TECHNICAL FIELD

This invention relates to compounds useful for treating disorders mediated by acyl coA-diacylglycerol acyl transferase 1 (DGAT1), e.g. metabolic disorders. The invention also provides methods of treating such disorders, and compounds and compositions etc. for their treatment.

BACKGROUND ART

Although triglycerides (also known as "triacylglycerides") are essential for normal physiology, excess triglyceride accumulation results in obesity and, particularly when it occurs in nonadipose tissues, is associated with insulin resistance. Obesity increases the risk of many common and serious conditions, including coronary heart disease, hypertension, dyslipidemia, atherosclerosis, type-II diabetes, stroke, osteoarthritis, restrictive pulmonary disease, sleep apnoea, certain types of cancers and inflammatory disorders. The standard treatment for obesity is calorific restriction and increase of physical exercise. However, such approaches are rarely successful and pharmaceutical treatments are required to correct these metabolic disorders.

A potential therapy for these conditions therefore involves inhibiting triglyceride synthesis. Diacylglycerol acyl-transferase (DGAT) is an enzyme that catalyzes the last step in triacylglycerol biosynthesis. DGAT catalyzes the coupling of a 1,2-diacylglycerol with a fatty acyl-CoA resulting in Coenzyme A and triacylglycerol. Two enzymes that display DGAT activity have been identified: DGAT1 (acyl coA-diacylglycerol acyl transferase 1) [Cases et al., Proc. Natl. Acad. Sci. 1998, 95:13018-13023] and DGAT2 (acyl coA-diacylglycerol acyl transferase 2) [Cases et al., J. Biol. Chem. 2001, 276:38870-38876].

DGAT1 and DGAT2 do not share significant protein sequence homology. Importantly, however, DGAT1 knockout mice are protected from high fat diet-induced weight gain and insulin resistance [Smith et al., Nature Genetics 2000, 25:87-90]. The phenotype of the DGAT1 knockout mice suggests that DGAT1 inhibitors would be useful for the treatment of obesity and obesity-associated complications [Smith et al., Nature Genetics 2000, 25:87-90].
There is therefore a need for compounds which inhibit the activity of DGAT1.

Compounds of Formula (I)-(IV) etc. and Derivatives Thereof

As used herein, the terms "compounds of the invention" and "compound of formula (I)" etc. include pharmaceutically acceptable derivatives thereof and polymorphs, isomers and isotopically labelled variants thereof. Furthermore, the term "compounds of the invention" and "compound of formula (I)" etc. include compounds of formula (II), (III) and (IV), and the embodiments thereof disclosed herein.

Pharmaceutically acceptable derivatives

The term "pharmaceutically acceptable derivative" includes any pharmaceutically acceptable salt, solvate, hydrate or prodrug of a compound of formula (I). In one embodiment, the pharmaceutically acceptable derivatives are pharmaceutically acceptable salts, solvates or hydrates of a compound of formula (I).

Pharmaceutically acceptable salts

As used herein, the terms "salt" or "salts" refers to an acid addition or base addition salt of a compound of the invention. "Salts" include in particular "pharmaceutical acceptable salts".

The term "pharmaceutically acceptable salts" refers to salts that retain the biological effectiveness and properties of the compounds of this invention and, which typically are not biologically or otherwise undesirable. In many cases, the compounds of the present invention are capable of forming acid and/or base salts by virtue of the presence of amino and/or carboxyl groups or groups similar thereto.

Pharmaceutically acceptable acid addition salts can be formed with inorganic acids and organic acids, e.g., acetate, aspartate, benzoate, besylate, bromide/hydrobromide, bicarbonate/carbonate, bisulfate/sulfate, camphorsulfonate, chloride/hydrochloride, chlorothephylidate, citrate, ethanisulfonate, fumarate, gluceptate, gluconate, glucuronate, hippurate, hydroiodide/iiodide, isethionate, lactate, lactobionate, laurylsulfate, malate, maleate, malonate, mandelate, mesylate, methysulphate, naphthoate, napsylate, nicotinate, nitrate, octadecanoate, oleate, oxalate, palmitate, pamoate, phosphate/hydrogen phosphate/dihydrogen phosphate, polygalacturonate, propionate, stearate, succinate, subsalicylate, tartrate, tosylate and trifluoroacetate salts.

