3,5-DIAMINOPYRAZOLE KINASE INHIBITORS

CROSS-REFERENCE TO RELATED APPLICATIONS

[0001] This application claims the benefit of priority to U.S. Provisional Patent Application Serial No. 61/612,007, filed March 16, 2012, the disclosure of which is incorporated by reference herein in its entirety.

FIELD

[0002] Provided herein are 3,5-diaminopyrazoles that are useful for modulating regulated-in-COPD kinase (RC kinase) activity, and pharmaceutical compositions thereof. Also provided herein are methods of their use for treating, preventing, or ameliorating one or more symptoms of a RC kinase-mediated disorder, disease, or condition.

BACKGROUND

[0003] Regulated-in-COPD kinase (RC kinase) is closely related to MAPKKK3, which directly regulates the pathways of stress-activated protein kinase (SAPK) and extracellular signal-regulated protein kinase (ERK) by activating SEK and MEK1/2, respectively. See, U.S. Pat. No. 7,829,685, the disclosure of which is incorporated herein by reference in its entirety. RC kinase is an upstream activator in MAP kinase signaling cascades, capable of phosphorylating MAP kinase kinases such as MKK4 and MKK6. The activation of MKK4 leads to the phosphorylation of JNK-type MAP kinases, leading to the phosphorylation of c-Jun and thus the activation of the AP-1 transcription factor complex. As a result, interleukin-8 production is increased, leading to the recruitment of inflammatory cells, such as neutrophils. The activation of MKK6 leads to the phosphorylation of p38-type MAP kinases, which is important in the activation of the immune response and key regulators of inflammatory cytokine expression. The occurrence of cellular stresses, the activation of the transcription factor, and the overproduction of interleukin-8 are characteristic of numerous inflammatory diseases. Thus, the regulation of RC kinase activity can potentially be beneficial to patients with inflammatory diseases.

[0004] RC kinase has been shown to be highly expressed in the lung and trachea. Some of the expressed sequence tags of human RC kinase are also expressed in the lung epithelial cells and in primary lung cystic fibrosis epithelial cells. Microarray analyses of
patients with chronic obstructive pulmonary disease (COPD) show that RC kinase is upregulated in the lungs of COPD patients. On cellular level, it has been shown that the expression of RC kinase is upregulated in response to a hyperosmotic or oxidative stress. For example, the expression of RC kinase in cells increase significantly after exposure to potassium chloride or hydrogen peroxide. Potassium chloride subjects cells to a hyperosmotic stress. Hydrogen peroxide subjects cells to an oxidative stress, which impairs the capacity of B cells to stimulate specific T cells. Such upregulation of RC kinase in cells in response to hyperosmotic and oxidative stress suggests that higher expression of RC kinase in lungs of COPD patients may be the result of cellular stresses caused by the irritants in tobacco smoke or stresses caused by inflammatory response to those irritants.

[0005] Therefore, RC kinase inhibitors are potentially useful for the treatment of inflammatory diseases, including COPD.

[0037] In describing an optically active compound, the prefixes R and S are used to
denote the absolute configuration of the molecule about its chiral center(s). The (+) and (-) are used to denote the optical rotation of the compound, that is, the direction in which a plane of polarized light is rotated by the optically active compound. The (-) prefix indicates that the compound is levorotatory, that is, the compound rotates the plane of polarized light to the left or counterclockwise. The (+) prefix indicates that the compound is dextrorotatory, that is, the compound rotates the plane of polarized light to the right or clockwise. However, the sign of optical rotation, (+) and (-), is not related to the absolute configuration of the molecule, R and S.

In certain embodiments, an "isotopic variant" of a compound contains a unnatural proportion of deuterium.

[0039] The term "solvate" refers to a complex or aggregate formed by one or more molecules of a solute, \textit{e.g.}, a compound provided herein, and one or more molecules of a solvent, which present in a stoichiometric or non-stoichiometric amount. Suitable solvents include, but are not limited to, water, methanol, ethanol, n-propanol, isopropanol, and acetic acid. In certain embodiments, the solvent is pharmaceutically acceptable. In one embodiment, the complex or aggregate is in a crystalline form. In another embodiment, the complex or aggregate is in a noncrystalline form. Where the solvent is water, the solvate is a hydrate. Examples of hydrates include, but are not limited to, a hemihydrate, monohydrate, dihydrate, trihydrate, tetrahydrate, and pentahydrate.

