agent. In some embodiments, a method of manufacturing a medical device is provided, wherein the method comprises coating the medical device with a coating comprising an enamine and an antifungal agent. In some
embodiments of the medical device or method, the medical device is selected from the group consisting of a catheter, an endoscope, a laryngoscope, a tube for feeding, a tube for drainage, a tube for endotracheal use, a guide wire, a condom, a glove, a wound dressing, a contact lens, an implant, an extracorporeal blood conduit, a membrane for dialysis, a blood filter, and a device for circulatory assistance. In some embodiments of the medical device or method, the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin. In some embodiments of the medical device or method, the polyene is selected from the group consisting of Amphotericin B, Candididin, Filipin, Hamycin, Natamycin and Rimocidin. In some embodiments of the medical device or method, the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Econiconazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Miconazone, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments of the medical device or method, the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravuconazole, Terconazole, and Voriconazole. In some embodiments of the medical device or method, the thiazole comprises Abafungin. In some embodiments of the medical device or method, the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine. In some embodiments of the medical device or method, the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

[0113] In some embodiments, a method of screening or testing a composition for fungal targets is provided, wherein the method comprises providing a concentration of an enamine, providing a concentration of an antifungal agent, and culturing fungal cells under conditions wherein the fungal cells are in contact with the concentration of antifungal agent and the concentration of an enamine and wherein the fungal cells comprise modified alleles of a gene. In some embodiments, the gene contributes to the virulence and/or pathogenicity of the fungal cells to a host organism. In some embodiments, the fungal cells are selected from the group consisting of Candida spp, Epidermophyton spp, Histoplasma spp, Trichophyton spp, Microsporum spp, Blastomyces spp, Histoplasma spp, Cryptococcus spp, Coccidioides spp Pneumocystis spp, Saccharomyces spp, Aspergillus spp, Kluveromyces spp, Schizosaccharomyces spp, and Streptomyces spp. In some embodiments, the Candida
spp is selected from the group consisting of *C. albicans*, *C. glabrata*, *C. rugosa*, *C. parapsilosis*, *C. tropicalis*, and *C. dubliniensis*. In some embodiments, the *Epidermophyton spp* is *E. floccosum*. In some embodiments, the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin. In some embodiments, the polyene is selected from the group consisting of Amphotericin B, Candidin, Filipin, Hamycin, Natamycin and Rimocidin. In some embodiments, the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole. In some embodiments, the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravuconazole, Terconazole, and Voriconazole. In some embodiments, the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine. In some embodiments, the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

[0114] The term “comprising” as used herein is synonymous with “including,” “containing,” or “characterized by,” and is inclusive or open-ended and does not exclude additional, unrecited elements or method steps.

[0115] The above description discloses several methods and materials of the present invention. This invention is susceptible to modifications in the methods and materials, as well as alterations in the fabrication methods and equipment. Such modifications will become apparent to those skilled in the art from a consideration of this disclosure or practice of the invention disclosed herein. Consequently, it is not intended that this invention be limited to the specific embodiments disclosed herein, but that it cover all modifications and alternatives coming within the true scope and spirit of the invention.

[0116] All references cited herein, including but not limited to published and unpublished applications, patents, and literature references, are incorporated herein by reference in their entirety and are hereby made a part of this specification. To the extent publications and patents or patent applications incorporated by reference contradict the disclosure contained in the specification, the specification is intended to supersede and/or take precedence over any such contradictory material.
WHAT IS CLAIMED IS:

1. A method of increasing the sensitivity of a fungal cell to an antifungal agent comprising:
   contacting the cell with phenyl ethanol in combination with the antifungal agent.

2. A method of increasing the sensitivity of a fungal cell to an antifungal agent comprising:
   contacting the cell with a compound of Formula I in combination with the antifungal agent, wherein Formula I is:

   \[ \begin{array}{c}
   \text{R}_1 \\
   \text{R}_2 \\
   \text{X} \\
   \text{R}_3 \\
   \text{R}_4 \\
   \text{R}_5 \\
   \text{OH}
   \end{array} \]

   (I)

   wherein X is selected from C, N, S and O;
   \( \text{R}_1 - \text{R}_5 \) is each independently selected from hydrogen, C\(_{1}\) to C\(_{6}\) alkyl, C\(_{1}\) to C\(_{6}\) substituted alkyl, C\(_{1}\) to C\(_{6}\) alkenyl, C\(_{1}\) to C\(_{6}\) substituted alkenyl; aryl, heteroaryl, alkoxy, and aryloxy; and
   \( n \) is 0, 1, 2, 3, 4, 5 or 6.