In certain embodiments, the salts are derived from sodium, potassium, ammonium, calcium, magnesium, iron, silver, zinc, and copper; particularly suitable salts include ammonium, potassium, sodium, calcium and magnesium salts.

Organic bases from which salts can be derived include, for example, primary, secondary, and tertiary amines, substituted amines including naturally occurring substituted amines, cyclic amines, basic ion exchange resins, and the like. Certain organic amines include isopropylamine, benzathine, cholinate, diethanolamine, diethylamine, lysine, meglumine, piperazine, tromethamine, arginine, proline and tris.

The pharmaceutically acceptable salts of the present invention can be synthesized from a basic or acidic moiety, by conventional chemical methods. Generally, such salts can be prepared by reacting free acid forms of these compounds with a stoichiometric amount of the appropriate base (such as Na, Ca, Mg, or K hydroxide, carbonate, bicarbonate or the like), or by reacting free base forms of these compounds with a stoichiometric amount of the appropriate acid. Such reactions are typically carried out in water or in an organic solvent, or in a mixture of the two. Generally, use of non-aqueous media like ether, ethyl acetate, ethanol, isopropanol, or acetonitrile is desirable, where practicable. Lists of additional suitable salts can be found, e.g., in "Remington's Pharmaceutical Sciences", 20th ed., Mack Publishing Company, Easton, Pa., (1985); and in "Handbook of Pharmaceutical Salts: Properties, Selection, and Use" by Stahl and Wermuth (Wiley-VCH, Weinheim, Germany, 2002).

**Solvates & hydrates**

The compounds of the invention may exist in both unsolvated and solvated forms. The term "solvate" includes molecular complexes comprising a compound of the invention and one or more pharmaceutically acceptable solvent molecules such as water or C\textsubscript{1-6} alcohols, e.g. ethanol. The term "hydrate" means a "solvate" where the solvent is water.
Prodrugs

Furthermore, the compounds of the present invention, including their salts, can also be obtained in the form of their hydrates, or include other solvents used for their crystallization. The compounds of the present invention may inherently or by design form solvates with pharmaceutically acceptable solvents (including water); therefore, it is intended that the invention embrace both solvated and unsolvated forms. The term “solvate” refers to a molecular complex of a compound of the present invention (including pharmaceutically acceptable salts thereof) with one or more solvent molecules. Such solvent molecules are those commonly used in the pharmaceutical art, which are known to be innocuous to the recipient, e.g., water, ethanol, and the like. The term “hydrate” refers to the complex where the solvent molecule is water.

The compounds of the present invention, including salts, hydrates and solvates thereof, may inherently or by design form polymorphs.

Description of Isomeric forms and Separation Methods

Any asymmetric atom (e.g., carbon or the like) of the compound(s) of the present invention can be present in racemic or enantiomerically enriched, for example the (R)-, (S)- or (R,S)- configuration. In certain embodiments, each asymmetric atom has at least 50 % enantiomeric excess, at least 60 % enantiomeric excess, at least 70 % enantiomeric excess, at least 80 % enantiomeric excess, at least 90 % enantiomeric excess, at least 95 % enantiomeric excess, or at least 99 % enantiomeric excess in the (R)- or (S)- configuration. Substituents at atoms with unsaturated double bonds may, if possible, be present in c/s- (Z)- or trans- (E)- form.

Accordingly, as used herein a compound of the present invention can be in the form of one of the possible isomers, rotamers, atropisomers, tautomers or mixtures thereof, for example, as substantially pure geometric (c/s or trans) isomers, diastereomers, optical isomers (antipodes), racemates or mixtures thereof.

Any resulting mixtures of isomers can be separated on the basis of the physicochemical differences of the constituents, into the pure or substantially pure geometric or optical isomers, diastereomers, racemates, for example, by chromatography and/or fractional crystallization.

