6H-THIENO[2,3-B]PYRROLE DERIVATIVES AS ANTAGONISTS OF GONADOTROPIN
RELEASING HORMONE (GNRH)

The present invention relates to compounds which are antagonists of gonadotropin
releasing hormone (GnRH) activity. The invention also relates to pharmaceutical
formulations, the use of a compound of the present invention in the manufacture of a
medicament, a method of therapeutic treatment using such a compound and processes for
producing the compounds.

Gonadotropin releasing hormone (GnRH) is a decapeptide that is secreted by the
hypothalamus into the hypophyseal portal circulation in response to neural and/or chemical
stimuli, causing the biosynthesis and release of luteinizing hormone (LH) and follicle-
stimulating hormone (FSH) by the pituitary. GnRH is also known by other names, including
gonadoliberin, LH releasing hormone (LHRH), FSH releasing hormone (FSH RH) and
LH/FSH releasing factor (LH/FSH RF).

GnRH plays an important role in regulating the action of LH and FSH (by regulation
of their levels), and thus has a role in regulating the levels of gonadal steroids in both sexes,
including the sex hormones progesterone, oestrogens and androgens. More discussion of
GnRH can be found in WO 98/5519 and WO 97/14697, the disclosures of which are
incorporated herein by reference.

It is believed that several diseases would benefit from the regulation of GnRH activity,
in particular by antagonising such activity. These include sex hormone related conditions
such as sex hormone dependent cancer, benign prostatic hypertrophy and myoma of the
uterus. Examples of sex hormone dependent cancers are prostatic cancer, uterine cancer,
brast cancer and pituitary gonadotrophe adenoma.

The following disclose compounds purported to act as GnRH antagonists:
99/41252, WO 00/04013, WO 00/69433, WO 99/51231, WO 99/51232, WO 99/51233, WO
99/51234, WO 99/51595, WO 99/51596, WO 00/53178, WO 00/53180, WO 00/53179, WO

WO 02/092565.
It would be desirable to provide further compounds, such compounds being GnRH antagonists. Thus, according to the first aspect of the invention there is provided a compound of Formula (I),

In the present specification, unless otherwise indicated, an alkyl, alkylene, alkenyl or

alkynyl moiety may be linear or branched. The term “alkylene” refers to the group \(-\text{CH}_2\) -.

Thus, \( C_8 \) alkylene for example is \(-\text{CH}_2\)\_8\(-\).
The term 'propylene' refers to trimethylene and the branched alkyl chains –CH(CH₃)CH₂- and –CH₂-CH(CH₃). The straight chain propylene di-radical is preferred, i.e. –CH₂CH₂CH₂-. Specific propylene radicals refer to the particular structure, thus the term propyl-2-ene refers to the group –CH₂-CH(CH₃). Similar notation is used for other divalent alkyl chains such as butylene.

The term '2-propenyl' refers to the group –CH₂–CH=CH₂.

The term ‘aryl’ refers to phenyl or naphthyl.

The term “carbamoyl” refers to the group –C(O)NH₂.

The term "halo" refers to fluoro, chloro, bromo or iodo.

The term “heterocyclic” or “heterocyclic ring” refers to a 4-12 membered, preferably 5-10 membered, aromatic mono or bicyclic ring or a 4–12 membered, preferably 5-10 membered, saturated or partially saturated mono or bicyclic ring, said aromatic, saturated or partially unsaturated rings containing up to 5 heteroatoms independently selected from nitrogen, oxygen or sulphur, linked via ring carbon atoms or ring nitrogen atoms where a bond from a nitrogen is allowed, for example no bond is possible to the nitrogen of a pyridine ring, but a bond is possible through the 1-nitrogen of a pyrazole ring. Examples of 5- or 6-membered aromatic heterocyclic rings include pyrrolyl, furanyl, imidazolyl, triazolyl, pyrazinyl, pyrimidinyl, pyridazinyl, pyridinyl, isoaxazolyl, oxazolyl, 1,2,4 oxadiazolyl, isothiazolyl, thiazolyl and thienyl. A 9 or 10 membered bicyclic aromatic heterocyclic ring is an aromatic bicyclic ring system comprising a 6-membered ring fused to either a 5 membered ring or another 6 membered ring. Examples of 5/6 and 6/6 bicyclic ring systems include benzofuranyl, benzimidazolyl, benzthiophenyl, benzthiazolyl, benzisothiazolyl, benzoxazolyl, benzisoxazolyl, indolyl, pyridooimidazolyl, pyrimidoimidazolyl, quinolinyl, isoquinolinyl, quinoxalinyl, quinazolinyl, phthalazinyl, cinnolinyl and naphthyridinyl. Examples of saturated or partially saturated heterocyclic rings include pyrrolinyl, pyrrolidinyl, morpholinyl, piperidinyl, piperezinyl, dihydropyridinyl and dihydropyrimidinyl. This definition further comprises sulphur-containing rings wherein the sulphur atom has been oxidised to an S(O) or S(O)₂ group.

