UNITED STATES PATENT OFFICE.

DAVID HAIGH, OF MUNCIE, INDIANA, ASSIGNOR OF ONE-HALF TO JOHN LENOX, OF HARTFORD CITY, INDIANA.

COMBINED CURTAIN-POLE AND SHADE HOLDER.

SPECIFICATION forming part of Letters Patent No. 780,794, dated January 24, 1905.

Application filed June 15, 1903. Serial No. 161,592.

To all whom it may concern:

Be it known that I, DAVID HAIGH, a citizen of the United States, and a resident of Muncie, county of Delaware, and State of Indiana, have invented a new and useful Combined Curtain-Pole and Shade Holder, of which the following is a specification.

The aim and purpose of this invention is to construct a curtain-pole and shade holder which can be readily fastened or taken down from the window-casing and which can be fastened in position without the aid of nails or screws being driven into the woodwork.

A further object is to provide an ornamental device and one which can be cheaply and easily manufactured.

These and other objects not hereinbefore mentioned are accomplished by the construction illustrated in the accompanying drawings, wherein like letters of reference indicate corresponding parts in the several views, and in which—

Figure 1 is a front elevation of the upper portion of a window-casing, showing my holders secured in place. Fig. 2 is a top plan view of one corner of the upper portion of the casing, showing one of my holders secured in place. Fig. 3 is a side elevation of the same. Fig. 4 is a rear view of the plate and bracket detached from the casing.

In the drawings, A designates the upper portion of the window, and B the inner and outer corner-blocks.

C and D designate the securing-plates, respectively. The ends of these plates are bent inwardly, as shown at C' and D', and are provided with the sharp points C'' and D'' for engaging the sides of the casing. The two plates C and D are slidably secured together by means of the clamps E on the plate D. The clamp E prevents the inner plate C from bearing against the front face of the casing. The plate C is provided with a screw-threaded shank F on its end opposite from the points. This screw-threaded shank extends through an aperture in the portion D' of the plate D.

F' designates a thumb-nut on the shank. In securing the plates to the corner of the casing the nut is screwed up on the shank and bears against the portion D' on the plate D. This operation will draw the two plates together and force the points on the plates into the sides of the casing.

H designates the bracket, which supports the curtain-pole and shade. The bracket is provided with a hook portion H', which fits over the plate C, as shown in Fig. 3. The bracket is provided with a shade-holder I and a curtain-pole holder K. The lower inner portion of the bracket is provided with a portion L, which bears against the side of the casing. By having the inner plate spaced apart away from the front of the casing there will always be room for the hook portion H' on the bracket to be placed upon the plate C.

Having thus described my invention, what I claim as new, and desire to secure by Letters Patent, is—

The combination with a shade and curtain-pole holder, of an inner and outer plate horizontally disposed and slidably secured together, the outer ends of the plates being provided with inwardly-turned portions and points projecting from the inwardly-turned portions adapted to engage the sides of the casing, the inner plate being spaced from the front of the casing, a screw-threaded shank on the inner plate extending through the inwardly-extending portion D' of the outer plate, a nut on the shank adapted to be screwed against the portion D', and a combined curtain-pole and shade holding bracket having an integral hook portion H' for detachably securing the bracket to the inner plate.

In testimony whereof I have hereunto affixed my signature in the presence of two witnesses.

DAVID HAIGH.
