(54) Title: DOSING FOR TREATMENT WITH ANTI-CD20/ANTI-CD3 BISPECIFIC ANTIBODIES

(57) Abstract: The invention provides methods of dosing for the treatment of cancers, such as B cell proliferative disorders, with anti-c cluster of differentiation 20 (CD20)/anti-cluster of differentiation 3 (CDS) bispecific antibodies.

WO 2018/093821 A8

**DOSING FOR TREATMENT WITH ANTI-CD20/ANTI-CD3 BISPECIFIC ANTIBODIES****SEQUENCE LISTING**

The instant application contains a Sequence Listing which has been submitted electronically in

5 ASCII format and is hereby incorporated by reference in its entirety. Said ASCII copy, created on November 13, 2017, is named 50474-150WO3\_Sequence\_Listing\_11.13.17\_ST25 and is 21,101 bytes in size.

**FIELD OF THE INVENTION**

10 The present invention relates to the treatment of cancers, such as B cell proliferative disorders. More specifically, the invention concerns the specific treatment of human patients having a B cell proliferative disorder using anti-cluster of differentiation 20 (CD20)/anti-cluster of differentiation 3 (CD3) bispecific antibodies.

**BACKGROUND**

Cancers are characterized by the uncontrolled growth of cell subpopulations. Cancers are the leading cause of death in the developed world and the second leading cause of death in developing countries, with over 14 million new cancer cases diagnosed and over eight million cancer deaths occurring each year. The National Cancer Institute has estimated that greater than half a million 20 Americans will die of cancer in 2016, accounting for nearly one out of every four deaths in the country. As the elderly population has grown, the incidence of cancer has concurrently risen, as the probability of developing cancer is more than two-fold higher after the age of seventy. Cancer care thus represents a significant and ever-increasing societal burden.

Hematologic cancers, in particular, are the second leading cause of cancer-related deaths.

25 Hematologic cancers include B cell proliferative disorders, such as non-Hodgkin's lymphoma (NHL) (e.g., diffuse-large B cell lymphoma (DLBCL)), which advances quickly and is fatal if untreated. Although treatment with the monoclonal anti-cluster of differentiation 20 (CD20) antibody rituximab has resulted in fewer relapsed DLBCL patients, it has become increasing challenging to treat those patients with relapsed or refractory DLBCL. For such patients, alternative or secondary treatment modalities, such as 30 bispecific antibody-based immunotherapies, may be particularly efficacious. Bispecific antibodies are capable of simultaneously binding cell surface antigens on cytotoxic cells (e.g., T cells, via binding to cluster of differentiation 3 (CD3)) and cancer cells (e.g., B cells, via binding to CD20), with the intent that the bound cytotoxic cell will destroy the bound cancer cell. However, such antibody-based immunotherapies may be limited by unwanted effects, including cytokine-driven toxicities (e.g., cytokine 35 release syndrome (CRS)), infusion-related reactions (IRRs), severe tumor lysis syndrome (TLS), and central nervous system (CNS) toxicities.

Thus, there is an unmet need in the field for the development of efficacious methods of dosing therapeutic bispecific antibodies (e.g., anti-CD20/anti-CD3 bispecific antibodies) for the treatment of cancers (e.g., B cell proliferative disorders) that achieve a more favorable benefit-risk profile.

## SUMMARY OF THE INVENTION

The present invention relates to methods of treating a subject having cancer (e.g., a B cell proliferative disorder) using anti-cluster of differentiation 20 (CD20)/anti-cluster of differentiation 3 (CD3) bispecific antibodies.

5 In one aspect, the invention features a method of treating a subject having a cancer (e.g., a B cell proliferative disorder) comprising administering to the subject a bispecific antibody that binds to CD20 and CD3 in a dosing regimen comprising at least a first dosing cycle and a second dosing cycle, wherein: (a) the first dosing cycle comprises a first dose (C1D1), a second dose (C1D2), and a third dose (C1D3) of the bispecific antibody, wherein the C1D1 and the C1D2 are each no greater than the C1D3, and (b) 10 the second dosing cycle comprises a single dose (C2D1) of the bispecific antibody, wherein the C2D1 is equal to or greater than the C1D3, wherein the C1D1, the C1D2, and the C1D3 have a cumulative dose that is about 50% greater than a highest cleared dose of the bispecific antibody in a first dosing cycle of a non-fractionated, dose-escalation dosing regimen, and wherein the highest cleared dose is between about 0.2 mg to about 30 mg. In some embodiments, the C1D3 is equal to the highest cleared dose of 15 the bispecific antibody in the first dosing cycle of the non-fractionated, dose-escalation dosing regimen. In some embodiments, the C1D2 and the C1D1 are equal. In some embodiments, the C1D2 is greater than the C1D1 by about 50% to about 250%. In some embodiments, the C1D3 is greater than the C1D2 by about 150% to about 300%.

In another aspect, the invention features a method of treating a subject having a B cell 20 proliferative disorder comprising administering to the subject a bispecific antibody that binds to CD20 and CD3 in a dosing regimen comprising at least a first dosing cycle and a second dosing cycle, wherein: (a) the first dosing cycle comprises a first dose (C1D1), a second dose (C1D2), and a third dose (C1D3) of the bispecific antibody, wherein the C1D1 and the C1D2 are each no greater than the C1D3, and wherein the C1D1 is between about 0.0056 mg to about 12.50 mg, the C1D2 is between about 0.0125 mg to 25 about 20.00 mg, and the C1D3 is between about 0.0500 mg to about 50.00 mg; and (b) the second dosing cycle comprises a single dose of the bispecific antibody, wherein the C2D1 is equal to or greater than the C1D3 and is between about 0.0500 mg to about 50.00 mg. In some embodiments, (a) the C1D1 is between about 0.02 mg to about 4.0 mg, the C1D2 is between about 0.05 mg to about 20.0 mg, and the C1D3 is between about 0.2 mg to about 50.0 mg, and (b) the C2D1 is between about 0.2 mg to about 30 30 50.0 mg. In some embodiments, (a) the C1D1 is between about 0.4 mg to about 4.0 mg, the C1D2 is between about 1.0 mg to about 20.0 mg, and the C1D3 is between about 3.0 mg to about 50.0 mg, and (b) the C2D1 is between about 3.0 mg to about 50.0 mg. In some embodiments, (a) the C1D1 is between about 0.4 mg to about 4.0 mg, the C1D2 is between about 1.0 mg to about 20.0 mg, and the C1D3 is between about 3.0 mg to about 20.0 mg, and (b) the C2D1 is between about 3.0 mg to about 20.0 mg. In some 35 40 embodiments, (a) the C1D1 is between about 0.8 mg to about 3.0 mg, the C1D2 is between about 1.0 mg to about 6.0 mg, and the C1D3 is between about 3.0 mg to about 50.0 mg, and (b) the C2D1 is between about 3.0 mg to about 50.0 mg. In some embodiments, (a) the C1D1 is between about 0.8 mg to about 3.0 mg, the C1D2 is between about 1.0 mg to about 6.0 mg, and the C1D3 is between about 3.0 mg to about 20.0 mg, and (b) the C2D1 is between about 3.0 mg to about 20.0 mg. In some embodiments, (a) the C1D1 is about 1.0 mg, the C1D2 is about 2.0 mg, and the C1D3 is between about

3.0 mg to about 50.0 mg (e.g., the C1D3 is about 6.0 mg), and (b) the C2D1 is between about 3.0 mg to about 50.0 mg (e.g., the C2D1 is about 6.0 mg). In some embodiments, (a) the C1D1 is about 1.0 mg, the C1D2 is about 2.0 mg, and the C1D3 is between about 3.0 mg to about 50.0 mg, and (b) the C2D1 is equal to the C1D3. In some embodiments, (a) the C1D1 is about 1.0 mg, the C1D2 is about 2.0 mg, and the C1D3 is about 6.0 mg, and (b) the C2D1 is equal to the C1D3. In some embodiments, (a) the C1D1 is between about 0.02 mg to about 4.0 mg, the C1D2 is between about 0.05 mg to about 20.0 mg, and the C1D3 is between about 0.2 mg to about 20.0 mg, and (b) the C2D1 is between about 3.0 mg to about 20.0 mg. In some embodiments, (a) the C1D1 is between about 0.4 mg to about 4.0 mg, the C1D2 is between about 1.0 mg to about 20.0 mg, and the C1D3 is between about 3.0 mg to about 20.0 mg, and (b) the C2D1 is between about 3.0 mg to about 20.0 mg. In some embodiments, (a) the C1D1 is between about 0.8 mg to about 3.0 mg, the C1D2 is between about 1.0 mg to about 6.0 mg, and the C1D3 is between about 3.0 mg to about 20.0 mg, and (b) the C2D1 is between about 3.0 mg to about 20.0 mg. In some embodiments, (a) the C1D1 is between about 0.8 mg to about 3.0 mg, the C1D2 is between about 1.0 mg to about 6.0 mg, and the C1D3 is between about 1.0 mg to about 6.0 mg, and the C1D3 is between about 3.0 mg to about 6.0 mg, and (b) the C2D1 is between about 3.0 mg to about 6.0 mg.

In some embodiments, (a) the C1D1 is about 0.8 mg, the C1D2 is about 2.0 mg, and the C1D3 is about 4.2 mg, and (b) the C2D1 is about 4.2 mg. In some embodiments, (a) the C1D1 is about 1.0 mg, the C1D2 is about 1.0 mg, and the C1D3 is about 3.0 mg, and (b) the C2D1 is about 3.0 mg. In some embodiments, (a) the C1D1 is about 1.0 mg, the C1D2 is about 2.0 mg, and the C1D3 is about 6.0 mg, and (b) the C2D1 is about 6.0 mg. In some embodiments, (a) the C1D1 is about 0.8 mg, the C1D2 is about 2.0 mg, and the C1D3 is about 6.0 mg, and (b) the C2D1 is about 6.0 mg. In some embodiments of any of the above aspects, the length of the first dosing cycle is 21 days. In some embodiments, the method comprises administering to the subject the C1D1, the C1D2, and the C1D3 on or about Days 1, 8, and 15, respectively, of the first dosing cycle.

In some embodiments of any of the above aspects, the length of the second dosing cycle is 21 days. In some embodiments, the method comprises administering to the subject the C2D1 on Day 1 of the second dosing cycle.

In some embodiments of any of the above aspects, the dosing regimen comprises one or more additional dosing cycles. In some embodiments, the dosing regimen comprises 1 to 14 additional dosing cycles. In some embodiments, the dosing regimen comprises one to six additional dosing cycles. In some embodiments, the length of each of the one or more additional dosing cycles is 7 days, 14 days, 21 days, or 28 days. In some embodiments, the length of each of the one or more additional dosing cycles is 21 days. In some embodiments, each of the one or more additional dosing cycles comprises a single dose of the bispecific antibody. In some embodiments, the method comprises administering to the subject the single dose of the one or more additional dosing cycles on Day 1 of the one or more additional dosing cycles.

In some embodiments of any of the above aspects, the bispecific antibody comprises an anti-CD20 arm comprising a first binding domain comprising the following six hypervariable regions (HVRs): (a) an HVR-H1 comprising the amino acid sequence of GYTFTSYNMH (SEQ ID NO: 1); (b) an HVR-H2 comprising the amino acid sequence of AIYPGNNGDTSYNQKFKG (SEQ ID NO: 2); (c) an HVR-H3

comprising the amino acid sequence of VVYYNSNSYWYFDV (SEQ ID NO:3); (d) an HVR-L1 comprising the amino acid sequence of RASSSVSYMH (SEQ ID NO: 4); (e) an HVR-L2 comprising the amino acid sequence of APSNLAS (SEQ ID NO: 5); and (f) an HVR-L3 comprising the amino acid sequence of QQWSFNPPT (SEQ ID NO: 6). In some embodiments, the bispecific antibody comprises an anti-CD20 arm comprising a first binding domain comprising (a) a heavy chain variable (VH) domain comprising an amino acid sequence having at least 95% sequence identity to the amino acid sequence of SEQ ID NO: 7; (b) a light chain variable (VL) domain comprising an amino acid sequence having at least 95% sequence identity to the amino acid sequence of SEQ ID NO: 8; or (c) a VH domain as in (a) and a VL domain as in (b). In some embodiments, the first binding domain comprises a VH domain comprising an amino acid sequence of SEQ ID NO: 7 and a VL domain comprising an amino acid sequence of SEQ ID NO: 8. In some embodiments, the bispecific antibody comprises an anti-CD3 arm comprising a second binding domain comprising the following six HVRs: (a) an HVR-H1 comprising the amino acid sequence of NYYIH (SEQ ID NO: 9); (b) an HVR-H2 comprising the amino acid sequence of WIYPGDGNTKYNEKFKG (SEQ ID NO: 10); (c) an HVR-H3 comprising the amino acid sequence of DSYSNYYFDY (SEQ ID NO: 11); (d) an HVR-L1 comprising the amino acid sequence of KSSQSLLNSRTRKNYLA (SEQ ID NO: 12); (e) an HVR-L2 comprising the amino acid sequence of WASTRES (SEQ ID NO: 13); and (f) an HVR-L3 comprising the amino acid sequence of TQSFILRT (SEQ ID NO: 14). In some embodiments, the bispecific antibody comprises an anti-CD3 arm comprising a second binding domain comprising (a) a VH domain comprising an amino acid sequence having at least 95% sequence identity to the amino acid sequence of SEQ ID NO: 15; (b) a VL domain comprising an amino acid sequence having at least 95% sequence identity to the amino acid sequence of SEQ ID NO: 16; or (c) a VH domain as in (a) and a VL domain as in (b). In some embodiments, the second binding domain comprises a VH domain comprising an amino acid sequence of SEQ ID NO: 15 and a VL domain comprising an amino acid sequence of SEQ ID NO: 16.

25 In some embodiments of any of the above aspects, the bispecific antibody comprises an aglycosylation site mutation. In some embodiments, the aglycosylation site mutation reduces effector function of the bispecific antibody. In some embodiments, the aglycosylation site mutation is a substitution mutation. In some embodiments, the bispecific antibody comprises a substitution mutation in the Fc region that reduces effector function. In some embodiments, the substitution mutation is at amino 30 acid residue N297, L234, L235, and/or D265 (EU numbering). In some embodiments, the substitution mutation is selected from the group consisting of N297G, N297A, L234A, L235A, D265A, and P329G. In some embodiments, the substitution mutation is at amino acid residue N297. In some embodiments, the substitution mutation is N297A.

35 In some embodiments of any of the above aspects, the bispecific antibody is a monoclonal antibody. In some embodiments of any of the above aspects, the bispecific antibody is a humanized antibody. In some embodiments of any of the above aspects, the bispecific antibody is a chimeric antibody. In some embodiments of any of the above aspects, the bispecific antibody is an antibody fragment that binds CD20 and CD3. In some embodiments, the antibody fragment is selected from the group consisting of Fab, Fab'-SH, Fv, scFv, and (Fab')<sub>2</sub> fragments. In some embodiments of any of the 40 above aspects, the bispecific antibody is a full-length antibody. In some embodiments of any of the

above aspects, the bispecific antibody is an IgG antibody. In some embodiments, the IgG antibody is an IgG<sub>1</sub> antibody.

In some embodiments of any of the above aspects, the bispecific antibody comprises one or more heavy chain constant domains, wherein the one or more heavy chain constant domains are selected from a first CH1 (CH1<sub>1</sub>) domain, a first CH2 (CH2<sub>1</sub>) domain, a first CH3 (CH3<sub>1</sub>) domain, a second CH1 (CH1<sub>2</sub>) domain, second CH2 (CH2<sub>2</sub>) domain, and a second CH3 (CH3<sub>2</sub>) domain. In some embodiments, at least one of the one or more heavy chain constant domains is paired with another heavy chain constant domain. In some embodiments, the CH3<sub>1</sub> and CH3<sub>2</sub> domains each comprise a protuberance or cavity, and wherein the protuberance or cavity in the CH3<sub>1</sub> domain is positionable in the cavity or protuberance, respectively, in the CH3<sub>2</sub> domain. In some embodiments, the CH3<sub>1</sub> and CH3<sub>2</sub> domains meet at an interface between the protuberance and cavity. In some embodiments, the CH2<sub>1</sub> and CH2<sub>2</sub> domains each comprise a protuberance or cavity, and wherein the protuberance or cavity in the CH2<sub>1</sub> domain is positionable in the cavity or protuberance, respectively, in the CH2<sub>2</sub> domain. In some embodiments, the CH2<sub>1</sub> and CH2<sub>2</sub> domains meet at an interface between said protuberance and cavity.

15 In some embodiments of any of the above aspects, the bispecific antibody is administered to the subject as a monotherapy.

In other embodiments of any of the above aspects, the bispecific antibody is administered to the subject as a combination therapy. In some embodiments, the bispecific antibody is administered to the subject concurrently with an additional therapeutic agent (e.g., atezolizumab). In other embodiments, the bispecific antibody is administered to the subject prior to the administration of an additional therapeutic agent (e.g., atezolizumab). In some embodiments, the additional therapeutic agent is atezolizumab. In some embodiments, the method further comprises administering to the subject a first dose of atezolizumab concurrently with the C2D1 of the bispecific antibody on Day 1 of the second dosing cycle. In some embodiments, the method further comprises administering to the subject atezolizumab concurrently with the single dose of the bispecific antibody of the one or more additional dosing cycles on Day 1 of the one or more additional dosing cycles. In some embodiments, atezolizumab is only administered to the subject concurrently with the bispecific antibody. In some embodiments, each dose of atezolizumab is about 1200 mg.

30 In yet other embodiments, the bispecific antibody is administered to the subject subsequent to the administration of an additional therapeutic agent (e.g., obinutuzumab (GAZYVA®) or tocilizumab (ACTEMRA® / RoACTEMRA®)).

In some embodiments of any of the above aspects, the B cell proliferative disorder is a non-Hodgkin's lymphoma (NHL) or a chronic lymphoid leukemia (CLL). In some embodiments, the NHL is a diffuse-large B cell lymphoma (DLBCL). In some embodiments, the DLBCL is a relapsed or refractory DLBCL. In some embodiments, the NHL is a follicular lymphoma (FL). In some embodiments, the NHL is a primary mediastinal (thymic) large B cell lymphoma (PMLBCL).

35 In some embodiments of any of the above aspects, the administering is by intravenous infusion.

In some embodiments of any of the above aspects, the administering is administering subcutaneously.

In some embodiments of any one the above aspects, the subject experiences a cytokine release syndrome (CRS) event, and the method further comprises administering to the subject an effective amount of an interleukin-6 receptor (IL-6R) antagonist (e.g., an anti-IL-6R antibody, e.g., tocilizumab (ACTEMRA® / RoACTEMRA®)) to manage the CRS event.

5 In some embodiments, tocilizumab is administered intravenously to the subject as a single dose of about 8 mg/kg.

In other embodiments, the CRS event does not resolve or worsens within 24 hours of treating the symptoms of the CRS event, and the method further comprises administering to the subject one or more additional doses of the IL-6R antagonist (e.g., an anti-IL-6R antibody, e.g., tocilizumab) to manage the 10 CRS event. In some embodiments, the CRS event does not resolve or worsens within 24 hours of treating the symptoms of the CRS event, and the method further comprises administering to the subject one or more additional doses of tocilizumab to manage CRS event. In some embodiments, the one or 15 more additional doses of tocilizumab is administered intravenously to the subject at a dose of about 8 mg/kg. In some embodiments, the method further comprises administering to the subject an effective amount of a corticosteroid. In some embodiments, the corticosteroid is administered intravenously to the 20 subject. In some embodiments, the corticosteroid is methylprednisolone. In some embodiments, the methylprednisolone is administered at a dose of about 2 mg/kg per day. In other embodiments, the corticosteroid is dexamethasone. In some embodiments, the dexamethasone is administered at a dose of about 10 mg.

20

## DETAILED DESCRIPTION OF EMBODIMENTS OF THE INVENTION

### I. DEFINITIONS

The term "about" as used herein refers to the usual error range for the respective value readily 25 known to the skilled person in this technical field. Reference to "about" a value or parameter herein includes (and describes) embodiments that are directed to that value or parameter per se.

An "acceptor human framework" for the purposes herein is a framework comprising the amino acid sequence of a light chain variable domain (VL) framework or a heavy chain variable domain (VH) framework derived from a human immunoglobulin framework or a human consensus framework, as 30 defined below. An acceptor human framework "derived from" a human immunoglobulin framework or a human consensus framework may comprise the same amino acid sequence thereof, or it may contain amino acid sequence changes. In some embodiments, the number of amino acid changes are 10 or less, 9 or less, 8 or less, 7 or less, 6 or less, 5 or less, 4 or less, 3 or less, or 2 or less. In some embodiments, the VL acceptor human framework is identical in sequence to the VL human immunoglobulin framework 35 sequence or human consensus framework sequence.

"Affinity" refers to the strength of the sum total of noncovalent interactions between a single binding site of a molecule (e.g., an antibody) and its binding partner (e.g., an antigen). Unless indicated otherwise, as used herein, "binding affinity" refers to intrinsic binding affinity which reflects a 1:1 interaction between members of a binding pair (e.g., antibody and antigen). The affinity of a molecule X 40 for its partner Y can generally be represented by the dissociation constant (Kd). Affinity can be measured

by common methods known in the art, including those described herein. Specific illustrative and exemplary embodiments for measuring binding affinity are described in the following.

An “affinity matured” antibody refers to an antibody with one or more alterations in one or more hypervariable regions (HVRs), compared to a parent antibody which does not possess such alterations, such alterations resulting in an improvement in the affinity of the antibody for antigen.

The terms “anti-CD3 antibody” and “an antibody that binds to CD3” refer to an antibody that is capable of binding CD3 with sufficient affinity such that the antibody is useful as a diagnostic and/or therapeutic agent in targeting CD3. In one embodiment, the extent of binding of an anti-CD3 antibody to an unrelated, non-CD3 protein is less than about 10% of the binding of the antibody to CD3 as measured, e.g., by a radioimmunoassay (RIA). In certain embodiments, an antibody that binds to CD3 has a dissociation constant (Kd) of  $\leq 1\mu\text{M}$ ,  $\leq 100\text{ nM}$ ,  $\leq 10\text{ nM}$ ,  $\leq 1\text{ nM}$ ,  $\leq 0.1\text{ nM}$ ,  $\leq 0.01\text{ nM}$ , or  $\leq 0.001\text{ nM}$  (e.g.  $10^{-8}\text{ M}$  or less, e.g. from  $10^{-8}\text{ M}$  to  $10^{-13}\text{ M}$ , e.g., from  $10^{-9}\text{ M}$  to  $10^{-13}\text{ M}$ ). In certain embodiments, an anti-CD3 antibody binds to an epitope of CD3 that is conserved among CD3 from different species.

The terms “anti-CD20 antibody” and “an antibody that binds to CD20” refer to an antibody that is capable of binding CD20 with sufficient affinity such that the antibody is useful as a diagnostic and/or therapeutic agent in targeting CD20. In one embodiment, the extent of binding of an anti-CD20 antibody to an unrelated, non-CD20 protein is less than about 10% of the binding of the antibody to CD20 as measured, e.g., by a radioimmunoassay (RIA). In certain embodiments, an antibody that binds to CD20 has a dissociation constant (Kd) of  $\leq 1\mu\text{M}$ ,  $\leq 100\text{ nM}$ ,  $\leq 10\text{ nM}$ ,  $\leq 1\text{ nM}$ ,  $\leq 0.1\text{ nM}$ ,  $\leq 0.01\text{ nM}$ , or  $\leq 0.001\text{ nM}$  (e.g.  $10^{-8}\text{ M}$  or less, e.g. from  $10^{-8}\text{ M}$  to  $10^{-13}\text{ M}$ , e.g., from  $10^{-9}\text{ M}$  to  $10^{-13}\text{ M}$ ). In certain embodiments, an anti-CD20 antibody binds to an epitope of CD20 that is conserved among CD20 from different species.

The terms “anti-CD20/anti-CD3 antibody” and “antibody that binds to CD20 and CD3,” or variants thereof, refer to a multispecific antibody (e.g., a bispecific antibody) that is capable of binding to CD20 and CD3 with sufficient affinity such that the antibody is useful as a diagnostic and/or therapeutic agent in targeting CD20 and/or CD3. In one embodiment, the extent of binding of an anti-CD20/anti-CD3 antibody to an unrelated, non-CD3 protein and/or non-CD20 protein is less than about 10% of the binding of the antibody to CD3 and/or CD20 as measured, e.g., by a radioimmunoassay (RIA). In certain embodiments, an antibody that binds to CD20 and CD3 has a dissociation constant (Kd) of  $\leq 1\mu\text{M}$ ,  $\leq 100\text{ nM}$ ,  $\leq 10\text{ nM}$ ,  $\leq 1\text{ nM}$ ,  $\leq 0.1\text{ nM}$ ,  $\leq 0.01\text{ nM}$ , or  $\leq 0.001\text{ nM}$  (e.g.  $10^{-8}\text{ M}$  or less, e.g. from  $10^{-8}\text{ M}$  to  $10^{-13}\text{ M}$ , e.g., from  $10^{-9}\text{ M}$  to  $10^{-13}\text{ M}$ ). In certain embodiments, an anti-CD20/anti-CD3 antibody binds to an epitope of CD3 that is conserved among CD3 from different species and/or an epitope of CD20 that is conserved among CD20 from different species.

The term “antibody” herein is used in the broadest sense and encompasses various antibody structures, including but not limited to monoclonal antibodies, polyclonal antibodies, multispecific antibodies (e.g., bispecific antibodies), and antibody fragments so long as they exhibit the desired antigen-binding activity.

An “antibody fragment” refers to a molecule other than an intact antibody that comprises a portion of an intact antibody that binds the antigen to which the intact antibody binds. Examples of antibody fragments include but are not limited to Fv, Fab, Fab', Fab'-SH, F(ab')<sub>2</sub>; diabodies; linear antibodies; single-chain antibody molecules (e.g. scFv); and multispecific antibodies formed from antibody fragments.

By "binding domain" is meant a part of a compound or a molecule that specifically binds to a target epitope, antigen, ligand, or receptor. Binding domains include but are not limited to antibodies (e.g., monoclonal, polyclonal, recombinant, humanized, and chimeric antibodies), antibody fragments or portions thereof (e.g., Fab fragments, Fab'2, scFv antibodies, SMIP, domain antibodies, diabodies, minibodies, scFv-Fc, affibodies, nanobodies, and VH and/or VL domains of antibodies), receptors, ligands, aptamers, and other molecules having an identified binding partner.