The term "aromatic ring" refers to a 5-10 membered aromatic mono or bicyclic ring optionally containing up to 5 heteroatoms independently selected from nitrogen, oxygen or sulphur. Examples of such "aromatic rings" include: phenyl, pyrrolyl, furanyl, imidazolyl, triazolyl, pyrazinyl, pyrimidinyl, pyridazinyl, pyridinyl, isoaxazolyl, oxazolyl, 1,2,4
oxadiazolyl, isothiazolyl, thiazolyl and thienyl. Preferred aromatic rings include phenyl, thienyl and pyridyl.

The symbol $\text{\textdegree}$ denotes where the respective group is linked to the remainder of the molecule.

For the avoidance of doubt where two groups or integers appear within the same definition, for example, \((\text{CH}_2)_n-L-(\text{CH}_2)_n\) or \(R^9R^{10}\text{NSO}_2\text{N}(R^{10})\), then these can be the same or different.

For the avoidance of doubt, where several groups together form a ring, for example:

\[
\begin{array}{c}
\text{R}^7 \\
\text{N} \\
\text{R}^6
\end{array}
\]

‘the group forms a heterocyclic ring containing 3-7 carbon atoms and one or more heteroatoms’, then the groups shown cyclises to form a ring, i.e.

\[
\begin{array}{c}
\text{R}^7 \\
\text{N} \\
\text{R}^6
\end{array}
\]

the component of which are defined by the definitions of the groups which form the ring, thus in the above example the ring would include a nitrogen atom. For example in Example 2 this group forms a piperazine ring.

The term $\text{C}_{1.3}\text{perfluoroalkyl}$ refers to a $\text{C}_{1.3}\text{alkyl}$ chain in which all hydrogens have been replaced with a fluorine atom. Examples of $\text{C}_{1.3}\text{perfluoroalkyl}$ include trifluoromethyl, pentafluoroethyl and 1-trifluoromethyl-1,2,2,2-tetrafluoroethyl. Preferably $\text{C}_{1.3}\text{perfluoroalkyl}$ is trifluoromethyl.

