**Description****FIELD OF THE INVENTION**

5 [0001] The present invention relates to pharmacologically active 2-substituted 4,5-dihydroxyisophthalonitriles, or pharmaceutically acceptable salts and esters thereof, as well as to pharmaceutical compositions containing them and to their use as inhibitors of the catechol O-methyltransferase (COMT) enzyme.

**BACKGROUND OF THE INVENTION**

10 [0002] Dopamine is deficient in the brain of patients suffering from Parkinson's disease. Levodopa is used orally in the treatment of Parkinson's disease. Levodopa is a dopamine precursor, which is converted to dopamine in the brain. However, only a small portion of orally administered levodopa reaches the brain, because levodopa is metabolized in the peripheral system by COMT as well as by dopa decarboxylase (DDC). COMT metabolizes levodopa by converting it to 3-O-methyldopa, which is therapeutically ineffective and detrimental when competing with levodopa. COMT inhibitors have been shown to be effective in clinical use for the treatment of Parkinson's disease as an adjunct to levodopa therapy.

15 [0003] It is generally thought that the levodopa concentration in plasma reflects the levodopa levels in the brain. It is thus desirable to achieve a high levodopa concentration in plasma. However, optimal levodopa concentration in plasma is not achieved, for example, with the currently used COMT inhibitor entacapone.

20 [0004] COMT inhibitors have also been indicated to be useful in the treatment of, for example, hypertension, heart failure and depression (US 5446194) as well as inhibitors for the prevention of diabetic vascular dysfunctions (WO 98/27973). COMT inhibitors have also been disclosed as being useful for treating or controlling pain (WO 01/68083) as well as for treating restless legs syndrome (RLS), which is also known as Ekbom's syndrome (WO 2006/051154). RLS is characterized by an irresistible urge to move the legs accompanied by other unpleasant sensations deep within the legs.

25 [0005] Some compounds with COMT inhibiting activity are known in the art. Isoflavone derivatives as COMT inhibitors have been disclosed in US 3974184 and CN 101643465 A. Catechol derivatives as COMT inhibitors have been disclosed in US 5236952, US 5446194, WO 96/37456, WO 00/37423, WO 01/98250, WO 01/98251, WO 02/02548, WO 02/22551, WO 2004/112729, WO 2005/058228, WO 2007/010085, WO 2007/013830, WO 2007/063789, WO 2007/117165, JP 2008308493, JP 2008308494, JP 2008308495, EP 2246338 A1, WO 2009/081892, EP 2305633 A1, JP 2011021010, 30 JP 2012051884, and JP 2012051885. 3-Hydroxypyridin-4(1H)-one derivatives, 3-hydroxypyridin-2(1H)-one derivatives, and 5-hydroxypyrimidin-4(3H)-one derivatives as COMT inhibitors have been disclosed in WO 2011/109254, WO 2011/109261, and WO 2011/109267, respectively. Flavone derivatives as COMT inhibitors have been disclosed in CN 102755312 A.

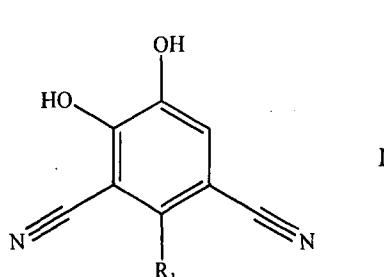

**35 SUMMARY OF THE INVENTION**

[0006] An object of the present invention is to provide further inhibitors of the catechol O-methyltransferase enzyme that can be used for the treatment of diseases or conditions wherein inhibition of COMT is indicated to be useful. Accordingly, an object of the present invention is to provide further compounds to be used as COMT inhibiting agents 40 in the treatment of mammals, including humans and animals. Furthermore, pharmaceutical compositions containing the present compounds are provided.

[0007] The COMT inhibitors of the invention provide in levodopa therapy an improved levodopa concentration in plasma.

**[0071]** The compounds of formula I can be prepared by a variety of synthetic routes analogously to or according to methods known in the literature using suitable starting materials.

