CROSS REFERENCE TO RELATED APPLICATIONS

[0001] This application claims the benefit of United States Provisional Application number 60/488,535, filed July 18, 2003, entitled "Inhibitors of Serine Proteases, Particularly HCV NS3-NS4A Protease", the entire contents of which is hereby incorporated by reference.

TECHNICAL FIELD OF THE INVENTION

[0002] The present invention relates to compounds that inhibit serine protease activity, particularly the activity of hepatitis C virus NS3-NS4A protease. As such, they act by interfering with the life cycle of the hepatitis C virus and are also useful as antiviral agents. The invention further relates to pharmaceutical compositions comprising these compounds either for ex vivo use or for administration to a patient suffering from HCV infection. The invention also relates to processes for preparing the compounds and methods of treating an HCV infection in a patient by administering a pharmaceutical composition comprising a compound of this invention.

BACKGROUND OF THE INVENTION

[0003] Infection by hepatitis C virus ("HCV") is a compelling human medical problem. HCV is recognized as the causative agent for most cases of non-A, non-B hepatitis, with an estimated human sero-prevalence of 3% globally [A. Alberti et al., "Natural History of Hepatitis C," J. Hepatology, 31., (Suppl. 1), pp. 17-24 (1999)]. Nearly four million individuals may be infected

[0004] Upon first exposure to HCV only about 20% of infected individuals develop acute clinical hepatitis while others appear to resolve the infection spontaneously. In almost 70% of instances, however, the virus establishes a chronic infection that persists for decades [S. Iwarson, "The Natural Course of Chronic Hepatitis," FEMS Microbiology Reviews, 14, pp. 201-204 (1994); D. Lavanchy, "Global Surveillance and Control of Hepatitis C," J. Viral Hepatitis, 6, pp. 35-47 (1999)]. This usually results in recurrent and progressively worsening liver inflammation, which often leads to more severe disease states such as cirrhosis and hepatocellular carcinoma [M.C. Kew, "Hepatitis C and Hepatocellular Carcinoma", FEMS Microbiology Reviews, 14, pp. 211-220 (1994); I. Saito et. al., "Hepatitis C Virus Infection is Associated with the Development of Hepatocellular Carcinoma," Proc. Natl. Acad. Sci. USA, 87, pp. 6547-6549 (1990)]. Unfortunately, there are no broadly effective treatments for the debilitating progression of chronic HCV.

[0005] HCV is a RNA virus of the Flaviviridae family. Acute infection with HCV causes a generally mild, often asymptomatic, acute hepatitis. However, at least 85% of patients infected with HCV do not fully clear the virus and develop chronic infection of the liver. Once chronic hepatitis C is established, spontaneous clearance of the virus is rare and the majority of patients with chronic hepatitis C develop slowly progressive liver disease.
cirrhosis. Long-term sequelae of chronic hepatitis C include cirrhosis, hepatic failure, and hepatocellular carcinoma. It is estimated that HCV infects 170 million persons worldwide. Over the next ten years, as a larger proportion of patients who are currently infected enter the third decade of their infection, the number of deaths attributed to hepatitis C is expected to significantly increase.

[0006] Typical symptoms of HCV infection include elevated ALT, positive test for anti-HCV antibodies, presence of HCV as demonstrated by a positive test for HCV-RNA, clinical stigmata of chronic liver disease, or hepatocellular damage.

[0008] The HCV NS protein 3 (NS3) contains a serine protease activity that helps process the majority of the viral enzymes, and is thus considered essential for viral replication and infectivity. It is known that mutations in the yellow fever virus NS3 protease decrease viral infectivity [Chambers, T.J. et. al., "Evidence that the N-terminal Domain of Nonstructural Protein NS3 From Yellow Fever Virus is a Serine Protease Responsible for Site-Specific Cleavages in the Viral Polyprotein", Proc. Natl. Acad. Sci. USA, 87, pp. 8898-8902 (1990)]. The first 181 amino acids of NS3 (residues 1027-1207 of the viral polyprotein) have been shown to contain the serine protease domain of NS3 that processes all four downstream sites of the HCV polyprotein [C. Lin et al., "Hepatitis C Virus NS3 Serine Proteinase: Trans-Cleavage Requirements and Processing Kinetics", J. Virol., 68, pp. 8147-8157 (1994)].