Examples of $\text{C}_{1.4}\text{alkyl}$ include: methyl, ethyl, propyl, isopropyl, butyl, $\text{iso}$-butyl, $\text{tert}$-butyl and 2-methyl-pentyl; example of $\text{C}_{1.4}\text{alkylene}$ include: methylene, ethylene and 2-methyl-propylene; examples of $\text{C}_{1.4}\text{alkenyl}$ include allyl (2-propenyl) and 2— butenyl, examples of $\text{C}_{1.4}\text{alkynyl}$ 2-propynyl and 3-butynyl, examples of $\text{haloC}_{1.4}\text{alkyl}$ include fluoroethyl, chloropropyl and bromobutyl, examples of $\text{hydroxyC}_{1.4}\text{alkyl}$ include hydroxymethyl, hydroxyethyl and hydroxybutyl, examples of $\text{C}_{1.4}\text{alkoxy}$ include methoxy, ethoxy and butoxy; examples of $\text{C}_{1.4}\text{alkoxyC}_{1.4}\text{alkyl}$ include methoxyethyl, propoxybutyl and propanoyl, examples of $\text{C}_{1.4}\text{alkanoyl}$ incude formyl, ethanoyl, propanoyl or pentanoyl, examples of $\text{N-C}_{1.4}\text{alkylamino}$ include $\text{N}$-methylamino and $\text{N}$-ethylamino;
examples of \( \text{N,N-di-C}_{1-4}\text{alkylamino} \) include \( \text{N,N-dimethylaminoethyl,} \) \( \text{N,N-di-methylaminopropyl} \) and \( \text{N,N-dipropylaminoethyl,} \) examples of \( \text{HO-C}_{2-4}\text{alkyl-NH} \) include hydroxymethylamino hydroxyethylamino and hydroxypropyamino, examples of \( \text{HO-C}_{2-4}\text{alkyl-N(C}_{1-4}\text{alkyl)} \) include \( \text{N-methyl-hydroxymethylamino,} \) 5 \( \text{N-ethyl-hydroxyethylamino,} \) and \( \text{N-propyl-hydroxypropyamino,} \) examples of \( \text{C}_{1-6}\text{alkyl-S(O}_{n}\text{)-methylothio,} \) methylsulphinyl, ethylsulphinyl, ethylsulphonyl and propylsulphonyl, include examples of \( \text{arylC}_{1-6}\text{alkyl} \) include benzyl, phenethyl and phenylbutyl, examples of \( \text{heterocyclcylC}_{1-6}\text{alkyl} \) include pyrrolidin-1-yl ethyl, imidazolylethyl, pyridimethyl and pyrimidinylethyl.

It will be appreciated by those skilled in the art that in the processes of the present invention certain functional groups such as hydroxyl or amino groups in the starting reagents or intermediate compounds may need to be protected by protecting groups. Thus, the preparation of the compounds of Formula (I) may involve, at an appropriate stage, the addition and subsequent removal of one or more protecting groups.

A suitable protecting group for an amino or alkylamino group is, for example, an acyl group, for example an alkanoyl group such as acetyl, an alkoxy carbonyl group, for example a methoxycarbonyl, ethoxycarbonyl or tert-butoxycarbonyl group, an arylmethoxycarbonyl group, for example benzyloxy carbonyl, or an aroyl group, for example benzoyl. The de-protection conditions for the above protecting groups necessarily vary with the choice of protecting group. Thus, for example, an acyl group such as an alkanoyl or alkoxy carbonyl group or an aroyl group may be removed for example, by hydrolysis with a suitable base such as an alkali metal hydroxide, for example lithium or sodium hydroxide. Alternatively an acyl group such as a tert-butoxycarbonyl group may be removed, for example, by treatment with a suitable acid as hydrochloric, sulphuric or phosphoric acid or trifluoroacetic acid and an arylmethoxycarbonyl group such as a benzyloxy carbonyl group may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon, or by treatment with a Lewis acid for example boron tris(trifluoroacetate). A suitable alternative protecting group for a primary amino group is, for example, a phthaloyl group which may be removed by treatment with an alkylamine, for example dimethylaminopropylamine, or with hydrazine.

A suitable protecting group for a hydroxy group is, for example, an acyl group, for example an alkanoyl group such as acetyl, an aroyl group, for example benzoyl, or an arylmethyl group, for example benzyl. The de-protection conditions for the above protecting groups will necessarily vary with the choice of protecting group. Thus, for example, an acyl group such as an alkanoyl or an aroyl group may be removed, for example, by hydrolysis with a suitable base such as an alkali metal hydroxide, for example lithium or sodium hydroxide. Alternatively an arylmethyl group such as a benzyl group may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon.
A suitable protecting group for a carboxy group is, for example, an esterifying group, for example a methyl or an ethyl group which may be removed, for example, by hydrolysis with a base such as sodium hydroxide, or for example a tert-butyl group which may be removed, for example, by treatment with an acid, for example an organic acid such as trifluoroacetic acid, or for example a benzyl group which may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon.

**GENERAL REACTION SCHEMES**

In the following schemes wherein Ri, Rii and Riii represent optional substituents on the phenyl ring which are optionally protected as necessary and R represents a protecting group, group C has been depicted as substituted phenyl for illustration purposes only. Other definitions of C are also appropriate.