**[0072]** While many general methods are available for the generation of a cyano group, most of them are not directly usable in the field of catechol chemistry. For instance, the Sandmeyer reaction provides an extremely reactive catecholic amine as an intermediate which creates serious preparative challenges.

**[0073]** Some methods useful for the preparation of the compounds of formula I are described below. The dicyano grouping can be constructed efficiently using simple starting materials essentially via two ways, either synthesizing two formyl groups simultaneously or building the second formyl group on a benzaldehyde derivative. In both cases the formyl groups are subsequently transformed into cyano groups in good yield. Further transformations provide a useful intermediate from which numerous final products can be formed.

**Scheme 1. Starting from 2-methoxy-5-methylphenol**

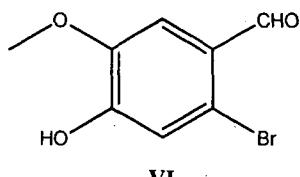

**[0074]** In Scheme 1, 2-methoxy-5-methylphenol is formylated with hexamethylenetetramine in a suitable solvent, e.g. acetic acid. 4-Hydroxy-5-methoxy-2-methylsophthalaldehyde is converted to 4-hydroxy-5-methoxy-2-methylsophthalonitrile with hydroxylamine hydrochloride in a suitable solvent, e.g. formic acid. 4-Hydroxy-5-methoxy-2-methylsophthalonitrile is brominated with N-bromosuccinimide in a suitable solvent, e.g. dichloromethane, to yield 2-(bromomethyl)-4-hydroxy-5-methoxyisophthalonitrile. The bromine atom is then converted to the desired functional group and the desired product is obtained by carrying out a demethylation with a Lewis acid in a suitable solvent, e.g. with aluminum chloride

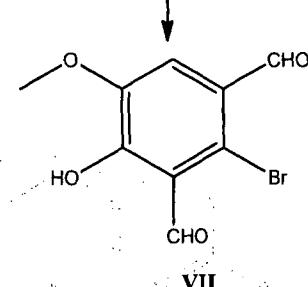

in acetonitrile or with boron tribromide in dichloromethane.

[0075] In Scheme 2, R<sub>1</sub> is as defined above. 2-Bromo-4-hydroxy-5-methoxybenzaldehyde is formylated with hexamethylenetetramine in a suitable solvent, e.g. acetic acid. 2-Bromo-4-hydroxy-5-methoxyisophthalaldehyde is converted to 2-bromo-4-hydroxy-5-methoxyisophthalonitrile with hydroxylamine hydrochloride in a suitable solvent, e.g. formic acid. The bromine atom is replaced with substituent R<sub>1</sub>, for instance, by a Suzuki cross-coupling reaction. 2-Bromo-4-hydroxy-5-methoxyisophthalonitrile is reacted with a suitable boronic acid derivative in a suitable solvent, e.g. 1,4-dioxane/water. Intermediate IX obtained is then demethylated. Alternatively, the demethylation is carried out before replacing the bromine atom with substituent R<sub>1</sub>. The demethylation is carried out with a Lewis acid in a suitable solvent, e.g. with aluminum chloride in acetonitrile or with boron tribromide in dichloromethane. Intermediate IX is not necessarily isolated from the reaction mixture. Another route for the conversion of 2-bromo-4-hydroxy-5-methoxyisophthalaldehyde to product I is depicted in Scheme 5.