3. The method of any one of claims 1-2, wherein the sensitivity of the cell is increased at least about 2-fold compared to a cell not contacted with phenyl ethanol.

4. The method of any one of claims 1-3, wherein the sensitivity of the cell is increased at least about 5-fold compared to a cell not contacted with phenyl ethanol.

5. The method of any one of claims 1-4, wherein the sensitivity of the cell is increased at least about 20-fold compared to a cell not contacted with phenyl ethanol.

7. The method of any one of claims 1-6, wherein the *Candida* spp is selected from the group consisting of *C. albicans*, *C. glabrata*, *C. rugosa*, *C. parapsilosis*, *C. tropicalis*, and *C. dubliniensis*.

8. The method of any one of claims 1-7, wherein the *Epidermophyton* spp is *E. floccosum*.

9. The method of claim 1-8, wherein the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, Sordarin, Flucytosine and an echinocandin.

10. The method of claim 9, wherein the polyene is selected from the group consisting of Amphotericin B, Candidcidin, Filipin, Hamycin, Natamycin and Rimocidin.

11. The method of claim 9 or 10, wherein the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole.

12. The method of any one of claims 9-11, wherein the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravuconazole, Terconazole, and Voriconazole.

13. The method of any one of claims 9-12, wherein the thiazole comprises Abafungin.

14. The method of any one of claims 9-13, wherein the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine.

15. The method of any one of claims 9-14, wherein the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

16. A method of treating and preventing a fungal infection comprising:
administering an effective amount of phenyl ethanol in combination with an antifungal agent to a subject in need thereof.

17. The method of claim 16, wherein the subject is mammalian.

18. The method of anyone of claims 16-17, wherein the subject is human.

19. The method of anyone of claims 16-18, wherein the subject is suffering from an autoimmune disorder.
20. The method of claim 19, wherein the autoimmune disorder is a result of chemotherapy.

21. The method of claim 19, wherein the autoimmune disorder is a result of an organ transplant.

22. The method of any one of claims 16-21, wherein the fungal infection is selected from the group consisting of *Candida spp, Epidermophyton spp, Histoplasma spp, Trichophyton spp, Microsporum spp, Blastomyces spp, Histoplasma spp, Cryptococcus spp, Coccidioides spp Pneumocystis spp, Saccharomyces spp, Aspergillus spp, Klyveromyces spp, Schizosaccharomyces spp, and Streptomyces spp.*

23. The method of claim 22, wherein the *Candida spp* is selected from the group consisting of *C. albicans, C. glabrata, C. rugosa, C. parapsilosis, C. tropicalis,* and *C. dubliniensis.*

24. The method of claim 22, wherein the *Epidermophyton spp* is *E. floccosum.*

25. The method of any one of claims 16-24, wherein the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin.

26. The method of claim 25, wherein the polyene is selected from the group consisting of *Amphotericin B, Candididin, Filipin, Hamycin, Natamycinand Rimocidin.*

27. The method of claim 25 or 26, wherein the imidazole is selected from the group consisting of *Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole,* and *Tioconazole.*

28. The method of any one of claims 25-27, wherein the triazole is selected from the group consisting of *Albacoanazole, Fluconazole, Isavucanazole, Itraconazole, Posaconazole, Ravuconazole, Terconazole,* and *Voriconazole.*

29. The method of any one of claims 25-28, wherein the thiazole comprises Abafungin.

30. The method of any one of claims 25-29, wherein the allylamine is selected from the group consisting of *Amorolfin, Butenafine, Naftifine,* and *Terbinafine.*

31. The method of any one of claims 25-30, wherein the echinocandin is selected from the group consisting of *Anidulafungin and Micafungin.*
32. A pharmaceutical composition comprising:
   phenyl ethanol;
   an antifungal agent; and
   a pharmaceutical acceptable carrier.
33. The pharmaceutical composition of claim 32, wherein the phenyl ethanol comprises a concentration of 625 μM to 10mM.
34. The pharmaceutical composition of claim 32 or 33 suitable for topical administration.
35. The pharmaceutical composition of any one of claims 32-34, wherein the composition is selected from the group consisting of an aerosol, powder, cream, paste, solution, suspension, and gel.
36. The pharmaceutical composition of any one of claims 32-33 or 35 suitable for intravenous administration.
37. The pharmaceutical composition of any one of claims 32-36, wherein the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin.
38. The pharmaceutical composition of claim 37, wherein the polyene is selected from the group consisting of Amphotericin B, Candididin, Filipin, Hamycin, Natamycin and Rimocidin.
39. The pharmaceutical composition of claim 37 or 38, wherein the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Oмоconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole.
40. The pharmaceutical composition of any one of claims 37-39, wherein the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravuconazole, Terconazole, and Voriconazole.
41. The pharmaceutical composition of any one of claims 37-40, wherein the thiazole comprises Abafungin.
42. The pharmaceutical composition of any one of claims 37-41, wherein the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine.
43. The pharmaceutical composition of any one of claims 37-42, wherein the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