[0040] The term "naturally occurring" or "native" when used in connection with biological materials such as nucleic acid molecules, polypeptides, host cells, and the like, refers to materials which are found in nature and are not manipulated by man. Similarly, "non-naturally occurring" or "non-native" refers to a material that is not found in nature or that has been structurally modified or synthesized by man.

[0041] The term "RC kinase" refers to regulated in COPD kinase or a variant thereof. RC kinase variants include proteins substantially homologous to a native RC kinase, \textit{i.e.}, proteins having one or more naturally or non-naturally occurring amino acid deletions, insertions, or substitutions \textit{e.g.}, RC kinase derivatives, homologs and fragments), as compared to the amino acid sequence of a native RC kinase. The amino acid sequence of a RC kinase variant is at least about 80\% identical, at least about 90\% identical, or at least about 95\% identical to a native RC kinase. Some examples of RC kinases are disclosed in U.S. Pat. No. 7,829,685, the disclosure of which is incorporated herein by reference in its entirety.

[0042] The terms "RC kinase-mediated disorder, disease, or condition" and "a disorder, disease, or condition mediated by RC kinase" refer to a disorder, disease, or
condition, characterized by abnormal or dysregulated, e.g., less than or greater than normal, RC kinase activity. Abnormal RC kinase functional activity might arise as the result of RC kinase overexpression in cells, expression of RC kinase in cells which normally do not express RC kinase, or dysregulation due to constitutive activation, caused, for example, by a mutation in RC kinase. A RC kinase-mediated disorder, disease, or condition may be completely or partially mediated by abnormal or dysregulated RC kinase activity. In particular, a RC kinase-mediated disorder, disease, or condition is one in which modulation of a RC kinase activity results in some effect on the underlying disorder, disease, or condition, e.g., a RC kinase inhibitor results in some improvement in at least some of patients being treated.

and stereoisomers, enantiomers, mixtures of enantiomers, mixtures of diastereomers, and isotopic variants thereof; and pharmaceutically acceptable salts, solvates, hydrates, and prodrugs thereof.

[00160] The compounds provided herein are intended to encompass all possible stereoisomers, unless a particular stereochemistry is specified. Where the compound provided herein contains an alkenyl or alkenylene group, the compound may exist as one or a mixture of geometric cis/trans (or Z/E) isomers. Where structural isomers are interconvertible, the compound may exist as a single tautomer or a mixture of tautomers.
This can take the form of proton tautomerism in the compound that contains, for example, an imino, keto, or oxime group; or so-called valence tautomerism in the compound that contain an aromatic moiety. It follows that a single compound may exhibit more than one type of isomerism.

[00161] The compounds provided herein may be enantiomerically pure, such as a single enantiomer or a single diastereomer, or be stereoisomeric mixtures, such as mixture of enantiomers, e.g., a racemic mixture of two enantiomers; or a mixture of two or more diastereomers. As such, one of skill in the art will recognize that administration of a compound in its (R) form is equivalent, for compounds that undergo epimerization in vivo, to administration of the compound in its (S) form. Conventional techniques for the preparation/isolation of individual enantiomers include synthesis from a suitable optically pure precursor, asymmetric synthesis from achiral starting materials, or resolution of an enantiomeric mixture, for example, chiral chromatography, recrystallization, resolution, diastereomeric salt formation, or derivatization into diastereomeric adducts followed by separation.

[00162] When the compound provided herein contains an acidic or basic moiety, it may also be provided as a pharmaceutically acceptable salt. See, Berge et al., J. Pharm. Sci. 1977, 66, 1-19; and Handbook of Pharmaceutical Salts, Properties, and Use; Stahl and Wermuth, Ed.; Wiley-VCH and VHCA: Zurich, Switzerland, 2002.