[0009] The HCV NS3 serine protease and its associated cofactor, NS4A, helps process all of the viral enzymes, and is thus considered essential for viral replication. This processing appears to be analogous to that carried out by the human immunodeficiency virus aspartyl protease, which is also involved in viral enzyme processing. HIV protease inhibitors, which inhibit viral protein processing, are potent antiviral agents in man,
Consequently HCV NS3 serine protease is also an attractive target for drug discovery.

Furthermore, the current understanding of HCV has not led to any other satisfactory anti-HCV agents or treatments. Until recently, the only established therapy for HCV disease was interferon treatment (see, e.g., PCT publication No. WO 02/18369, the disclosure of which is herein incorporated by reference). However, interferons have significant side effects [M. A. Wlaker et al., "Hepatitis C Virus: An Overview of Current Approaches and Progress," DDT, 4, pp. 518-29 (1999); D. Moradpour et al., "Current and Evolving Therapies for Hepatitis C," Eur. J. Gastroenterol. Hepatol., 11, pp. 1199-1202 (1999); H. L. A. Janssen et al. "Suicide Associated with Alfa-Interferon Therapy for Chronic Viral Hepatitis," J. Hepatol., 21, pp. 241-243 (1994); P.F. Renault et al., "Side Effects of Alpha Interferon," Seminars in Liver Disease, 9, pp. 273-277. (1989)] and induce long term remission in only a fraction (~ 25%) of cases [O. Weiland, "Interferon Therapy in Chronic Hepatitis C Virus Infection", FEMS Microbiol. Rev., 14, pp. 279-288 (1994)]. Ribavirin, a broad spectrum antiviral agent, has reported acitivity in chronic hepatitis C. Recent introductions of the pegylated forms of interferon (PEG-Intron® and Pegasys®) and the combination therapy of ribavirin and pegylated interferon (Rebetol®) have resulted in only modest improvements in remission rates and only partial reductions in side effects (see, e.g., United States patent 6,299,872, United States patent 6,387,365, United States patent 6,172,046, United States patent 6,472,373, the disclosures of which are incorporated herein by reference). Moreover, the
Thus, there is a need for more effective anti-HCV therapies particularly compounds that may be used as protease inhibitors. Such inhibitors would have therapeutic potential as protease inhibitors, particularly as serine protease inhibitors, and more particularly as HCV NS3 protease inhibitors. Specifically, such compounds may be useful as antiviral agents, particularly as anti-HCV agents.

The present invention provides compounds that are potent binders and inhibitors of the HCV NS3/NS4A serine protease and are, therefore, useful as anti-HCV agents.

Definitions

[0016] The term "aryl" as used herein means a monocyclic or bicyclic carbocyclic aromatic ring system. Phenyl is an example of a monocyclic aromatic ring.
systems wherein only one of the two rings is aromatic, e.g., tetralin. It is understood that as used herein, the term "(C6-C10)-aryl-" includes any one of a C6, C7, C8, C9, and C10 monocyclic or bicyclic carbocyclic aromatic ring.

[0017] The term "heterocyclyl" as used herein means a monocyclic or bicyclic non-aromatic ring system having 1 to 3 heteroatom or heteroatom groups in each ring selected from O, N, NH, S, SO, and SO₂ in a chemically stable arrangement. In a bicyclic non-aromatic ring system embodiment of "heterocyclyl" one or both rings may contain said heteroatom or heteroatom groups. It is understood that as used herein, the term "(C5-C10)-heterocyclyl-" includes any one of a C5, C6, C7, C8, C9, and C10 monocyclic or bicyclic non-aromatic ring system having 1 to 3 heteroatom or heteroatom groups in each ring selected from O, N, NH, and S in a chemically stable arrangement.

[0018] The term "heteroaryl" as used herein means a monocyclic or bicyclic aromatic ring system having 1 to 3 heteroatom or heteroatom groups in each ring selected from O, N, NH, and S in a chemically stable arrangement. In such a bicyclic aromatic ring system embodiment of "heteroaryl":

- one or both rings may be aromatic; and
- one or both rings may contain said heteroatom or heteroatom groups. It is understood that as used herein, the term "(C5-C10)-heteroaryl-" includes any one of a C5, C6, C7, C8, C9, and C10 monocyclic or bicyclic aromatic ring system having 1 to 3 heteroatom or heteroatom groups in each ring selected from O, N, NH, and S in a chemically stable arrangement.