44. A medical device comprising an antifungal coating, wherein the antifungal coating comprises phenyl ethanol.

45. The medical device of claim 44, wherein the antifungal coating further comprises an antifungal agent.

46. A method of manufacturing a medical device comprising: coating the medical device with a coating comprising phenyl ethanol and an antifungal agent.

47. The medical device or method of any one of claims 44-46, wherein the medical device is selected from the group consisting of a catheter, an endoscope, a laryngoscope, a tube for feeding, a tube for drainage, a tube for endotracheal use, a guide wire, a condom, a glove, a wound dressing, a contact lens, an implant, an extracorporeal blood conduit, a membrane for dialysis, a blood filter, and a device for circulatory assistance.

48. The medical device or method of any one of claims 44-47, wherein the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin.

49. The medical device or method of any one of claims 44-48, wherein the polyene is selected from the group consisting of Amphotericin B, Cандicidin, Filipin, Hamycin, Natamycin, and Rimocidin.

50. The medical device or method of any one of claims 44-49, wherein the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Idoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazole, Sertaconazole, Sulconazole, and Tioconazole.

51. The medical device or method of any one of claims 48-50, wherein the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravuconazole, Terconazole, and Voriconazole.

52. The medical device or method of any one of claims 48-51, wherein the thiazole comprises Abafungin.

53. The medical device or method of any one of claims 48-52, wherein the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine.
54. The medical device or method of any one of claims 48-53, wherein the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

55. A method of screening or testing a composition for fungal targets, the method comprising

   providing a concentration of phenyl ethanol;
   providing a concentration of an antifungal agent; and
   culturing fungal cells under conditions wherein the fungal cells are in contact with the concentration of antifungal agent and the concentration of phenyl ethanol and wherein the fungal cells comprise modified alleles of a gene.

56. The method of claim 56, wherein the gene contributes to the virulence and/or pathogenicity of the fungal cells to a host organism.

57. The method of any one of claims 55-56, wherein the fungal cells are selected from the group consisting of Candida spp, Epidermophyton spp, Histoplasma spp, Trichophyton spp, Microsporum spp, Blastomyces spp, Histoplasma spp, Cryptococcus spp, Coccidioides spp, Pneumocystis spp, Saccharomyces spp, Aspergillus spp, Kluyveromyces spp, Schizosaccharomyces spp, and Streptomyces spp.

58. The method of any one of claims 57, wherein the Candida spp is selected from the group consisting of C. albicans, C. glabrata, C. rugosa, C. parapsilosis, C. tropicalis, and C. dubliniensis.

59. The method of any one of claims 57-58, wherein the Epidermophyton spp is E. floccosum.

60. The method of any one of claims 55-59, wherein the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin.

61. The method of claim 60, wherein the polyene is selected from the group consisting of Amphotericin B, Candidcidin, Filipin, Hamycin, Natamycin and Rimocidin.

62. The method of any one of claims 60-61, wherein the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole.
63. The method of any one of claims 60-63, wherein the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravuconazole, Terconazole, and Voriconazole.

64. The method of any one of claims 60-63, wherein the thiazole comprises Abafungin.

65. The method of any one of claims 60-64, wherein the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine.

66. The method of any one of claims 60-65, wherein the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

67. A method of increasing the sensitivity of a fungal cell to an antifungal agent comprising:

   contacting the cell with an enamine in combination with the antifungal agent.

68. The method of claim 67, wherein the sensitivity of the cell is increased at least about 2-fold compared to a cell not contacted with the enamine.

69. The method of any one of claims 67-68, wherein the sensitivity of the cell is increased at least about 5-fold compared to a cell not contacted with the enamine.

70. The method of any one of claims 67-69, wherein the sensitivity of the cell is increased at least about 20-fold compared to a cell not contacted with the enamine.

71. The method of any one of claims 67-70, wherein the cell is selected from the group consisting of Candida spp, Epidermophyton spp, Histoplasma spp, Trichophyton spp, Microsporum spp, Blastomyces spp, Histoplasma spp, Cryptococcus spp, Coccioidioides spp, Pneumocystis spp, Saccharomyces spp, Aspergillus spp, Kluveromyces spp, Schizosaccharomyces spp, and Streptomyces spp.