Scheme 3. Starting from a 5-substituted 2-methoxyphenol

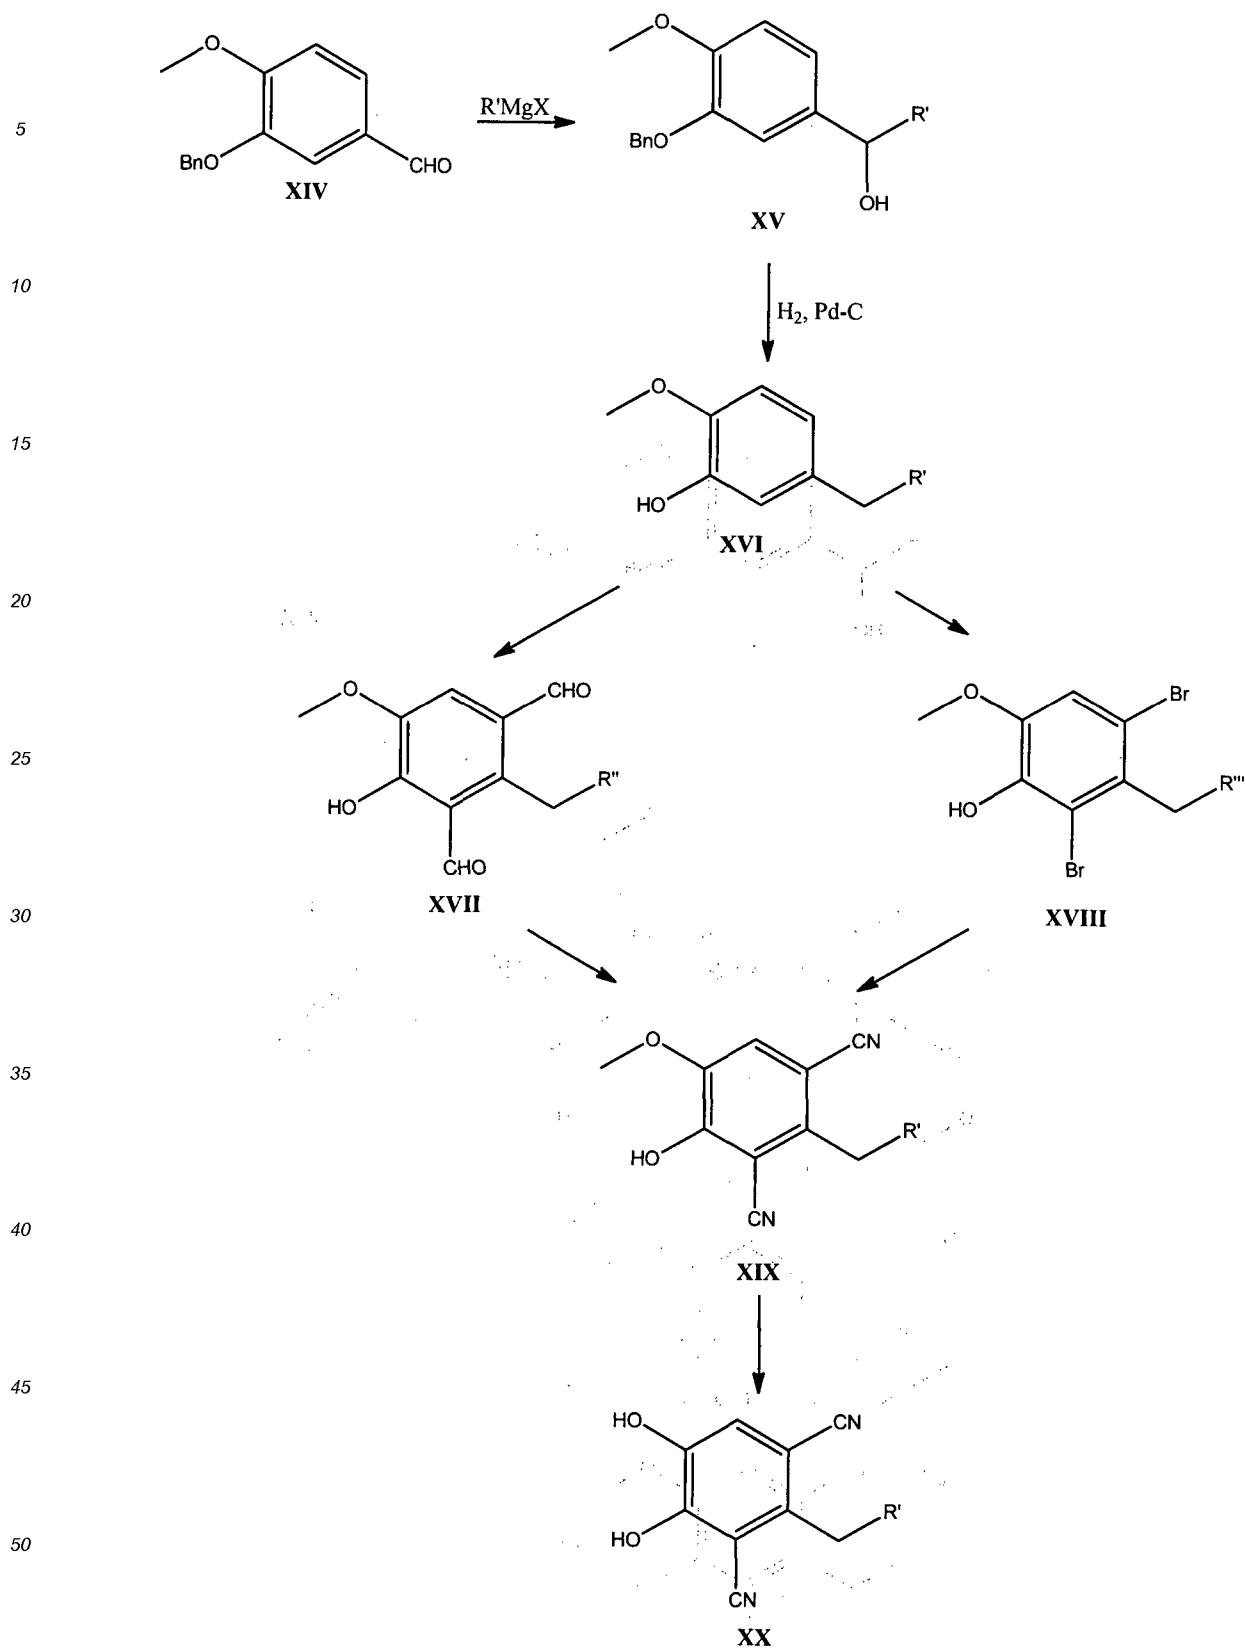

[0076] In Scheme 3, R<sub>1</sub> is as defined above. Compound XI is diformylated, for example, with hexamethylenetetramine in a suitable solvent such as acetic acid or trifluoroacetic acid, or dibrominated, for example, with bromine in a suitable solvent such as a mixture of dichloromethane and acetic acid. Dicyano derivative IX is obtained by reacting diformyl derivative XII with hydroxylamine hydrochloride in a suitable solvent such as formic acid or by reacting dibromo derivative XIII with copper(I) cyanide in a suitable solvent such as N,N-dimethylformamide. Dicyano derivative IX is demethylated with a Lewis acid in a suitable solvent, e.g. with aluminum chloride in acetonitrile or with boron tribromide in dichloromethane.

[0077] In Scheme 4, Bn is benzyl, R' is, for example, (C<sub>1</sub>-C<sub>5</sub>)alkyl or aryl, R" is, for example, (C<sub>1</sub>-C<sub>5</sub>)alkyl, R'" is, for example, aryl, and X is halogen. 3-Benzyl-4-methoxybenzaldehyde is converted to alcohol XV using a suitable Grignard reagent. Compound XVI is obtained by hydrogenating alcohol XV. When R' is, for example, (C<sub>1</sub>-C<sub>5</sub>)alkyl, compound XVI can be diformylated, for example, with hexamethylenetetramine in a suitable solvent such as acetic acid

or trifluoroacetic acid. When R' is, for example, aryl, compound XVI can be dibrominated, for example, with bromine in a suitable solvent such as a mixture of dichloromethane and acetic acid. Dicyano derivative XIX is obtained by reacting diformyl derivative XVII with hydroxylamine hydrochloride in a suitable solvent such as formic acid or by reacting dibromo derivative XVIII with copper(I) cyanide in a suitable solvent such as N,N-dimethylformamide. Dicyano derivative XIX is demethylated with a Lewis acid in a suitable solvent, e.g. with aluminum chloride in acetonitrile or with boron tribromide in dichloromethane.