5 A "chemotherapeutic agent" is a chemical compound useful in the treatment of cancer. Examples of chemotherapeutic agents include alkylating agents such as thiotepa and cyclophosphamide (CYTOXAN®); alkyl sulfonates such as busulfan, improsulfan and piposulfan; aziridines such as benzodopa, carboquone, meturedopa, and uredopa; ethylenimines and methylamelamines including altretamine, triethylenemelamine, triethylenephosphoramide, triethylenethiophosphoramide and trimethylomelamine; acetogenins (especially bullatacin and bullatacinone); delta-9-tetrahydrocannabinol (dronabinol, MARINOL®); beta-lapachone; lapachol; colchicines; betulinic acid; a camptothecin (including the synthetic analogue topotecan (HYCAMTIN®), CPT-11 (irinotecan, CAMPTOSAR®), acetylcamptothecin, scopolectin, and 9-aminocamptothecin); bryostatin; callystatin; CC-1065 (including its adozelesin, carzelesin and bizelesin synthetic analogues); podophyllotoxin; podophyllinic acid; teniposide; cryptophycins (particularly cryptophycin 1 and cryptophycin 8); dolastatin; duocarmycin (including the synthetic analogues, KW-2189 and CB1-TM1); eleutherobin; pancratistatin; a sarcodictyin; spongistatin; nitrogen mustards such as chlorambucil, chloraphazine, chlorophosphamide, estramustine, ifosfamide, mechlorethamine, mechlorethamine oxide hydrochloride, melphalan, novembichin, phenesterine, prednimustine, trofosfamide, uracil mustard; nitrosoureas such as carmustine, chlorozotocin, fotemustine, lomustine, nimustine, and ranimustine; antibiotics such as the enediyne antibiotics (e.g., calicheamicin, especially calicheamicin gamma1I and calicheamicin omegall (see, e.g., Nicolaou et al., *Angew. Chem. Int'l. Ed. Engl.*, 33: 183-186 (1994)); CDP323, an oral alpha-4 integrin inhibitor; dynemicin, including dynemicin A; an esperamicin; as well as 10 neocarzinostatin chromophore and related chromoprotein enediyne antibiotic chromophores), aclacinomysins, actinomycin, authramycin, azaserine, bleomycins, cactinomycin, carabicin, caminomycin, carzinophilin, chromomycins, dactinomycin, daunorubicin, detorubicin, 6-diazo-5-oxo-L-norleucine, doxorubicin (including ADRIAMYCIN®, morpholino-doxorubicin, cyanomorpholino-doxorubicin, 2-pyrrolino-doxorubicin, doxorubicin HCl liposome injection (DOXIL®), liposomal doxorubicin TLC D-99 (MYOCET®), pegylated liposomal doxorubicin (CAELYX®), and deoxydoxorubicin), epirubicin, esorubicin, idarubicin, marcellomycin, mitomycins such as mitomycin C, mycophenolic acid, nogalamycin, olivomycins, peplomycin, porfiromycin, puromycin, quelamycin, rodorubicin, streptonigrin, streptozocin, tubercidin, ubenimex, zinostatin, zorubicin; anti-metabolites such as methotrexate, gemcitabine (GEMZAR®), tegafur (UFTORAL®), capecitabine (XELODA®), an epothilone, and 5-fluorouracil (5-FU); combretastatin; folic acid analogues such as 15 denopterin, methotrexate, pteropterin, trimetrexate; purine analogs such as fludarabine, 6-mercaptopurine, thiamiprine, thioguanine; pyrimidine analogs such as ancitabine, azacitidine, 6-azauridine, carmofur, cytarabine, dideoxyuridine, doxifluridine, enocitabine, floxuridine; androgens such as calusterone, dromostanolone propionate, epitiostanol, mepitiostane, testolactone; anti-adrenals such as aminoglutethimide, mitotane, trilostane; folic acid replenisher such as folinic acid; aceglatone; aldophosphamide glycoside; 20 aminolevulinic acid; eniluracil; amsacrine; bestrabucil; bisantrene; edatraxate; defofamine; demecolcine;

diaziquone; elformithine; elliptinium acetate; an epothilone; etoglucid; gallium nitrate; hydroxyurea; lentinan; ionidainine; maytansinoids such as maytansine and ansamitocins; mitoguazone; mitoxantrone; mopidanmol; nitraerine; pentostatin; phenacet; pirarubicin; losoxantrone; 2-ethylhydrazide; procarbazine; PSK® polysaccharide complex (JHS Natural Products, Eugene, Oreg.); razoxane; rhizoxin; sizofuran; 5 spirogermanium; tenuazonic acid; triaziquone; 2,2',2'-trichlorotriethylamine; trichothecenes (especially T-2 toxin, verracurin A, roridin A and anguidine); urethan; vindesine (ELDISINE®, FILDESIN®); dacarbazine; mannomustine; mitobronitol; mitolactol; pipobroman; gacytosine; arabinoside ("Ara-C"); thiopeta; taxoid, e.g., paclitaxel (TAXOL®, Bristol-Myers Squibb Oncology, Princeton, N.J.), albumin-engineered nanoparticle formulation of paclitaxel (ABRAXANE™), and docetaxel (TAXOTERE®, Rhône-Poulenc Rorer, Antony, France); chlorambucil; 6-thioguanine; mercaptopurine; methotrexate; platinum agents such as cisplatin, oxaliplatin (e.g., ELOXATIN®), and carboplatin; vincas, which prevent tubulin polymerization from forming microtubules, including vinblastine (VELBAN®), vincristine (ONCOVIN®), vindesine (ELDISINE®, FILDESIN®), and vinorelbine (NAVELBINE®); etoposide (VP-16); ifosfamide; mitoxantrone; leucovorin; novantrone; edatrexate; daunomycin; aminopterin; ibandronate; topoisomerase inhibitor RFS 2000; 10 difluoromethylornithine (DMFO); retinoids such as retinoic acid, including bexarotene (TARGRETIN®); bisphosphonates such as clodronate (for example, BONEFOS® or OSTAC®), etidronate (DIDROCAL®), NE-58095, zoledronic acid/zoledronate (ZOMETA®), alendronate (FOSAMAX®), pamidronate (AREDIA®), tiludronate (SKELID®), or risedronate (ACTONEL®); troxacitabine (a 1,3-dioxolane nucleoside cytosine analog); antisense oligonucleotides, particularly those that inhibit expression of genes in signaling pathways 15 implicated in aberrant cell proliferation, such as, for example, PKC-alpha, Raf, H-Ras, and epidermal growth factor receptor (EGF-R) (e.g., erlotinib (Tarceva™)); and VEGF-A that reduce cell proliferation; vaccines such as THERATOPE® vaccine and gene therapy vaccines, for example, ALLOVECTIN® vaccine, LEUVECTIN® vaccine, and VAXID® vaccine; topoisomerase 1 inhibitor (e.g., LURTOTECAN®); rmRH (e.g., ABARELIX®); BAY439006 (sorafenib; Bayer); SU-11248 (sunitinib, SUTENT®, Pfizer); perifosine, COX-2 inhibitor (e.g. 20 celecoxib or etoricoxib), proteosome inhibitor (e.g. PS341); bortezomib (VELCADE®); CCI-779; tipifarnib (R11577); orafenib, ABT510; Bcl-2 inhibitor such as oblimersen sodium (GENASENSE®); pixantrone; EGFR inhibitors; tyrosine kinase inhibitors; serine-threonine kinase inhibitors such as rapamycin (sirolimus, RAPAMUNE®); farnesyltransferase inhibitors such as lonafarnib (SCH 6636, SARASART™); and 25 pharmaceutically acceptable salts, acids or derivatives of any of the above; as well as combinations of two or more of the above such as CHOP, an abbreviation for a combined therapy of cyclophosphamide, doxorubicin, vincristine, and prednisolone; and FOLFOX, an abbreviation for a treatment regimen with oxaliplatin (ELOXATIN™) combined with 5-FU and leucovorin, and pharmaceutically acceptable salts, acids or derivatives of any of the above; as well as combinations of two or more of the above. 30

Chemotherapeutic agents as defined herein include "anti-hormonal agents" or "endocrine 35 therapeutics" which act to regulate, reduce, block, or inhibit the effects of hormones that can promote the growth of cancer. They may be hormones themselves, including, but not limited to: anti-estrogens and selective estrogen receptor modulators (SERMs), including, for example, tamoxifen (including NOLVADEX® tamoxifen), raloxifene, droloxifene, 4-hydroxytamoxifen, trioxifene, keoxifene, LY117018, onapristone, and FARESTON. and aromatase inhibitors that inhibit the enzyme aromatase, 40 which regulates estrogen production in the adrenal glands, such as, for example, 4(5)-imidazoles,

aminoglutethimide, MEGASE® megestrol acetate, AROMASIN® exemestane, formestanone, fadrozole, RIVISOR® vorozole, FEMARA® letrozole, and ARIMIDEX® anastrozole; and anti-androgens such as flutamide, nilutamide, bicalutamide, leuprolide, and goserelin; as well as troxacitabine (a 1,3-dioxolane nucleoside cytosine analog); antisense oligonucleotides, particularly those which inhibit expression of 5 genes in signaling pathways implicated in aberrant cell proliferation, such as, for example, PKC-alpha, Raf and H-Ras; ribozymes such as a VEGF expression inhibitor (e.g., ANGIOZYME® ribozyme) and a HER2 expression inhibitor; vaccines such as gene therapy vaccines, for example, ALLOVECTIN® vaccine, LEUVECTIN® vaccine, and VAXID® vaccine; PROLEUKIN® rIL-2; LURTOTECAN® topoisomerase 1 inhibitor; ABARELIX® rmRH; Vinorelbine and Esperamicins (see U.S. Pat. No. 10 4,675,187), and pharmaceutically acceptable salts, acids or derivatives of any of the above; as well as combinations of two or more of the above.

The term "chimeric" antibody refers to an antibody in which a portion of the heavy and/or light chain is derived from a particular source or species, while the remainder of the heavy and/or light chain is derived from a different source or species.

15 The term "cluster of differentiation 3" or "CD3," as used herein, refers to any native CD3 from any vertebrate source, including mammals such as primates (e.g. humans) and rodents (e.g., mice and rats), unless otherwise indicated, including, for example, CD3 $\epsilon$ , CD3 $\gamma$ , CD3 $\alpha$ , and CD3 $\beta$  chains. The term encompasses "full-length," unprocessed CD3 (e.g., unprocessed or unmodified CD3 $\epsilon$  or CD3 $\gamma$ ), as well as any form of CD3 that results from processing in the cell. The term also encompasses naturally occurring 20 variants of CD3, including, for example, splice variants or allelic variants. CD3 includes, for example, human CD3 $\epsilon$  protein (NCBI RefSeq No. NP\_000724), which is 207 amino acids in length, and human CD3 $\gamma$  protein (NCBI RefSeq No. NP\_000064), which is 182 amino acids in length.

25 The term "cluster of differentiation 20" or "CD20," as used herein, refers to any native CD20 from any vertebrate source, including mammals such as primates (e.g. humans) and rodents (e.g., mice and rats), unless otherwise indicated. The term encompasses "full-length," unprocessed CD20, as well as any form of 30 CD20 that results from processing in the cell. The term also encompasses naturally occurring variants of CD20, including, for example, splice variants or allelic variants. CD20 includes, for example, human CD20 protein (see, e.g., NCBI RefSeq Nos. NP\_068769.2 and NP\_690605.1), which is 297 amino acids in length and may be generated, for example, from variant mRNA transcripts that lack a portion of the 5' UTR (see, e.g., NCBI RefSeq No. NM\_021950.3) or longer variant mRNA transcripts (see, e.g., NCBI RefSeq No. NM\_152866.2).

35 The "class" of an antibody refers to the type of constant domain or constant region possessed by its heavy chain. There are five major classes of antibodies: IgA, IgD, IgE, IgG, and IgM, and several of these may be further divided into subclasses (isotypes), e.g., IgG<sub>1</sub>, IgG<sub>2</sub>, IgG<sub>3</sub>, IgG<sub>4</sub>, IgA<sub>1</sub>, and IgA<sub>2</sub>. The heavy chain constant domains that correspond to the different classes of immunoglobulins are called  $\alpha$ ,  $\delta$ ,  $\epsilon$ ,  $\gamma$ , and  $\mu$ , respectively.

It is understood that aspects and embodiments of the invention described herein include "comprising," "consisting," and "consisting essentially of" aspects and embodiments.

40 The term "cytotoxic agent" as used herein refers to a substance that inhibits or prevents a cellular function and/or causes cell death or destruction. Cytotoxic agents include, but are not limited to,

radioactive isotopes (e.g., At<sup>211</sup>, I<sup>131</sup>, I<sup>125</sup>, Y<sup>90</sup>, Re<sup>186</sup>, Re<sup>188</sup>, Sm<sup>153</sup>, Bi<sup>212</sup>, P<sup>32</sup>, Pb<sup>212</sup> and radioactive isotopes of Lu); chemotherapeutic agents or drugs (e.g., methotrexate, adriamicin, vinca alkaloids (vincristine, vinblastine, etoposide), doxorubicin, melphalan, mitomycin C, chlorambucil, daunorubicin or other intercalating agents); growth inhibitory agents; enzymes and fragments thereof such as nucleolytic enzymes; antibiotics; toxins such as small molecule toxins or enzymatically active toxins of bacterial, fungal, plant or animal origin, including fragments and/or variants thereof; and the various antitumor or anticancer agents disclosed below.

A "disorder" is any condition that would benefit from treatment including, but not limited to, chronic and acute disorders or diseases including those pathological conditions which predispose the mammal to the disorder in question.

The terms "cell proliferative disorder" and "proliferative disorder" refer to disorders that are associated with some degree of abnormal cell proliferation. In one embodiment, the cell proliferative disorder is cancer. In another embodiment, the cell proliferative disorder is a tumor.

The terms "B cell proliferative disorder" or "B cell malignancy" refer to disorders that are associated with some degree of abnormal B cell proliferation and include, for example, lymphomas, leukemias, myelomas, and myelodysplastic syndromes. In one embodiment, the B cell proliferative disorder is a lymphoma, such as non-Hodgkin's lymphoma (NHL), including, for example, diffuse large B cell lymphoma (DLBCL) (e.g., relapsed or refractory DLBCL). In another embodiment, the B cell proliferative disorder is a leukemia, such as chronic lymphocytic leukemia (CLL).

The terms "cancer" and "cancerous" refer to or describe the physiological condition in mammals that is typically characterized by unregulated cell growth. Examples of cancer include, but are not limited to, hematologic cancers, such as mature B cell cancers, excluding Hodgkin's lymphoma, but including non-Hodgkin's lymphoma (NHL), such as diffuse large B cell lymphoma (DLBCL), which may be relapsed or refractory DLBCL. Other specific examples of cancer also include germinal-center B cell-like (GCB) diffuse large B cell lymphoma (DLBCL), activated B cell-like (ABC) DLBCL, follicular lymphoma (FL), mantle cell lymphoma (MCL), acute myeloid leukemia (AML), chronic lymphoid leukemia (CLL), marginal zone lymphoma (MZL), small lymphocytic leukemia (SLL), lymphoplasmacytic lymphoma (LL), Waldenstrom macroglobulinemia (WM), central nervous system lymphoma (CNSL), Burkitt's lymphoma (BL), B cell prolymphocytic leukemia, splenic marginal zone lymphoma, hairy cell leukemia, splenic lymphoma/leukemia, unclassifiable, splenic diffuse red pulp small B cell lymphoma, hairy cell leukemia variant, Waldenström macroglobulinemia, heavy chain diseases,  $\alpha$  heavy chain disease,  $\gamma$  heavy chain disease,  $\mu$  heavy chain disease, plasma cell myeloma, solitary plasmacytoma of bone, extraosseous plasmacytoma, extranodal marginal zone lymphoma of mucosa-associated lymphoid tissue (MALT lymphoma), nodal marginal zone lymphoma, pediatric nodal marginal zone lymphoma, pediatric follicular lymphoma, primary cutaneous follicle centre lymphoma, T cell/histiocyte rich large B cell lymphoma, primary DLBCL of the CNS, primary cutaneous DLBCL, leg type, EBV-positive DLBCL of the elderly, DLBCL associated with chronic inflammation, lymphomatoid granulomatosis, primary mediastinal (thymic) large B cell lymphoma (PMLBCL), intravascular large B cell lymphoma, ALK-positive large B cell lymphoma, plasmablastic lymphoma, large B cell lymphoma arising in HHV8-associated multicentric Castleman disease, primary effusion lymphoma: B cell lymphoma, unclassifiable, with features

intermediate between DLBCL and Burkitt lymphoma, and B cell lymphoma, unclassifiable, with features intermediate between DLBCL and classical Hodgkin's lymphoma. Further examples of cancer include, but are not limited to, carcinoma, lymphoma, blastoma, sarcoma, and leukemia or lymphoid malignancies, including B cell lymphomas. More particular examples of such cancers include, but are not limited to,

5 multiple myeloma (MM); low grade/follicular NHL; small lymphocytic (SL) NHL; intermediate grade/follicular NHL; intermediate grade diffuse NHL; high grade immunoblastic NHL; high grade lymphoblastic NHL; high grade small non-cleaved cell NHL; bulky disease NHL; AIDS-related lymphoma; and acute lymphoblastic leukemia (ALL); chronic myeloblastic leukemia; and post-transplant lymphoproliferative disorder (PTLD).

10 "Tumor," as used herein, refers to all neoplastic cell growth and proliferation, whether malignant or benign, and all pre-cancerous and cancerous cells and tissues. The terms "cancer", "cancerous", "cell proliferative disorder", "proliferative disorder," and "tumor" are not mutually exclusive as referred to herein.

15 The term "tumor antigen," as used herein, may be understood as those antigens that are presented on tumor cells. These antigens can be presented on the cell surface with an extracellular part, which is often combined with a transmembrane and cytoplasmic part of the molecule. These antigens can sometimes be presented only by tumor cells and never by the normal ones. Tumor antigens can be exclusively expressed on tumor cells or might represent a tumor specific mutation compared to normal cells. In this case, they are called tumor-specific antigens. More common are tumor antigens that are presented by tumor cells and normal cells, and they are called tumor-associated antigens. These tumor-  
20 associated antigens can be overexpressed compared to normal cells or are accessible for antibody binding in tumor cells due to the less compact structure of the tumor tissue compared to normal tissue. In one aspect the tumor antigen is CD20.

25 "Effector functions" refer to those biological activities attributable to the Fc region of an antibody, which vary with the antibody isotype. Examples of antibody effector functions include: C1q binding and complement dependent cytotoxicity (CDC); Fc receptor binding; antibody-dependent cell-mediated cytotoxicity (ADCC); phagocytosis; down regulation of cell surface receptors (e.g. B cell receptor); and B cell activation.

30 An "effective amount" of a compound, for example, an anti-CD20/anti-CD3 antibody or a composition (e.g., pharmaceutical composition) thereof, is at least the minimum amount required to achieve the desired therapeutic or prophylactic result, such as a measurable improvement or prevention of a particular disorder (e.g., a cancer, e.g., a B cell proliferative disorder, e.g., NHL, e.g., DLBCL). An effective amount herein may vary according to factors such as the disease state, age, sex, and weight of the patient, and the ability of the antibody to elicit a desired response in the individual. An effective amount is also one in which any toxic or detrimental effects of the treatment are outweighed by the  
35 therapeutically beneficial effects. For prophylactic use, beneficial or desired results include results such as eliminating or reducing the risk, lessening the severity, or delaying the onset of the disease, including biochemical, histological and/or behavioral symptoms of the disease, its complications and intermediate pathological phenotypes presenting during development of the disease. For therapeutic use, beneficial or desired results include clinical results such as decreasing one or more symptoms resulting from the  
40 disease, increasing the quality of life of those suffering from the disease, decreasing the dose of other

medications required to treat the disease, enhancing effect of another medication such as via targeting, delaying the progression of the disease, and/or prolonging survival. In the case of cancer or tumor, an effective amount of the drug may have the effect in reducing the number of cancer cells; reducing the tumor size; inhibiting (i.e., slow to some extent or desirably stop) cancer cell infiltration into peripheral organs; inhibit (i.e., slow to some extent and desirably stop) tumor metastasis; inhibiting to some extent tumor growth; and/or relieving to some extent one or more of the symptoms associated with the disorder. An effective amount can be administered in one or more administrations. For purposes of this invention, an effective amount of drug, compound, or pharmaceutical composition is an amount sufficient to accomplish prophylactic or therapeutic treatment either directly or indirectly. As is understood in the clinical context, an effective amount of a drug, compound, or pharmaceutical composition may or may not be achieved in conjunction with another drug, compound, or pharmaceutical composition. Thus, an "effective amount" may be considered in the context of administering one or more therapeutic agents, and a single agent may be considered to be given in an effective amount if, in conjunction with one or more other agents, a desirable result may be or is achieved.

The term "Fc region" herein is used to define a C-terminal region of an immunoglobulin heavy chain that contains at least a portion of the constant region. The term includes native sequence Fc regions and variant Fc regions. In one embodiment, a human IgG heavy chain Fc region extends from Cys226, or from Pro230, to the carboxyl-terminus of the heavy chain. However, the C-terminal lysine (Lys447) of the Fc region may or may not be present. Unless otherwise specified herein, numbering of amino acid residues in the Fc region or constant region is according to the EU numbering system, also called the EU index, as described in Kabat *et al.*, *Sequences of Proteins of Immunological Interest*, 5th Ed. Public Health Service, National Institutes of Health, Bethesda, MD, 1991.

"Framework" or "FR" refers to variable domain residues other than hypervariable region (HVR) residues. The FR of a variable domain generally consists of four FR domains: FR1, FR2, FR3, and FR4. Accordingly, the HVR and FR sequences generally appear in the following sequence in VH (or VL): FR1-H1(L1)-FR2-H2(L2)-FR3-H3(L3)-FR4.

The terms "full-length antibody," "intact antibody," and "whole antibody" are used herein interchangeably to refer to an antibody having a structure substantially similar to a native antibody structure or having heavy chains that contain an Fc region as defined herein.

A "human antibody" is one which possesses an amino acid sequence which corresponds to that of an antibody produced by a human or a human cell or derived from a non-human source that utilizes human antibody repertoires or other human antibody-encoding sequences. This definition of a human antibody specifically excludes a humanized antibody comprising non-human antigen-binding residues. Human antibodies can be produced using various techniques known in the art, including phage-display libraries. Hoogenboom and Winter, *J. Mol. Biol.*, 227:381 (1991); Marks *et al.*, *J. Mol. Biol.*, 222:581 (1991). Also available for the preparation of human monoclonal antibodies are methods described in Cole *et al.*, *Monoclonal Antibodies and Cancer Therapy*, Alan R. Liss, p. 77 (1985); Boerner *et al.*, *J. Immunol.*, 147(1):86-95 (1991). See also van Dijk and van de Winkel, *Curr. Opin. Pharmacol.*, 5: 368-74 (2001). Human antibodies can be prepared by administering the antigen to a transgenic animal that has been modified to produce such antibodies in response to antigenic challenge, but whose endogenous loci

have been disabled, e.g., immunized xenomice (see, e.g., U.S. Pat. Nos. 6,075,181 and 6,150,584 regarding XENOMOUSE™ technology). See also, for example, Li *et al.*, *Proc. Natl. Acad. Sci. USA*, 103:3557-3562 (2006) regarding human antibodies generated via a human B-cell hybridoma technology.

A "human consensus framework" is a framework which represents the most commonly occurring 5 amino acid residues in a selection of human immunoglobulin VL or VH framework sequences. Generally, the selection of human immunoglobulin VL or VH sequences is from a subgroup of variable domain sequences. Generally, the subgroup of sequences is a subgroup as in Kabat *et al.*, *Sequences of Proteins of Immunological Interest*, Fifth Edition, NIH Publication 91-3242, Bethesda MD (1991), vols. 1-3. In one embodiment, for the VL, the subgroup is subgroup kappa I as in Kabat *et al.*, *supra*. In one 10 embodiment, for the VH, the subgroup is subgroup III as in Kabat *et al.*, *supra*.

A "humanized" antibody refers to a chimeric antibody comprising amino acid residues from non-human HVRs and amino acid residues from human FRs. In certain embodiments, a humanized antibody will comprise substantially all of at least one, and typically two, variable domains, in which all or substantially all of the HVRs (e.g., CDRs) correspond to those of a non-human antibody, and all or 15 substantially all of the FRs correspond to those of a human antibody. A humanized antibody optionally may comprise at least a portion of an antibody constant region derived from a human antibody. A "humanized form" of an antibody, e.g., a non-human antibody, refers to an antibody that has undergone humanization.

The term "hypervariable region" or "HVR" as used herein refers to each of the regions of an 20 antibody variable domain which are hypervariable in sequence ("complementarity determining regions" or "CDRs") and/or form structurally defined loops ("hypervariable loops") and/or contain the antigen-contacting residues ("antigen contacts"). Generally, antibodies comprise six HVRs: three in the VH (H1, H2, H3), and three in the VL (L1, L2, L3). Exemplary HVRs herein include:

- (a) hypervariable loops occurring at amino acid residues 26-32 (L1), 50-52 (L2), 91-96 (L3), 26-32 (H1), 53-55 (H2), and 96-101 (H3) (Chothia and Lesk, *J. Mol. Biol.* 196:901-917 (1987));
- (b) CDRs occurring at amino acid residues 24-34 (L1), 50-56 (L2), 89-97 (L3), 31-35b (H1), 50-65 (H2), and 95-102 (H3) (Kabat *et al.*, *Sequences of Proteins of Immunological Interest*, 5th Ed. Public Health Service, National Institutes of Health, Bethesda, MD (1991));
- (c) antigen contacts occurring at amino acid residues 27c-36 (L1), 46-55 (L2), 89-96 (L3), 30-35b (H1), 47-58 (H2), and 93-101 (H3) (MacCallum *et al.* *J. Mol. Biol.* 262: 732-745 (1996)); and
- (d) combinations of (a), (b), and/or (c), including HVR amino acid residues 46-56 (L2), 47-56 (L2), 48-56 (L2), 49-56 (L2), 26-35 (H1), 26-35b (H1), 49-65 (H2), 93-102 (H3), and 94-102 (H3).

Unless otherwise indicated, HVR residues and other residues in the variable domain (e.g., FR residues) are numbered herein according to Kabat *et al.*, *supra*.

35 An "immunoconjugate" is an antibody conjugated to one or more heterologous molecule(s), including but not limited to a cytotoxic agent.