Any resulting racemates of final products or intermediates can be resolved into the optical antipodes by known methods, e.g., by separation of the diastereomeric salts thereof, obtained with an optically active acid or base, and liberating the optically active acidic or basic compound. In particular, a basic moiety may thus be employed to resolve the compounds of the present invention into their optical antipodes, e.g., by fractional
crystallization of a salt formed with an optically active acid, e.g., tartaric acid, dibenzoyl tartaric acid, diacetyl tartaric acid, di-0,0'-p-toluoyl tartaric acid, mandelic acid, malic acid or camphor-10-sulfonic acid. Racemic products can also be resolved by chiral chromatography, e.g., high pressure liquid chromatography (HPLC) using a chiral adsorbent.

5 Amorphous & crystalline forms

The compounds of the invention may exist in solid states from amorphous through to crystalline forms. All such solid forms are included within the invention.

Isomeric forms

As used herein, the term "an optical isomer" or "a stereoisomer" refers to any of the various stereo isomeric configurations which may exist for a given compound of the present invention and includes geometric isomers. It is understood that a substituent may be attached at a chiral center of a carbon atom. The term "chiral" refers to molecules which have the property of non-superimposability on their mirror image partner, while the term "achiral" refers to molecules which are superimposable on their mirror image partner.

Therefore, the invention includes enantiomers, diastereomers or racemates of the compound. "Enantiomers" are a pair of stereoisomers that are non-superimposable mirror images of each other. A 1:1 mixture of a pair of enantiomers is a "racemic" mixture. The term is used to designate a racemic mixture where appropriate.

"Diastereoisomers" are stereoisomers that have at least two asymmetric atoms, but which are not mirror-images of each other. The absolute stereochemistry is specified according to the Cahn-Ingold-Prelog R-S system. When a compound is a pure enantiomer the stereochemistry at each chiral carbon may be specified by either R or S. Resolved compounds whose absolute configuration is unknown can be designated (+) or (-) depending on the direction (dextro- or levorotatory) which they rotate plane polarized light at the wavelength of the sodium D line. Certain compounds described herein contain one or more asymmetric centers or axes and may thus give rise to enantiomers, diastereomers, and other stereoisomeric forms that may be defined, in terms of absolute stereochemistry, as (R)- or (S)-.

Depending on the choice of the starting materials and procedures, the compounds can be present in the form of one of the possible isomers or as mixtures thereof, for example as pure optical isomers, or as isomer mixtures, such as racemates and diastereoisomer mixtures, depending on the number of asymmetric carbon atoms. The present invention is meant to include all such possible isomers, including racemic mixtures, diastereomeric mixtures and optically pure forms. Optically active (R)- and (S)- isomers may be prepared using chiral synths or chiral reagents, or resolved using conventional techniques. If the
compound contains a double bond, the substituent may be E or Z configuration. If the compound contains a disubstituted cycloalkyl, the cycloalkyl substituent may have a cis- or trans-configuration. All tautomeric forms are also intended to be included.

Isotopic labeling

Any formula given herein is also intended to represent unlabeled forms as well as isotopically labelled forms of the compounds. Isotopically labelled compounds have structures depicted by the formulas given herein except that one or more atoms are replaced by an atom having a selected atomic mass or mass number. Examples of isotopes that can be incorporated into compounds of the invention include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorous, fluorine, and chlorine, such as $^2$H, $^3$H, $^{11}$C, $^{13}$C, $^{14}$C, $^{15}$N, $^{16}$F, $^{31}$P, $^{32}$P, $^{35}$S, $^{36}$Cl, $^{125}$I respectively. The invention includes various isotopically labelled compounds as defined herein, for example those into which radioactive isotopes, such as $^3$H and $^{14}$C, or those into which non-radioactive isotopes, such as $^2$H and $^{13}$C are present. Such isotopically labelled compounds are useful in metabolic studies (with $^{14}$C), reaction kinetic studies (with, for example $^2$H or $^3$H), detection or imaging techniques, such as positron emission tomography (PET) or single-photon emission computed tomography (SPECT) including drug or substrate tissue distribution assays, or in radioactive treatment of patients. In particular, an $^{18}$F or labelled compound may be particularly desirable for PET or SPECT studies. Isotopically-labelled compounds of formula (I) can generally be prepared by conventional techniques known to those skilled in the art or by processes analogous to those described in the accompanying Examples and Preparations using an appropriate isotopically-labelled reagents in place of the non-labelled reagent previously employed.