![Reaction Schemes Diagram]

**Scheme a**

Thienopyrroles, such as 3 can be synthesised by the classic Fisher thienopyrrole synthesis reaction by the condensation of a hydrazine-HCl 1 and a ketone 2, bearing hydrogen atoms α to the carbonyl (Scheme a). Treatment of these reactants in a suitable solvent, such as acetic acid, ethanol, sec-butanol, toluene, in the presence of an acid, such as sulphuric, hydrochloric, polyphosphoric and/or a Lewis acid, for example, boron trifluoride, zinc
chloride, magnesium bromide, at elevated temperatures (for example 100 °C), gives the desired product. R represents a protecting group, eg tert-butylcarbamate or phthalimide.

Scheme b

Thienopyrroles, such as represented in structure 5, can also be made using aldehydes 4, bearing hydrogen atoms α to the carbonyl, by cyclization using the conditions above. In this case the substituent at the 2-position must be added later (see scheme d).
Thienopyrrole may also be synthesised utilising the Granburg reaction, wherein a hydrazine 1 is mixed with ketone 6, bearing a chlorine atom γ to the carbonyl, and heated in a suitable solvent such as ethanol, sec-butanol, toluene at a temperature between 50 °C and 120 °C (Scheme c).

Scheme d

The thienopyrrole 5 can be treated with a ‘bromine source’, such as molecular bromide, pyridinium tribromide, pyrrolidone hydrobromide or polymer supported reagent equivalents, in an inert solvent such as chloroform, methylene chloride at -10 °C to 25 °C to yield the 2-bromo compound 8 (Scheme d). Reaction under Suzuki conditions with a palladium(0) catalyst, a weak base such as aqueous sodium carbonate or saturated sodium hydrogen carbonate and the like, and a substituted aryl boronic acid from commercial sources or prepared (as described in: Gronowitz, S.; Hornfeldt, A.-B.; Yang, Y.,-H Chem. Sci. 1986, 26, 311-314), in an inert solvent such as toluene, benzene, dioxane, THF, DMF and the like, with heating between 25 °C and 100 °C, preferably 80 °C, for a period of 1-12 hours, to give the desired compound 3.
The thiophene 1 can be synthesised by reaction of a hydrazine under the preferred conditions of sodium hydride in DMF at a temperature between -10 °C and -5 °C, followed by reaction with di-tert-butyl dicarbonate in THF under reflux.

Substituted ketones 2 can be prepared, as outlined in Scheme e starting from appropriate acid chlorides such as 9. Treatment of the acid chloride with N,N-dimethylhydroxylamine hydrochloride in the presence of an amine base such as triethylamine, and a suitable solvent such as methylene chloride at a temperature of -10 °C to 25 °C, yields the amide 10. Further reaction with a substituted aryl organolithium (prepared essentially as described in Wakefield B. J.; Organolithium Methods Academic Press Limited, 1988, pp. 27-29 and references therein) in an inert solvent such as tetrahydrofuran, diethyl ether, benzene, toluene or mixture thereof and the like, at a temperature between -100 °C and 0 °C then quenching of the reaction mixture with a mineral acid such as hydrochloric acid, yields the aryl ketone 2.

Commencing with a readily available amino acid with a suitable chain length [a] 11, the nitrogen atom can be brought in at the beginning of the synthesis by the route shown in
Scheme f. Protection of the amine group of 11 with a tert-butylcarbamate group is achieved by condensation with di-tert-butyl di-carbonate in the presence of an amine base, for example triethylamine, in an inert solvent such as methylene chloride, chloroform, benzene, toluene, tetrahydrofuran and mixtures thereof and the like, at a temperature of -10 °C to 25 °C.

Coupling of the acid product with N,N-dimethylhydroxylamine in the presence of a coupling reagent 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (EDC) or 1,3-dicyclohexylcarbodiimide (DCC) or the like, with or without 1-hydroxybenzotriazole (HOBT), and suitable amine base, such as triethylamine and the like, in an inert solvent such as methylene chloride, chloroform, dimethylformamide, or mixture thereof, at or near room temperature for a period of 3 to 24 hours provided the corresponding coupled product 12.