72. The method of any one of claims 67-71, wherein the Candida spp is selected from the group consisting of C. albicans, C. glabrata, C. rugosa, C. parapsilosis, C. tropicalis, and C. dubliniensis.

73. The method of any one of claims 67-72, wherein the Epidermophyton spp is E. floccosum.

74. The method of claim 67-73, wherein the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, Sordarin, Fluconytone and an echinocandin.
75. The method of claim 74, wherein the polyene is selected from the group consisting of Amphotericin B, Candididin, Filipin, Hamycin, Natamycin and Rimocidin.

76. The method of claim 74 or 75, wherein the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole.

77. The method of any one of claims 74-76, wherein the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravuconazole, Terconazole, and Voriconazole.

78. The method of any one of claims 74-77, wherein the thiazole comprises Abafungin.

79. The method of any one of claims 74-78, wherein the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine.

80. The method of any one of claims 74-79, wherein the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

81. A method of treating and preventing a fungal infection comprising:
administering an effective amount of an enamine in combination with an antifungal agent to a subject in need thereof.

82. The method of claim 81, wherein the subject is mammalian.

83. The method of any one of claims 81-82, wherein the subject is human.

84. The method of any one of claims 81-83, wherein the subject is suffering from an autoimmune disorder.

85. The method of claim 84, wherein the autoimmune disorder is a result of chemotherapy.

86. The method of claim 84, wherein the autoimmune disorder is a result of an organ transplant.

87. The method of any one of claims 81-86, wherein the fungal infection is selected from the group consisting of Candida spp, Epidermophyton spp, Histoplasma spp, Trichophyton spp, Microsporum spp, Blastomyces spp, Histoplasma spp, Cryptococcus spp, Coccidioides spp Pneumocystis spp, Saccharomyces spp, Aspergillus spp, Kluyveromyces spp, Schizosaccharomyces spp, and Streptomycetes spp.
88. The method of claim 87, wherein the *Candida spp* is selected from the group consisting of *C. albicans*, *C. glabrata*, *C. rugosa*, *C. parapsilosis*, *C. tropicalis*, and *C. dubliniensis*.

89. The method of claim 87, wherein the *Epidermophyton spp* is *E. floccosum*.

90. The method of any one of claims 81-89, wherein the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin.

91. The method of claim 90, wherein the polyene is selected from the group consisting of Amphotericin B, Candididin, Filipin, Hamycin, Natamycin and Rimocidin.

92. The method of claim 90 or 91, wherein the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole.

93. The method of any one of claims 90-92, wherein the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravuconazole, Terconazole, and Voriconazole.

94. The method of any one of claims 90-93, wherein the thiazole comprises Abafungin.

95. The method of any one of claims 90-94, wherein the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine.

96. The method of any one of claims 90-95, wherein the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

97. A pharmaceutical composition comprising:
   an enamine;
   an antifungal agent; and
   a pharmaceutical acceptable carrier.

98. The pharmaceutical composition of claim 97, wherein the enamine comprises a concentration of 625 μM to 10mM.

99. The pharmaceutical composition of claim 97 or 98 suitable for topical administration.
100. The pharmaceutical composition of any one of claims 97-99, wherein the composition is selected from the group consisting of an aerosol, powder, cream, paste, solution, suspension, and gel.

101. The pharmaceutical composition of any one of claims 97-98 or 100 suitable for intravenous administration.

102. The pharmaceutical composition of any one of claims 97-101, wherein the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin.

103. The pharmaceutical composition of claim 102, wherein the polyene is selected from the group consisting of Amphotericin B, Candididin, Filipin, Hamycin, Natamycin and Rimocidin.

104. The pharmaceutical composition of claim 102 or 103, wherein the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole.

105. The pharmaceutical composition of any one of claims 102-104, wherein the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravuconazole, Terconazole, and Voriconazole.

106. The pharmaceutical composition of any one of claims 102-105, wherein the thiazole comprises Abafungin.

107. The pharmaceutical composition of any one of claims 102-106, wherein the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine.

108. The pharmaceutical composition of any one of claims 102-107, wherein the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

109. A medical device comprising an antifungal coating, wherein the antifungal coating comprises an enamine.

110. The medical device of claim 109, wherein the antifungal coating further comprises an antifungal agent.

111. A method of manufacturing a medical device comprising: coating the medical device with a coating comprising an enamine and an antifungal agent.
112. The medical device or method of any one of claims 110-111, wherein the medical device is selected from the group consisting of a catheter, an endoscope, a laryngoscope, a tube for feeding, a tube for drainage, a tube for endotracheal use, a guide wire, a condom, a glove, a wound dressing, a contact lens, an implant, an extracorporeal blood conduit, a membrane for dialysis, a blood filter, and a device for circulatory assistance.