Further, substitution with heavier isotopes, particularly deuterium (i.e., $^2$H or D) may afford certain therapeutic advantages resulting from greater metabolic stability, for example increased in vivo half-life or reduced dosage requirements or an improvement in therapeutic index. It is understood that deuterium in this context is regarded as a substituent of a compound of the formula (I). The concentration of such a heavier isotope, specifically deuterium, may be defined by the isotopic enrichment factor. The term "isotopic enrichment factor" as used herein means the ratio between the isotopic abundance and the natural abundance of a specified isotope. If a substituent in a compound of this invention is denoted deuterium, such compound has an isotopic enrichment factor for each designated deuterium atom of at least 3500 (52.5% deuterium incorporation at each designated deuterium atom), at least 4000 (60% deuterium incorporation), at least 4500 (67.5% deuterium incorporation), at least 5000 (75% deuterium incorporation), at least 5500 (82.5% deuterium incorporation), at least 6000 (90% deuterium incorporation), at least 6333.3 (95% deuterium incorporation),
at least 6466.7 (97% deuterium incorporation), at least 6600 (99% deuterium incorporation), or at least 6633.3 (99.5% deuterium incorporation).

Pharmaceutically acceptable solvates in accordance with the invention include those wherein the solvent of crystallization may be isotopically substituted, e.g. D$_2$O, d$_6$-acetone, de-DMSO.

**Co-Crystals**

Compounds of the invention, i.e. compounds of formula (I) that contain groups capable of acting as donors and/or acceptors for hydrogen bonds may be capable of forming co-crystals with suitable co-crystal formers. These co-crystals may be prepared from compounds of formula (I) by known co-crystal forming procedures. Such procedures include grinding, heating, co-subliming, co-melting, or contacting in solution compounds of formula (I) with the co-crystal former under crystallization conditions and isolating co-crystals thereby formed. Suitable co-crystal formers include those described in WO 2004/078163. Hence the invention further provides co-crystals comprising a compound of formula (I).

**Treatment of Diseases and Conditions**

Compounds of formula (I) have been found to be inhibitors of DGAT1.

The invention provides a compound of formula (I) for use in therapy. The invention further provides a pharmaceutical composition comprising a compound of formula (I) in combination with a pharmaceutically acceptable excipient.

The invention further provides a method for the treatment of a disease or condition mediated by DGAT1, comprising the step of administering a therapeutically effective amount of a compound of formula (I) to a patient. The invention also provides the use of a compound of formula (I) in the manufacture of a medicament for the treatment of a disease or condition mediated by DGAT1. The invention also provides a compound of formula (I) for use in treating a disease or condition mediated by DGAT1.

As used herein a patient is suffering from "obesity" if the patient exhibits at least one of:

In another embodiment, the present invention relates to the use of a DGAT1 inhibitor, or a pharmaceutically acceptable salt or ester thereof, for the treatment of, or the prevention, delay of progression, or treatment of a disease or condition which is selected from chylomicronemia syndrome, familial chylomicronemia syndrome and Type V hyperlipoproteinemia. The present invention further relates to the use of a pharmaceutical composition comprising a DGAT1 inhibitor, or a pharmaceutically acceptable salt or ester thereof, for the prevention, delay of progression, or treatment of a disease or condition which is selected from chylomicronemia syndrome, familial chylomicronemia syndrome and Type V hyperlipoproteinemia.
Hyperlipidemia, or the presence of elevated levels of lipids in the bloodstream, can take the form of hypercholesterolemia (elevated cholesterol), hypertriglyceridemia (elevated triglyceride) or a combination of the two. Hypercholesterolemia, which can further be subdivided, is typically associated with increased risk of atherosclerosis cardiovascular disease. Hypertriglyceridemia occurs when the body's production or intake of triglyceride exceeds the body's ability to metabolize or remove the triglyceride from the bloodstream. The most severe form of hypertriglyceridemia is chylomicronemia (also called hyperchylomicronemia), and is associated with an increased risk of pancreatitis.

Chylomicrons are lipoprotein particles that carry absorbed dietary fat from the gut to other body tissues via the bloodstream, and are typically present only during meal times. Chylomicronemia is defined as having the presence of chylomicrons in the bloodstream during times of fasting, and is typically associated with total plasma triglyceride levels above 1000 mg/dL.