A "subject" or an "individual" is a mammal. Mammals include, but are not limited to, domesticated animals (e.g., cows, sheep, cats, dogs, and horses), primates (e.g., humans and non-human primates such as monkeys), rabbits, and rodents (e.g., mice and rats). In certain embodiments, the subject or 40 individual is a human.

An “isolated” antibody is one which has been separated from a component of its natural environment. In some embodiments, an antibody is purified to greater than 95% or 99% purity as determined by, for example, electrophoretic (e.g., SDS-PAGE, isoelectric focusing (IEF), capillary electrophoresis) or chromatographic (e.g., ion exchange or reverse phase HPLC). For review of methods 5 for assessment of antibody purity, see, e.g., Flatman et al., *J. Chromatogr. B* 848:79-87 (2007).

The term “monoclonal antibody” as used herein refers to an antibody obtained from a population 10 of substantially homogeneous antibodies, i.e., the individual antibodies comprising the population are identical and/or bind the same epitope, except for possible variant antibodies, e.g., containing naturally occurring mutations or arising during production of a monoclonal antibody preparation, such variants 15 generally being present in minor amounts. In contrast to polyclonal antibody preparations, which typically include different antibodies directed against different determinants (epitopes), each monoclonal antibody of a monoclonal antibody preparation is directed against a single determinant on an antigen. Thus, the modifier “monoclonal” indicates the character of the antibody as being obtained from a substantially 20 homogeneous population of antibodies, and is not to be construed as requiring production of the antibody by any particular method. For example, the monoclonal antibodies to be used in accordance with the present invention may be made by a variety of techniques, including but not limited to the hybridoma method, recombinant DNA methods, phage-display methods, and methods utilizing transgenic animals containing all or part of the human immunoglobulin loci, such methods and other exemplary methods for 25 making monoclonal antibodies being described herein.

20 A “naked antibody” refers to an antibody that is not conjugated to a heterologous moiety (e.g., a cytotoxic moiety) or radiolabel. The naked antibody may be present in a pharmaceutical formulation.

“Native antibodies” refer to naturally occurring immunoglobulin molecules with varying structures. 25 For example, native IgG antibodies are heterotetrameric glycoproteins of about 150,000 daltons, composed of two identical light chains and two identical heavy chains that are disulfide-bonded. From N- to C-terminus, each heavy chain has a variable region (VH), also called a variable heavy domain or a heavy chain variable domain, followed by three constant domains (CH1, CH2, and CH3). Similarly, from 30 N- to C-terminus, each light chain has a variable region (VL), also called a variable light domain or a light chain variable domain, followed by a constant light (CL) domain. The light chain of an antibody may be assigned to one of two types, called kappa (κ) and lambda (λ), based on the amino acid sequence of its constant domain.

The term “package insert” is used to refer to instructions customarily included in commercial packages of therapeutic products, that contain information about the indications, usage, dosage, administration, combination therapy, contraindications and/or warnings concerning the use of such therapeutic products.

35 The term “protein,” as used herein, refers to any native protein from any vertebrate source, including mammals such as primates (e.g. humans) and rodents (e.g., mice and rats), unless otherwise indicated. The term encompasses “full-length,” unprocessed protein as well as any form of the protein that results from processing in the cell. The term also encompasses naturally occurring variants of the protein, e.g., splice variants or allelic variants.

"Percent (%) amino acid sequence identity" with respect to a reference polypeptide sequence is defined as the percentage of amino acid residues in a candidate sequence that are identical with the amino acid residues in the reference polypeptide sequence, after aligning the sequences and introducing gaps, if necessary, to achieve the maximum percent sequence identity, and not considering any 5 conservative substitutions as part of the sequence identity. Alignment for purposes of determining percent amino acid sequence identity can be achieved in various ways that are within the skill in the art, for instance, using publicly available computer software such as BLAST, BLAST-2, ALIGN or Megalign (DNASTAR) software. Those skilled in the art can determine appropriate parameters for aligning sequences, including any algorithms needed to achieve maximal alignment over the full length of the 10 sequences being compared. For purposes herein, however, % amino acid sequence identity values are generated using the sequence comparison computer program ALIGN-2. The ALIGN-2 sequence comparison computer program was authored by Genentech, Inc., and the source code has been filed with user documentation in the U.S. Copyright Office, Washington D.C., 20559, where it is registered under U.S. Copyright Registration No. TXU510087. The ALIGN-2 program is publicly available from 15 Genentech, Inc., South San Francisco, California, or may be compiled from the source code. The ALIGN-2 program should be compiled for use on a UNIX operating system, including digital UNIX V4.0D. All sequence comparison parameters are set by the ALIGN-2 program and do not vary.

In situations where ALIGN-2 is employed for amino acid sequence comparisons, the % amino acid sequence identity of a given amino acid sequence A to, with, or against a given amino acid 20 sequence B (which can alternatively be phrased as a given amino acid sequence A that has or comprises a certain % amino acid sequence identity to, with, or against a given amino acid sequence B) is calculated as follows:

$$100 \text{ times the fraction } X/Y$$

where X is the number of amino acid residues scored as identical matches by the sequence alignment 25 program ALIGN-2 in that program's alignment of A and B, and where Y is the total number of amino acid residues in B. It will be appreciated that where the length of amino acid sequence A is not equal to the length of amino acid sequence B, the % amino acid sequence identity of A to B will not equal the % amino acid sequence identity of B to A. Unless specifically stated otherwise, all % amino acid sequence 30 identity values used herein are obtained as described in the immediately preceding paragraph using the ALIGN-2 computer program.

The term "pharmaceutical formulation" refers to a preparation which is in such form as to permit the biological activity of an active ingredient contained therein to be effective, and which contains no additional components which are unacceptably toxic to a subject to which the formulation would be administered.

35 A "pharmaceutically acceptable carrier" refers to an ingredient in a pharmaceutical formulation, other than an active ingredient, which is nontoxic to a subject. A pharmaceutically acceptable carrier includes, but is not limited to, a buffer, excipient, stabilizer, or preservative.

40 As used herein, "treatment" (and grammatical variations thereof, such as "treat" or "treating") refers to clinical intervention in an attempt to alter the natural course of the individual being treated, and can be performed either for prophylaxis or during the course of clinical pathology. Desirable effects of

treatment include, but are not limited to, preventing occurrence or recurrence of disease, alleviation of symptoms, diminishment of any direct or indirect pathological consequences of the disease, preventing metastasis, decreasing the rate of disease progression, amelioration or palliation of the disease state, and remission or improved prognosis. In some embodiments, antibodies of the invention are used to

5 delay development of a disease or to slow the progression of a disease.

As used herein, “delaying progression” of a disorder or disease means to defer, hinder, slow, retard, stabilize, and/or postpone development of the disease or disorder (e.g., a B cell proliferative disorder, e.g., NHL, e.g., DLBCL). This delay can be of varying lengths of time, depending on the history of the disease and/or individual being treated. As is evident to one skilled in the art, a sufficient or

10 significant delay can, in effect, encompass prevention, in that the individual does not develop the disease. For example, a late stage cancer, such as development of metastasis, may be delayed.

By “reduce” or “inhibit” is meant the ability to cause an overall decrease, for example, of 20% or greater, of 50% or greater, or of 75%, 85%, 90%, 95%, or greater. In certain embodiments, reduce or inhibit can refer to the reduction or inhibition of undesirable events, such as cytokine-driven toxicities (e.g., cytokine release syndrome (CRS)), infusion-related reactions (IRRs), macrophage activation syndrome (MAS), neurologic toxicities, severe tumor lysis syndrome (TLS), neutropenia, thrombocytopenia, elevated liver enzymes, and/or central nervous system (CNS) toxicities, following treatment with an anti-CD20/anti-CD3 bispecific antibody using the fractionated, dose-escalation dosing regimen of the invention relative to treatment with an anti-CD20/anti-CD3 bispecific antibody using an

20 non-fractionated dosing regimen. In other embodiments, reduce or inhibit can refer to effector function of an antibody that is mediated by the antibody Fc region, such effector functions specifically including complement-dependent cytotoxicity (CDC), antibody-dependent cellular cytotoxicity (ADCC), and antibody-dependent cellular phagocytosis (ADCP).

The term “variable region” or “variable domain” refers to the domain of an antibody heavy or light chain that is involved in binding the antibody to antigen. The variable domains of the heavy chain and light chain (VH and VL, respectively) of a native antibody generally have similar structures, with each domain comprising four conserved framework regions (FRs) and three hypervariable regions (HVRs). (See, e.g., Kindt et al. *Kuby Immunology*, 6<sup>th</sup> ed., W.H. Freeman and Co., page 91 (2007).) A single VH or VL domain may be sufficient to confer antigen-binding specificity. Furthermore, antibodies that bind a particular antigen may be isolated using a VH or VL domain from an antibody that binds the antigen to screen a library of complementary VL or VH domains, respectively. See, e.g., Portolano et al., *J. Immunol.* 150:880-887 (1993); Clarkson et al., *Nature* 352:624-628 (1991).

The term “PD-1 axis binding antagonist” refers to a molecule that inhibits the interaction of a PD-1 axis binding partner with either one or more of its binding partner, so as to remove T-cell dysfunction resulting from signaling on the PD-1 signaling axis, with a result being to restore or enhance T-cell function (e.g., proliferation, cytokine production, target cell killing). As used herein, a PD-1 axis binding antagonist includes a PD-1 binding antagonist, a PD-L1 binding antagonist, and a PD-L2 binding antagonist.

The term “PD-1 binding antagonist” refers to a molecule that decreases, blocks, inhibits, abrogates, or interferes with signal transduction resulting from the interaction of PD-1 with one or more of

its binding partners, such as PD-L1, PD-L2. In some embodiments, the PD-1 binding antagonist is a molecule that inhibits the binding of PD-1 to one or more of its binding partners. In a specific aspect, the PD-1 binding antagonist inhibits the binding of PD-1 to PD-L1 and/or PD-L2. For example, PD-1 binding antagonists include anti-PD-1 antibodies, antigen-binding fragments thereof, immunoadhesins, fusion proteins, oligopeptides, and other molecules that decrease, block, inhibit, abrogate, or interfere with signal transduction resulting from the interaction of PD-1 with PD-L1 and/or PD-L2. In one embodiment, a PD-1 binding antagonist reduces the negative co-stimulatory signal mediated by or through cell surface proteins expressed on T lymphocytes mediated signaling through PD-1 so as render a dysfunctional T-cell less dysfunctional (e.g., enhancing effector responses to antigen recognition). In some embodiments, 5 the PD-1 binding antagonist is an anti-PD-1 antibody. In a specific embodiment, a PD-1 binding antagonist is MDX-1106 (nivolumab), described herein. In another specific embodiment, a PD-1 binding antagonist is MK-3475 (lambrolizumab), described herein. In another specific embodiment, a PD-1 binding antagonist is CT-011 (pidilizumab), described herein. In another specific embodiment, a PD-1 binding antagonist is AMP-224, described herein.

10

15 The term "PD-L1 binding antagonist" refers to a molecule that decreases, blocks, inhibits, abrogates, or interferes with signal transduction resulting from the interaction of PD-L1 with either one or more of its binding partners, such as PD-1 or B7-1. In some embodiments, a PD-L1 binding antagonist is a molecule that inhibits the binding of PD-L1 to its binding partners. In a specific aspect, the PD-L1 binding antagonist inhibits binding of PD-L1 to PD-1 and/or B7-1. In some embodiments, the PD-L1 20 binding antagonists include anti-PD-L1 antibodies, antigen-binding fragments thereof, immunoadhesins, fusion proteins, oligopeptides, and other molecules that decrease, block, inhibit, abrogate, or interfere with signal transduction resulting from the interaction of PD-L1 with one or more of its binding partners, such as PD-1 or B7-1. In one embodiment, a PD-L1 binding antagonist reduces the negative co-stimulatory signal mediated by or through cell surface proteins expressed on T lymphocytes mediated 25 signaling through PD-L1 so as to render a dysfunctional T-cell less dysfunctional (e.g., enhancing effector responses to antigen recognition). In some embodiments, a PD-L1 binding antagonist is an anti-PD-L1 antibody. In a specific embodiment, the anti-PD-L1 antibody is atezolizumab (CAS Registry Number: 1422185-06-5), also known as MPDL3280A, and described herein. In another specific embodiment, the anti-PD-L1 antibody is YW243.55.S70, described herein. In another specific embodiment, the anti-PD-L1 30 antibody is MDX-1105, described herein. In still another specific aspect, the anti-PD-L1 antibody is MEDI4736, described herein.

35 The term "PD-L2 binding antagonist" refers to a molecule that decreases, blocks, inhibits, abrogates, or interferes with signal transduction resulting from the interaction of PD-L2 with either one or more of its binding partners, such as PD-1. In some embodiments, a PD-L2 binding antagonist is a molecule that inhibits the binding of PD-L2 to one or more of its binding partners. In a specific aspect, the PD-L2 binding antagonist inhibits binding of PD-L2 to PD-1. In some embodiments, the PD-L2 40 antagonists include anti-PD-L2 antibodies, antigen-binding fragments thereof, immunoadhesins, fusion proteins, oligopeptides, and other molecules that decrease, block, inhibit, abrogate, or interfere with signal transduction resulting from the interaction of PD-L2 with either one or more of its binding partners, such as PD-1. In one embodiment, a PD-L2 binding antagonist reduces the negative co-stimulatory

signal mediated by or through cell surface proteins expressed on T lymphocytes mediated signaling through PD-L2 so as render a dysfunctional T-cell less dysfunctional (e.g., enhancing effector responses to antigen recognition). In some embodiments, a PD-L2 binding antagonist is an immunoadhesin.

As used herein, a "week" is 7 days  $\pm$  2 days.

5 As used herein, "administering" is meant a method of giving a dosage of a compound (e.g., an anti-CD20/anti-CD3 antibody) or a composition (e.g., a pharmaceutical composition, e.g., a pharmaceutical composition including an anti-CD20/anti-CD3 antibody) to a subject. The compounds and/or compositions utilized in the methods described herein can be administered, for example, intravenously (e.g., by intravenous infusion), subcutaneously, intramuscularly, intradermally, 10 percutaneously, intraarterially, intraperitoneally, intralesionally, intracranially, intraarticularly, intraprostatically, intrapleurally, intratracheally, intranasally, intravirtrealy, intravaginally, intrarectally, 15 topically, intratumorally, peritoneally, subconjunctivally, intravesicularly, mucosally, intrapericardially, intraumbilically, intraocularly, orally, topically, locally, by inhalation, by injection, by infusion, by continuous infusion, by localized perfusion bathing target cells directly, by catheter, by lavage, in creams, or in lipid compositions. The method of administration can vary depending on various factors (e.g., the compound or composition being administered and the severity of the condition, disease, or disorder being treated).

## II. THERAPEUTIC METHODS

20 The invention is based, in part, on methods of treating a subject having cancer (e.g., a B cell proliferative disorder) using fractionated, dose-escalation dosing regimens with anti-cluster of differentiation 20 (CD20)/anti-cluster of differentiation 3 (CD3) bispecific antibodies. The methods are expected to reduce or inhibit unwanted treatment effects, which include cytokine-driven toxicities (e.g., cytokine release syndrome (CRS)), infusion-related reactions (IRRs), macrophage activation syndrome (MAS), neurologic toxicities, severe tumor lysis syndrome (TLS), neutropenia, thrombocytopenia, 25 elevated liver enzymes, and/or central nervous system (CNS) toxicities. Therefore, the methods are useful for treating the subject while achieving a more favorable benefit-risk profile.

25 The invention provides methods useful for treating a subject having cancer (e.g., a B cell proliferative disorder, e.g., non-Hodgkin's lymphoma (NHL), e.g., diffuse large B-cell lymphoma (DLBCL) (e.g., relapsed or refractory DLBCL), follicular lymphoma (FL), or primary mediastinal (thymic) large B cell lymphoma (PMLBCL)) that include administering to the subject a bispecific antibody that binds to CD20 and CD3 (i.e., an anti-CD20/anti-CD3 antibody) in a fractionated, dose-escalation dosing regimen.

30 The invention provides a method of treating a subject having a cancer (e.g., a B cell proliferative disorder) comprising administering to the subject a bispecific antibody that binds to CD20 and CD3 in a dosing regimen comprising at least a first dosing cycle and a second dosing cycle, wherein: (a) the first dosing cycle comprises a first dose (C1D1), a second dose (C1D2), and a third dose (C1D3) of the bispecific antibody, wherein the C1D1 and the C1D2 are each no greater than the C1D3, and (b) the second dosing cycle comprises a single dose (C2D1) of the bispecific antibody, wherein the C2D1 is equal to or greater than the C1D3, wherein the C1D1, the C1D2, and the C1D3 have a cumulative dose that is about 50% greater than a highest cleared dose (i.e., dose which does not induce unacceptable 35 toxicity in a patient) of the bispecific antibody in a first dosing cycle of a non-fractionated, dose-escalation 40 toxicology study.

dosing regimen, and wherein the highest cleared dose is between about 0.05 mg to about 30 mg (e.g., between about 0.05 mg to about 25 mg, e.g., between about 0.05 mg to about 20 mg, e.g., between about 0.05 mg to about 15 mg, e.g., between about 0.05 mg to about 13 mg, e.g., between about 0.1 mg to about 13 mg, e.g., between about 0.2 mg to about 13 mg, e.g., between about 0.2 mg to about 10 mg, e.g., between about 0.2 mg to about 7.5 mg, e.g., between about 0.4 mg to about 7.5 mg, e.g., between about 0.4 mg to about 6 mg, e.g., between about 0.4 mg to about 5 mg, e.g., between about 0.8 mg to about 5 mg, e.g., between about 1 mg to about 5 mg, e.g., about 2.8 mg). In some embodiments, the C1D3 is equal to the highest cleared dose of the bispecific antibody in the first dosing cycle of the non-fractionated, dose-escalation dosing regimen. In some embodiments, the C1D2 and the C1D1 are equal.

5 In some embodiments, the C1D2 is greater than the C1D1 by about 50% to about 250% (e.g., the C1D2 is greater than the C1D1 by about 50% to about 225%, e.g., the C1D2 is greater than the C1D1 by about 50% to about 200%, e.g., the C1D2 is greater than the C1D1 by about 50% to about 175%, e.g., the C1D2 is greater than the C1D1 by about 50% to about 150%, e.g., the C1D2 is greater than the C1D1 by about 50% to about 125%, e.g., the C1D2 is greater than the C1D1 by about 50% to about 100%, e.g.,

10 the C1D2 is greater than the C1D1 by about 50% to about 75%). In some embodiments, the C1D3 is greater than the C1D2 by about 150% to about 300% (e.g., the C1D3 is greater than the C1D2 by about 150% to about 275%, e.g., the C1D3 is greater than the C1D2 by about 150% to about 250%, e.g., the C1D3 is greater than the C1D2 by about 150% to about 233%, e.g., the C1D3 is greater than the C1D2 by about 150% to about 225%, e.g., the C1D3 is greater than the C1D2 by about 150% to about 200%, e.g., the C1D3 is greater than the C1D2 by about 150% to about 180%, e.g., the C1D3 is greater than the C1D2 by about 150% to about 175%, e.g., the C1D3 is greater than the C1D2 by about 150% to about 167%, e.g., the C1D3 is greater than the C1D2 by about 150% to about 157%).

15

20

The invention also provides a method of treating a subject having a cancer (e.g., a B cell proliferative disorder) comprising administering to the subject a bispecific antibody that binds to CD20 and CD3 in a dosing regimen comprising at least a first dosing cycle and a second dosing cycle, wherein: (a) the first dosing cycle comprises a first dose (C1D1), a second dose (C1D2), and a third dose (C1D3) of the bispecific antibody, wherein the C1D1 and the C1D2 are each no greater than the C1D3, and wherein the C1D1 is between about 0.0056 mg to about 12.50 mg (e.g., between about 0.0075 mg to about 12.50 mg, e.g., between about 0.0075 mg to about 12 mg, e.g., between about 0.0075 mg to about 10 mg, e.g., between about 0.0075 mg to about 8 mg, e.g., between about 0.010 mg to about 8 mg, e.g., between about 0.010 mg to about 7 mg, e.g., between about 0.010 mg to about 6 mg, e.g., between about 0.010 mg to about 5 mg, e.g., between about 0.010 mg to about 4 mg, e.g., between about 0.010 mg to about 3.5 mg, e.g., between about 0.015 mg to about 3.5 mg, e.g., between about 0.020 mg to about 3.5 mg, e.g., between about 0.020 mg to about 3.2 mg, e.g., about 0.8 mg or about 1 mg), the C1D2 is between about 0.0125 mg to about 20.00 mg (e.g., between about 0.0125 mg to about 17.5 mg, e.g., between about 0.0125 mg to about 15 mg, e.g., between about 0.020 mg to about 15 mg, e.g., between about 0.025 mg to about 15 mg, e.g., between about 0.030 mg to about 15 mg, e.g., between about 0.035 mg to about 15 mg, e.g., between about 0.040 mg to about 15 mg, e.g., between about 0.045 mg to about 15 mg, e.g., between about 0.050 mg to about 15 mg, e.g., between about 0.050 mg to about 12.5 mg, e.g., between about 0.050 mg to about 10 mg, e.g., between about 0.050 mg to about 7.5 mg, e.g., between

about 0.050 mg to about 5 mg, e.g., about 1 mg or about 2 mg), and the C1D3 is between about 0.0500 mg to about 50 mg (e.g., between about 0.055 mg to about 50 mg, e.g., between about 0.10 mg to about 50 mg, e.g., between about 1.0 mg to about 50 mg, e.g., between about 2 mg to about 10 mg, e.g., between about 3.0 mg to about 6.0, e.g., about 3.0 mg, 4.2 mg, or 6 mg); and (b) the second dosing cycle 5 comprises a single dose (C2D1) of the bispecific antibody, wherein the C2D1 is equal to or greater than the C1D3 and is between about 0.0500 mg to about 50 mg (e.g., 0.0500 mg to about 50 mg (e.g., between about 0.055 mg to about 50 mg, e.g., between about 0.10 mg to about 50 mg, e.g., between about 1.0 mg to about 50 mg, e.g., between about 1.0 mg to about 35 mg, e.g., between about 2 mg to about 10 mg, e.g., between about 3.0 mg to about 6.0 mg, e.g., about 3.0 mg, 4.2, mg or 6 mg). In some 10 instances, for example, (a) the C1D1 is between about 0.02 mg to about 4.0 mg, the C1D2 is between about 0.05 mg to about 20.0 mg, and the C1D3 is between about 0.2 mg to about 50.0 mg, and (b) the C2D1 is between about 3.0 mg to about 50.0 mg. In some instances, (a) the C1D1 is between about 0.4 mg to about 4.0 mg, the C1D2 is between about 1.0 mg to about 20.0 mg, and the C1D3 is between about 3.0 mg to about 50.0 mg, and (b) the C2D1 is between about 3.0 mg to about 50.0 mg. In some 15 instances, (a) the C1D1 is between about 1.0 mg to about 3.0 mg, the C1D2 is between about 2.0 mg to about 6.0 mg, and the C1D3 is between about 6.0 mg to about 50.0 mg, and (b) the C2D1 is between about 6.0 mg to about 50.0 mg. In some instances, (a) the C1D1 is about 1.0 mg, the C1D2 is about 2.0 mg, and the C1D3 is between about 6.0 mg to about 50.0 mg, and (b) the C2D1 is between about 6.0 mg to about 50.0 mg. In some 20 instances, (a) the C1D1 is about 1.0 mg, the C1D2 is about 2.0 mg, and the C1D3 is between about 6.0 mg to about 50.0 mg, and (b) the C2D1 is equal to the C1D3. In some instances, (a) the C1D1 is about 1.0 mg, the C1D2 is about 2.0 mg, and the C1D3 is about 20.0 mg, and (b) the C2D1 is equal to the C1D3. In some instances, for example, (a) the C1D1 is between about 0.02 mg to about 4.0 mg, the C1D2 is between about 0.05 mg to about 20.0 mg, and the C1D3 is between about 0.2 mg to about 20.0 mg, and (b) the C2D1 is between about 0.2 mg to about 20.0 mg. In some 25 instances, (a) the C1D1 is between about 0.4 mg to about 4.0 mg, the C1D2 is between about 1.0 mg to about 20.0 mg, and the C1D3 is between about 3.0 mg to about 20.0 mg, and (b) the C2D1 is between about 3.0 mg to about 20.0 mg. In other instances, (a) the C1D1 is between about 0.8 mg to about 3.0 mg, the C1D2 is between about 1.0 mg to about 6.0 mg, and the C1D3 is about 3.0 mg to about 20.0 mg, and (b) the C2D1 is about 3.0 mg to about 20.0 mg. In other instances, (a) the C1D1 is between about 30 0.8 mg to about 3.0 mg, the C1D2 is between about 1.0 mg to about 6.0 mg, and the C1D3 is about 3.0 mg to about 6.0 mg, and (b) the C2D1 is about 3.0 mg to about 6.0 mg.