Landro et al., "Mechanistic Role of an NS4A Peptide Cofactor with the Truncated NS3 Protease of Hepatitis C Virus: Elucidation of the NS4A Stimulatory Effect via Kinetic analysis and Inhibitor Mapping", *Biochemistry*, 36, pp. 9340-9348 (1997)] and as such are well known to skilled practitioners.

[0137] The present invention provides potent binders and inhibitors of the HCV NS3/NS4a serine protease. In certain embodiments of compounds of formulae I and Ia of the present invention, the compounds have P4 caps that allow for additional hydrogen bonds with the enzyme backbone. In certain embodiments of the present invention, a P4 cap nitrogen atom and the carbonyl (adjacent to radical V or T in formulae I or Ia) form hydrogen bonds to the main chain carbonyl and NH groups respectively of the Cys-158 residue of the protease enzyme. In certain embodiments of the present invention, another hydrogen bond is formed by the NH moiety (represented by the N-R2 group in formulae I and Ia, wherein R2 is hydrogen) of the P3 group with the protease
the HCV NS3/NS4a serine protease binding site. Additionally, the P2 spiocyclic proline group fills the P2 pocket and makes favorable van der Waals contact with the Arg-155 side chain in the HCV NS3/NS4A serine protease enzyme. This invention also provides W groups that bind efficiently to the catalytic site of the HCV NS3/NS4a serine protease located in the P1' pocket.

These oil solutions or suspensions may also contain a long-chain alcohol diluent or dispersant, such as carboxymethyl cellulose or similar dispersing agents which are commonly used in the formulation of pharmaceutically acceptable dosage forms including emulsions and suspensions. Other commonly used surfactants, such as Tweens, Spans and other emulsifying agents or bioavailability enhancers which are commonly used in the manufacture of pharmaceutically acceptable solid, liquid, or other dosage forms may also be used for the purposes of formulation.

[0157] Dosage levels of between about 0.01 and about 100 mg/kg body weight per day, preferably between about 0.5 and about 75 mg/kg body weight per day of the protease inhibitor compounds described herein are useful in a monotherapy for the prevention and treatment of antiviral, particularly anti-HCV mediated disease. Typically, the pharmaceutical compositions of this invention will be administered from about 1 to about 5 times per day or alternatively, as a continuous infusion. Such administration can be used as a chronic or acute therapy. The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated and the particular mode of administration. [0158] When the compositions of this invention comprise a combination of a compound of formula I or
agent should be present at dosage levels of between about 10 to 100%, and more preferably between about 10 to 80% of the dosage normally administered in a monotherapy regimen.

[0159] The pharmaceutical compositions of this invention may be orally administered in any orally acceptable dosage form including, but not limited to, capsules, tablets, aqueous suspensions or solutions. In the case of tablets for oral use, carriers that are commonly used include lactose and corn starch. Lubricating agents, such as magnesium stearate, are also typically added. For oral administration in a capsule form, useful diluents include lactose and dried cornstarch. When aqueous suspensions are required for oral use, the active ingredient is combined with emulsifying and suspending agents. If desired, certain sweetening, flavoring or coloring agents may also be added.

[0160] Alternatively, the pharmaceutical compositions of this invention may be administered in the form of suppositories for rectal administration. These may be prepared by mixing the agent with a suitable non-irritating excipient that is solid at room temperature but liquid at rectal temperature and therefore will melt in the rectum to release the drug. Such materials include cocoa butter, beeswax and polyethylene glycols.

[0161] The pharmaceutical compositions of this invention may also be administered topically, especially when the target of treatment includes areas or organs readily accessible by topical application, including diseases of the eye, the skin, or the lower intestinal
Topical application for the lower intestinal tract may be effected in a rectal suppository formulation (see above) or in a suitable enema formulation. Topically-transdermal patches may also be used.