[00164] Suitable bases for use in the preparation of pharmaceutically acceptable salts, including, but not limited to, inorganic bases, such as magnesium hydroxide, calcium hydroxide, potassium hydroxide, zinc hydroxide, or sodium hydroxide; and organic bases, such as primary, secondary, tertiary, and quaternary, aliphatic and aromatic amines, including L-arginine, benethamine, benzathine, choline, deanol, diethanolamine, diethylamine, dimethylamine, dipropylamine, diisopropylamine, 2-(diethylamino)-ethanol, ethanolamine, ethylamine, ethylenediamine, isopropylamine, N-methyl-glucamine, hydrabamine, 1H-imidazole, L-lysine, morpholine, 4-(2-hydroxyethyl)-morpholine, methylamine, piperidine, piperazine, propylamine, pyrrolidine, 1-(2-hydroxyethyl)-pyrrolidine, pyridine, quinuclidine, quinoline, isoquinoline, secondary amines, triethanolamine, trimethylamine, triethyamine, N-methyl-D-glucamine, 2-amino-2-(hydroxymethyl)-1,3-propanediol, and tromethamine.

Methods of Synthesis

[00166] The compounds provided herein can be prepared, isolated, or obtained by any method known to one of skill in the art; and the following examples are only representative and do not exclude other related methods and procedures.

[00167] In one embodiment, for example, a compound of Formula IA can be prepared as shown in Scheme I. Compound 1-1 is first converted to compound 1-2 by reacting with carbon disulfide and dimethylsulfate. Compound 1-2 then reacts with an amine, such as R2NH2, to form compound 1-3. Subsequently, compound 1-3 reacts with hydrazine to form
compound 1-4, which is then treated with a carbonyl compound, such as an aldehyde \( R_{4a}^{\text{CHO}} \) or ketone \( R_{4a}^{\text{COR}} \), to form a compound of Formula IA, e.g., compound 1-5.

![Scheme I](image)

In another embodiment, for example, a compound of Formula IA can be prepared as shown in Scheme II. Compound 1-7 reacts an amine, such as \( R_{2}^{\text{NH}} \), to form compound 1-8. Alternatively, compound 1-8 can be made by reacting an isothiocyanate (\( R_{2}^{\text{NCS}} \)) with malononitrile and methyl iodide. Compound 1-8 is then treated with hydrazine to form compound 1-9, which reacts with a carbonyl compound, such as an aldehyde \( R_{4a}^{\text{CHO}} \), or ketone \( R_{4a}^{\text{COR}} \), to form a compound of Formula IA, compound 1-10.

![Scheme II](image)
In yet another embodiment, for example, a compound of Formula IA can be prepared as shown in Scheme III. The cyano group of compound 1-9 is converted to aminocarbonyl, e.g., by reacting with hydrogen peroxide. Compound 1-4 can then be converted into compounds 1-5 as described herein.

In still another embodiment, for example, a compound of Formula IA can be prepared as shown in Scheme IV. Compound 1-7 is first treated with a hydrazine to form compound 1-12, which is then treated with a carbonyl compound, such as an aldehyde R^4aCHO or ketone R^4aCOR^4b, to form a compound of Formula IA, compound 1-13, followed by the reaction with an amine, such as R^2NH₂, to form compound 1-10.
Pharmaceutical Compositions

[00171] Provided herein are pharmaceutical compositions comprising a compound provided herein, e.g., a compound of Formula IA, as an active ingredient, including a stereoisomer, enantiomer, mixture of enantiomers, mixture of diastereomers, or isotopic variant thereof; or a pharmaceutically acceptable salt, solvate, hydrate, or prodrug thereof; and a pharmaceutically excipient.