In some embodiments, (a) the C1D1 is about 0.8 mg, the C1D2 is about 2.0 mg, and the C1D3 is about 4.2 mg, and (b) the C2D1 is about 4.2 mg. In some embodiments, (a) the C1D1 is about 1.0 mg, the C1D2 is about 1.0 mg, and the C1D3 is about 3.0 mg, and (b) the C2D1 is about 3.0 mg. In some 35 embodiments, (a) the C1D1 is about 1.0 mg, the C1D2 is about 2.0 mg, and the C1D3 is about 6.0 mg, and (b) the C2D1 is about 6.0 mg. In some embodiments, (a) the C1D1 is about 0.8 mg, the C1D2 is about 2.0 mg, and the C1D3 is about 6.0 mg, and (b) the C2D1 is about 6.0 mg. The invention also provides a method of treating a subject having a cancer (e.g., a B cell proliferative disorder) comprising administering to the subject a bispecific antibody that binds to CD20 and CD3 in a dosing regimen 40 comprising a first dosing cycle and, optionally, a second dosing cycle, wherein: (a) the first dosing cycle

comprises a first dose (C1D1) and a second dose (C1D2) of the bispecific antibody, wherein the C1D1 is no greater than the C1D2 dose, and optionally (b) the second dosing cycle comprises a single dose (C2D1) of the bispecific antibody, wherein the C2D1 is equal to or greater than the C1D2, wherein the C1D1 and the C1D2 have a cumulative dose that is about 50% greater than a highest cleared dose of the bispecific antibody in a first dosing cycle of a non-fractionated, dose-escalation dosing regimen, and wherein the highest cleared dose is between about 0.05 mg to about 30 mg (e.g., between about 0.05 mg to about 25 mg, e.g., between about 0.05 mg to about 20 mg, e.g., between about 0.05 mg to about 15 mg, e.g., between about 0.05 mg to about 13 mg, e.g., between about 0.1 mg to about 13 mg, e.g., between about 0.2 mg to about 13 mg, e.g., between about 0.2 mg to about 10 mg, e.g., between about 0.2 mg to about 7.5 mg, e.g., between about 0.4 mg to about 7.5 mg, e.g., between about 0.4 mg to about 6 mg, e.g., between about 0.4 mg to about 5 mg, e.g., between about 0.8 mg to about 5 mg, e.g., between about 1 mg to about 5 mg, e.g., about 2.8 mg). In some embodiments, the C1D2 is equal to the highest cleared dose of the bispecific antibody in the first dosing cycle of the non-fractionated, dose-escalation dosing regimen. In some instances, the C1D2 is greater than the C1D1 by about 50% to about 250% (e.g., the C1D2 is greater than the C1D1 by about 50% to about 225%, e.g., the C1D2 is greater than the C1D1 by about 50% to about 200%, e.g., the C1D2 is greater than the C1D1 by about 50% to about 175%, e.g., the C1D2 is greater than the C1D1 by about 50% to about 150%, e.g., the C1D2 is greater than the C1D1 by about 50% to about 125%, e.g., the C1D2 is greater than the C1D1 by about 50% to about 100%, e.g., the C1D2 is greater than the C1D1 by about 50% to about 75%).

In some instances, the C1D1 is between about 0.0056 mg to about 12.50 mg (e.g., between about 0.0075 mg to about 12.50 mg, e.g., between about 0.0075 mg to about 12 mg, e.g., between about 0.0075 mg to about 10 mg, e.g., between about 0.0075 mg to about 8 mg, e.g., between about 0.010 mg to about 8 mg, e.g., between about 0.010 mg to about 7 mg, e.g., between about 0.010 mg to about 6 mg, e.g., between about 0.010 mg to about 5 mg, e.g., between about 0.010 mg to about 4 mg, e.g., between about 0.010 mg to about 3.5 mg, e.g., between about 0.015 mg to about 3.5 mg, e.g., between about 0.020 mg to about 3.5 mg, e.g., between about 0.020 mg to about 3.2 mg, e.g., about 0.8 mg or about 1 mg). In some instances, the C1D2 is between about 0.0125 mg to about 19.44 mg (e.g., between about 0.0125 mg to about 17.5 mg, e.g., between about 0.0125 mg to about 15 mg, e.g., between about 0.020 mg to about 15 mg, e.g., between about 0.025 mg to about 15 mg, e.g., between about 0.030 mg to about 15 mg, e.g., between about 0.035 mg to about 15 mg, e.g., between about 0.040 mg to about 15 mg, e.g., between about 0.045 mg to about 15 mg, e.g., between about 0.050 mg to about 15 mg, e.g., between about 0.050 mg to about 12.5 mg, e.g., between about 0.050 mg to about 10 mg, e.g., between about 0.050 mg to about 7.5 mg, e.g., between about 0.050 mg to about 5 mg). In some instances, the C1D2 is between about 0.0500 mg to about 50 mg (e.g., between about 0.055 mg to about 50 mg, e.g., between about 0.055 mg to about 45 mg, e.g., between about 0.055 mg to about 40 mg, e.g., between about 0.055 mg to about 35 mg, e.g., between about 0.055 mg to about 30 mg, e.g., between about 0.10 mg to about 30 mg, e.g., between about 0.15 mg to about 30 mg, e.g., between about 0.15 mg to about 25 mg, e.g., between about 0.15 mg to about 20 mg, e.g., between about 0.15 mg to about 17.5 mg, e.g., between about 0.15 mg to about 15 mg, e.g., between about 0.20 mg to about 15 mg, e.g., between about 0.20 mg to about 12.5 mg).

In some instances, the C1D1 is between about 0.0056 mg to about 12.50 mg (e.g., between about 0.0075 mg to about 12.50 mg, e.g., between about 0.0075 mg to about 12 mg, e.g., between about 0.0075 mg to about 10 mg, e.g., between about 0.0075 mg to about 8 mg, e.g., between about 0.010 mg to about 8 mg, e.g., between about 0.010 mg to about 7 mg, e.g., between about 0.010 mg to about 6 mg, e.g., between about 0.010 mg to about 5 mg, e.g., between about 0.010 mg to about 4 mg, e.g., between about 0.010 mg to about 3.5 mg, e.g., between about 0.015 mg to about 3.5 mg, e.g., between about 0.020 mg to about 3.5 mg, e.g., between about 0.020 mg to about 3.2 mg, e.g., about 1.6 mg) and the C1D2 is between about 0.0125 mg to about 19.44 mg (e.g., between about 0.0125 mg to about 17.5 mg, e.g., between about 0.0125 mg to about 15 mg, e.g., between about 0.020 mg to about 15 mg, e.g., between about 0.025 mg to about 15 mg, e.g., between about 0.030 mg to about 15 mg, e.g., between about 0.035 mg to about 15 mg, e.g., between about 0.040 mg to about 15 mg, e.g., between about 0.045 mg to about 15 mg, e.g., between about 0.050 mg to about 15 mg, e.g., between about 0.050 mg to about 12.5 mg, e.g., between about 0.050 mg to about 10 mg, e.g., between about 0.050 mg to about 7.5 mg, e.g., between about 0.050 mg to about 5 mg). In some instances, the C1D1 is between about 0.0056 mg to about 12.50 mg (e.g., between about 0.0075 mg to about 12.50 mg, e.g., between about 0.0075 mg to about 12 mg, e.g., between about 0.0075 mg to about 10 mg, e.g., between about 0.0075 mg to about 8 mg, e.g., between about 0.010 mg to about 8 mg, e.g., between about 0.010 mg to about 7 mg, e.g., between about 0.010 mg to about 6 mg, e.g., between about 0.010 mg to about 5 mg, e.g., between about 0.010 mg to about 4 mg, e.g., between about 0.010 mg to about 3.5 mg, e.g., between about 0.015 mg to about 3.5 mg, e.g., between about 0.020 mg to about 3.5 mg, e.g., between about 0.020 mg to about 3.2 mg, e.g., about 1.6 mg) and the C1D2 is between about 0.0500 mg to about 50 mg (e.g., between about 0.055 mg to about 50 mg, e.g., between about 0.055 mg to about 45 mg, e.g., between about 0.055 mg to about 40 mg, e.g., between about 0.055 mg to about 35 mg, e.g., between about 0.055 mg to about 30 mg, e.g., between about 0.10 mg to about 30 mg, e.g., between about 0.15 mg to about 30 mg, e.g., between about 0.15 mg to about 25 mg, e.g., between about 0.15 mg to about 20 mg, e.g., between about 0.15 mg to about 17.5 mg, e.g., between about 0.15 mg to about 15 mg, e.g., between about 0.20 mg to about 15 mg, e.g., between about 0.20 mg to about 12.8 mg, e.g., between about 0.20 mg to about 12.5 mg). In any of the above instances, the dosing regimen may comprise a first dosing cycle and, optionally, a second dosing cycle, wherein: (a) the first dosing cycle consists of a C1D1 and a C1D2 of the bispecific antibody, and optionally (b) the second dosing cycle comprises a C2D1 of the bispecific antibody. In any of the above instances, the dosing regimen may comprise at least a first dosing cycle and a second dosing cycle, wherein: (a) the first dosing cycle consists of a C1D1 and a C1D2 of the bispecific antibody, and (b) the second dosing cycle consists of a C2D1 of the bispecific antibody.

In some instances, the methods described above may include a first dosing cycle of three weeks or 21 days. In some instances, the methods may include administering to the subject the C1D1, the C1D2, and the C1D3 on or about Days 1, 8, and 15, respectively, of the first dosing cycle.

In some instances, the methods described above may include a second dosing cycle of three weeks or 21 days. In some instances, the methods may include administering to the subject the C2D1 on or about Day 1 of the second dosing cycle.

In some instances, the methods described above may include one or more additional dosing cycles. In some instances, the dosing regimen comprises 1 to 14 additional dosing cycles (e.g., 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, or 14 additional dosing cycles (i.e., the dosing regimen includes one or more of additional dosing cycle(s) C3, C4, C5, C6, C7, C8, C9, C10, C11, C12, C13, C14, C15, and C16). In 5 some instances, the dosing regimen comprises one to six additional dosing cycles (i.e., the dosing regimen includes one or more of additional dosing cycle(s) C3, C4, C5, C6, C7, and C8). In some embodiments, the length of each of the one or more additional dosing cycles is 7 days, 14 days, 21 days, or 28 days. In some instances, the length of each of the one or more additional dosing cycles is three weeks or 21 days. In some instances, each of the one or more additional dosing cycles comprises a 10 single dose of the bispecific antibody. In some instances, the method comprises administering to the subject the single dose of the one or more additional dosing cycles on or about Day 1 of the one or more additional dosing cycles.

In some instances, the bispecific antibody is administered subcutaneously to the subject. In this embodiment, the bispecific antibody is administered at a dose of between about 0.5 mg to about 40 mg. 15 In some embodiments, the bispecific antibody is administered at a dose of between about 1.0 to about 20 mg, between about 1.0 to about 10 mg, or between about 1.0 to about 5 mg. In one embodiment, the bispecific antibody is administered in a dose of 1.6 mg. Subsequent doses are administered in amounts equal to the initial subcutaneous dose.

In some instances, the bispecific anti-CD20/anti-CD3 antibody is administered to the subject as a 20 monotherapy.

In other instances, the bispecific anti-CD20/anti-CD3 antibody is administered to the subject in a combination therapy. For example, the bispecific anti-CD20/anti-CD3 antibody may be co-administered with one or more additional therapeutic agents. In one instance, the therapeutic agent is another antibody targeting CD20. In one instance, the bispecific anti-CD20/anti-CD3 antibody co-administered 25 with one or more antibodies targeting CD20 selected from the chimeric monoclonal CD20 antibody rituximab (RITUXAN®) or the monoclonal CD20 antibody obinutuzumab (GAZYVA®). In some instances, the bispecific anti-CD20/anti-CD3 antibody is co-administered with rituximab. In some instances, the bispecific anti-CD20/anti-CD3 antibody is co-administered with obinutuzumab. In some instances, the bispecific anti-CD20/anti-CD3 antibody is co-administered with obinutuzumab and rituximab. In other 30 instances, the bispecific anti-CD20/anti-CD3 antibody is co-administered with tocilizumab (ACTEMRA® / RoACTEMRA®).

In some instances, the methods described above include administering the bispecific anti-CD20/anti-CD3 antibody, with or without a CD20 monoclonal antibody, with a further chemotherapy agent and/or an antibody-drug conjugate (ADC). In some instances, the bispecific anti-CD20/anti-CD3 antibody 35 is co-administered with one or more additional chemotherapy agents selected from cyclophosphamide, doxorubicin, vincristine, and prednisolone (CHOP). In some instances, the bispecific anti-CD20/anti-CD3 antibody is co-administered with an ADC. In some instances, the bispecific anti-CD20/anti-CD3 antibody is co-administered with CHOP, wherein vincristine is replaced with an ADC. In some instances, the bispecific anti-CD20/anti-CD3 antibody is co-administered with an ADC selected from an anti-CD79b 40 antibody drug conjugate (such as anti-CD79b-MC-vc-PAB-MMAE or the anti-CD79b antibody drug

conjugate described in any one of U.S. 8,088,378 and/or US 2014/0030280, or polatuzumab vedotin), an anti-CD19 antibody drug conjugate, an anti-CD22 antibody drug conjugate, an anti-CD45 antibody drug conjugate, and an anti-CD32 drug conjugate.

In some instances, the therapeutic agent is a biological modifier. In one instance, the bispecific anti-CD20/anti-CD3 antibody is co-administered with one or more biological modifiers selected from a BCL-2 inhibitor (such as GDC-0199/ABT-199), lenalidomide (REVLIMID®), a PI3K-delta inhibitor (such as idelalisib (ZYDELIG®)), a PD-1 axis binding antagonist, an agonist, e.g., agonist antibody, directed against an activating co-stimulatory molecule, e.g., CD40, CD226, CD28, OX40 (e.g., AgonOX), GITR, CD137 (also known as TNFRSF9, 4-1BB, or ILA), CD27 (e.g., CDX-1127), HVEM, or CD127, an antagonist, e.g., antagonist antibody, directed against an inhibitory co-stimulatory molecule, e.g., CTLA-4 (also known as CD152), PD-1, TIM-3, BTLA, VISTA, LAG-3, B7-H3, B7-H4, IDO (e.g., 1-methyl-D-tryptophan (also known as 1-D-MT)), TIGIT, MICA/B, GITR (e.g., TRX518) or arginase, ipilimumab (also known as MDX-010, MDX-101, or YERVOY®), tremelimumab (also known as tictilimumab or CP-675,206, urelumab (also known as BMS-663513), MGA271, an antagonist directed against a TGF beta, e.g., metelimumab (also known as CAT-192), fresolimumab (also known as GC1008), LY2157299k, and an adoptive transfer of a T cell (e.g., a cytotoxic T cell or CTL) expressing a chimeric antigen receptor (CAR), e.g., adoptive transfer of a T cell comprising a dominant-negative TGF beta receptor, e.g., a dominant-negative TGF beta type II receptor.

In some instances, for example, the bispecific anti-CD20/anti-CD3 antibody is administered to the subject in a combination therapy that includes a PD-1 axis binding antagonist. The PD-1 axis binding antagonist may be administered prior to, subsequent to, and/or concurrently with the bispecific anti-CD20/anti-CD3 antibody. The PD-1 axis binding antagonist may, in some instances, be a PD-1 binding antagonist, a PD-L1 binding antagonist, or a PD-L2 binding antagonist.

In some instances, the PD-1 binding antagonist is an anti-PD-1 antibody. For example, in some particular instances, the anti-PD-L1 antibody is atezolizumab (CAS Registry Number: 1422185-06-5). Atezolizumab (Genentech) is also known as MPDL3280A.

Atezolizumab comprises: (a) an HVR-H1, HVR-H2, and HVR-H3 sequence of GFTFSDSWIH (SEQ ID NO: 33), AWISPYGGSTYYADSVKG (SEQ ID NO: 34) and RHWPGGF DY (SEQ ID NO: 35), respectively, and (b) an HVR-L1, HVR-L2, and HVR-L3 sequence of RASQDVSTAVA (SEQ ID NO: 36), SASFLYS (SEQ ID NO: 37) and QQYLYHPAT (SEQ ID NO: 38), respectively.

Atezolizumab comprises a heavy chain and a light chain sequence, wherein: (a) the heavy chain variable region sequence comprises the amino acid sequence: EVQLVESGGGLVQPGGSLRLSCAASGFTFSDSWIHWRQAPGKGLEWVAWISPYGGSTYYADSVKGRFTISADTSKNTAYLQMNSLRAEDTAVYYCARRHWPGGF DYWGQQGTLTVSS (SEQ ID NO: 39), and (b) the light chain variable region sequence comprises the amino acid sequence: DIQMTQSPSSLSASVGDRVTITCRASQDVSTAVAWYQQKPGKAPKLIYSASFLYSGVPSRFSGSGSGTDFTLTSSLQPEDFATYYCQQYL YHPATFGQGTKVEIKR (SEQ ID NO: 40).

Atezolizumab comprises a heavy chain and a light chain sequence, wherein: (a) the heavy chain comprises the amino acid sequence: 40 EVQLVESGGGLVQPGGSLRLSCAASGFTFSDSWIHWRQAPGKGLEWVAWISPYGGSTYYADSVKGRF

RGEC (SEQ ID NO: 42).

Accordingly, in some instances, the methods include administering the bispecific anti-CD20/anti-CD3 antibody, with or without a CD20 monoclonal antibody, with atezolizumab. In some instances, a dose of atezolizumab is administered concurrently with the C2D1 of the bispecific antibody on Day 1 of  
15 the second dosing cycle. In some instances, a first dose of atezolizumab is administered concurrently with the C2D1 of the bispecific antibody on Day 1 of the second dosing cycle (i.e., the subject is not administered atezolizumab in the context of the dosing regimen prior to its concurrent dosing with the C2D1 of the bispecific anti-CD20/anti-CD3 antibody). In some instances, the methods further include administering to the subject atezolizumab concurrently with the single dose of the bispecific anti-  
20 CD20/anti-CD3 antibody of the one or more additional dosing cycles on Day 1 of the one or more additional dosing cycles. In some instances, atezolizumab is only administered to the subject concurrently with the bispecific anti-CD20/anti-CD3 antibody. In any of the above instances, each dose of atezolizumab may be about 1200 mg.

Accordingly, in some instances, the invention provides a method of treating a subject having a  
25 cancer (e.g., a B cell proliferative disorder) comprising administering to the subject a bispecific antibody that binds to CD20 and CD3 in a dosing regimen comprising at least a first dosing cycle and a second dosing cycle, (a) the first dosing cycle comprising a first dose (C1D1), a second dose (C1D2), and a third dose (C1D3) of the bispecific antibody, wherein the C1D1 and the C1D2 are each no greater than the C1D3, and the C1D1 is between about 0.02 mg to about 4.0 mg (e.g., about 0.8 or 1.0 mg), the C1D2 is between about 0.05 mg to about 20.0 mg (e.g., about 1 mg or 2 mg), and the C1D3 is between about 0.2 mg to about 50.0 mg (e.g., between about 2 mg to about 10 mg, e.g., about 3.0 mg, 4.2 mg, or 6.0 mg), and (b) the second dosing cycle comprises a single dose (C2D1) of the bispecific antibody, wherein the C2D1 is approximately equal to or greater than the C1D3 and is between about 0.2 mg to about 50.0 mg (e.g., between about 2 mg to about 10 mg, e.g., about 3.0 mg, 4.2 mg, or 6.0 mg ), and wherein the  
30 length of each dosing cycle of the dosing regimen is 21 days; the C1D1, the C1D2, and the C1D3 is administered on or about Days 1, 8, and 15, respectively, of the first dosing cycle; the C2D1 of the bispecific antibody is administered concurrently with a first dose of about 1200 mg of atezolizumab on Day 1 of the second dosing cycle; and the dosing regimen optionally includes one to six additional dosing cycles, each 21 days in length, and each including a single dose of the bispecific antibody that is  
35 approximately equal to the C2D1, which is concurrently administered with a single dose of about 1200 mg  
40

of atezolizumab, on Day 1 of each of the one to six additional dosing cycles. Atezolizumab may only be administered to the subject concurrently with the bispecific anti-CD20/anti-CD3 antibody in the dosing regimen. In such instances, the method may include administration of one or more additional therapeutic agents in the context of the dosing regimen. For example, in a particular instance, the bispecific anti-

5 CD20/anti-CD3 antibody can be co-administered with obinutuzumab (GAZYVA®) or tocilizumab (ACTEMRA® / RoACTEMRA®), wherein the patient is first administered with obinutuzumab (GAZYVA®) or tocilizumab (ACTEMRA® / RoACTEMRA®) and then separately administered with the bispecific anti-CD20/anti-CD3 antibody (e.g., the patient is pre-treated with obinutuzumab (GAZYVA®) or tocilizumab (ACTEMRA® / RoACTEMRA®)).

10 In some instances, the PD-1 binding antagonist is another anti-PD-1 antibody, such as an anti-PD-1 antibody selected from the group consisting of MDX-1106 (nivolumab), MK-3475 (pembrolizumab), CT-011 (pidilizumab), MEDI-0680 (AMP-514), PDR001, REGN2810, and BGB-108. MDX-1106, also known as MDX- 1106-04, ONO-4538, BMS-936558, or nivolumab, is an anti-PD-1 antibody described in PCT Pub. No. WO 2006/121168. MK-3475, also known as pembrolizumab or lambrolizumab, is an anti-15 PD-1 antibody described in PCT Pub. No. WO 2009/114335. CT-011, also known as hBAT, hBAT-1 or pidilizumab, is an anti-PD-1 antibody described in PCT Pub. No. WO 2009/101611. In other instances, the PD-1 binding antagonist is an immunoadhesin (e.g., an immunoadhesin comprising an extracellular or PD-1 binding portion of PD-L1 or PD-L2 fused to a constant region (e.g., an Fc region of an immunoglobulin sequence). In other instances, the PD-1 binding antagonist is AMP-224. AMP-224, also 20 known as B7-DCIg, is a PD-L2-Fc fusion soluble receptor described in PCT Pub. Nos. WO 2010/027827 and WO 2011/066342.

In other instances, the anti-PD-L1 antibody is selected from YW243.55.S70, MDX-1105, and MEDI4736 (durvalumab), and MSB0010718C (avelumab). Antibody YW243.55.S70 is an anti-PD-L1 described in PCT Pub. No. WO 2010/077634. MDX-1105, also known as BMS-936559, is an anti-PD-L1 25 antibody described in PCT Pub. No. WO 2007/005874. MEDI4736 (durvalumab) is an anti-PD-L1 monoclonal antibody described in PCT Pub. No. WO 2011/066389 and U.S. Pub. No. 2013/034559. Examples of anti-PD-L1 antibodies useful for the methods of this invention, and methods for making thereof are described in PCT Pub. Nos. WO 2010/077634, WO 2007/005874, and WO 2011/066389, and also in U.S. Pat. No. 8,217,149, and U.S. Pub. No. 2013/034559, which are incorporated herein by 30 reference.

In other instances, the PD-L2 binding antagonist is an anti-PD-L2 antibody (e.g., a human, a humanized, or a chimeric anti-PD-L2 antibody). In some instances, the PD-L2 binding antagonist is an immunoadhesin.

In some instances, the bispecific anti-CD20/anti-CD3 antibody is co-administered with rituximab 35 and one or more chemotherapy agents. In one instance, the bispecific anti-CD20/anti-CD3 antibody is co-administered with rituximab and CHOP. In one instance, the bispecific anti-CD20/anti-CD3 antibody is co-administered with rituximab and an ADC. In one instance, the bispecific anti-CD20/anti-CD3 antibody is co-administered with rituximab and CHOP, wherein vincristine is replaced with an ADC. In one instance, the bispecific anti-CD20/anti-CD3 antibody is co-administered with an ADC selected from an 40 anti-CD79b antibody drug conjugate (such as anti-CD79b-MC-vc-PAB-MMAE or the anti-CD79b antibody

drug conjugate described in any one of U.S. 8,088,378 and/or US 2014/0030280, or polatuzumab vedotin), an anti-CD19 antibody drug conjugate, an anti-CD22 antibody drug conjugate, an anti-CD45 antibody drug conjugate, and an anti-CD32 drug conjugate.

In some instances, the bispecific anti-CD20/anti-CD3 antibody is co-administered with rituximab and one or more biological modifiers selected from a BCL-2 inhibitor (such as GDC-0199/ABT-199), lenalidomide (REVLIMID®), a PI3K-delta inhibitor (such as idelalisib (ZYDELIG®)), a PD-1 axis binding antagonist, an agonist, e.g., agonist antibody, directed against an activating co-stimulatory molecule, e.g., CD40, CD226, CD28, OX40 (e.g., AgonOX), GITR, CD137 (also known as TNFRSF9, 4-1BB, or ILA), CD27 (e.g., CDX-1127), HVEM, or CD127, an antagonist, e.g., antagonist antibody, directed against an inhibitory co-stimulatory molecule, e.g., CTLA-4 (also known as CD152), PD-1, TIM-3, BTLA, VISTA, LAG-3, B7-H3, B7-H4, IDO (e.g., 1-methyl-D-tryptophan (also known as 1-D-MT)), TIGIT, MICA/B, GITR (e.g., TRX518) or arginase, ipilimumab (also known as MDX-010, MDX-101, or YERVOY®), tremelimumab (also known as ticilimumab or CP-675,206, urelumab (also known as BMS-663513), MGA271, an antagonist directed against a TGF beta, e.g., metelimumab (also known as CAT-192), fresolimumab (also known as GC1008), LY2157299k, and an adoptive transfer of a T cell (e.g., a cytotoxic T cell or CTL) expressing a chimeric antigen receptor (CAR), e.g., adoptive transfer of a T cell comprising a dominant-negative TGF beta receptor, e.g., a dominant-negative TGF beta type II receptor.

In some instances, the bispecific anti-CD20/anti-CD3 antibody is co-administered with rituximab, one or more chemotherapy agents, and one or more biological modifiers selected from a BCL-2 inhibitor (such as GDC-0199/ABT-199), lenalidomide (REVLIMID®), a PI3K-delta inhibitor (such as idelalisib (ZYDELIG®)), a PD-1 axis binding antagonist, an agonist, e.g., agonist antibody, directed against an activating co-stimulatory molecule, e.g., CD40, CD226, CD28, OX40 (e.g., AgonOX), GITR, CD137 (also known as TNFRSF9, 4-1BB, or ILA), CD27 (e.g., CDX-1127), HVEM, or CD127, an antagonist, e.g., antagonist antibody, directed against an inhibitory co-stimulatory molecule, e.g., CTLA-4 (also known as CD152), PD-1, TIM-3, BTLA, VISTA, LAG-3, B7-H3, B7-H4, IDO (e.g., 1-methyl-D-tryptophan (also known as 1-D-MT)), TIGIT, MICA/B, GITR (e.g., TRX518) or arginase, ipilimumab (also known as MDX-010, MDX-101, or YERVOY®), tremelimumab (also known as ticilimumab or CP-675,206, urelumab (also known as BMS-663513), MGA271, an antagonist directed against a TGF beta, e.g., metelimumab (also known as CAT-192), fresolimumab (also known as GC1008), LY2157299k, and an adoptive transfer of a T cell (e.g., a cytotoxic T cell or CTL) expressing a chimeric antigen receptor (CAR), e.g., adoptive transfer of a T cell comprising a dominant-negative TGF beta receptor, e.g., a dominant-negative TGF beta type II receptor.