Following the same route described above for scheme e, the aryl group can then be installed.

Scheme g.

Scheme g illustrates another method for the synthesis of ketone such as 2 and 16, where the nitrogen group is introduced at a latter stage. As above a Weinreb amide 14 can be synthesised from an acid chloride. Treatment with the required amine, in an inert solvent such as THF, toluene, water and the such like can displace the group X to give 17. As above the aryl group can be introduced by displacement of the Weinreb amide with a suitable aryl lithium nucleophile. Alternatively the nitrogen atom can be introduced already protected as a phthalimide by displacement of the group X by potassium phthalimide, or similar salt thereof,
by heating in an inert polar solvent such as DMF, DMSO, THF, toluene with or without the presence of a catalyst such as tetrabutylammonium iodide and the such like, to yield the compound 15. Again displacement of the Weinreb amide with an organolithium species completes the synthesis of ketone 16 suitable for cyclization under the Fischer condition described above for thienopyrrole synthesis.

Scheme h.

An alternative approach to a phthalimide protected nitrogen ketone, such as 16, can be taken by firstly treating a lactone, with an organolithium species as in the above schemes in a suitable solvent such as THF or ether at a low temperature of between −100 °C and −50 °C to yield a primary alcohol 18 (Scheme h). The hydroxyl function of 18 is replaced with a phthalimide group by a Mitsunobu reaction with an activating agent such as diethylidiazocarboxylate (DEAD), diisopropylidiazocarboxylate or the like with triphenylphosphine, tri-butylphosphine and the like, in an inert solvent such as benzene, toluene, tetrahydrofuran or mixtures thereof to give the desired ketone 16.

If the group $R^1$ was not present on the starting hydrazine before cyclization to form a thienopyrrole it may be added post cyclization by an alkylation reaction (19→3). The thienopyrrole is de-protonated by a strong base, such as sodium hydride, $n$-butyl lithium, lithium diisopropylamine, sodium hydroxide, potassium tert-butoxide in a suitable inert
solvent such as THF, DMF, DMSO and the such like, and an alkyl halide added and the mixture stirred at room temperature.

![Chemical structures](image)

Scheme i

5 Depending on the route used above a thienopyrrole 20 suitable for conversion to a cyano-guanidine can be formed by removal of the protecting group, for example if a tert-butylcarbamate group was used then removal is accomplished using a strong acid, for
example trifluoroacetic acid or hydrochloric acid in an inert solvent such as methylene chloride, chloroform, THF or dioxane at a temperature between −20 °C and 25 °C. A phthalimide group, for example, can be removed by hydrazine in a suitable solvent for example methanol, ethanol, methylene chloride, chloroform, THF dioxane at a temperature between −20 °C and 25 °C. The primary amine 20 can be converted to a cyano-guanidine 22 by the two step process of reaction with diphenyl cyanocarbonimidate in an inert organic solvent such as iso-propyl alcohol, methylene chloride, chloroform, benzene, tetrahydrofuran and the like, at a temperature between −20 °C and 50 °C, followed by condensation with an appropriately substituted amine in an inert organic from the list above, with heating at a temperature between −20 °C and 100 °C (Scheme i 20→21→22). Further treatment of 22 with 2 molar Hydrochloric acid in methanol at elevated temperature yields guanidine compounds 23.

Similarly, reaction with 1,1'-bis(methylthio)-2-nitroethylene in an inert solvent such methylene chloride, chloroform, benzene, tetrahydrofuran and the like, followed by condensation with an appropriately substituted amine in an inert organic solvent from the list above yields the nitroethyleneimidazo[1,2-a]pyridine 25 (Scheme j, 20→24→25).
Scheme k.