[00172] Suitable excipients are well known to those skilled in the art, and non-limiting examples of suitable excipients are provided herein. Whether a particular excipient is suitable for incorporation into a pharmaceutical composition or dosage form depends on a variety of factors well known in the art, including, but not limited to, the method of administration. For example, oral dosage forms such as tablets may contain excipients not suited for use in parenteral dosage forms. The suitability of a particular excipient may also depend on the specific active ingredients in the dosage form. For example, the decomposition of some active ingredients may be accelerated by some excipients such as lactose, or when exposed to water. Active ingredients that comprise primary or secondary amines are particularly susceptible to such accelerated decomposition. Consequently, provided herein are pharmaceutical compositions and dosage forms that contain little, if any, lactose, or other mono- or di-saccharides. As used herein, the term "lactose-free" means that the amount of lactose present, if any, is insufficient to substantially increase the degradation rate of an active ingredient. In one embodiment, lactose-free compositions comprise an active ingredient provided herein, a binder/filler, and a lubricant. In another embodiment, lactose-free dosage forms comprise an active ingredient, microcrystalline cellulose, pre-
gelatinized starch, and magnesium stearate.

[00173] The compound provided herein may be administered alone, or in combination with one or more other compounds provided herein. The pharmaceutical compositions that comprise a compound provided herein, e.g., a compound of Formula IA, including a stereoisomer, enantiomer, mixture of enantiomers, mixture of diastereomers, or isotopic variant thereof; or a pharmaceutically acceptable salt, solvate, hydrate, or prodrug thereof, can be formulated in various dosage forms for oral, parenteral, and topical administration. The pharmaceutical compositions can also be formulated as modified release dosage forms, including delayed-, extended-, prolonged-, sustained-, pulsatile-, controlled-, accelerated-, fast-, targeted-, programmed-release, and gastric retention dosage forms. These dosage forms can be prepared according to conventional methods and techniques known to those skilled in the art (see, Remington: The Science and Practice of Pharmacy, supra; Modified-Release Drug Delivery Technology, 2nd ed.; Rathbone et al., Eds.; Marcel Dekker, Inc.: New York, NY, 2008).

[00174] In one embodiment, the pharmaceutical compositions are provided in a dosage form for oral administration, which comprise a compound provided herein, e.g., a compound of Formula IA, including a stereoisomer, enantiomer, mixture of enantiomers, mixture of diastereomers, or isotopic variant thereof; or a pharmaceutically acceptable salt, solvate, hydrate, or prodrug thereof; and one or more pharmaceutically acceptable excipients.

[00175] In another embodiment, the pharmaceutical compositions are provided in a dosage form for parenteral administration, which comprise a compound provided herein, e.g., a compound of Formula IA, including a stereoisomer, enantiomer, mixture of enantiomers, mixture of diastereomers, or isotopic variant thereof; or a pharmaceutically acceptable salt, solvate, hydrate, or prodrug thereof; and one or more pharmaceutically acceptable excipients.

[00176] In yet another embodiment, the pharmaceutical compositions are provided in a dosage form for topical administration, which comprise a compound provided herein, e.g., a compound of Formula IA, including a stereoisomer, enantiomer, mixture of enantiomers, mixture of diastereomers, or isotopic variant thereof; or a pharmaceutically acceptable salt, solvate, hydrate, or prodrug thereof; and one or more pharmaceutically acceptable excipients.

[00177] The pharmaceutical compositions provided herein can be provided in a unit-dosage form or multiple-dosage form. A unit-dosage form, as used herein, refers to
physically discrete a unit suitable for administration to a human and animal subject, and
packaged individually as is known in the art. Each unit-dose contains a predetermined
quantity of an active ingredient(s) sufficient to produce the desired therapeutic effect, in
association with the required pharmaceutical carriers or excipients. Examples of a unit-
dosage form include an ampoule, syringe, and individually packaged tablet and capsule. For
example, a 100 mg unit dose contains about 100 mg of an active ingredient in a packaged
tablet or capsule. A unit-dosage form may be administered in fractions or multiples thereof.
A multiple-dosage form is a plurality of identical unit-dosage forms packaged in a single
container to be administered in segregated unit-dosage form. Examples of a multiple-dosage
form include a vial, bottle of tablets or capsules, or bottle of pints or gallons.

[00178] The pharmaceutical compositions provided herein can be administered at
once, or multiple times at intervals of time. It is understood that the precise dosage and
duration of treatment may vary with the age, weight, and condition of the patient being
treated, and may be determined empirically using known testing protocols or by extrapolation
from in vivo or in vitro test or diagnostic data. It is further understood that for any particular
individual, specific dosage regimens should be adjusted over time according to the individual
need and the professional judgment of the person administering or supervising the
administration of the formulations.