In some instances, the bispecific anti-CD20/anti-CD3 antibody is co-administered with rituximab, an ADC, and one or more biological modifiers selected from a BCL-2 inhibitor (such as GDC-0199/ABT-199), lenalidomide (REVLIMID®), a PI3K-delta inhibitor (such as idelalisib (ZYDELIG®)), a PD-1 axis binding antagonist, an agonist, e.g., agonist antibody, directed against an activating co-stimulatory molecule, e.g., CD40, CD226, CD28, OX40 (e.g., AgonOX), GITR, CD137 (also known as TNFRSF9, 4-1BB, or ILA), CD27 (e.g., CDX-1127), HVEM, or CD127, an antagonist, e.g., antagonist antibody, directed against an inhibitory co-stimulatory molecule, e.g., CTLA-4 (also known as CD152), PD-1, TIM-3, BTLA, VISTA, LAG-3, B7-H3, B7-H4, IDO (e.g., 1-methyl-D-tryptophan (also known as 1-D-MT)), TIGIT,

MICA/B, GITR (e.g., TRX518) or arginase, ipilimumab (also known as MDX-010, MDX-101, or YERVOY®), tremelimumab (also known as ticilimumab or CP-675,206, urelumab (also known as BMS-663513), MGA271, an antagonist directed against a TGF beta, e.g., metelimumab (also known as CAT-192), fresolimumab (also known as GC1008), LY2157299k, and an adoptive transfer of a T cell (e.g., a cytotoxic T cell or CTL) expressing a chimeric antigen receptor (CAR), e.g., adoptive transfer of a T cell comprising a dominant-negative TGF beta receptor, e.g., a dominant-negative TGF beta type II receptor.

5 In some instances, the bispecific anti-CD20/anti-CD3 antibody is co-administered with obinutuzumab and one or more chemotherapy agents. In one instance, the bispecific anti-CD20/anti-CD3 antibody is co-administered with obinutuzumab and CHOP. In one instance, the bispecific anti-CD20/anti-CD3 antibody is co-administered with obinutuzumab and an ADC. In one instance, the bispecific anti-CD20/anti-CD3 antibody is co-administered with obinutuzumab and CHOP, wherein vincristine is replaced with an ADC. In one instance, the bispecific anti-CD20/anti-CD3 antibody is co-administered with an ADC selected from an anti-CD79b antibody drug conjugate (such as anti-CD79b-MC-vc-PAB-MMAE or the anti-CD79b antibody drug conjugate described in any one of U.S. 8,088,378 and/or US 2014/0030280, or polatuzumab vedotin), an anti-CD19 antibody drug conjugate, an anti-CD22 antibody drug conjugate, an anti-CD45 antibody drug conjugate, and an anti-CD32 drug conjugate. In one instance, the bispecific anti-CD20/anti-CD3 antibody is co-administered with obinutuzumab and one or more biological modifiers selected from a BCL-2 inhibitor (such as GDC-0199/ABT-199), lenalidomide (REVLIMID®), a PI3K-delta inhibitor (such as idelalisib (ZYDELIG®)), a PD-1 axis binding antagonist, an agonist, e.g., agonist antibody, directed against an activating co-stimulatory molecule, e.g., CD40, CD226, CD28, OX40 (e.g., AgonOX), GITR, CD137 (also known as TNFRSF9, 4-1BB, or ILA), CD27 (e.g., CDX-1127), HVEM, or CD127, an antagonist, e.g., antagonist antibody, directed against an inhibitory co-stimulatory molecule, e.g., CTLA-4 (also known as CD152), PD-1, TIM-3, BTLA, VISTA, LAG-3, B7-H3, B7-H4, IDO (e.g., 1-methyl-D-tryptophan (also known as 1-D-MT)), TIGIT, MICA/B, GITR (e.g., TRX518) or arginase, ipilimumab (also known as MDX-010, MDX-101, or YERVOY®), tremelimumab (also known as ticilimumab or CP-675,206, urelumab (also known as BMS-663513), MGA271, an antagonist directed against a TGF beta, e.g., metelimumab (also known as CAT-192), fresolimumab (also known as GC1008), LY2157299k, and an adoptive transfer of a T cell (e.g., a cytotoxic T cell or CTL) expressing a chimeric antigen receptor (CAR), e.g., adoptive transfer of a T cell comprising a dominant-negative TGF beta receptor, e.g., a dominant-negative TGF beta type II receptor.

10 In some instances, the bispecific anti-CD20/anti-CD3 antibody is co-administered with obinutuzumab and one or more biological modifiers selected from a BCL-2 inhibitor (such as GDC-0199/ABT-199), lenalidomide (REVLIMID®), a PI3K-delta inhibitor (such as idelalisib (ZYDELIG®)), a PD-1 axis binding antagonist, an agonist, e.g., agonist antibody, directed against an activating co-20 stimulatory molecule, e.g., CD40, CD226, CD28, OX40 (e.g., AgonOX), GITR, CD137 (also known as TNFRSF9, 4-1BB, or ILA), CD27 (e.g., CDX-1127), HVEM, or CD127, an antagonist, e.g., antagonist antibody, directed against an inhibitory co-stimulatory molecule, e.g., CTLA-4 (also known as CD152), PD-1, TIM-3, BTLA, VISTA, LAG-3, B7-H3, B7-H4, IDO (e.g., 1-methyl-D-tryptophan (also known as 1-D-MT)), TIGIT, MICA/B, GITR (e.g., TRX518) or arginase, ipilimumab (also known as MDX-010, MDX-101, or YERVOY®), tremelimumab (also known as ticilimumab or CP-675,206, urelumab (also known as BMS-30

663513), MGA271, an antagonist directed against a TGF beta, e.g., metelimumab (also known as CAT-192), fresolimumab (also known as GC1008), LY2157299k, and an adoptive transfer of a T cell (e.g., a cytotoxic T cell or CTL) expressing a chimeric antigen receptor (CAR), e.g., adoptive transfer of a T cell comprising a dominant-negative TGF beta receptor, e.g., a dominant-negative TGF beta type II receptor.

5 In some instances, the additional therapy includes an alkylating agent. In one instance, the alkylating agent is 4-[bis(2-chloroethyl)amino]-1-methylbenzimidazol-2-yl]butanoic acid and salts thereof. In one instance, the alkylating agent is bendamustine.

10 In some instances, the additional therapy comprises a BCL-2 inhibitor. In one embodiment, the BCL-2 inhibitor is 4-(4-[(2-(4-chlorophenyl)-4,4-dimethylcyclohex-1-en-1-yl)methyl]piperazin-1-yl)-N-({3-nitro-4-[(tetrahydro-2H-pyran-4-ylmethyl)amino]phenyl}sulfonyl)-2-(1H-pyrrolo[2,3-b]pyridin-5-yl)oxy)benzamide and salts thereof. In one instance, the BCL-2 inhibitor is venetoclax (CAS#: 1257044-40-8).

15 In some instances, the additional therapy comprises a phosphoinositide 3-kinase (PI3K) inhibitor. In one instance, the PI3K inhibitor inhibits delta isoform PI3K (i.e., P110δ). In some instances, the PI3K inhibitor is 5-Fluoro-3-phenyl-2-[(1S)-1-(7H-purin-6-ylamino)propyl]-4(3H)-quinazolinone and salts thereof. In some instances, the PI3K inhibitor is idelalisib (CAS#: 870281-82-6). In one instance, the PI3K inhibitor inhibits alpha and delta isoforms of PI3K. In some instances, the PI3K inhibitor is 2-{3-[2-(1-Isopropyl-3-methyl-1H-1,2,4-triazol-5-yl)-5,6-dihydrobenzo[f]imidazo[1,2-d][1,4]oxazepin-9-yl]-1H-pyrazol-1-yl}-2-methylpropanamide and salts thereof.

20 In a further aspect of the invention, the additional therapy comprises a Bruton's tyrosine kinase (BTK) inhibitor. In one instance, the BTK inhibitor is 1-[(3R)-3-[4-Amino-3-(4-phenoxyphenyl)-1H-pyrazolo[3,4-d]pyrimidin-1-yl]piperidin-1-yl]prop-2-en-1-one and salts thereof. In one instance, the BTK inhibitor is ibrutinib (CAS#: 936563-96-1).

25 In some instances, the additional therapy comprises thalidomide or a derivative thereof. In one instance, the thalidomide or a derivative thereof is (RS)-3-(4-Amino-1-oxo-1,3-dihydro-2H-isoindol-2-yl)piperidine-2,6-dione and salts thereof. In one instance, the thalidomide or a derivative thereof is lenalidomide (CAS#: 191732-72-6).

30 In instances for which the methods described herein involve a combination therapy, such as a particular combination therapy noted above, the combination therapy encompasses the co-administration of the bispecific anti-CD20/anti-CD3 antibody with one or more additional therapeutic agents, and such co-administration may be combined administration (where two or more therapeutic agents are included in the same or separate formulations) or separate administration, in which case, administration of the anti-CD20/anti-CD3 bispecific antibody can occur prior to, simultaneously, and/or following, administration of the additional therapeutic agent or agents. In one embodiment, administration of the anti-CD20/anti-CD3 bispecific antibody and administration of an additional therapeutic agent or exposure to radiotherapy can occur within about one month, or within about one, two or three weeks, or within about one, two, three, four, five, or six days, of each other. In a particular instance, the bispecific anti-CD20/anti-CD3 antibody can be co-administered with obinutuzumab (GAZYVA®), wherein the patient is first administered with obinutuzumab (GAZYVA®) and then separately administered with the bispecific anti-CD20/anti-CD3 antibody (e.g., the patient is pre-treated with obinutuzumab (GAZYVA®)). In another particular instance,

the bispecific anti-CD20/anti-CD3 antibody can be co-administered with tocilizumab (ACTEMRA® / RoACTEMRA®), wherein the patient is first administered with tocilizumab (ACTEMRA® / RoACTEMRA®) and then separately administered with the bispecific anti-CD20/anti-CD3 antibody (e.g., the patient is pre-treated with tocilizumab (ACTEMRA® / RoACTEMRA®)).

5 Any of the methods of the invention described herein may be useful for treating cancer, such as hematologic cancer, including B cell proliferative disorders/malignancies. In particular, B cell proliferative disorders amenable to treatment with a bispecific anti-CD20/anti-CD3 antibody in accordance with the methods described herein include, without limitation, non-Hodgkin's lymphoma (NHL), including diffuse large B cell lymphoma (DLBCL), which may be relapsed or refractory DLBCL, as well as other cancers  
10 including germinal-center B cell-like (GCB) diffuse large B cell lymphoma (DLBCL), activated B cell-like (ABC) DLBCL, follicular lymphoma (FL), mantle cell lymphoma (MCL), acute myeloid leukemia (AML), chronic lymphoid leukemia (CLL), marginal zone lymphoma (MZL), small lymphocytic leukemia (SLL), lymphoplasmacytic lymphoma (LL), Waldenstrom macroglobulinemia (WM), central nervous system lymphoma (CNSL), Burkitt's lymphoma (BL), B cell prolymphocytic leukemia, splenic marginal zone  
15 lymphoma, hairy cell leukemia, splenic lymphoma/leukemia, unclassifiable, splenic diffuse red pulp small B cell lymphoma, hairy cell leukemia variant, Waldenström macroglobulinemia, heavy chain diseases,  $\alpha$  heavy chain disease,  $\gamma$  heavy chain disease,  $\mu$  heavy chain disease, plasma cell myeloma, solitary plasmacytoma of bone, extraosseous plasmacytoma, extranodal marginal zone lymphoma of mucosa-associated lymphoid tissue (MALT lymphoma), nodal marginal zone lymphoma, pediatric nodal marginal  
20 zone lymphoma, pediatric follicular lymphoma, primary cutaneous follicle centre lymphoma, T cell/histiocyte rich large B cell lymphoma, primary DLBCL of the CNS, primary cutaneous DLBCL, leg type, EBV-positive DLBCL of the elderly, DLBCL associated with chronic inflammation, lymphomatoid granulomatosis, primary mediastinal (thymic) large B cell lymphoma (PMLBCL), intravascular large B cell lymphoma, ALK-positive large B cell lymphoma, plasmablastic lymphoma, large B cell lymphoma arising  
25 in HHV8-associated multicentric Castleman disease, primary effusion lymphoma: B cell lymphoma, unclassifiable, with features intermediate between DLBCL and Burkitt lymphoma, and B cell lymphoma, unclassifiable, with features intermediate between DLBCL and classical Hodgkin's lymphoma. Further examples of B cell proliferative disorders include, but are not limited to, multiple myeloma (MM); low grade/follicular NHL; small lymphocytic (SL) NHL; intermediate grade/follicular NHL; intermediate grade  
30 diffuse NHL; high grade immunoblastic NHL; high grade lymphoblastic NHL; high grade small non-cleaved cell NHL; bulky disease NHL; AIDS-related lymphoma; and acute lymphoblastic leukemia (ALL); chronic myeloblastic leukemia; and post-transplant lymphoproliferative disorder (PTLD). In particular instances, the B cell proliferative disorder may be NHL (e.g., DLBCL (e.g., relapsed or refractory DLBCL), PMLBCL, or FL) or CLL.

35 The methods described herein may result in an improved benefit-risk profile for patients having cancer (e.g., a B cell proliferative disorder, e.g., NHL, (e.g., DLBCL (e.g., relapsed or refractory DLBCL), PMLBCL, or FL) or CLL) being treated with an anti-CD20/anti-CD3 bispecific antibody. In some instances, treatment using the methods described herein that result in administering the anti-CD20/anti-CD3 bispecific antibody in the context of a fractionated, dose-escalation dosing regimen results in a  
40 reduction (e.g., by 20% or greater, 25% or greater, 30% or greater, 35% or greater, 40% or greater, 45%

or greater, 50% or greater, 55% or greater, 60% or greater, 65% or greater, 70% or greater, 75% or greater, 80% or greater, 85% or greater, 90% or greater, 95% or greater, 96% or greater, 97% or greater, 98% or greater, or 99% or greater) or complete inhibition (100% reduction) of undesirable events, such as cytokine-driven toxicities (e.g., cytokine release syndrome (CRS)), infusion-related reactions (IRRs),

5 macrophage activation syndrome (MAS), neurologic toxicities, severe tumor lysis syndrome (TLS), neutropenia, thrombocytopenia, elevated liver enzymes, and/or central nervous system (CNS) toxicities, following treatment with an anti-CD20/anti-CD3 bispecific antibody using the fractionated, dose-escalation dosing regimen of the invention relative to treatment with an anti-CD20/anti-CD3 bispecific antibody using an non-fractionated dosing regimen.

10 The methods may involve administering the anti-CD20/anti-CD3 bispecific antibody (and/or any additional therapeutic agent) by any suitable means, including parenteral, intrapulmonary, and intranasal, and, if desired for local treatment, intralesional administration. Parenteral infusions include intravenous, subcutaneous, intramuscular, intraarterial, and intraperitoneal administration routes. In some 15 embodiments, the anti-CD20/anti-CD3 bispecific antibody is administered by intravenous infusion. In other instances, the anti-CD20/anti-CD3 bispecific antibody is administered subcutaneously. In some instances, the anti-CD20/anti-CD3 bispecific antibody administered by intravenous injection exhibits a less toxic response (i.e., fewer unwanted effects) in a patient than the same anti-CD20/anti-CD3 20 bispecific antibody administered by subcutaneous injection, or vice versa.

For all the methods described herein, the anti-CD20/anti-CD3 bispecific antibody would be 25 formulated, dosed, and administered in a fashion consistent with good medical practice. Factors for consideration in this context include the particular disorder being treated, the particular mammal being treated, the clinical condition of the individual patient, the cause of the disorder, the site of delivery of the agent, the method of administration, the scheduling of administration, and other factors known to medical practitioners. The anti-CD20/anti-CD3 bispecific antibody need not be, but is optionally formulated with, one or more agents currently used to prevent or treat the disorder in question. The effective amount of 30 such other agents depends on the amount of the anti-CD20/anti-CD3 bispecific antibody present in the formulation, the type of disorder or treatment, and other factors discussed above. The anti-CD20/anti-CD3 bispecific antibody may be suitably administered to the patient over a series of treatments.

In the event that the subject has an adverse cytokine release syndrome (CRS) event following 35 commencement of any of the methods described above, the methods may involve additional measures to treat the CRS event.

The National Cancer Institute (NCI) Common Terminology Criteria for Adverse Events (CTCAE) v4.0 includes a grading system for CRS, which was subsequently revised by Lee et al. (*Blood*. 124(2): 188-95, 2014) to define mild, moderate, severe, or life-threatening CRS regardless of the inciting agent. This revised CRS grading system is shown in Table 1 below.

**Table 1. CRS Grading System**

Grade	Toxicity
Grade 1	Symptoms are not life-threatening and require symptomatic treatment only, e.g., fever, nausea, fatigue, headache, myalgias, malaise
Grade 2	Symptoms require and respond to moderate intervention

	Oxygen requirement < 40% or Hypotension responsive to fluids or low dose of one vasopressor or Grade 2 organ toxicity
Grade 3	Symptoms require and respond to aggressive intervention Oxygen requirement $\geq$ 40% or Hypotension requiring high dose or multiple vasopressors or Grade 3 organ toxicity or grade 4 transaminitis
Grade 4	Life-threatening symptoms Requirement for ventilator support or Grade 4 organ toxicity (excluding transaminitis)
Grade 5	Death

As indicated in Table 1, CRS can result in significant disability or death if unsuccessfully managed. Current clinical management focuses on treating the individual signs and symptoms, providing supportive care, and attempting to dampen the inflammatory response using a high dose of corticosteroids. However, this approach is not always successful, especially in the case of late intervention. CRS observed in patients during the double-step fractionated, dose-escalation dosing regimen may be alternatively managed.

CRS is associated with elevations in a wide array of cytokines, including marked elevations in IFN $\gamma$ , IL-6, and TNF- $\alpha$  levels. Emerging evidence implicates IL-6, in particular, as a central mediator in CRS. IL-6 is a proinflammatory, multi-functional cytokine produced by a variety of cell types, which has been shown to be involved in a diverse array of physiological processes, including T cell activation. Regardless of the inciting agent, CRS is associated with high IL-6 levels (Nagorsen et al. *Cytokine*. 25(1): 31-5, 2004; Lee et al. *Blood*. 124(2): 188-95, 2014); Doesegger et al. *Clin. Transl. Immunology*. 4(7): e39, 2015), and IL-6 correlates with the severity of CRS, with patients who experience a grade 4 or 5 CRS event having much higher IL-6 levels compared to patients who do not experience CRS or experience milder CRS (grades 0-3) (Chen et al. *J. Immunol. Methods*. 434:1-8, 2016). Therefore, blocking the inflammatory action of IL-6 using an agent that inhibits IL-6-mediated signaling to manage CRS observed in patients during the double-step fractionated, dose-escalation dosing regimen is an alternative to steroid treatment that would not be expected to negatively impact T cell function or diminish the efficacy or clinical benefit of anti-CD20/anti-CD3 bispecific antibody therapy in the treatment of B cell proliferative disorders.

Tocilizumab (ACTEMRA® / RoACTEMRA®) is a recombinant, humanized, anti-human monoclonal antibody directed against soluble and membrane-bound IL-6R, which inhibits IL-6-mediated signaling (see, e.g., WO 1992/019579, which is incorporated herein by reference in its entirety).

If the subject has a cytokine release syndrome (CRS) event following administration of the bispecific antibody, the method may further involve administering to the subject an effective amount of an interleukin-6 receptor (IL-6R) antagonist (e.g., an anti-IL-6R antibody, e.g., tocilizumab (ACTEMRA® / RoACTEMRA®)) to manage the event. In some instances, tocilizumab is administered intravenously to the subject as a single dose of about 8 mg/kg. Other anti-IL-6R antibodies that could be used instead of, or in combination with, tocilizumab include sarilumab, vobalizumab (ALX-0061), SA-237, and variants thereof.

If the subject has a CRS event that does not resolve or worsens within 24 hours of administering the IL-6R antagonist to treat the symptoms of the CRS event, and the method may further comprise administering to the subject one or more additional doses of the IL-6R antagonist (e.g., an anti-IL-6R antibody, e.g., tocilizumab) to manage the CRS event. The subject may be administered a corticosteroid, 5 such as methylprednisolone or dexamethasone if CRS event is not managed through administration of the IL-6R antagonist.

Management of the CRS events may be tailored based on the Stage of the CRS and the presence of comorbidities. For example, if the subject has a grade 2 cytokine release syndrome (CRS) event in the absence of comorbidities or in the presence of minimal comorbidities following administration 10 of the bispecific antibody, the method may further include treating the symptoms of the grade 2 CRS event while suspending treatment with the bispecific antibody. If the grade 2 CRS event then resolves to a grade  $\leq$  1 CRS event for at least three consecutive days, the method may further include resuming treatment with the bispecific antibody without altering the dose. On the other hand, if the grade 2 CRS event does not resolve or worsens to a grade  $\geq$  3 CRS event within 24 hours of treating the symptoms of 15 the grade 2 CRS event, the method may further involve administering to the subject an effective amount of an interleukin-6 receptor (IL-6R) antagonist (e.g., an anti-IL-6R antibody, e.g., tocilizumab (ACTEMRA® / RoACTEMRA®)) to manage the grade 2 or grade  $\geq$  3 CRS event. In some instances, tocilizumab is administered intravenously to the subject as a single dose of about 8 mg/kg. Other anti-IL- 20 6R antibodies that could be used instead of, or in combination with, tocilizumab include sarilumab, vobarilizumab (ALX-0061), SA-237, and variants thereof.

If the subject has a grade 2 CRS event in the presence of extensive comorbidities following administration of the bispecific antibody, the method may further include administering to the subject a first dose of an IL-6R antagonist (e.g., an anti-IL-6R antibody, e.g., tocilizumab (ACTEMRA® / RoACTEMRA®)) to manage the grade 2 CRS event while suspending treatment with the bispecific 25 antibody. In some instances, the first dose of tocilizumab is administered intravenously to the subject at a dose of about 8 mg/kg. Other anti-IL-6R antibodies that could be used instead of, or in combination with, tocilizumab include sarilumab, vobarilizumab (ALX-0061), SA-237, and variants thereof. In some instances, if the grade 2 CRS event resolves to a grade  $\leq$  1 CRS event within two weeks, the method further includes resuming treatment with the bispecific antibody at a reduced dose. In some instances, 30 the reduced dose is the next highest cleared dose of the bispecific antibody in the first dosing cycle of a non-fractionated, dose-escalation dosing regimen. If, on the other hand, the grade 2 CRS event does not resolve or worsens to a grade  $\geq$  3 CRS event within 24 hours of treating the symptoms of the grade 2 CRS event, the method may further include administering to the subject one or more (e.g., one, two, three, four, or five or more) additional doses of an IL-6R antagonist (e.g., an anti-IL-6R antibody, e.g., 35 tocilizumab) to manage the grade 2 or grade  $\geq$  3 CRS event. In some particular instances, the grade 2 CRS event does not resolve or worsens to a grade  $\geq$  3 CRS event within 24 hours of treating the symptoms of the grade 2 CRS event, and the method may further include administering to the subject one or more additional doses of tocilizumab to manage the grade 2 or grade  $\geq$  3 CRS event. In some instances, the one or more additional doses of tocilizumab is administered intravenously to the subject at 40 a dose of about 1 mg/kg to about 15 mg/kg, e.g., about 4 mg/kg to about 10 mg/kg, e.g., about 6 mg/kg to

about 10 mg/kg, e.g., about 8 mg/kg. In some instances, the method further includes administering to the subject an effective amount of a corticosteroid. The corticosteroid may be administered before, after, or concurrently with the one or more additional doses of tocilizumab or other anti-IL-6R antibody. In some instances, the corticosteroid is administered intravenously to the subject. In some instances, the 5 corticosteroid is methylprednisolone. In some instances, the methylprednisolone is administered at a dose of about 1 mg/kg per day to about 5 mg/kg per day, e.g., about 2 mg/kg per day. In some instances, the corticosteroid is dexamethasone. In some instances, the dexamethasone is administered at a dose of about 10 mg (e.g., a single dose of about 10 mg intravenously).

If the subject has a grade 3 CRS event following administration of the bispecific antibody, the 10 method may further include administering to the subject a first dose of an IL-6R antagonist (e.g., an anti-IL-6R antibody, e.g., tocilizumab (ACTEMRA® / RoACTEMRA®)) to manage the grade 3 CRS event while suspending treatment with the bispecific antibody. In some instances, the first dose of tocilizumab is administered intravenously to the subject at a dose of about 8 mg/kg. Other anti-IL-6R antibodies that could be used instead of, or in combination with, tocilizumab include sarilumab, vobilizumab (ALX- 15 0061), SA-237, and variants thereof. In some instances, the grade 3 CRS event resolves to a grade ≤ 1 CRS event within two weeks, and the method further includes resuming treatment with the bispecific antibody at a reduced dose. In some instances, the reduced dose is the next highest cleared dose of the bispecific antibody in the first dosing cycle of a non-fractionated, dose-escalation dosing regimen. In other instances, if the grade 3 CRS event does not resolve or worsens to a grade 4 CRS event within 24 20 hours of treating the symptoms of the grade 3 CRS event, the method may further include administering to the subject one or more (e.g., one, two, three, four, or five or more) additional doses of an IL-6R antagonist (e.g., an anti-IL-6R antibody, e.g., tocilizumab) to manage the grade 3 or grade 4 CRS event. In some particular instances, the grade 3 CRS event does not resolve or worsens to a grade 4 CRS event within 24 hours of treating the symptoms of the grade 3 CRS event, and the method further includes 25 administering to the subject one or more additional doses of tocilizumab to manage the grade 3 or grade 4 CRS event. In some instances, the one or more additional doses of tocilizumab is administered intravenously to the subject at a dose of about 1 mg/kg to about 15 mg/kg, e.g., about 4 mg/kg to about 10 mg/kg, e.g., about 6 mg/kg to about 10 mg/kg, e.g., about 8 mg/kg. In some instances, the method further includes administering to the subject an effective amount of a corticosteroid. The corticosteroid 30 may be administered before, after, or concurrently with the one or more additional doses of tocilizumab or other anti-IL-6R antibody. In some instances, the corticosteroid is administered intravenously to the subject. In some instances, the corticosteroid is methylprednisolone. In some instances, the methylprednisolone is administered at a dose of about 1 mg/kg per day to about 5 mg/kg per day, e.g., about 2 mg/kg per day. In some instances, the corticosteroid is dexamethasone. In some instances, the 35 dexamethasone is administered at a dose of about 10 mg (e.g., a single dose of about 10 mg intravenously).