Again in a similar fashion the suitable thienopyrrole 20, derived from de-protection, can be converted to a urea by either direct treatment with an iso-cyanate in an inert solvent such as methylene chloride, chloroform or THF and the such like, or by a two step procedure of reaction with triphosgene (20 → 27) followed by addition of an amine (27 → 26), bearing the required substitution to yield 26.
Chloro thieno-pyrrole intermediates, such as 31, can be made as shown in Scheme I. 30 can synthesized by the classic Fisher thieno-pyrrole synthesis reaction by the condensation of a hydrazine-HCl 28 and a ketone 29, bearing hydrogen atoms α to the carbonyl. Treatment of these reactants in a suitable solvent, such as acetic acid, ethanol, sec-butanol, toluene, in the presence of an acid, such as sulphuric, hydrochloric, polyphosphoric and/or a Lewis acid, for example, boron trifluoride, zinc chloride, magnesium bromide, at elevated temperatures (for example 100 °C), gives the desired product. The chloro intermediate 31 can then be synthesized from 30 using, for example, either (i) sulphonyl chloride in methylene chloride at a temperature of about 0°C, or (ii) CCl₄ followed by triphenylphosphine in a solvent such as acetonitrile at a temperature of about 0°C. Thienopyrroles of the invention can then be prepared by displacement of chlorine atom using an appropriate side chain intermediate such as a substituted heterocyclic ring.
Thienopyrroles of Formula (I) wherein A is a direct bond and R^6 and R'^6 are both hydrogen can be prepared as shown in Scheme m. A thieno-pyrrole 32 can be reacted with formaldehyde and an amine, in a suitable solvent such as acetic acid/dioxan at a temperature of about 0°C to 25°C for between about 1 to 8 hours, form the thieno-pyrrole 34.

**EXAMPLES**

The invention will now be illustrated with the following non-limiting examples in which, unless otherwise stated:

(i) evaporations were carried out by rotary evaporation in vacuo and work-up procedures were carried out after removal of residual solids such as drying agents by filtration;

(ii) operations were carried out at room temperature, that is in the range 18-25°C and under an atmosphere of an inert gas such as argon or nitrogen;

(iii) yields are given for illustration only and are not necessarily the maximum attainable;

(iv) the structures of the end-products of the Formula (I) were confirmed by nuclear (generally proton) magnetic resonance (NMR) and mass spectral techniques; proton magnetic resonance chemical shift values were measured on the delta scale and peak multiplicities are shown as follows: s, singlet; d, doublet; t, triplet; m, multiplet; br, broad; q, quartet, quintet;

(v) intermediates were not generally fully characterised and purity was assessed by thin layer chromatography (TLC), high-performance liquid chromatography (HPLC), infra-red (IR) or NMR analysis;

(vi) chromatography was performed on silica (Merck Keiselgel: Art.9385);

(vii) isolute™ refers to silica (SiO₂) based columns with irregular particles with an average size of 50µm with nominal 60 Å porosity [Source: Jones Chromatography, Ltd., Glamorgan, Wales, United Kingdom].

To a suspension of sodium hydride (44.6 g ; 1.12 mol) in DMF (700 ml) at 10°C, was added a solution of 5 (290 g ; 930 mmol) in DMF (1 l) over a period of 5 minutes. The resulting orange suspension was allowed to warm to room temperature and stirred for 2 hours. The resulting solution was cooled to −5°C in an acetone/ice bath and a solution of 8 (201 g ; 1.02 mol) in DMF (1.4 l) was added over a period of 1 hour. During this period additional DMF (1 l) was added to mobilize the thick precipitate which formed. The resulting suspension was allowed to warm to room temperature and stirred over night after which HPLC showed no remaining starting material. The suspension was poured into water (6 l) and extracted with diethyl ether (3x2 l). The organic extracts were combined and concentrated to approximately 3 l and washed with water (4x1.5 l), a saturated solution of brine (1 l), dried over magnesium sulfate and evaporated to dryness to afford the free base as an off-white solid in quantitative

It was cooled back to −20 °C and water (20ml) was added carefully so that the temperature did not rise above −10 °C. It was then warmed to ambient temperature and the organics were separated, dried and evaporated to dryness under reduced pressure. The residue was purified on a silica flash column which was eluted with 10-20% EtOAc/DCM and then EtOAc to give 31 (1.35g) as a pale yellow solid.