**[0078]** In Scheme 5, Ac is acetyl and R''' is, for example, aryl-S- or heteroaryl-S-. 2-Bromo-4-hydroxy-5-methoxyisophthalaldehyde, which can be prepared as depicted in Scheme 2, is converted to (1E,1'E)-2-bromo-6-hydroxy-3-((E)-(hydroxyimino)methyl)-5-methoxybenzaldehyde oxime with hydroxylamine hydrochloride in a suitable solvent, e.g. tetrahydrofuran. Treating (1E,1'E)-2-bromo-6-hydroxy-3-((E)-(hydroxyimino)methyl)-5-methoxybenzaldehyde oxime with acetic anhydride yields 3-bromo-2,4-dicyano-6-methoxyphenyl acetate. Dicyano derivative IX is obtained by reacting 3-bromo-2,4-dicyano-6-methoxyphenyl acetate with a suitable thiol in a suitable solvent, e.g. N,N-dimethylformamide. Dicyano derivative IX is demethylated with a Lewis acid in a suitable solvent, e.g. with aluminum chloride in acetonitrile or with boron tribromide in dichloromethane.

**[0079]** It is obvious for a person skilled in the art that any starting material or intermediate in the reactions described above can be protected, if necessary, in a manner well known in the chemical field. For instance, ethyl vanillin can be used instead of vanillin. Any protected functionality can subsequently be deprotected in a manner known in the art.

**[0080]** Stepwise routes can be used. For instance, the dicyano target can be prepared from a suitable starting compound

in the following order: 1) monobromination, 2) monoformylation, 3) conversion of CHO to CN, and 4) conversion of Br to CN. The order of all of these separate steps of bromination, formylation, conversion of CHO to CN and conversion of Br to CN can be optionally changed. For instance, one can start with a formylation. Likewise, if desired, conversion of Br to CN can be carried out prior to conversion of CHO to CN.

5 [0081] The synthetic routes described above are meant to illustrate the preparation of the compounds of formula I and the preparation is by no means limited thereto, i.e., there are also other possible synthetic methods which are within the general knowledge of a person skilled in the art. For instance, formylation can be accomplished also via lithiation of an aromatic methoxy halogenide, e.g. an aromatic methoxy bromide, or an aromatic methoxy dihalogenide, e.g. an aromatic methoxy dibromide, oxidation of a methyl group or reduction of a carboxy group. An aromatic formyl group can be converted into a hydroxy group via a Dakin reaction.

10 [0082] The compounds of formula I may be converted, if desired, into their pharmaceutically acceptable salt or ester form using methods well known in the art.

15 [0083] The present invention will be explained in more detail by the following examples. The examples are meant for illustrating purposes only and do not limit the scope of the invention defined in the claims.

[0416] As already mentioned hereinbefore, the compounds of formula I show interesting pharmacological properties, 35 namely they exhibit COMT inhibiting activity and provide in levodopa therapy an improved levodopa concentration in plasma. Said properties are demonstrated with the pharmacological tests presented below.

**Experiment 1: Determination of COMT inhibiting activity *in vitro***

40 [0417] The inhibitory potency was determined by measuring recombinant human soluble COMT (S-COMT) activity at various compound concentrations. COMT activity measurements were performed according to the method published in Kurkela, M. et al. *Analytical Biochemistry*, 331 (2004) 198 with slight modifications according to Assay 1 or Assay 2 described below.