If the subject has a grade 4 CRS event following administration of the bispecific antibody, the method may further include administering to the subject a first dose of an IL-6R antagonist (e.g., an anti-IL-6R antibody, e.g., tocilizumab (ACTEMRA® / RoACTEMRA®)) to manage the grade 4 CRS event and 40 permanently discontinuing treatment with the bispecific antibody. In some instances, the first dose of

tocilizumab is administered intravenously to the subject at a dose of about 8 mg/kg. Other anti-IL-6R antibodies that could be used instead of, or in combination with, tocilizumab include sarilumab, vobarilizumab (ALX-0061), SA-237, and variants thereof. The grade 4 CRS event, in some instances, may resolve within 24 of treating the symptoms of the grade 4 CRS event. In other instances, if the grade 5 4 CRS event does not resolve within 24 hours of treating the symptoms of the grade 4 CRS event, the method may further include administering to the subject one or more additional doses of an IL-6R antagonist (e.g., an anti-IL-6R antibody, e.g., tocilizumab (ACTEMRA® / RoACTEMRA®)) to manage the grade 4 CRS event. In some particular instances, the grade 4 CRS event does not resolve within 24 hours of treating the symptoms of the grade 4 CRS event, and the method further includes administering 10 to the subject one or more (e.g., one, two, three, four, or five or more) additional doses of tocilizumab to manage the grade 4 CRS event. In some instances, the one or more additional doses of tocilizumab is administered intravenously to the subject at a dose of about 1 mg/kg to about 15 mg/kg, e.g., about 4 mg/kg to about 10 mg/kg, e.g., about 6 mg/kg to about 10 mg/kg, e.g., about 8 mg/kg. In some instances, the method further includes administering to the subject an effective amount of a corticosteroid. The 15 corticosteroid may be administered before, after, or concurrently with the one or more additional doses of tocilizumab or other anti-IL-6R antibody. In some instances, the corticosteroid is administered intravenously to the subject. In some instances, the corticosteroid is methylprednisolone. In some instances, the methylprednisolone is administered at a dose of about 1 mg/kg per day to about 5 mg/kg per day, e.g., about 2 mg/kg per day. In some instances, the corticosteroid is dexamethasone. In some 20 instances, the dexamethasone is administered at a dose of about 10 mg (e.g., a single dose of about 10 mg intravenously).

#### A. Anti-CD20/Anti-CD3 Bispecific Antibodies

The methods described herein include administering to a subject having cancer (e.g., a B cell 25 proliferative disorder, e.g., non-Hodgkin's lymphoma (NHL), e.g., diffuse large B-cell lymphoma (DLBCL), e.g., relapsed or refractory DLBCL) a bispecific antibody that binds to CD20 and CD3 (i.e., an anti-CD20/anti-CD3 antibody).

In some instances, any of the methods described herein may include administering a bispecific antibody that includes an anti-CD20 arm having a first binding domain comprising at least one, two, three, 30 four, five, or six hypervariable regions (HVRs) selected from (a) an HVR-H1 comprising the amino acid sequence of GYTFTSYNMH (SEQ ID NO: 1); (b) an HVR-H2 comprising the amino acid sequence of AIYPGNGDTSYNQKFKG (SEQ ID NO: 2); (c) an HVR-H3 comprising the amino acid sequence of VVYYNSYWYFDV (SEQ ID NO:3); (d) an HVR-L1 comprising the amino acid sequence of RASSSVSYMH (SEQ ID NO: 4); (e) an HVR-L2 comprising the amino acid sequence of APSNLAS (SEQ 35 ID NO: 5); and (f) an HVR-L3 comprising the amino acid sequence of QQWSFNPPT (SEQ ID NO: 6). In some instances, the anti-CD20/anti-CD3 bispecific antibody comprises at least one (e.g., 1, 2, 3, or 4) of heavy chain framework regions FR-H1, FR-H2, FR-H3, and FR-H4 comprising the sequences of SEQ ID NOs: 17-20, respectively, and/or at least one (e.g., 1, 2, 3, or 4) of the light chain framework regions FR-L1, FR-L2, FR-L3, and FR-L4 comprising the sequences of SEQ ID NOs: 21-24, respectively. In some 40 instances, the bispecific antibody comprises an anti-CD20 arm comprising a first binding domain

comprising (a) a heavy chain variable (VH) domain comprising an amino acid sequence having at least 90% sequence identity (e.g., at least 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% sequence identity) to, or the sequence of, SEQ ID NO: 7; (b) a light chain variable (VL) domain comprising an amino acid sequence having at least 90% sequence identity (e.g., at least 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% sequence identity) to, or the sequence of, SEQ ID NO: 8; or (c) a VH domain as in (a) and a VL domain as in (b). Accordingly, in some instances, the first binding domain comprises a VH domain comprising an amino acid sequence of SEQ ID NO: 7 and a VL domain comprising an amino acid sequence of SEQ ID NO: 8.

5 In some instances, any of the methods described herein may include administering a bispecific antibody that includes an anti-CD3 arm having a second binding domain comprising at least one, two, three, four, five, or six HVRs selected from (a) an HVR-H1 comprising the amino acid sequence of NYYIH (SEQ ID NO: 9); (b) an HVR-H2 comprising the amino acid sequence of WIYPGDGNTKYNEKFKG (SEQ ID NO: 10); (c) an HVR-H3 comprising the amino acid sequence of DSYSNYYFDY (SEQ ID NO: 11); (d) an HVR-L1 comprising the amino acid sequence of KSSQSLNSRTRKNYLA (SEQ ID NO: 12); (e) an HVR-L2 comprising the amino acid sequence of WASTRES (SEQ ID NO: 13); and (f) an HVR-L3 comprising the amino acid sequence of TQSFILRT (SEQ ID NO: 14). In some instances, the anti-CD20/anti-CD3 bispecific antibody comprises at least one (e.g., 1, 2, 3, or 4) of heavy chain framework regions FR-H1, FR-H2, FR-H3, and FR-H4 comprising the sequences of SEQ ID NOs: 25-28, respectively, and/or at least one (e.g., 1, 2, 3, or 4) of the light chain framework regions FR-L1, FR-L2, 10 FR-L3, and FR-L4 comprising the sequences of SEQ ID NOs: 29-32, respectively. In some instances, the bispecific antibody comprises an anti-CD3 arm comprising a second binding domain comprising (a) a VH domain comprising an amino acid sequence having at least 90% sequence identity (e.g., at least 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% sequence identity) to, or the sequence of, SEQ ID NO: 15; (b) a VL domain comprising an amino acid sequence having at least 90% sequence identity (e.g., at least 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% sequence identity) to, or the sequence of, SEQ ID NO: 16; or (c) a VH domain as in (a) and a VL domain as in (b). Accordingly, in some instances, the second binding domain comprises a VH domain comprising an amino acid sequence of SEQ ID NO: 15 and a VL domain comprising an amino acid sequence of SEQ ID NO: 16.

15 In some instances, any of the methods described herein may include administering a bispecific antibody that includes (1) an anti-CD20 arm having a first binding domain comprising at least one, two, three, four, five, or six HVRs selected from (a) an HVR-H1 comprising the amino acid sequence of GYTFTSYNMH (SEQ ID NO: 1); (b) an HVR-H2 comprising the amino acid sequence of AIYPGNGDTSYNQKFKG (SEQ ID NO: 2); (c) an HVR-H3 comprising the amino acid sequence of VVYYSNSYWYFDV (SEQ ID NO: 3); (d) an HVR-L1 comprising the amino acid sequence of 20 RASSSVSYMH (SEQ ID NO: 4); (e) an HVR-L2 comprising the amino acid sequence of APSNLAS (SEQ ID NO: 5); and (f) an HVR-L3 comprising the amino acid sequence of QQWSFNPPT (SEQ ID NO: 6); and (2) an anti-CD3 arm having a second binding domain comprising at least one, two, three, four, five, or six HVRs selected from (a) an HVR-H1 comprising the amino acid sequence of NYYIH (SEQ ID NO: 9); (b) an HVR-H2 comprising the amino acid sequence of WIYPGDGNTKYNEKFKG (SEQ ID NO: 10); (c) an HVR-H3 comprising the amino acid sequence of DSYSNYYFDY (SEQ ID NO: 11); (d) an HVR-L1 25

comprising the amino acid sequence of KSSQSLLNSRTRKNYLA (SEQ ID NO: 12); (e) an HVR-L2 comprising the amino acid sequence of WASTRES (SEQ ID NO: 13); and (f) an HVR-L3 comprising the amino acid sequence of TQSFLILRT (SEQ ID NO: 14). In some instances, the anti-CD20/anti-CD3 bispecific antibody comprises (1) at least one (e.g., 1, 2, 3, or 4) of heavy chain framework regions FR-5 H1, FR-H2, FR-H3, and FR-H4 comprising the sequences of SEQ ID NOs: 17-20, respectively, and/or at least one (e.g., 1, 2, 3, or 4) of the light chain framework regions FR-L1, FR-L2, FR-L3, and FR-L4 comprising the sequences of SEQ ID NOs: 21-24, respectively, and (2) at least one (e.g., 1, 2, 3, or 4) of heavy chain framework regions FR-H1, FR-H2, FR-H3, and FR-H4 comprising the sequences of SEQ ID NOs: 25-28, respectively, and/or at least one (e.g., 1, 2, 3, or 4) of the light chain framework regions FR-10 L1, FR-L2, FR-L3, and FR-L4 comprising the sequences of SEQ ID NOs: 29-32, respectively. In some instances, the anti-CD20/anti-CD3 bispecific antibody comprises (1) an anti-CD20 arm comprising a first binding domain comprising (a) a VH domain comprising an amino acid sequence having at least 90% sequence identity (e.g., at least 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% sequence identity) to, or the sequence of, SEQ ID NO: 7; (b) a VL domain comprising an amino acid sequence having at 15 least 90% sequence identity (e.g., at least 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% sequence identity) to, or the sequence of, SEQ ID NO: 8; or (c) a VH domain as in (a) and a VL domain as in (b), and (2) an anti-CD3 arm comprising a second binding domain comprising (a) a VH domain comprising an amino acid sequence having at least 90% sequence identity (e.g., at least 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% sequence identity) to, or the sequence of, SEQ ID NO: 15; (b) a VL 20 domain comprising an amino acid sequence having at least 90% sequence identity (e.g., at least 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% sequence identity) to, or the sequence of, SEQ ID NO: 16; or (c) a VH domain as in (a) and a VL domain as in (b). In some instances, the anti-CD20/anti-CD3 bispecific antibody comprises (1) a first binding domain comprising a VH domain comprising an amino acid sequence of SEQ ID NO: 7 and a VL domain comprising an amino acid sequence of SEQ ID NO: 8 25 and (2) a second binding domain comprising a VH domain comprising an amino acid sequence of SEQ ID NO: 15 and a VL domain comprising an amino acid sequence of SEQ ID NO: 16.

The anti-CD20/anti-CD3 bispecific antibody may be produced using recombinant methods and compositions, for example, as described in U.S. Patent No. 4,816,567.

In some instances, the anti-CD20/anti-CD3 bispecific antibody according to any of the above 30 embodiments described above may incorporate any of the features, singly or in combination, as described in Sections 1-5 below.

### 1. Antibody Affinity

In certain embodiments, the bispecific antibody provided herein has a dissociation constant (Kd) 35 of  $\leq 1\mu\text{M}$ ,  $\leq 100\text{ nM}$ ,  $\leq 10\text{ nM}$ ,  $\leq 1\text{ nM}$ ,  $\leq 0.1\text{ nM}$ ,  $\leq 0.01\text{ nM}$ , or  $\leq 0.001\text{ nM}$  (e.g.,  $10^{-8}\text{ M}$  or less, e.g., from  $10^{-8}\text{ M}$  to  $10^{-13}\text{ M}$ , e.g., from  $10^{-9}\text{ M}$  to  $10^{-13}\text{ M}$ ) with respect to CD20, CD3, or both.

In one embodiment, Kd is measured by a radiolabeled antigen binding assay (RIA). In one embodiment, an RIA is performed with the Fab version of an antibody of interest and its antigen. For example, solution binding affinity of Fabs for antigen is measured by equilibrating Fab with a minimal 40 concentration of ( $^{125}\text{I}$ )-labeled antigen in the presence of a titration series of unlabeled antigen, then

capturing bound antigen with an anti-Fab antibody-coated plate (see, e.g., Chen et al., *J. Mol. Biol.* 293:865-881(1999)). To establish conditions for the assay, MICROTITER® multi-well plates (Thermo Scientific) are coated overnight with 5 µg/ml of a capturing anti-Fab antibody (Cappel Labs) in 50 mM sodium carbonate (pH 9.6), and subsequently blocked with 2% (w/v) bovine serum albumin in PBS for 5 two to five hours at room temperature (approximately 23°C). In a non-adsorbent plate (Nunc #269620), 100 pM or 26 pM [<sup>125</sup>I]-antigen are mixed with serial dilutions of a Fab of interest (e.g., consistent with assessment of the anti-VEGF antibody, Fab-12, in Presta et al., *Cancer Res.* 57:4593-4599 (1997)). The Fab of interest is then incubated overnight; however, the incubation may continue for a longer period (e.g., about 65 hours) to ensure that equilibrium is reached. Thereafter, the mixtures are transferred to 10 the capture plate for incubation at room temperature (e.g., for one hour). The solution is then removed and the plate washed eight times with 0.1% polysorbate 20 (TWEEN-20®) in PBS. When the plates have dried, 150 µl/well of scintillant (MICROSCINT-20™; Packard) is added, and the plates are counted on a TOPCOUNT™ gamma counter (Packard) for ten minutes. Concentrations of each Fab that give less than or equal to 20% of maximal binding are chosen for use in competitive binding assays.

15 According to another embodiment, Kd is measured using a BIACORE® surface plasmon resonance assay. For example, an assay using a BIACORE®-2000 or a BIACORE®-3000 (BIAcore, Inc., Piscataway, NJ) is performed at 25°C with immobilized antigen CM5 chips at ~10 response units (RU). In one embodiment, carboxymethylated dextran biosensor chips (CM5, BIACORE, Inc.) are activated with *N*-ethyl-*N'*- (3-dimethylaminopropyl)-carbodiimide hydrochloride (EDC) and *N*-hydroxysuccinimide (NHS) 20 according to the supplier's instructions. Antigen is diluted with 10 mM sodium acetate, pH 4.8, to 5 µg/ml (~0.2 µM) before injection at a flow rate of 5 µl/minute to achieve approximately 10 response units (RU) of coupled protein. Following the injection of antigen, 1 M ethanolamine is injected to block unreacted groups. For kinetics measurements, two-fold serial dilutions of Fab (0.78 nM to 500 nM) are injected in PBS with 0.05% polysorbate 20 (TWEEN-20™) surfactant (PBST) at 25°C at a flow rate of approximately 25 µl/min. Association rates (k<sub>on</sub>) and dissociation rates (k<sub>off</sub>) are calculated using a simple one-to-one Langmuir binding model (BIACORE® Evaluation Software version 3.2) by simultaneously fitting the 25 association and dissociation sensorgrams. The equilibrium dissociation constant (Kd) is calculated as the ratio k<sub>off</sub>/k<sub>on</sub>. See, for example, Chen et al., *J. Mol. Biol.* 293:865-881 (1999). If the on-rate exceeds 10<sup>6</sup> M<sup>-1</sup>s<sup>-1</sup> by the surface plasmon resonance assay above, then the on-rate can be determined by using a 30 fluorescent quenching technique that measures the increase or decrease in fluorescence emission intensity (excitation = 295 nm; emission = 340 nm, 16 nm band-pass) at 25°C of a 20 nM anti-antigen antibody (Fab form) in PBS, pH 7.2, in the presence of increasing concentrations of antigen as measured in a spectrometer, such as a stop-flow equipped spectrophotometer (Aviv Instruments) or a 8000-series 35 SLM-AMINCO™ spectrophotometer (ThermoSpectronic) with a stirred cuvette.

35

## 2. Antibody Fragments

In certain embodiments, the anti-CD20/anti-CD3 bispecific antibody is an antibody fragment, e.g., an antibody fragment that binds to CD20 and CD3. Antibody fragments include, but are not limited to, Fab, Fab', Fab'-SH, F(ab')<sub>2</sub>, Fv, and scFv fragments, and other fragments described below. For a review 40 of certain antibody fragments, see Hudson et al. *Nat. Med.* 9:129-134 (2003). For a review of scFv

fragments, see, e.g., Pluckthün, in *The Pharmacology of Monoclonal Antibodies*, vol. 113, Rosenburg and Moore eds., (Springer-Verlag, New York), pp. 269-315 (1994); see also WO 93/16185; and U.S. Patent Nos. 5,571,894 and 5,587,458. For discussion of Fab and F(ab')<sub>2</sub> fragments comprising salvage receptor binding epitope residues and having increased *in vivo* half-life, see U.S. Patent No. 5,869,046.

5 Diabodies are antibody fragments with two antigen-binding sites that may be bivalent or bispecific. See, for example, EP 404,097; WO 1993/01161; Hudson et al. *Nat. Med.* 9:129-134 (2003); and Hollinger et al. *Proc. Natl. Acad. Sci. USA* 90: 6444-6448 (1993). Triabodies and tetrabodies are also described in Hudson et al. *Nat. Med.* 9:129-134 (2003).

10 Single-domain antibodies are antibody fragments comprising all or a portion of the heavy chain variable domain or all or a portion of the light chain variable domain of an antibody. In certain 15 embodiments, a single-domain antibody is a human single-domain antibody (Domantis, Inc., Waltham, MA; see, e.g., U.S. Patent No. 6,248,516 B1).

Antibody fragments can be made by various techniques, including but not limited to proteolytic digestion of an intact antibody as well as production by recombinant host cells (e.g. *E. coli* or phage), as 15 described herein.

### 3. Chimeric and Humanized Antibodies

In certain embodiments, an anti-CD20/anti-CD3 antibody for use in accordance with the methods described herein is a chimeric antibody. Certain chimeric antibodies are described, e.g., in U.S. Patent 20 No. 4,816,567; and Morrison et al. *Proc. Natl. Acad. Sci. USA*, 81:6851-6855 (1984)). In one example, a chimeric antibody comprises a non-human variable region (e.g., a variable region derived from a mouse, rat, hamster, rabbit, or non-human primate, such as a monkey) and a human constant region. In a further example, a chimeric antibody is a "class switched" antibody in which the class or subclass has been changed from that of the parent antibody. Chimeric antibodies include antigen-binding fragments thereof.

25 In certain embodiments, a chimeric antibody is a humanized antibody. Typically, a non-human antibody is humanized to reduce immunogenicity to humans, while retaining the specificity and affinity of the parental non-human antibody. Generally, a humanized antibody comprises one or more variable domains in which HVRs, e.g., CDRs, (or portions thereof) are derived from a non-human antibody, and 30 FRs (or portions thereof) are derived from human antibody sequences. A humanized antibody optionally will also comprise at least a portion of a human constant region. In some embodiments, some FR residues in a humanized antibody are substituted with corresponding residues from a non-human antibody (e.g., the antibody from which the HVR residues are derived), e.g., to restore or improve antibody specificity or affinity.

Humanized antibodies and methods of making them are reviewed, e.g., in Almagro and 35 Fransson, *Front. Biosci.* 13:1619-1633 (2008), and are further described, e.g., in Riechmann et al., *Nature* 332:323-329 (1988); Queen et al., *Proc. Natl. Acad. Sci. USA* 86:10029-10033 (1989); US Patent Nos. 5,821,337, 7,527,791, 6,982,321, and 7,087,409; Kashmiri et al., *Methods* 36:25-34 (2005) (describing specificity determining region (SDR) grafting); Padlan, *Mol. Immunol.* 28:489-498 (1991) (describing "resurfacing"); Dall'Acqua et al., *Methods* 36:43-60 (2005) (describing "FR shuffling"); and

Osbourn et al., *Methods* 36:61-68 (2005) and Klimka et al., *Br. J. Cancer*, 83:252-260 (2000) (describing the “guided selection” approach to FR shuffling).

Human framework regions that may be used for humanization include but are not limited to: framework regions selected using the “best-fit” method (see, e.g., Sims et al. *J. Immunol.* 151:2296 (1993)); framework regions derived from the consensus sequence of human antibodies of a particular subgroup of light or heavy chain variable regions (see, e.g., Carter et al. *Proc. Natl. Acad. Sci. USA*, 89:4285 (1992); and Presta et al. *J. Immunol.*, 151:2623 (1993)); human mature (somatically mutated) framework regions or human germline framework regions (see, e.g., Almagro and Fransson, *Front. Biosci.* 13:1619-1633 (2008)); and framework regions derived from screening FR libraries (see, e.g., Baca et al., *J. Biol. Chem.* 272:10678-10684 (1997) and Rosok et al., *J. Biol. Chem.* 271:22611-22618 (1996)).

#### 4. Knob-in-Hole Bispecific Antibody Engineering

The anti-CD20/anti-CD3 bispecific antibody may be prepared as a full-length antibody or an antibody fragment. Techniques for making bispecific antibodies include, but are not limited to, recombinant co-expression of two immunoglobulin heavy chain-light chain pairs having different specificities (see Milstein and Cuello, *Nature* 305: 537 (1983)), WO 93/08829, and Traunecker et al., *EMBO J.* 10: 3655 (1991)), and “knob-in-hole” engineering (see, e.g., U.S. Patent No. 5,731,168). “Knob-in-hole” engineering of bispecific antibodies may be utilized to generate a first arm containing a knob and a second arm containing the hole into which the knob of the first arm may bind. The knob of the bispecific antibodies may be on the anti-CD3 arm in one embodiment. Alternatively, the knob of the bispecific antibodies of the invention may on the anti-CD20 arm. The hole of the bispecific antibodies of the invention may be on the anti-CD3 arm in one embodiment. Alternatively, the hole of the bispecific antibodies of the invention may be on the anti-CD20 arm. In some instances, the anti-CD20/anti-CD3 bispecific antibody produced using knob-in-hole technology may comprise one or more heavy chain constant domains, wherein the one or more heavy chain constant domains are selected from a first CH1 ( $CH1_1$ ) domain, a first CH2 ( $CH2_1$ ) domain, a first CH3 ( $CH3_1$ ) domain, a second CH1 ( $CH1_2$ ) domain, second CH2 ( $CH2_2$ ) domain, and a second CH3 ( $CH3_2$ ) domain. In some instances, at least one of the one or more heavy chain constant domains is paired with another heavy chain constant domain. In some instances, the  $CH3_1$  and  $CH3_2$  domains each comprise a protuberance or cavity, and wherein the protuberance or cavity in the  $CH3_1$  domain is positionable in the cavity or protuberance, respectively, in the  $CH3_2$  domain. In some instances, the  $CH3_1$  and  $CH3_2$  domains meet at an interface between the protuberance and cavity. In some instances, the  $CH2_1$  and  $CH2_2$  domains each comprise a protuberance or cavity, and wherein the protuberance or cavity in the  $CH2_1$  domain is positionable in the cavity or protuberance, respectively, in the  $CH2_2$  domain. In some instances, the  $CH2_1$  and  $CH2_2$  domains meet at an interface between said protuberance and cavity.

Bispecific antibodies may also be engineered using immunoglobulin crossover (also known as Fab domain exchange or CrossMab format) technology (see eg., WO2009/080253; Schaefer et al., *Proc. Natl. Acad. Sci. USA*, 108:11187-11192 (2011)). Bispecific antibodies may also be made by engineering electrostatic steering effects for making antibody Fc-heterodimeric molecules (WO 2009/089004A1); cross-linking two or more antibodies or fragments (see, e.g., US Patent No. 4,676,980, and Brennan et

al., *Science*, 229: 81 (1985)); using leucine zippers to produce bispecific antibodies (see, e.g., Kostelny et al., *J. Immunol.*, 148(5):1547-1553 (1992)); using “diabody” technology for making bispecific antibody fragments (see, e.g., Hollinger et al., *Proc. Natl. Acad. Sci. USA*, 90:6444-6448 (1993)); and using single-chain Fv (sFv) dimers (see, e.g. Gruber et al., *J. Immunol.*, 152:5368 (1994)); and preparing trispecific antibodies as described, e.g., in Tutt et al. *J. Immunol.* 147: 60 (1991).

The anti-CD20/anti-CD3 bispecific antibodies, or antibody fragments thereof, may also include a “Dual Acting FAb” or “DAF” comprising an antigen binding site that binds to CD3 as well as CD20 (see, e.g., U.S. Pub. No. 2008/0069820).

10                   5. *Anti-CD20/Anti-CD3 Bispecific Antibody Variants*

In some instances, amino acid sequence variants of the anti-CD20/anti-CD3 bispecific antibodies described above are envisioned. For example, it may be desirable to improve the binding affinity and/or other biological properties of the bispecific antibody. Amino acid sequence variants of an antibody may be prepared by introducing appropriate modifications into the nucleotide sequence encoding the antibody, 15 or by peptide synthesis. Such modifications include, for example, deletions from, and/or insertions into and/or substitutions of residues within the amino acid sequences of the antibody. Any combination of deletion, insertion, and substitution can be made to arrive at the final construct, provided that the final construct possesses the desired characteristics, for example, antigen-binding.

20                   a. *Substitution, Insertion, and Deletion Variants*

In certain embodiments, antibody variants having one or more amino acid substitutions are provided. Sites of interest for substitutional mutagenesis include the HVRs and FRs. Conservative substitutions are shown in Table 2 under the heading of “preferred substitutions.” More substantial changes are provided in Table 2 under the heading of “exemplary substitutions,” and as further described 25 below in reference to amino acid side chain classes. Amino acid substitutions may be introduced into an antibody of interest and the products screened for a desired activity, for example, retained/improved antigen binding, decreased immunogenicity, or improved ADCC or CDC.

TABLE 2. Exemplary and Preferred Amino Acid Substitutions

Original Residue	Exemplary Substitutions	Preferred Substitutions
Ala (A)	Val; Leu; Ile	Val
Arg (R)	Lys; Gln; Asn	Lys
Asn (N)	Gln; His; Asp, Lys; Arg	Gln
Asp (D)	Glu; Asn	Glu
Cys (C)	Ser; Ala	Ser
Gln (Q)	Asn; Glu	Asn
Glu (E)	Asp; Gln	Asp
Gly (G)	Ala	Ala

Original Residue	Exemplary Substitutions	Preferred Substitutions
His (H)	Asn; Gln; Lys; Arg	Arg
Ile (I)	Leu; Val; Met; Ala; Phe; Norleucine	Leu
Leu (L)	Norleucine; Ile; Val; Met; Ala; Phe	Ile
Lys (K)	Arg; Gln; Asn	Arg
Met (M)	Leu; Phe; Ile	Leu
Phe (F)	Trp; Leu; Val; Ile; Ala; Tyr	Tyr
Pro (P)	Ala	Ala
Ser (S)	Thr	Thr
Thr (T)	Val; Ser	Ser
Trp (W)	Tyr; Phe	Tyr
Tyr (Y)	Trp; Phe; Thr; Ser	Phe
Val (V)	Ile; Leu; Met; Phe; Ala; Norleucine	Leu

Amino acids may be grouped according to common side-chain properties:

- (1) hydrophobic: Norleucine, Met, Ala, Val, Leu, Ile;
- (2) neutral hydrophilic: Cys, Ser, Thr, Asn, Gln;
- 5 (3) acidic: Asp, Glu;
- (4) basic: His, Lys, Arg;
- (5) residues that influence chain orientation: Gly, Pro;
- (6) aromatic: Trp, Tyr, Phe.