A. Oral Administration

[00179] The pharmaceutical compositions provided herein for oral administration can

Modified release dosage forms include, but are not limited to, delayed-, extended-, prolonged-, sustained-, pulsatile-, controlled-, accelerated- and fast-, targeted-, programmed-release, and gastric retention dosage forms. The pharmaceutical compositions in modified release dosage forms can be prepared using a variety of modified release devices and methods known to those skilled in the art, including, but not limited to, matrix controlled release devices, osmotic controlled release devices, multiparticulate controlled release devices, ion-exchange resins, enteric coatings, multilayered coatings, microspheres, liposomes, and combinations thereof. The
release rate of the active ingredient(s) can also be modified by varying the particle sizes and polymorphorism of the active ingredient(s).

1. Matrix Controlled Release Devices

[00223] The pharmaceutical compositions provided herein in a modified release dosage form can be fabricated using a matrix controlled release device known to those skilled in the art. See, Takada et al. in Encyclopedia of Controlled Drug Delivery; Mathiowitz Ed.; Wiley: 1999; Vol 2.

[00224] In certain embodiments, the pharmaceutical compositions provided herein in a modified release dosage form is formulated using an erodible matrix device, which is water-swellable, erodible, or soluble polymers, including, but not limited to, synthetic polymers, and naturally occurring polymers and derivatives, such as polysaccharides and proteins.

[00225] Materials useful in forming an erodible matrix include, but are not limited to, chitin, chitosan, dextran, and pullulan; gum agar, gum arabic, gum karaya, locust bean gum,
In certain embodiments, the pharmaceutical compositions provided herein are formulated with a non-erodible matrix device. The active ingredient(s) is dissolved or dispersed in an inert matrix and is released primarily by diffusion through the inert matrix once administered. Materials suitable for use as a non-erodible matrix device include, but are not limited to, insoluble plastics, such as polyethylene, polypropylene, polyisoprene, polyisobutylene, polybutadiene, polymethylmethacrylate, polybutylmethacrylate, chlorinated polyethylene, polyvinylchloride, methyl acrylate-methyl methacrylate copolymers, ethylene-vinyl acetate copolymers, ethylene/propylene copolymers, ethylene/ethyl acrylate copolymers, vinyl chloride copolymers with vinyl acetate, vinylidene chloride, ethylene and propylene, ionomer polyethylene terephthalate, butyl rubbers, epichlorohydrin rubbers, ethylene/vinyl alcohol copolymer, ethylene/vinyl acetate/vinyl alcohol terpolymer, ethylene/vinylxyethanol copolymer, polyvinyl chloride, plasticized nylon, plasticized polyethylene terephthalate, natural rubber, silicone rubbers, polydimethylsiloxanes, and silicone carbonate copolymers; hydrophilic polymers, such as ethyl cellulose, cellulose acetate, crospovidone, and cross-linked partially hydrolyzed polyvinyl acetate; and fatty compounds, such as carnauba wax, microcrystalline wax, and triglycerides.
In a matrix controlled release system, the desired release kinetics can be controlled, for example, via the polymer type employed, the polymer viscosity, the particle sizes of the polymer and/or the active ingredient(s), the ratio of the active ingredient(s) versus the polymer, and other excipients or carriers in the compositions.

The pharmaceutical compositions provided herein in a modified release dosage form can be prepared by methods known to those skilled in the art, including direct compression, dry or wet granulation followed by compression, and melt-granulation followed by compression.

2. Osmotic Controlled Release Devices

The pharmaceutical compositions provided herein in a modified release dosage form can be fabricated using an osmotic controlled release device, including, but not limited to, one-chamber system, two-chamber system, asymmetric membrane technology (AMT), and extruding core system (ECS). In general, such devices have at least two components: (a) a core which contains an active ingredient; and (b) a semipermeable membrane with at least one delivery port, which encapsulates the core. The semipermeable membrane controls the influx of water to the core from an aqueous environment of use so as to cause drug release by extrusion through the delivery port(s).