**45 Assay 1**

[0418] Recombinant human S-COMT (12 nM) was preincubated with the COMT inhibitor and 400  $\mu\text{M}$  S-adenosyl-L-methionine in 100 mM  $\text{Na}_2\text{HPO}_4$  buffer, pH 7.4, containing 5 mM  $\text{MgCl}_2$  for 60 min at 37 °C. The reaction was started with the addition of the substrate esculetin for a final concentration of 2  $\mu\text{M}$  and the production of O-methylated esculetin was followed with the FlexStation fluorescence plate reader (Molecular Probes, USA) using excitation at 355 nm and emission at 460 nm. The inhibitor dissociation constant,  $K_i$ , of the studied compounds was calculated using the Morrison equation, which takes the tight binding inhibition into account (Copeland, R. A. *Evaluation of Enzyme Inhibitors in Drug Discovery: A Guide for Medicinal Chemists and Pharmacologists*, John Wiley & Sons, Inc., Hoboken, NJ, 2005, pp. 185-187):

55

$$\frac{v_i}{v_0} = 1 - \frac{(E + I + K_i) - \sqrt{(E + I + K_i)^2 - 4E \cdot I}}{2E}$$

5

wherein  $v_0$  and  $v_i$  are the reaction velocities in the absence and presence, respectively, of the inhibitor,  $E$  is the active enzyme concentration, and  $I$  is the inhibitor concentration. The data were analyzed with GraphPad Prism version 4.00 software (GraphPad Software, San Diego, CA, USA).

10 **Assay 2**

[0419] Recombinant human S-COMT (0.8 nM) was incubated with the COMT inhibitor and 200  $\mu$ M S-adenosyl-L-methionine in 100 mM Na<sub>2</sub>HPO<sub>4</sub> buffer, pH 7.4, containing 5 mM MgCl<sub>2</sub> for 30 min at 37 °C. The reaction was started with the addition of esculetin for a final concentration of 0.5  $\mu$ M and the reaction mixture with total volume of 200  $\mu$ l was incubated for 30 min at 37 °C. The reaction was stopped with 20  $\mu$ l of 4 M HClO<sub>4</sub> and the precipitated protein was removed by Sirocco protein precipitation plate (centrifuged at 4 °C for 10 min at 3000g). O-Methylated esculetin was detected by Waters HT Alliance HPLC setup with Waters 474 fluorescence detector (Ex 460 nm, Em 460 nm, Gain 100). The analytes were separated isocratically using 0.1 M Na<sub>2</sub>HPO<sub>4</sub>, 20 mM citric acid, 0.15 mM EDTA, pH 3.2, in 40% methanol as mobile phase and Waters Spherisorb ODS2 (3  $\mu$ m, 4.6 mm x 100 mm) column. O-Methylated esculetin concentrations were calculated based on the standard curve and the  $K_i$  values were calculated using the Morrison equation as in Assay 1.

[0420] The results of the determination of COMT inhibiting activity *in vitro* are shown in Table 1. The results show that the compounds of formula I are capable of inhibiting COMT activity *in vitro*.

10 **Experiment 2: Determination of levodopa concentration in rat plasma**

5 [0421] Levodopa concentration in rat plasma was determined substantially as described in e.g. Kim, T. K. et al. European Journal of Pharmaceutical Sciences, 38 (2009) 525. The studies were performed in adult male Wistar rats. The COMT inhibitor was dosed orally over a range of doses and several sampling time points were chosen between 0 min and 300 min after drug administration (levodopa + carbidopa and COMT inhibitor). Blood samples were collected by cardiac puncture under CO<sub>2</sub> anaesthesia into pre-cooled K<sub>2</sub>EDTA tubes and kept on ice until the separation of plasma by centrifugation. For levodopa analysis, 75 µl of separated plasma was pipetted without delay into pre-cooled polypropylene tubes containing a conserving agent. All the samples were stored at -80 °C nominal until analyzed. Plasma levels of levodopa were determined by LC-MS/MS (or HPLC). Standard pharmacokinetic methods were used to evaluate the 15 concentration - time data by non-compartmental analysis modeling. The analyses were performed using WinNonlin® Professional v. 5.0.1.

20 [0422] The results of the determination of levodopa concentration in rat plasma are shown in Table 2. The results show that the compounds of formula I provide an improved levodopa concentration in plasma.

40 [0423] The compounds of formula I exhibit COMT inhibiting activity. The present invention thus provides compounds for use as a medicament. Compounds for use in the treatment of a disease or condition where a COMT inhibiting agent is indicated to be useful are also provided. Furthermore, a method for the treatment of a disease or condition where a COMT inhibiting agent is indicated to be useful is described. In said method a therapeutically effective amount of at least one compound of formula I is administered to a mammal, e.g. human, in need of such treatment..