113. The medical device or method of any one of claims 110-112, wherein the antifungal agent is selected from the group consisting of a polyene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin.

114. The medical device or method of any one of claims 110-113, wherein the polyene is selected from the group consisting of Amphotericin B, Candicidin, Filipin, Flamycin, Natamycin, and Rimocidin.

115. The medical device or method of any one of claims 113-114, wherein the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole.

116. The medical device or method of any one of claims 113-115, wherein the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravuconazole, Terconazole, and Voriconazole.

117. The medical device or method of any one of claims 113-116, wherein the thiazole comprises Abafungin.

118. The medical device or method of any one of claims 113-117, wherein the allylamine is selected from the group consisting of Amorolfine, Butenafine, Naftifine, and Terbitinafine.

119. The medical device or method of any one of claims 113-118, wherein the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

120. A method of screening or testing a composition for fungal targets, the method comprising

   providing a concentration of an enamine;
   providing a concentration of an antifungal agent; and
culturing fungal cells under conditions wherein the fungal cells are in contact with the concentration of antifungal agent and the concentration of an enamine and wherein the fungal cells comprise modified alleles of a gene.

121. The method of claim 120, wherein the gene contributes to the virulence and/or pathogenicity of the fungal cells to a host organism.

122. The method of any one of claims 120-121, wherein the fungal cells are selected from the group consisting of Candida spp, Epidermophyton spp, Histoplasma spp, Trichophyton spp, Microsporum spp, Blastomyces spp, Histoplasma spp, Cryptococcus spp, Coccidioides spp, Pneumocystis spp, Saccharomyces spp, Aspergillus spp, Kluyveromyces spp, Schizosaccharomyces spp, and Streptomyces spp.

123. The method of any one of claims 122, wherein the Candida spp is selected from the group consisting of C. albicans, C. glabrata, C. rugosa, C. parapsilosis, C. tropicalis, and C. dubliniensis.

124. The method of any one of claims 122-123, wherein the Epidermophyton spp is E. floccosum.

125. The method of any one of claims 120-124, wherein the antifungal agent is selected from the group consisting of a polycene, an imidazole, a triazole, a thiazole, an allylamine, and an echinocandin.

126. The method of claim 125, wherein the polycene is selected from the group consisting of Amphotericin B, Candidin, Filipin, Hamycin, Natamycin and Rimocidin.

127. The method of any one of claims 125-126, wherein the imidazole is selected from the group consisting of Bifonazole, Butoconazole, Clotrimazole, Econazole, Fenticonazole, Isoconazole, Ketoconazole, Luliconazole, Miconazole, Omoconazole, Oxiconazol, Sertaconazole, Sulconazole, and Tioconazole.

128. The method of any one of claims 125-127, wherein the triazole is selected from the group consisting of Albaconazole, Fluconazole, Isavuconazole, Itraconazole, Posaconazole, Ravaconazole, Terconazole, and Voriconazole.

129. The method of any one of claims 125-128, wherein the thiazole comprises Abafungin.

130. The method of any one of claims 125-129, wherein the allylamine is selected from the group consisting of Amorolfin, Butenafine, Naftifine, and Terbinafine.
131. The method of any one of claims 125-130, wherein the echinocandin is selected from the group consisting of Anidulafungin and Micafungin.

Further documents are listed in the continuation of Box C.

* Special categories of cited documents:
  "A" document defining the general state of the art which is not considered to be of particular relevance
  "E" earlier application or patent but published on or after the international filing date
  "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
  "O" document referring to an oral disclosure, use, exhibition or other means
  "P" document published prior to the international filing date but later than the priority date claimed
  "T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
  "X" document of particular relevance, the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
  "Y" document of particular relevance, the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
  "&" document member of the same patent family

Date of the actual completion of the international search 29 November 2015 (29.11.2015)

INTERNATIONAL SEARCH REPORT

Box No. II  Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. □ Claims Nos.:
   because they relate to subject matter not required to be searched by this Authority, namely:

2. □ Claims Nos.:
   because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

   because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box No. III  Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. □ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. □ As all searchable claims could be searched without effort justifying additional fees, this Authority did not invite payment of additional fees.

3. □ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. □ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

□ The additional search fees were accompanied by the applicant’s protest and, where applicable, the payment of a protest fee.

□ The additional search fees were accompanied by the applicant’s protest but the applicable protest fee was not paid within the time limit specified in the invitation.

□ No protest accompanied the payment of additional search fees.