In addition to the active ingredient(s), the core of the osmotic device optionally includes an osmotic agent, which creates a driving force for transport of water from the environment of use into the core of the device. One class of osmotic agents is water-swellable hydrophilic polymers, which are also referred to as "osmopolymers" and "hydrogels." Suitable water-swellable hydrophilic polymers as osmotic agents include, but are not limited to, hydrophilic vinyl and acrylic polymers, polysaccharides such as calcium alginate, polyethylene oxide (PEO), polyethylene glycol (PEG), polypropylene glycol (PPG), poly(2-hydroxyethyl methacrylate), poly(acrylic) acid, poly(methacrylic) acid, polyvinylpyrrolidone (PVP), crosslinked PVP, polyvinyl alcohol (PVA), PVA/PVP copolymers, PVA/PVP copolymers with hydrophobic monomers such as methyl methacrylate and vinyl acetate, hydrophilic polyurethanes containing large PEO blocks, sodium croscarmellose, carrageenan, hydroxyethyl cellulose (HEC), hydroxypropyl cellulose (HPC), hydroxypropyl methyl cellulose (HPMC), carboxymethyl cellulose (CMC) and carboxyethyl, cellulose (CEC), sodium alginate, polycarbophil, gelatin, xanthan gum, and sodium starch.
glycolate.

[00231] The other class of osmotic agents is osmogens, which are capable of imbibing water to affect an osmotic pressure gradient across the barrier of the surrounding coating. Suitable osmogens include, but are not limited to, inorganic salts, such as magnesium sulfate, magnesium chloride, calcium chloride, sodium chloride, lithium chloride, potassium sulfate, potassium phosphates, sodium carbonate, sodium sulfate, lithium sulfate, potassium chloride, and sodium sulfate; sugars, such as dextrose, fructose, glucose, inositol, lactose, maltose, mannitol, raffinose, sorbitol, sucrose, trehalose, and xylitol; organic acids, such as ascorbic acid, benzoic acid, fumaric acid, citric acid, maleic acid, sebacic acid, sorbic acid, adipic acid, edetic acid, glutamic acid, p-toluenesulfonic acid, succinic acid, and tartaric acid; urea; and mixtures thereof.

[00232] Osmotic agents of different dissolution rates can be employed to influence how rapidly the active ingredient(s) is initially delivered from the dosage form. For example, amorphous sugars, such as MANNOGEM™ EZ (SPI Pharma, Lewes, DE) can be used to provide faster delivery during the first couple of hours to promptly produce the desired therapeutic effect, and gradually and continually release of the remaining amount to maintain the desired level of therapeutic or prophylactic effect over an extended period of time. In this case, the active ingredient(s) is released at such a rate to replace the amount of the active ingredient metabolized and excreted.

[00233] The core can also include a wide variety of other excipients and carriers as described herein to enhance the performance of the dosage form or to promote stability or processing.

[00234] Materials useful in forming the semipermeable membrane include various grades of acrylics, vinyls, ethers, polyamides, polyesters, and cellululosic derivatives that are water-permeable and water-insoluble at physiologically relevant pHs, or are susceptible to being rendered water-insoluble by chemical alteration, such as crosslinking. Examples of suitable polymers useful in forming the coating, include plasticized, unplasticized, and reinforced cellulose acetate (CA), cellulose diacetate, cellulose triacetate, CA propionate, cellulose nitrate, cellulose acetate butyrate (CAB), CA ethyl carbamate, CAP, CA methyl carbamate, CA succinate, cellulose acetate trimellitate (CAT), CA dimethylaminoacetate, CA ethyl carbonate, CA chloroacetate, CA ethyl oxalate, CA methyl sulfonate, CA butyl
sulfonate, CA p-toluene sulfonate, agar acetate, amylose triacetate, beta glucan acetate, beta glucan triacetate, acetaldehyde dimethyl acetate, triacetate of locust bean gum, hydroxylated ethylene-vinylacetate, EC, PEG, PPG, PEG/PPG copolymers, PVP, HEC, HPC, CMC, CMEC, HPMC, HPMCP, HPMCAS, HPMECAT, poly(acrylic) acids and esters and poly-(methacrylic) acids and esters and copolymers thereof, starch, dextran, dextrin, chitosan, collagen, gelatin, polyalkenes, polyethers, polysulfones, polyethersulfones, polystyrenes, polyvinyl halides, polyvinyl esters and ethers, natural waxes, and synthetic waxes.