Non-conservative substitutions will entail exchanging a member of one of these classes for 10 another class.

One type of substitutional variant involves substituting one or more hypervariable region residues of a parent antibody (e.g. a humanized or human antibody). Generally, the resulting variant(s) selected for further study will have modifications (e.g., improvements) in certain biological properties (e.g., increased affinity, reduced immunogenicity) relative to the parent antibody and/or will have substantially 15 retained certain biological properties of the parent antibody. An exemplary substitutional variant is an affinity matured antibody, which may be conveniently generated, e.g., using phage display-based affinity maturation techniques such as those described herein. Briefly, one or more HVR residues are mutated and the variant antibodies displayed on phage and screened for a particular biological activity (e.g. binding affinity).

20 Alterations (e.g., substitutions) may be made in HVRs, e.g., to improve antibody affinity. Such alterations may be made in HVR "hotspots," i.e., residues encoded by codons that undergo mutation at high frequency during the somatic maturation process (see, e.g., Chowdhury, *Methods Mol. Biol.* 207:179-196 (2008)), and/or residues that contact antigen, with the resulting variant VH or VL being tested for binding affinity. Affinity maturation by constructing and reselecting from secondary libraries has

been described, e.g., in Hoogenboom et al. in *Methods in Molecular Biology* 178:1-37 (O'Brien et al., ed., Human Press, Totowa, NJ, (2001).) In some embodiments of affinity maturation, diversity is introduced into the variable genes chosen for maturation by any of a variety of methods (e.g., error-prone PCR, chain shuffling, or oligonucleotide-directed mutagenesis). A secondary library is then created. The library 5 is then screened to identify any antibody variants with the desired affinity. Another method to introduce diversity involves HVR-directed approaches, in which several HVR residues (e.g., 4-6 residues at a time) are randomized. HVR residues involved in antigen binding may be specifically identified, e.g., using alanine scanning mutagenesis or modeling. CDR-H3 and CDR-L3 in particular are often targeted.

In certain embodiments, substitutions, insertions, or deletions may occur within one or more 10 HVRs so long as such alterations do not substantially reduce the ability of the antibody to bind antigen. For example, conservative alterations (e.g., conservative substitutions as provided herein) that do not substantially reduce binding affinity may be made in HVRs. Such alterations may, for example, be 15 outside of antigen contacting residues in the HVRs. In certain embodiments of the variant VH and VL sequences provided above, each HVR either is unaltered, or contains no more than one, two or three amino acid substitutions.

A useful method for identification of residues or regions of an antibody that may be targeted for 20 mutagenesis is called "alanine scanning mutagenesis" as described by Cunningham and Wells (1989) *Science*, 244:1081-1085. In this method, a residue or group of target residues (e.g., charged residues such as Arg, Asp, His, Lys, and Glu) are identified and replaced by a neutral or negatively charged amino 25 acid (e.g., alanine or polyalanine) to determine whether the interaction of the antibody with antigen is affected. Further substitutions may be introduced at the amino acid locations demonstrating functional sensitivity to the initial substitutions. Alternatively, or additionally, a crystal structure of an antigen- antibody complex to identify contact points between the antibody and antigen. Such contact residues and neighboring residues may be targeted or eliminated as candidates for substitution. Variants may be screened to determine whether they contain the desired properties.

Amino acid sequence insertions include amino- and/or carboxyl-terminal fusions ranging in length 30 from one residue to polypeptides containing a hundred or more residues, as well as intrasequence insertions of single or multiple amino acid residues. Examples of terminal insertions include an antibody with an N-terminal methionyl residue. Other insertional variants of the antibody molecule include the fusion to the N- or C-terminus of the antibody to an enzyme (e.g. for ADEPT) or a polypeptide which increases the serum half-life of the antibody.

*b. Glycosylation variants*

In some instances, the methods of the invention involve administering to the subject in the 35 context of a fractionated, dose-escalation dosing regimen an anti-CD20/anti-CD3 bispecific antibody variant that has been modified to increase or decrease the extent to which the bispecific antibody is glycosylated. Addition or deletion of glycosylation sites to anti-CD20/anti-CD3 antibody of the invention may be conveniently accomplished by altering the amino acid sequence such that one or more glycosylation sites is created or removed.

Where the bispecific antibody comprises an Fc region, the carbohydrate attached thereto may be altered. Native antibodies produced by mammalian cells typically comprise a branched, biantennary oligosaccharide that is generally attached by an N-linkage to Asn297 of the CH2 domain of the Fc region. See, e.g., Wright et al. *TIBTECH* 15:26-32 (1997). The oligosaccharide may include various 5 carbohydrates, e.g., mannose, N-acetyl glucosamine (GlcNAc), galactose, and sialic acid, as well as a fucose attached to a GlcNAc in the "stem" of the biantennary oligosaccharide structure. In some embodiments, modifications of the oligosaccharide in an antibody of the invention may be made in order to create antibody variants with certain improved properties.

In some instances, the methods involve administering an anti-CD20/anti-CD3 bispecific antibody 10 variant having a carbohydrate structure that lacks fucose attached (directly or indirectly) to an Fc region. For example, the amount of fucose in such antibody may be from 1% to 80%, from 1% to 65%, from 5% to 65% or from 20% to 40%. The amount of fucose is determined by calculating the average amount of fucose within the sugar chain at Asn297, relative to the sum of all glycostructures attached to Asn 297 (e.g. complex, hybrid and high mannose structures) as measured by MALDI-TOF mass spectrometry, as 15 described in WO 2008/077546, for example. Asn297 refers to the asparagine residue located at about position 297 in the Fc region (EU numbering of Fc region residues); however, Asn297 may also be located about  $\pm$  3 amino acids upstream or downstream of position 297, i.e., between positions 294 and 300, due to minor sequence variations in antibodies. Such fucosylation variants may have improved 20 ADCC function. See, e.g., US Patent Publication Nos. US 2003/0157108 (Presta, L.); US 2004/0093621 (Kyowa Hakko Kogyo Co., Ltd). Examples of publications related to "defucosylated" or "fucose-deficient" 25 antibody variants include: US 2003/0157108; WO 2000/61739; WO 2001/29246; US 2003/0115614; US 2002/0164328; US 2004/0093621; US 2004/0132140; US 2004/0110704; US 2004/0110282; US 2004/0109865; WO 2003/085119; WO 2003/084570; WO 2005/035586; WO 2005/035778; WO2005/053742; WO2002/031140; Okazaki et al. *J. Mol. Biol.* 336:1239-1249 (2004); Yamane-Ohnuki 30 et al. *Biotech. Bioeng.* 87: 614 (2004). Examples of cell lines capable of producing defucosylated antibodies include Lec13 CHO cells deficient in protein fucosylation (Ripka et al. *Arch. Biochem. Biophys.* 249:533-545 (1986); US Pat Appl No US 2003/0157108 A1, Presta, L; and WO 2004/056312 A1, Adams et al., especially at Example 11), and knockout cell lines, such as alpha-1,6-fucosyltransferase gene, *FUT8*, knockout CHO cells (see, e.g., Yamane-Ohnuki et al. *Biotech. Bioeng.* 87: 614 (2004); Kanda, Y. et al., *Biotechnol. Bioeng.*, 94(4):680-688 (2006); and WO2003/085107).

In view of the above, in some instances, the methods of the invention involve administering to the subject in the context of a fractionated, dose-escalation dosing regimen an anti-CD20/anti-CD3 bispecific antibody variant that comprises an aglycosylation site mutation. In some instances, the aglycosylation site mutation reduces effector function of the bispecific antibody. In some instances, the aglycosylation 35 site mutation is a substitution mutation. In some instances, the bispecific antibody comprises a substitution mutation in the Fc region that reduces effector function. In some instances, the substitution mutation is at amino acid residue N297, L234, L235, and/or D265 (EU numbering). In some instances, the substitution mutation is selected from the group consisting of N297G, N297A, L234A, L235A, D265A, and P329G. In some instances, the substitution mutation is at amino acid residue N297. In a preferred 40 embodiment, the substitution mutation is N297A.

In other instances, bispecific antibody variants with bisected oligosaccharides are used in accordance with the methods of the invention, for example, in which a biantennary oligosaccharide attached to the Fc region of the antibody is bisected by GlcNAc. Such antibody variants may have reduced fucosylation and/or improved ADCC function. Examples of such antibody variants are described, 5 e.g., in WO 2003/011878 (Jean-Mairet et al.); US Patent No. 6,602,684 (Umana et al.); and US 2005/0123546 (Umana et al.). Antibody variants with at least one galactose residue in the oligosaccharide attached to the Fc region are also provided. Such antibody variants may have improved 10 CDC function. Such antibody variants are described, e.g., in WO 1997/30087 (Patel et al.); WO 1998/58964 (Raju, S.); and WO 1999/22764 (Raju, S.).

10

c. *Fc region variants*

In some instances, an anti-CD20/anti-CD3 bispecific antibody variant that has one or more amino acid modifications introduced into the Fc region (i.e., an Fc region variant (see e.g., US 2012/0251531)) of the bispecific antibody may be administered to a subject having cancer (e.g., a B cell proliferation 15 disorder) in accordance with the methods of the invention. The Fc region variant may comprise a human Fc region sequence (e.g., a human IgG1, IgG2, IgG3 or IgG4 Fc region) comprising an amino acid modification (e.g., a substitution) at one or more amino acid positions.

In some instances, the bispecific Fc region antibody variant possesses some but not all effector 20 functions, which makes it a desirable candidate for applications in which the half-life of the antibody *in vivo* is important yet certain effector functions (such as complement and ADCC) are unnecessary or deleterious. *In vitro* and/or *in vivo* cytotoxicity assays can be conducted to confirm the reduction/depletion 25 of CDC and/or ADCC activities. For example, Fc receptor (FcR) binding assays can be conducted to ensure that the antibody lacks Fc $\gamma$ R binding (hence likely lacking ADCC activity), but retains FcRn binding ability. The primary cells for mediating ADCC, NK cells, express Fc $\gamma$ RIII only, whereas monocytes 30 express Fc $\gamma$ RI, Fc $\gamma$ RII and Fc $\gamma$ RIII. FcR expression on hematopoietic cells is summarized in Table 3 on page 464 of Ravetch and Kinet, *Annu. Rev. Immunol.* 9:457-492 (1991). Non-limiting examples of *in vitro* assays to assess ADCC activity of a molecule of interest is described in U.S. Patent No. 5,500,362 (see, e.g. Hellstrom, I. et al. *Proc. Nat'l Acad. Sci. USA* 83:7059-7063 (1986)) and Hellstrom, I et al., *Proc. Nat'l Acad. Sci. USA* 82:1499-1502 (1985); 5,821,337 (see Bruggemann, M. et al., *J. Exp. Med.* 166:1351-35 35 1361 (1987)). Alternatively, non-radioactive assays methods may be employed (see, for example, ACTI™ non-radioactive cytotoxicity assay for flow cytometry (CellTechnology, Inc. Mountain View, CA; and CytoTox 96® non-radioactive cytotoxicity assay (Promega, Madison, WI)). Useful effector cells for such assays include peripheral blood mononuclear cells (PBMC) and Natural Killer (NK) cells. Alternatively, or additionally, ADCC activity of the molecule of interest may be assessed *in vivo*, e.g., in a 40 animal model such as that disclosed in Clynes et al. *Proc. Nat'l Acad. Sci. USA* 95:652-656 (1998). C1q binding assays may also be carried out to confirm that the antibody is unable to bind C1q and hence lacks CDC activity. See, e.g., C1q and C3c binding ELISA in WO 2006/029879 and WO 2005/100402. To assess complement activation, a CDC assay may be performed (see, for example, Gazzano-Santoro et al. *J. Immunol. Methods* 202:163 (1996); Cragg, M.S. et al. *Blood*. 101:1045-1052 (2003); and Cragg, M.S. and M.J. Glennie *Blood*. 103:2738-2743 (2004)). FcRn binding and *in vivo* clearance/half life

determinations can also be performed using methods known in the art (see, e.g., Petkova, S.B. et al. *Int'l. Immunol.* 18(12):1759-1769 (2006)).

Antibodies with reduced effector function include those with substitution of one or more of Fc region residues 238, 265, 269, 270, 297, 327 and 329 (U.S. Patent Nos. 6,737,056 and 8,219,149). Such Fc mutants include Fc mutants with substitutions at two or more of amino acid positions 265, 269, 270, 297 and 327, including the so-called "DANA" Fc mutant with substitution of residues 265 and 297 to alanine (US Patent No. 7,332,581 and 8,219,149).

In certain instances, the proline at position 329 of a wild-type human Fc region in the antibody is substituted with glycine or arginine or an amino acid residue large enough to destroy the proline sandwich within the Fc/Fcy receptor interface that is formed between the proline 329 of the Fc and tryptophan residues Trp 87 and Trp 110 of FcgRIII (Sondermann et al. *Nature*. 406, 267-273 (2000)). In certain embodiments, the bispecific antibody comprises at least one further amino acid substitution. In one embodiment, the further amino acid substitution is S228P, E233P, L234A, L235A, L235E, N297A, N297D, or P331S, and still in another embodiment the at least one further amino acid substitution is L234A and L235A of the human IgG1 Fc region or S228P and L235E of the human IgG4 Fc region (see e.g., US 2012/0251531), and still in another embodiment the at least one further amino acid substitution is L234A and L235A and P329G of the human IgG1 Fc region.

Certain antibody variants with improved or diminished binding to FcRs are described. (See, e.g., U.S. Patent No. 6,737,056; WO 2004/056312, and Shields et al., *J. Biol. Chem.* 9(2): 6591-6604 (2001).)

In certain instances, the anti-CD20/anti-CD3 bispecific antibody comprises an Fc region with one or more amino acid substitutions which improve ADCC, e.g., substitutions at positions 298, 333, and/or 334 of the Fc region (EU numbering of residues).

In some instances, alterations are made in the Fc region that result in altered (i.e., either improved or diminished) C1q binding and/or Complement Dependent Cytotoxicity (CDC), e.g., as described in US Patent No. 6,194,551, WO 99/51642, and Idusogie et al. *J. Immunol.* 164: 4178-4184 (2000).

Antibodies with increased half-lives and improved binding to the neonatal Fc receptor (FcRn), which is responsible for the transfer of maternal IgGs to the fetus (Guyer et al., *J. Immunol.* 117:587 (1976) and Kim et al., *J. Immunol.* 24:249 (1994)), are described in US2005/0014934A1 (Hinton et al.). Those antibodies comprise an Fc region with one or more substitutions therein which improve binding of the Fc region to FcRn. Such Fc variants include those with substitutions at one or more of Fc region residues: 238, 256, 265, 272, 286, 303, 305, 307, 311, 312, 317, 340, 356, 360, 362, 376, 378, 380, 382, 413, 424 or 434, e.g., substitution of Fc region residue 434 (US Patent No. 7,371,826).

See also Duncan & Winter, *Nature* 322:738-40 (1986); U.S. Patent No. 5,648,260; U.S. Patent No. 5,624,821; and WO 94/29351 concerning other examples of Fc region variants.

*d. Cysteine engineered antibody variants*

In certain embodiments, it may be desirable to create cysteine engineered anti-CD20/anti-CD3 bispecific antibodies, e.g., "thioMAbs," in which one or more residues of the bispecific antibody are substituted with cysteine residues. In particular embodiments, the substituted residues occur at

accessible sites of the antibody. By substituting those residues with cysteine, reactive thiol groups are thereby positioned at accessible sites of the bispecific antibody and may be used to conjugate the antibody to other moieties, such as drug moieties or linker-drug moieties, to create an immunoconjugate. In certain embodiments, any one or more of the following residues may be substituted with cysteine:

5 V205 (Kabat numbering) of the light chain; A118 (EU numbering) of the heavy chain; and S400 (EU numbering) of the heavy chain Fc region. Cysteine engineered antibodies may be generated as described, for example, in U.S. Patent No. 7,521,541.

10 Therefore, immunoconjugates of an anti-CD20/anti-CD3 bispecific antibody conjugated to one or more cytotoxic agents, such as chemotherapeutic agents or drugs, growth inhibitory agents, toxins (e.g., protein toxins, enzymatically active toxins of bacterial, fungal, plant, or animal origin, or fragments thereof), or radioactive isotopes, are specifically contemplated.

15 In some instances, an immunoconjugate is an antibody-drug conjugate (ADC) in which an bispecific antibody is conjugated to one or more drugs, including but not limited to a maytansinoid (see U.S. Patent Nos. 5,208,020, 5,416,064 and European Patent EP 0 425 235 B1); an auristatin such as monomethylauristatin drug moieties DE and DF (MMAE and MMAF) (see U.S. Patent Nos. 5,635,483 and 5,780,588, and 7,498,298); a dolastatin; a calicheamicin or derivative thereof (see U.S. Patent Nos. 5,712,374, 5,714,586, 5,739,116, 5,767,285, 5,770,701, 5,770,710, 5,773,001, and 5,877,296; Hinman et al., *Cancer Res.* 53:3336-3342 (1993); and Lode et al., *Cancer Res.* 58:2925-2928 (1998)); an anthracycline such as daunomycin or doxorubicin (see Kratz et al., *Current Med. Chem.* 13:477-523 (2006); Jeffrey et al., *Bioorganic & Med. Chem. Letters* 16:358-362 (2006); Torgov et al., *Bioconj. Chem.* 16:717-721 (2005); Nagy et al., *Proc. Natl. Acad. Sci. USA* 97:829-834 (2000); Dubowchik et al., *Bioorg. & Med. Chem. Letters* 12:1529-1532 (2002); King et al., *J. Med. Chem.* 45:4336-4343 (2002); and U.S. Patent No. 6,630,579); methotrexate; vindesine; a taxane such as docetaxel, paclitaxel, larotaxel, tesetaxel, and ortataxel; a trichothecene; and CC1065.

20 25 In some instances, an immunoconjugate comprises the bispecific antibody conjugated to an enzymatically active toxin or fragment thereof, including but not limited to diphtheria A chain, nonbinding active fragments of diphtheria toxin, exotoxin A chain (from *Pseudomonas aeruginosa*), ricin A chain, abrin A chain, modeccin A chain, alpha-sarcin, *Aleurites fordii* proteins, dianthin proteins, *Phytolaca americana* proteins (PAPI, PAPII, and PAP-S), *momordica charantia* inhibitor, curcin, crotin, sapaonaria officinalis inhibitor, gelonin, mitogellin, restrictocin, phenomycin, enomycin, and the trichothecenes.

30 35 In another embodiment, an immunoconjugate comprises an the bispecific antibody conjugated to a radioactive atom to form a radioconjugate. A variety of radioactive isotopes are available for the production of radioconjugates. Examples include At<sup>211</sup>, I<sup>131</sup>, I<sup>125</sup>, Y<sup>90</sup>, Re<sup>186</sup>, Re<sup>188</sup>, Sm<sup>153</sup>, Bi<sup>212</sup>, P<sup>32</sup>, Pb<sup>212</sup> and radioactive isotopes of Lu. When the radioconjugate is used for detection, it may comprise a radioactive atom for scintigraphic studies, for example Ic99m or I123, or a spin label for nuclear magnetic resonance (NMR) imaging (also known as magnetic resonance imaging, mri), such as iodine-123 again, iodine-131, indium-111, fluorine-19, carbon-13, nitrogen-15, oxygen-17, gadolinium, manganese or iron.

40 Conjugates of the anti-CD20/anti-CD3 bispecific antibody and a cytotoxic agent may be made using a variety of bifunctional protein coupling agents such as N-succinimidyl-3-(2-pyridyldithio) propionate (SPDP), succinimidyl-4-(N-maleimidomethyl) cyclohexane-1-carboxylate (SMCC),

iminothiolane (IT), bifunctional derivatives of imidoesters (such as dimethyl adipimidate HCl), active esters (such as disuccinimidyl suberate), aldehydes (such as glutaraldehyde), bis-azido compounds (such as bis-(p-azidobenzoyl) hexanediamine), bis-diazonium derivatives (such as bis-(p-diazoniumbenzoyl)-ethylenediamine), diisocyanates (such as toluene 2,6-diisocyanate), and bis-active fluorine compounds (such as 1,5-difluoro-2,4-dinitrobenzene). For example, a ricin immunotoxin can be prepared as described in Vitetta et al., *Science* 238:1098 (1987). Carbon-14-labeled 1-isothiocyanatobenzyl-3-methyldiethylene triaminepentaacetic acid (MX-DTPA) is an exemplary chelating agent for conjugation of radionucleotide to the antibody. See WO94/11026. The linker may be a "cleavable linker" facilitating release of a cytotoxic drug in the cell. For example, an acid-labile linker, peptidase-sensitive linker, photolabile linker, dimethyl linker or disulfide-containing linker (Chari et al., *Cancer Res.* 52:127-131 (1992); U.S. Patent No. 5,208,020) may be used.

The immunoconjugates or ADCs herein expressly contemplate, but are not limited to such conjugates prepared with cross-linker reagents including, but not limited to, BMPS, EMCS, GMBS, HBVS, LC-SMCC, MBS, MPBH, SBAP, SIA, SIAB, SMCC, SMPB, SMPH, sulfo-EMCS, sulfo-GMBS, sulfo-KMUS, sulfo-MBS, sulfo-SIAB, sulfo-SMCC, and sulfo-SMPB, and SVSB (succinimidyl-(4-vinylsulfone)benzoate), which are commercially available (e.g., from Pierce Biotechnology, Inc., Rockford, IL., U.S.A.).

e. Other antibody derivatives

In some instances, an anti-CD20/anti-CD3 bispecific antibody may be modified to contain additional nonproteinaceous moieties that are known in the art and readily available and administered to the subject in accordance with the methods described herein. The moieties suitable for derivatization of the antibody include but are not limited to water soluble polymers. Non-limiting examples of water soluble polymers include, but are not limited to, polyethylene glycol (PEG), copolymers of ethylene glycol/propylene glycol, carboxymethylcellulose, dextran, polyvinyl alcohol, polyvinyl pyrrolidone, poly-1,3-dioxolane, poly-1,3,6-trioxane, ethylene/maleic anhydride copolymer, polyaminoacids (either homopolymers or random copolymers), and dextran or poly(n-vinyl pyrrolidone)polyethylene glycol, propylene glycol homopolymers, propylene oxide/ethylene oxide co-polymers, polyoxyethylated polyols (e.g., glycerol), polyvinyl alcohol, and mixtures thereof. Polyethylene glycol propionaldehyde may have advantages in manufacturing due to its stability in water. The polymer may be of any molecular weight, and may be branched or unbranched. The number of polymers attached to the antibody may vary, and if more than one polymer are attached, they can be the same or different molecules. In general, the number and/or type of polymers used for derivatization can be determined based on considerations including, but not limited to, the particular properties or functions of the antibody to be improved, whether the antibody derivative will be used in a therapy under defined conditions, etc.

In some instances, conjugates of an antibody and nonproteinaceous moiety that may be selectively heated by exposure to radiation are provided. In one instance, the nonproteinaceous moiety is a carbon nanotube (Kam et al., *Proc. Natl. Acad. Sci. USA* 102: 11600-11605 (2005)). The radiation may be of any wavelength, and includes, but is not limited to, wavelengths that do not harm ordinary cells, but

which heat the nonproteinaceous moiety to a temperature at which cells proximal to the antibody-nonproteinaceous moiety are killed.

*B. Pharmaceutical Compositions and Formulations*

5 Pharmaceutical compositions and formulations of the anti-CD20/anti-CD3 bispecific antibodies can be prepared by mixing such antibodies having the desired degree of purity with one or more optional pharmaceutically acceptable carriers (*Remington's Pharmaceutical Sciences* 16th edition, Osol, A. Ed. (1980)), in the form of lyophilized formulations or aqueous solutions. Pharmaceutically acceptable carriers are generally nontoxic to recipients at the dosages and concentrations employed, and include, 10 but are not limited to: buffers such as phosphate, citrate, and other organic acids; antioxidants including ascorbic acid and methionine; preservatives (such as octadecyldimethylbenzyl ammonium chloride; hexamethonium chloride; benzalkonium chloride; benzethonium chloride; phenol, butyl or benzyl alcohol; alkyl parabens such as methyl or propyl paraben; catechol; resorcinol; cyclohexanol; 3-pentanol; and m-cresol); low molecular weight (less than about 10 residues) polypeptides; proteins, such as serum 15 albumin, gelatin, or immunoglobulins; hydrophilic polymers such as polyvinylpyrrolidone; amino acids such as glycine, glutamine, asparagine, histidine, arginine, or lysine; monosaccharides, disaccharides, and other carbohydrates including glucose, mannose, or dextrins; chelating agents such as EDTA; sugars such as sucrose, mannitol, trehalose or sorbitol; salt-forming counter-ions such as sodium; metal 20 complexes (e.g. Zn-protein complexes); and/or non-ionic surfactants such as polyethylene glycol (PEG). 25 Exemplary pharmaceutically acceptable carriers herein further include interstitial drug dispersion agents such as soluble neutral-active hyaluronidase glycoproteins (sHASEGP), for example, human soluble PH-20 hyaluronidase glycoproteins, such as rHuPH20 (HYLENEX®, Baxter International, Inc.). Certain exemplary sHASEGPs and methods of use, including rHuPH20, are described in US Patent Publication Nos. 2005/0260186 and 2006/0104968. In one aspect, a sHASEGP is combined with one or more additional glycosaminoglycanases such as chondroitinases.

Exemplary lyophilized antibody formulations are described in US Patent No. 6,267,958. Aqueous antibody formulations include those described in US Patent No. 6,171,586 and WO2006/044908, the latter formulations including a histidine-acetate buffer.

30 The formulation herein may also contain more than one active ingredients as necessary for the particular indication being treated, preferably those with complementary activities that do not adversely affect each other. For example, it may be desirable to further provide an additional therapeutic agent (e.g., a chemotherapeutic agent, a cytotoxic agent, a growth inhibitory agent, and/or an anti-hormonal agent, such as those recited herein above). Such active ingredients are suitably present in combination in amounts that are effective for the purpose intended.