To this end, a compound of Formula (I) can be provided as part of a pharmaceutical formulation which also includes a pharmaceutically acceptable diluent or carrier (eg, water). The
formulation may be in the form of tablets, capsules, granules, powders, syrups, emulsions (eg, lipid emulsions), suppositories, ointments, creams, drops, suspensions (eg, aqueous or oily suspensions) or solutions (eg, aqueous or oily solutions). If desired, the formulation may include one or more additional substances independently selected from stabilising agents, wetting agents, emulsifying agents, buffers, lactose, sialic acid, magnesium stearate, terra alba, sucrose, corn starch, talc, gelatin, agar, pectin, peanut oil, olive oil, cacao butter and ethylene glycol.

The compound is preferably orally administered to a patient, but other routes of administration are possible, such as parenteral or rectal administration. For intravenous, subcutaneous or intramuscular administration, the patient may receive a daily dose of 0.1mgkg$^{-1}$ to 30mgkg$^{-1}$ (preferably, 5mgkg$^{-1}$ to 20mgkg$^{-1}$) of the compound, the compound being administered 1 to 4 times per day. The intravenous, subcutaneous and intramuscular dose may be given by means of a bolus injection. Alternatively, the intravenous dose may be given by continuous infusion over a period of time. Alternatively, the patient may receive a daily oral dose which is approximately equivalent to the daily parenteral dose, the composition being administered 1 to 4 times per day. A suitable pharmaceutical formulation is one suitable for oral administration in unit dosage form, for example as a tablet or capsule, which contains between 10mg and 1g (preferably, 100 mg and 1g) of the compound of the invention.

One aspect of the invention relates to the use of compounds according to the invention for reducing the secretion of LH and/or FSH by the pituitary gland of a patient. In this respect, the reduction may be by way of a reduction in biosynthesis of the LH and FSH and/or a reduction in the release of LH and FSH by the pituitary gland. Thus, compounds according to the invention can be used for therapeutically treating and/or preventing a sex hormone related condition in the patient. By “preventing” we mean reducing the patient’s risk of contracting the condition. By “treating” we mean eradicating the condition or reducing its severity in the patient. Examples of sex hormone related conditions are: a sex hormone dependent cancer, benign prostatic hypertrophy, myoma of the uterus, endometriosis, polycystic ovarian disease, uterine fibroids, prostatopaulx, myoma uteri, hirsutism and precocious puberty. Examples of sex hormone dependent cancers are: prostatic cancer,
uterine cancer, breast cancer and pituitary gonadotrope adenoma.

The compounds of the invention may be used in combination with other drugs and therapies used to treat / prevent sex-hormone related conditions.

If formulated as a fixed dose such combination products employ the compounds of this invention within the dosage range described herein and the other pharmaceutically-active agent within its approved dosage range. Sequential use is contemplated when a combination formulation is inappropriate.

ASSAYS
The ability of compounds according to the invention to act as antagonists of GnRH can be determined using the following in vitro assays.

Binding Assay Using Rat pituitary GnRH Receptor
The assay is performed as follows:-

1. Incubate crude plasma membranes prepared from rat pituitary tissues in a Tris.HCl buffer (pH 7.5, 50 mM) containing bovine serum albumin (0.1%), [I-125]D-t-Bu-Ser6-Pro9-ethyl amide-GnRH, and the test compound. Incubation is at 4°C for 90 minutes to 2 hours.
2. Rapidly filter and repeatedly wash through a glass fibre filter.
3. Determine the radioactivity of membrane bound radio-ligands using a gamma counter.

From this data, the IC$_{50}$ of the test compound can be determined as the concentration of the compound required to inhibit radio-ligand binding to GnRH receptors by 50%. Compounds according to the present invention have activity at a concentration from 1nM to 5 μM.