[00235] Semipermeable membrane can also be a hydrophobic microporous membrane, wherein the pores are substantially filled with a gas and are not wetted by the aqueous medium but are permeable to water vapor, as disclosed in U.S. Pat. No. 5,798,119. Such hydrophobic but water-vapor permeable membrane are typically composed of hydrophobic polymers such as polyalkenes, polyethylene, polypropylene, polytetrafluoroethylene, polyacrylic acid derivatives, polyethers, polysulfones, polyethersulfones, polystyrenes, polyvinyl halides, polyvinylidene fluoride, polyvinyl esters and ethers, natural waxes, and synthetic waxes.

[00236] The delivery port(s) on the semipermeable membrane can be formed post-coating by mechanical or laser drilling. Delivery port(s) can also be formed in situ by erosion of a plug of water-soluble material or by rupture of a thinner portion of the membrane over an indentation in the core. In addition, delivery ports can be formed during coating process, as in the case of asymmetric membrane coatings of the type disclosed in U.S. Pat. Nos. 5,612,059 and 5,698,220.

[00237] The total amount of the active ingredient(s) released and the release rate can substantially by modulated via the thickness and porosity of the semipermeable membrane, the composition of the core, and the number, size, and position of the delivery ports.

Example II

Enzymatic Assays for Kinase Inhibitory Activity

[S00347] Solutions of a test compound, Crebtide (a substrate), a kinase, and ATP were prepared using 1x MAPK Buffer (50 mM HEPES, 1 mM EGTA, 10 mM EGTA, 10 mM MgCl₂, 2 mM DTT, and 0.01% Tween 20). The test compound solution had a concentration of either 10 µM or 10 x IC₅₀ of the compound. The Crebtide solution had a concentration of 200 nM. The kinase domain protein of RC kinase had a concentration of 3 mg/mL. The full-length kinase protein of RC kinase had a concentration of 40 mg/mL. ATP had a concentration of 4 µM when the kinase domain protein was used or 12 µM when the full-length protein was used in the assay.

[S00348] To each well, the test compound (1 µL) was first added (in duplicate) to reach a final concentration of 1 µM or 1 x IC₅₀ of the compound. The kinase (5 µL) was then added to each well to reach a final concentration of 1 mg/mL for the kinase domain or 20 mg/mL for the full-length domain. Each plate included a positive and negative controls in duplicate wells. Crebtide (2.5 µL) was then added to each well in duplicate to reach a final concentration of 50 nM. If the full-length kinase was used, the plates were incubated for 45 min at room temperature before proceeding further. ATP (2.5 µL) was added to each well to
reach a final concentration of 1 µM for the kinase domain and 3 µM for the full-length.

[00349] After the addition of ATP, the plates were incubated for 45 min at room temperature. During the incubation, an EDTA solution (40 mM) and anti-Crebtide (16 mM) were prepared. Additionally, a detection buffer stock solution was diluted ten fold before use.

[00350] After the incubation, the anti-Crebtide (5 µL) and EDTA (5 µL) were added to each well to reach their final concentrations of 4 mM and 10 mM, respectively. The plates were allowed to develop at room temperature for 45 min. The plates were then read at 665 nm and 615 nm using Perkin Elmer Lance machine.

[00351] The biological results of inhibition of the kinase domain protein of RC kinase are summarized in Tables 2 and 3, wherein A represents at least 50% inhibition of the RC kinase activity at 1 µM; B represents no greater than 50% but at least 20% inhibition of the RC kinase activity at 1 µM; C represents no greater than 20% but at least 5% inhibition of the RC kinase activity at 1 µM; and D represents no greater than 5% inhibition of the RC kinase activity at 1 µM.