For topical applications, the pharmaceutical compositions may be formulated in a suitable ointment containing the active component suspended or dissolved in one or more carriers. Carriers for topical administration of the compounds of this invention include, but are not limited to, mineral oil, liquid petrolatum, white petrolatum, propylene glycol, polyoxyethylene, polyoxypropylene compound, emulsifying wax and water. Alternatively, the pharmaceutical compositions may be formulated in a suitable lotion or cream containing the active components suspended or dissolved in one or more pharmaceutically acceptable carriers. Suitable carriers include, but are not limited to, mineral oil, sorbitan monostearate, polysorbate 60, cetyl esters wax, cetearyl alcohol, 2-octyldodecanol, benzyl alcohol and water.

For ophthalmic use, the pharmaceutical compositions may be formulated as micronized suspensions in isotonic, pH adjusted sterile saline, or, preferably, as solutions in isotonic, pH adjusted sterile saline, either with or without a preservative such as benzylalkonium chloride. Alternatively, for ophthalmic uses, the pharmaceutical compositions may be formulated in an ointment such as petrolatum.

The pharmaceutical compositions of this invention may also be administered by nasal aerosol or inhalation. Such compositions are prepared according to techniques well known in the art of pharmaceutical
absorption promoters to enhance bioavailability, fluorocarbons, and/or other conventional solubilizing or dispersing agents.

[0166] In another embodiment, the pharmaceutical compositions are formulated for oral administration.

[0167] In one embodiment, the compositions of this invention additionally comprise another agent, such as a cytochrome P-450 inhibitor. Such cytochrome P-450 inhibitors include, but are not limited to, ritonavir.

Alternatively, the CYP inhibitor may be administered in any time period around administration of the protease inhibitor. That is, the CYP inhibitor may be administered prior to, together with, or following the NS3/4A protease inhibitor. The time period of administration should be such that the CYP inhibitor affects the metabolism of the protease inhibitor. For example, if the protease inhibitor is administered first, the CYP inhibitor should be administered before the protease inhibitor is substantially metabolized and/or excreted (e.g., within the half-life of the protease inhibitor).

Example 4

HCV Replicon Cell Assay Protocol:

[0204] Cells containing hepatitis C virus (HCV)

25 replicon were maintained in DMEM containing 10% fetal
bovine serum (FBS), 0.25 mg per ml of G418, with
appropriate supplements (media A).

[0205] On day 1, replicon cell monolayer was treated
with a trypsin:EDTA mixture, removed, and then media A
was diluted into a final concentration of 100,000 cells
per ml wit. 10,000 cells in 100 ul were plated into each
well of a 96-well tissue culture plate, and cultured
overnight in a tissue culture incubator at 37°C.

[0206] On day 2, compounds (in 100% DMSO) were
35 serially diluted into DMEM containing 2% FBS, 0.5% DMSO,
the dilution series.

[0207] Media on the replicon cell monolayer was removed, and then media B containing various concentrations of compounds was added. Media B without any compound was added to other wells as no compound controls.

[0208] Cells were incubated with compound or 0.5% DMSO in media B for 48 hours in a tissue culture incubator at 37°C. At the end of the 48-hour incubation, the media was removed, and the replicon cell monolayer was washed once with PBS and stored at -80°C prior to RNA extraction.

[0209] Culture plates with treated replicon cell monolayers were thawed, and a fixed amount of another RNA virus, such as Bovine Viral Diarrhea Virus (BVDV) was added to cells in each well. RNA extraction reagents (such as reagents from RNeasy kits) were added to the cells immediately to avoid degradation of RNA. Total RNA was extracted according the instruction of manufacturer with modification to improve extraction efficiency and consistency. Finally, total cellular RNA, including HCV replicon RNA, was eluted and stored at -80°C until further processing.

[0210] A Taqman real-time RT-PCR quantification assay was set up with two sets of specific primers and probe. One was for HCV and the other was for BVDV. Total RNA extractants from treated HCV replicon cells was added to the PCR reactions for quantification of both HCV and BVDV RNA in the same PCR well. Experimental failure was flagged and rejected based on the level of BVDV RNA in each well. The level of HCV RNA in each well was calculated according to a standard curve run in the same
using the DMSO or no compound control as 0% of inhibition. The IC50 (concentration at which 50% inhibition of HCV RNA level is observed) was calculated from the titration curve of any given compound.