Binding Assay Using Human GnRH Receptor
Crude membranes prepared from CHO cells expressing human GnRH receptors are sources for the GnRH receptor. The binding activity of compounds according to the invention can be determined as an IC$_{50}$ which is the compound concentration required to inhibit the specific binding of $[^{125}]$buserelin to GnRH receptors by 50%. $[^{125}]$Buserelin (a peptide GnRH analogue) is used here as a radiolabelled ligand of the receptor.
Assay to Determine Inhibition of LH release

The LH release assay can be used to demonstrate antagonist activity of compounds, as demonstrated by a reduction in GnRH-induced LH release.

5 Preparation of Pituitary Glands

Pituitary glands obtained from rats are prepared as follows. Suitable rats are Wistar male rats (150-200g) which have been maintained at a constant temperature (eg, 25°C) on a 12 hour light/12 hour dark cycle. The rats are sacrificed by decapitation before the pituitary glands are aseptically removed to tube containing Hank’s Balanced Salt Solution (HBSS).

10 The glands are further processed by:

1. Centrifugation at 250 x g for 5 minutes;
2. Aspiration of the HBSS solution;
3. Transfer of the glands to a petri dish before mincing with a scalpel;
4. Transfer of the minced tissue to a centrifuge tube by suspending the tissue three successive times in 10 ml aliquots of HBSS containing 0.2% collagenase and 0.2% hyaluronidase;
5. Cell dispersion by gentle stirring of the tissue suspension while the tube is kept in a water bath at 37°C;
6. Aspiration 20 to 30 times using a pipette, undigested pituitary fragments being allowed to settle for 3 to 5 minutes;
7. Aspiration of the suspended cells followed by centrifugation at 1200 x g for 5 minutes;
8. Re-suspension of the cells in culture medium of DMEM containing 0.37% NaHCO₃, 10% horse serum, 2.5% foetal bovine serum, 1% non essential amino acids, 1% glutamine and 0.1% gentamycin;

10. Pooling of the cell suspensions and dilution to a concentration of 3 x 10⁵ cells/ml;
11. Placing of 1.0ml of this suspension in each of a 24 well tray, with the cells being maintained in a humidified 5% CO₂/95% air atmosphere at 37°C for 3 to 4 days
Testing of Compounds

The test compound is dissolved in DMSO to a final concentration of 0.5% in the incubation medium.

1.5 hours prior to the assay, the cells are washed three times with DMEM containing 0.37% NaHCO₃, 10% horse serum, 2.5% foetal bovine serum, 1% non essential amino acids (100X), 1% glutamine (100X), 1% penicillin/streptomycin (10,000 units of each per ml) and 25 mM HEPES at pH 7.4. Immediately prior to the assay, the cells are again washed twice in this medium.

Following this, 1ml of fresh medium containing the test compound and 2nM GnRH is added to two wells. For other test compounds (where it is desired to test more than one compound), these are added to other respective duplicate wells. Incubation is then carried out at 37°C for three hours.

Following incubation, each well is analysed by removing the medium from the well and centrifuging the medium at 2000 x g for 15 minutes to remove any cellular material. The supernatant is removed and assayed for LH content using a double antibody radio-immuno assay. Comparison with a suitable control (no test compound) is used to determine whether the test compound reduces LH release. Compounds according to the present invention have activity at a concentration from 1nM to 5 μM.

### Box I  Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. □ Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:

2. ⌇ Claims Nos.: 1-10 (partly), 12-15 because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
   see FURTHER INFORMATION sheet PCT/ISA/210

3. □ Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

### Box II  Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This international Searching Authority found multiple inventions in this International application, as follows:

1. □ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2. □ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. □ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:

4. □ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

**Remark on Protest**

- □ The additional search fees were accompanied by the applicant's protest.
- □ No protest accompanied the payment of additional search fees.
Continuation of Box I.2

Claims Nos.: 1-10 (partly), 12-15

Present claims 1-10 and 12-15 relate to extremely large number of possible compounds, products and methods. Support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT is to be found, however, for only a very small proportion of the compounds, products and methods claimed. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Consequently, the search has been carried out for those parts of the claims which appear to be supported and disclosed, namely those parts relating to the compounds based on the disclosure of the present examples, specifically to compounds according to claim 3 and claim 9 insofar as the disclosed sub-structures (III) comprise a C(0)N or N-C(0) group which is a characteristic feature of the present examples.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