35 Active ingredients may be entrapped in microcapsules prepared, for example, by coacervation techniques or by interfacial polymerization, for example, hydroxymethylcellulose or gelatin-microcapsules and poly-(methylmethacrylate) microcapsules, respectively, in colloidal drug delivery systems (for example, liposomes, albumin microspheres, microemulsions, nano-particles and nanocapsules) or in macroemulsions. Such techniques are disclosed in *Remington's Pharmaceutical Sciences* 16th edition, 40 Osol, A. Ed. (1980).

Sustained-release preparations may be prepared. Suitable examples of sustained-release preparations include semipermeable matrices of solid hydrophobic polymers containing the antibody, which matrices are in the form of shaped articles, for example, films, or microcapsules.

The formulations to be used for *in vivo* administration are generally sterile. Sterility may be

5 readily accomplished, e.g., by filtration through sterile filtration membranes.

### III. ARTICLES OF MANUFACTURE

In another aspect of the invention, an article of manufacture containing materials useful for the treatment, prevention, and/or diagnosis of the disorders described above is provided. The article of manufacture comprises a container and a label or package insert on or associated with the container. Suitable containers include, for example, bottles, vials, syringes, IV solution bags, etc. The containers may be formed from a variety of materials such as glass or plastic. The container holds a composition which is by itself or combined with another composition effective for treating, preventing and/or diagnosing the condition and may have a sterile access port (for example the container may be an intravenous solution bag or a vial having a stopper pierceable by a hypodermic injection needle). At least one active agent in the composition is an anti-CD20/anti-CD3 bispecific antibody described herein. The label or package insert indicates that the composition is used for treating the condition of choice (e.g., a B cell proliferation disorder, e.g., non-Hodgkin's lymphoma (NHL), e.g., diffuse large B cell lymphoma (DLBCL), e.g., relapsed or refractory DLBCL) and further includes information related to at least one of the dosing regimens described herein. Moreover, the article of manufacture may comprise (a) a first container with a composition contained therein, wherein the composition comprises an anti-CD20/anti-CD3 bispecific antibody described herein; and (b) a second container with a composition contained therein, wherein the composition comprises a further cytotoxic or otherwise therapeutic agent. Alternatively, or additionally, the article of manufacture may further comprise a second (or third) container comprising a pharmaceutically-acceptable buffer, such as bacteriostatic water for injection (BWFI), phosphate-buffered saline, Ringer's solution and dextrose solution. It may further include other materials desirable from a commercial and user standpoint, including other buffers, diluents, filters, needles, and syringes.

### 30 IV. EXAMPLES

The following are examples of the methods of the invention. It is understood that various other embodiments may be practiced, given the general description provided above.

#### 35 Example 1. Fractionated, Dose-Escalation Dosing Regimens for Treatment of B Cell Proliferation Disorders with Anti-Cluster of Differentiation 20 (CD20)/Anti-Cluster of Differentiation 3 (CD3) Bispecific Antibodies

A full-length, IgG1 bispecific antibody that binds both CD20 and CD3 was generated using "knob-in-hole" engineering (see, e.g., U.S. Patent No. 5,731,168). The safety and pharmacodynamics (PD) were consistent with its proposed mechanism of action in toxicology studies in cynomolgus monkeys.

40 The toxicities associated with treatment with the anti-CD20/anti-CD3 bispecific antibody were largely

driven by stimulation of T cells, as evidenced by PD changes in cytokine levels and activated T cell numbers. In repeat-dose toxicity studies in cynomolgus monkeys with the anti-CD20/anti-CD3 bispecific antibody, the increase of cytokine levels, T-cell activation, and acute post-dose observations were primarily limited to the first dose and were reduced or negligible following subsequent doses. Therefore, 5 clinical strategies were designed to control the extent of T-cell stimulation through alternative dosing regimens.

In previous dosing studies, the anti-CD20/anti-CD3 bispecific antibody was dosed in a non-fractionated manner during Cycle 1, with the entirety of the dose being given on Cycle 1, Day 1 (C1D1). Preclinical data with the anti-CD20/anti-CD3 bispecific antibody indicated that double-step fractionation 10 had the potential to decrease the risk of cytokine-driven toxicities. Therefore, we modified the protocol to administer the anti-CD20/anti-CD3 bispecific antibody in the context of a double-step fractionated, dose-escalation dosing schedule in Cycle 1.

To support this fractionated dosing schedule with the anti-CD20/anti-CD3 bispecific antibody, an 15 exploratory quantitative systems pharmacology (QSP) model was used to simulate the time course of systemic cytokine (IL6) and activated T cell profiles in Cycle 1 following administration of the anti-CD20/anti-CD3 bispecific antibody as a single agent, using various dosing regimens of the anti-CD20/anti-CD3 bispecific antibody in patients with non-Hodgkin's lymphoma (NHL). Model-based 20 predictions of serum cytokine concentrations and activated T cell time profiles following two cycles of treatment with the anti-CD20/anti-CD3 bispecific antibody as a single agent were used to compare non-fractionated and double-step fractionated dose schedules. The modeling and simulation support 25 achieving a more favorable benefit-risk profile through a double-step fractionated, dose-escalation dosing regimen for treating hematologic cancers, such as B cell proliferation disorders (e.g., NHL, e.g., DLBCL), with the anti-CD20/anti-CD3 bispecific antibody. Based on the above, the double-step fractionated, dose-escalation dosing regimen is expected to reduce or inhibit cytokine-driven toxicities (e.g., cytokine release syndrome (CRS)), infusion-related reactions (IRRs), macrophage activation syndrome (MAS), neurologic toxicities, severe tumor lysis syndrome (TLS), neutropenia, thrombocytopenia, elevated liver enzymes, and/or central nervous system (CNS) toxicities.

The double-step fractionated, dose-escalation dosing regimen commences with a dose-escalating first dosing cycle (C1), in which patients receive the anti-CD20/anti-CD3 bispecific antibody on 30 Days 1, 8, and 15 of Cycle 1 (C1D1, C1D8, and C1D15, respectively). In Cycle 2 and beyond, the bispecific antibody is given as a single dose only on Day 1 of each 21-day cycle, with Day 1 of Cycle 2 (C2D1) being approximately 7 days after the C1D15 dose. In Cycle 2 and beyond, in which the bispecific antibody is given as a single dose only on Day 1 of each 21-day cycle, the bispecific antibody maybe 35 concurrently administered on Day 1 of each 21-day cycle with atezolizumab. The anti-CD20/anti-CD3 bispecific antibody and atezolizumab may be given up to  $\pm$  2 days from the scheduled date (i.e., with a minimum of 19 days between doses) for logistic/scheduling reasons.

The cumulative Cycle 1 dose is about 50% greater than the highest cleared dose of the first cycle of a non-fractionated, dose-escalation dosing regimen, with the starting C1D15 dose corresponding to the highest cleared dose of the first cycle of the non-fractionated, dose-escalation dosing regimen. The

C1D15 dose is the dose level administered on Day 1 of subsequent cycles (Cycle 2 through the terminal dosing cycle). This dose escalation uses a standard 3 + 3 design.

**Example 2. Management of Cytokine Release Syndrome (CRS) with an Anti-Interleukin-6 Receptor (IL-6R) Antibody**

In the event that CRS is observed in patients who are administered an anti-CD20/anti-CD3 bispecific antibody in the context of the double-step fractionated, dose-escalation dosing regimen described in Example 1, the observed CRS should be managed appropriately.

CRS can result in significant disability or death if unsuccessfully managed. Current clinical management focuses on treating the individual signs and symptoms, providing supportive care, and attempting to dampen the inflammatory response using a high dose of corticosteroids. However, this approach is not always successful, especially in the case of late intervention. CRS observed in patients during the double-step fractionated, dose-escalation dosing regimen may be alternatively managed.

CRS is associated with elevations in a wide array of cytokines, including marked elevations in IFN $\gamma$ , IL-6, and TNF- $\alpha$  levels. Emerging evidence implicates IL-6, in particular, as a central mediator in CRS. IL-6 is a proinflammatory, multi-functional cytokine produced by a variety of cell types, which has been shown to be involved in a diverse array of physiological processes, including T cell activation. Regardless of the inciting agent, CRS is associated with high IL-6 levels (Nagorsen et al. *Cytokine*. 25(1): 31-5, 2004; Lee et al. *Blood*. 124(2): 188-95, 2014); Doesegger et al. *Clin. Transl. Immunology*. 4(7): e39, 2015), and IL-6 correlates with the severity of CRS, with patients who experience a grade 4 or 5 CRS event having much higher IL-6 levels compared to patients who do not experience CRS or experience milder CRS (grades 0-3) (Chen et al. *J. Immunol. Methods*. 434:1-8, 2016). Therefore, blocking the inflammatory action of IL-6 using an agent that inhibits IL-6-mediated signaling to manage CRS observed in patients during the double-step fractionated, dose-escalation dosing regimen is an alternative to steroid treatment that would not be expected to negatively impact T cell function or diminish the efficacy or clinical benefit of anti-CD20/anti-CD3 bispecific antibody therapy in the treatment of B cell proliferative disorders.

Tocilizumab (ACTEMRA® / RoACTEMRA®) is a recombinant, humanized, anti-human monoclonal antibody directed against soluble and membrane-bound IL-6R, which inhibits IL-6-mediated signaling (see, e.g., WO 1992/019579, which is incorporated herein by reference in its entirety).

In the event of a grade 1 CRS event, management can be accomplished without tocilizumab therapy, with the CRS symptoms treated symptomatically using, for example, antihistamines, antipyretics, and/or analgesics as needed. In addition, fever and neutropenia is treated, if present, and the patient is monitored for fluid balance, with intravenous fluids administered as clinically indicated.

A grade 2 CRS event is managed in a patient having no (or minimal) comorbidities by following the management scheme for grade 1 CRS events and immediately suspending (i.e., delaying dosing) anti-CD20/anti-CD3 bispecific antibody treatment temporarily until CRS symptoms have resolved to grade  $\leq$  1 for three consecutive days, at which point the patient may receive the next dose of the anti-CD20/anti-CD3 bispecific antibody without dose reduction with the approval of the medical monitor. Cardiac and other organ function is carefully monitored in patients with grade 2 CRS, and oxygen is given for hypoxia,

as needed. If there is no clinical improvement within 24 hours, the medical monitor should be notified and tocilizumab can be administered intravenously to the patient as a single dose at 8 mg/kg. A grade 2 CRS event is managed in a patient having extensive comorbidities by following the management scheme for a grade 3 CRS event described below.

5        In the event of a grade 3 CRS event, the medical monitor is immediately notified. Cardiopulmonary and organ function are monitored, oxygen is given for hypoxia, and hemodynamic support and other supportive care (e.g., for fever and/or neutropenia) is provided, as needed. In addition, anti-CD20/anti-CD3 bispecific antibody treatment is immediately suspended and the patient is administered tocilizumab intravenously at 8 mg/kg. If there is no clinical improvement within 24 hours, a 10      second dose of tocilizumab is administered intravenously to the patient at 8 mg/kg, optionally in combination with the initiation of intravenous corticosteroid treatment (e.g., methylprednisolone at 2 mg/kg/day or dexamethasone at 10 mg for neurologic symptoms). Dosing of the anti-CD20/anti-CD3 bispecific antibody can be delayed for up to two weeks in order for the patient to recover from the CRS toxicity. If, following tocilizumab administration, CRS symptoms have resolved to grade  $\leq 1$  within two 15      weeks, then dosing of the anti-CD20/anti-CD3 bispecific antibody is continued at a reduced dose. The reduced dose of the anti-CD20/anti-CD3 bispecific antibody is the next highest cleared dose level assessed during dose escalation (i.e., in the non-fractionated, dose-escalation dosing regimen). If similar toxicity is observed at the reduced dose, then anti-CD20/anti-CD3 bispecific antibody treatment is discontinued. In addition, if the reduced dose is below the pharmacodynamics activity range of the anti- 20      CD20/anti-CD3 bispecific antibody, then anti-CD20/anti-CD3 bispecific antibody treatment may also be discontinued (i.e., permanently stopped).

A grade 4 CRS event is managed as described above for a grade 3 CRS event, but the anti-CD20/anti-CD3 bispecific antibody treatment is immediately discontinued (i.e., permanently stopped).

25      **Other Embodiments**

Although the foregoing invention has been described in some detail by way of illustration and example for purposes of clarity of understanding, the descriptions and examples should not be construed as limiting the scope of the invention. The disclosures of all patent and scientific literature cited herein are expressly incorporated in their entirety by reference.

30      Reference to any prior art in the specification is not an acknowledgement or suggestion that this prior art forms part of the common general knowledge in any jurisdiction or that this prior art could reasonably be expected to be combined with any other piece of prior art by a skilled person in the art.

## WHAT IS CLAIMED IS:

1. A method of treating a subject having a B cell proliferative disorder comprising administering to the subject a bispecific antibody that binds to CD20 and CD3 in a dosing regimen comprising at least a first 21-day dosing cycle and a second 21-day dosing cycle, wherein:
  - (a) the first dosing cycle comprises a first dose (C1D1), a second dose (C1D2), and a third dose (C1D3) of the bispecific antibody, wherein the C1D1 is about 1.0 mg, the C1D2 is about 2.0 mg, and the C1D3 is between about 3.0 mg to about 50.0 mg; and
  - (b) the second dosing cycle comprises a single dose (C2D1) of the bispecific antibody, wherein the C2D1 is equal in amount to the C1D3,

wherein the dosing regimen comprises administering to the subject the C1D1, the C1D2, and the C1D3 on Days 1, 8, and 15, respectively, of the first dosing cycle, wherein the bispecific antibody is a full-length bispecific antibody, and wherein the bispecific antibody comprises:

an anti-CD20 arm comprising a first binding domain comprising the following six hypervariable regions (HVRs):

    - (i) an HVR-H1 comprising the amino acid sequence of GYTFTSYNMH (SEQ ID NO: 1);
    - (ii) an HVR-H2 comprising the amino acid sequence of AIYPGNGDTSYNQKFKG (SEQ ID NO: 2);
    - (iii) an HVR-H3 comprising the amino acid sequence of VVYYSSNSYWYFDV (SEQ ID NO:3);
    - (iv) an HVR-L1 comprising the amino acid sequence of RASSSVSYM (SEQ ID NO: 4);
    - (v) an HVR-L2 comprising the amino acid sequence of APSNLAS (SEQ ID NO: 5); and
    - (vi) an HVR-L3 comprising the amino acid sequence of QQWSFNPPT (SEQ ID NO: 6); and

an anti-CD3 arm comprising a second binding domain comprising the following six HVRs:

    - (i) an HVR-H1 comprising the amino acid sequence of NYYIH (SEQ ID NO: 9);
    - (ii) an HVR-H2 comprising the amino acid sequence of WIYPGDGNTKYNEKFKG (SEQ ID NO: 10);
    - (iii) an HVR-H3 comprising the amino acid sequence of DSYSNYYFDY (SEQ ID NO: 11);
    - (iv) an HVR-L1 comprising the amino acid sequence of KSSQSLLNSRTRKNYLA (SEQ ID NO: 12);
    - (v) an HVR-L2 comprising the amino acid sequence of WASTRES (SEQ ID NO: 13); and
    - (vi) an HVR-L3 comprising the amino acid sequence of TQSFILRT (SEQ ID NO: 14).
2. The method of claim 1, wherein the method comprises administering to the subject the C2D1 on Day 1 of the second dosing cycle.
3. The method of claim 1 or 2, wherein the dosing regimen comprises one or more additional dosing cycles.
4. The method of claim 3, wherein the dosing regimen comprises one to six additional dosing cycles.

5. The method of claim 3 or 4, wherein the length of each of the one or more additional dosing cycles is 21 days or 28 days.
6. The method of any one of claims 3-5, wherein each of the one or more additional dosing cycles comprises a single dose of the bispecific antibody.
7. The method of claim 6, wherein the method comprises administering to the subject the single dose of the one or more additional dosing cycles on Day 1, of the one or more additional dosing cycles.
8. The method of claim 6 or 7, wherein each single dose of the bispecific antibody is equal in amount to the C1D3.
9. The method of any one of claims 1-8, wherein the bispecific antibody comprises an anti-CD20 arm comprising a first binding domain comprising (a) a heavy chain variable (VH) domain comprising an amino acid sequence having at least 95% sequence identity to the amino acid sequence of SEQ ID NO: 7; (b) a light chain variable (VL) domain comprising an amino acid sequence having at least 95% sequence identity to the amino acid sequence of SEQ ID NO: 8; or (c) a VH domain as in (a) and a VL domain as in (b).
10. The method of claim 9, wherein the first binding domain comprises a VH domain comprising an amino acid sequence of SEQ ID NO: 7 and a VL domain comprising an amino acid sequence of SEQ ID NO: 8.
11. The method of any one of claims 1-10, wherein the bispecific antibody comprises an anti-CD3 arm comprising a second binding domain comprising (a) a VH domain comprising an amino acid sequence having at least 95% sequence identity to the amino acid sequence of SEQ ID NO: 15; (b) a VL domain comprising an amino acid sequence having at least 95% sequence identity to the amino acid sequence of SEQ ID NO: 16; or (c) a VH domain as in (a) and a VL domain as in (b).
12. The method of claim 11, wherein the second binding domain comprises a VH domain comprising an amino acid sequence of SEQ ID NO: 15 and a VL domain comprising an amino acid sequence of SEQ ID NO: 16.
13. The method of any one of claims 1-12, wherein:
  - (i) the first binding domain comprises a VH domain comprising the amino acid sequence of SEQ ID NO: 7 and a VL domain comprising the amino acid sequence of SEQ ID NO: 8; and
  - (ii) the second binding domain comprises a VH domain comprising the amino acid sequence of SEQ ID NO: 15 and a VL domain comprising the amino acid sequence of SEQ ID NO: 16.

14. The method of any one of claims 1-13, wherein the bispecific antibody comprises an aglycosylation site mutation.
15. The method of claim 14, wherein:
  - (i) the aglycosylation site mutation reduces effector function of the bispecific antibody; and/or
  - (ii) the aglycosylation site mutation is a substitution mutation.
16. The method of claim 15, wherein the bispecific antibody comprises a substitution mutation in the Fc region that reduces effector function.
17. The method of claim 16, wherein the substitution mutation is at amino acid residue N297, L234, L235, and/or D265 (EU numbering).
18. The method of claim 17, wherein the substitution mutation is selected from the group consisting of N297G, N297A, L234A, L235A, D265A, and P329G.
19. The method of claim 17 or 18, wherein the substitution mutation is at amino acid residue N297.
20. The method of claim 19, wherein the substitution mutation is N297G.
21. The method of any one of claims 1-20, wherein the bispecific antibody is:
  - (i) a monoclonal antibody;
  - (ii) a humanized antibody or a chimeric antibody; and/or
  - (iii) an IgG antibody.
22. The method of claim 21, wherein the IgG antibody is an IgG<sub>1</sub> antibody.
23. The method of any one of claims 1-22, wherein the bispecific antibody comprises one or more heavy chain constant domains, wherein the one or more heavy chain constant domains are selected from a first CH1 (CH1<sub>1</sub>) domain, a first CH2 (CH2<sub>1</sub>) domain, a first CH3 (CH3<sub>1</sub>) domain, a second CH1 (CH1<sub>2</sub>) domain, a second CH2 (CH2<sub>2</sub>) domain, and a second CH3 (CH3<sub>2</sub>) domain, wherein at least one of the one or more heavy chain constant domains is paired with another heavy chain constant domain, wherein:
  - (i) the CH3<sub>1</sub> and CH3<sub>2</sub> domains each comprise a protuberance or cavity, and wherein the protuberance or cavity in the CH3<sub>1</sub> domain is positionable in the cavity or protuberance, respectively, in the CH3<sub>2</sub> domain, wherein the CH3<sub>1</sub> and CH3<sub>2</sub> domains meet at an interface between the protuberance and cavity; or
  - (ii) the CH2<sub>1</sub> and CH2<sub>2</sub> domains each comprise a protuberance or cavity, and wherein the protuberance or cavity in the CH2<sub>1</sub> domain is positionable in the cavity or protuberance, respectively, in the CH2<sub>2</sub> domain, wherein the CH2<sub>1</sub> and CH2<sub>2</sub> domains meet at an interface between said protuberance and cavity.

24. The method of any one of claims 1-23, wherein the bispecific antibody is administered to the subject as a monotherapy.
25. The method of any one of claims 1-24, wherein the bispecific antibody is administered to the subject therapying combination with an additional therapeutic agent.
26. The method of claim 25, wherein the bispecific antibody is administered to the subject concurrently with the additional therapeutic agent.
27. The method of claim 26, wherein the bispecific antibody is administered to the subject prior to the administration of the additional therapeutic agent.
28. The method of claim 26 or 27, wherein the additional therapeutic agent is atezolizumab.
29. The method of any one of claims 1-28, further comprising administering to the subject a first dose of atezolizumab concurrently with the C2D1 of the bispecific antibody on Day 1 of the second dosing cycle.
30. The method of any one of claims 6-29, further comprising administering to the subject atezolizumab concurrently with the single dose of the bispecific antibody of the one or more additional dosing cycles on Day 1 of the one or more additional dosing cycles.
31. The method of claim 28, wherein atezolizumab is only administered to the subject concurrently with the bispecific antibody.
32. The method of any one of claims 28-31, wherein each dose of atezolizumab is about 1200 mg.
33. The method of claim 25, wherein the bispecific antibody is administered to the subject subsequent to the administration of the additional therapeutic agent.
34. The method of claim 33, wherein the additional therapeutic agent is obinutuzumab (GAZYVA®) or tocilizumab.
35. The method of claim 25, wherein the additional therapeutic agent is an antibody-drug conjugate (ADC).
36. The method of claim 35, wherein the ADC is an anti-CD79b ADC.
37. The method of claim 36, wherein the anti-CD79b ADC is polatuzumab vedotin.

38. The method of any one of claims 1-37, wherein the B cell proliferative disorder is a non-Hodgkin's lymphoma (NHL) or a chronic lymphoid leukemia (CLL).
39. The method of claim 38, wherein the NHL is a diffuse-large B cell lymphoma (DLBCL), a primary mediastinal (thymic) large B cell lymphoma (PMLBCL), a mantle cell lymphoma (MCL), or a follicular lymphoma (FL).
40. The method of claim 39, wherein the DLBCL is a relapsed or refractory DLBCL.
41. The method of any one of claims 1-40, wherein the administering is by intravenous infusion.
42. The method of any one of claims 1-40, wherein the administering is administering subcutaneously.
43. The method of any one of claims 1-42, wherein the subject has a cytokine release syndrome (CRS) event, and the method further comprising treating the symptoms of the CRS event while suspending treatment with the bispecific antibody.
44. The method of claim 43, wherein the method further comprising administering to the subject an effective amount of tocilizumab to treat the CRS event.
45. The method of claim 44, wherein tocilizumab is administered intravenously to the subject as a single dose of about 8 mg/kg.
46. The method of claim 45, wherein the CRS event does not resolve or worsens within 24 hours of treating the symptoms of the CRS event, the method further comprising administering to the subject one or more additional doses of tocilizumab and/or an effective amount of a corticosteroid to manage the CRS event.
47. The method of claim 46, wherein the one or more additional doses of tocilizumab is administered intravenously to the subject at a dose of about 8 mg/kg.
48. The method of claim 46, wherein the corticosteroid is administered intravenously to the subject.
49. The method of claim 46 or 48, wherein the corticosteroid is methylprednisolone or dexamethasone.

50. The method of claim 49, wherein the corticosteroid is methylprednisolone and methylprednisolone is administered at a dose of about 2 mg/kg per day or the corticosteroid is dexamethasone and dexamethasone is administered at a dose of about 10 mg.

51. Use of a bispecific antibody that binds to CD20 and CD3 in the manufacture of a medicament for treating a B cell proliferative disorder in a subject in need thereof, wherein the medicament is for administration to the subject according to a dosing regimen comprising at least a first 21-day dosing cycle and a second 21-day dosing cycle, wherein:

(a) the first dosing cycle comprises a first dose (C1D1), a second dose (C1D2), and a third dose (C1D3) of the medicament, wherein the C1D1 and the C1D2 are each no greater than the C1D3, and wherein the C1D1 is about 1.0 mg, the C1D2 is about 2.0 mg, and the C1D3 is between about 3.0 mg to about 50.0 mg; and

(b) the second dosing cycle comprises a single dose (C2D1) of the medicament, wherein the C2D1 is equal to in amount to the C1D3,

wherein the dosing regimen is to be administered to the subject with the C1D1, the C1D2, and the C1D3 doses on Days 1, 8, and 15, respectively, of the first dosing cycle,

wherein the bispecific antibody is a full-length bispecific antibody, and wherein the bispecific antibody comprises:

an anti-CD20 arm comprising a first binding domain comprising the following six hypervariable regions (HVRs):

- (i) an HVR-H1 comprising the amino acid sequence of GYTFTSYNMH (SEQ ID NO: 1);
- (ii) an HVR-H2 comprising the amino acid sequence of AIYPGNGDTSYNQKFKG (SEQ ID NO: 2);
- (iii) an HVR-H3 comprising the amino acid sequence of VVYYNSNSYWYFDV (SEQ ID NO: 3);
- (iv) an HVR-L1 comprising the amino acid sequence of RASSSVSYMH (SEQ ID NO: 4);
- (v) an HVR-L2 comprising the amino acid sequence of APSNLAS (SEQ ID NO: 5); and
- (vi) an HVR-L3 comprising the amino acid sequence of QQWSFNPPT (SEQ ID NO: 6); and

an anti-CD3 arm comprising a second binding domain comprising the following six HVRs:

- (i) an HVR-H1 comprising the amino acid sequence of NYYIH (SEQ ID NO: 9);
- (ii) an HVR-H2 comprising the amino acid sequence of WIYPGDGNTKYNEKFKG (SEQ ID NO: 10);
- (iii) an HVR-H3 comprising the amino acid sequence of DSYSNYYFDY (SEQ ID NO: 11);
- (iv) an HVR-L1 comprising the amino acid sequence of KSSQSLLNSRTRKNYLA (SEQ ID NO: 12);
- (v) an HVR-L2 comprising the amino acid sequence of WASTRES (SEQ ID NO: 13); and
- (vi) an HVR-L3 comprising the amino acid sequence of TQSFILRT (SEQ ID NO: 14).