45 [0424] In one embodiment of the invention the disease where a COMT inhibiting agent is indicated to be useful is Parkinson's disease.

[0425] In one aspect potentiation of therapy with a dopamine precursor, e.g. levodopa, is described.

50 [0426] The compounds of formula I can be administered, for example, enterally, topically or parenterally by means of any pharmaceutical formulation useful for said administration and comprising as active ingredient at least one compound of formula I in pharmaceutically acceptable and effective amounts together with pharmaceutically acceptable diluents, carriers and/or excipients known in the art.

55 [0427] The therapeutic dose to be given to a patient in need of the treatment will vary depending on the compound being administered, the age and the sex of the subject being treated, the particular condition being treated, as well as the route and method of administration, and is easily determined by a person skilled in the art. Accordingly, the typical dosage for oral administration is from 5 µg/kg to 100 mg/kg per day and for parenteral administration from 0.5 µg/kg to 10 mg/kg for an adult mammal.

[0428] The compounds according to this invention are given to a patient as such or in combination with one or more other active ingredients and/or suitable pharmaceutical excipients. The latter group comprises conventionally used excipients and formulation aids, such as fillers, binders, disintegrating agents, lubricants, solvents, gel forming agents,

emulsifiers, stabilizers, colorants and/or preservatives.

[0429] The compounds of formula I are formulated into dosage forms using commonly known pharmaceutical manufacturing methods. The dosage forms can be e.g. tablets, capsules, granules, suppositories, emulsions, suspensions or solutions. Depending on the route of administration and the galenic form, the amount of the active ingredient in a formulation can typically vary between 0.01% and 100% (w/w).

[0430] For the treatment of Parkinson's disease the compounds of formula I can be administered together with levodopa or another dopamine precursor, each in its own composition or combined in a single composition. Also a dopa decarboxylase (DDC) inhibitor, such as benserazide or carbidopa, and/or a monoamine oxidase type B (MAO-B) inhibitor, such as lazabemide, rasagiline, safinamide or selegiline, can be present. The amount of levodopa can be from 50 mg to 400 mg, e.g. from 50 mg to 300 mg, such as from 50 mg to 200 mg. The amount of carbidopa can be from 5 mg to 200 mg, e.g. from 10 mg to 150 mg, such as from 20 mg to 110 mg.

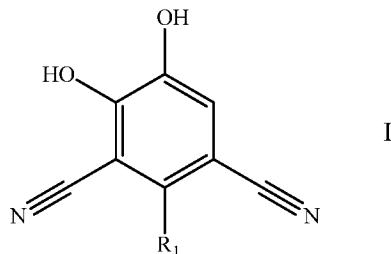

[0431] If all active ingredients are not combined in a single composition, the amount of daily administrations of the active ingredients can vary. For instance, the composition comprising a compound of formula I can be administered once a day and the composition comprising a dopamine precursor and a DDC inhibitor can be administered three times a day.

[0432] The DDC inhibitor and the dopamine precursor, such as levodopa, are typically administered in a ratio of from 1:1 to 1:40, e.g. from 1:4 to 1:10.

[0433] The daily dose of lazabemide is typically from 100 mg to 800 mg, e.g. from 100 mg to 200 mg, divided into 1 to 10 individual doses, e.g. 1 to 2 individual doses. The daily dose of rasagiline is typically from 0.1 mg to 5 mg, e.g. from 0.5 mg to 2 mg, divided into 1 to 10 individual doses, e.g. 1 to 2 individual doses. The daily dose of safinamide is typically from 10 mg to 600 mg, e.g. from 50 mg to 150 mg, divided into 1 to 10 individual doses, e.g. 1 to 2 individual doses. The daily dose of selegiline is typically from 1 mg to 20 mg, e.g. from 2 mg to 10 mg, divided into 1 to 10 individual doses, e.g. 1 to 2 individual doses.