The chylomicronemia syndrome refers to a set of clinical complications associated with high chylomicron levels. Typically, patients with the chylomicronemia syndrome have markedly elevated fasting triglyceride levels (1000-2000 mg/dL) with profound excursions (up to 5000 mg/dL and higher) following oral fat intake. The massively elevated plasma triglyceride levels are associated with a number of clinical findings and complications including recurrent episodes of pancreatitis, deposition of triglycerides in the skin in the form of eruptive xanthomas, epatospplenomegaly, a milky pink appearance of the blood vessels in the back of the eye (lipemia retinalis), and mild neuro-cognitive deficits.

The chylomicronemia syndrome can be further subdivided into two groups based on ultracentrifugation of lipoprotein species (see "A system for phenotyping hyperlipoproteinemia", Fredrickson D.S., Lees R.S. Circulation, 1965 Mar;31, pp. 321-327).

Fredrickson classification Type I, also known as the familial chylomicronemia syndrome (FCS), patients have accumulation of only chylomicrons in the bloodstream whereas Fredrickson classification Type V, also known as Type V hyperlipoproteinemia, patients have accumulation of both chylomicrons and very low density lipoproteins (VLDL) in the bloodstream.

The familial chylomicronemia syndrome (FCS or Type I hyperlipoproteinemia) is caused by a homozygous or compound heterozygous defect in the clearance of chylomicrons from the bloodstream. The most common cause of FCS is a defect in lipoprotein lipase (LPL), the protein that hydrolyzes triglycerides carried on chylomicrons. Other causes of FCS include defects in apolipoprotein cII (apoCII, a co-activator of LPL) or glycosylphosphatidylinositol-anchored high-density lipoprotein-binding protein 1 (GPIHBP1, an anchoring protein of LPL).
Type I patients are usually identified by early onset as youth of hypertriglyceridemia and pancreatitis. Thus, patients with FCS typically present in childhood with massively elevated triglyceride levels (>2,000 mg/dL), and recurrent bouts of abdominal pain due to pancreatitis. Into adulthood, the triglyceride levels remain elevated, and patients typically experience multiple episodes of abdominal pain and pancreatitis, which can result in hospitalization and death.

Patients also experience other manifestations including eruptive xanthomas, lipemia retinalis, hepatosplenomegaly, and mild neuro-cognitive deficits. The main therapeutic goal in FCS treatment is to prevent or treat pancreatitis via the reduction of triglycerides.

Unfortunately, standard lipid-lowering therapies, such as fibrates, omega-3 fatty acids, statins and nicotinic acid derivatives (niacin), are not effective in lowering triglycerides in patients with FCS. Therefore, the standard of care therapy for FCS patients is a very low fat diet (<10% by calories), something which is very difficult to stay compliant with throughout a lifetime [The Familial Chylomicronemia Syndrome. Santamaria-Fojo S. Lipid Disorders 1998. 27(3): 551-567].

Another approach to treat FCS that is under investigation is gene therapy using a replication-deficient Adeno-Associated Viral vector to deliver a naturally-occurring, “beneficial” variant of LPL (Glybera®) intramuscularly. However, this treatment is only transiently effective and requires immunosuppression with mycophenolate, cyclosporine, and steroids [Alipogene tiparvovec, and adeno-associated virus encoding the Ser(447)X variant of human lipoprotein lipase gene for the treatment of patients with lipoprotein lipase deficiency. Burnett JR., Hooper AJ. Curr Opin Mol Ther 2009. 6:681-691].

At present there is thus no effective pharmacotherapy for treating FCS and there is thus a need for new methods of treating familial chylomicronemia syndrome (FCS), also known as Type I hyperlipoproteinemia.

Type V hyperlipoproteinemia patients represent a second group at risk for the chylomicronemia syndrome and are usually diagnosed by severe hypertriglyceridemia as adults. This is a heterogeneous group at the extreme end of a spectrum of multifactorial hypertriglyceridemia. Patients with Type V hyperlipoproteinemia generally have both an underlying genetic cause and one or more acquired causes of hypertriglyceridemia. The underlying genetic causes include well characterized dyslipidemia such as familial combined hyperlipidemia (Type IIa), dysbetalipoproteinemia (Type III) and familial hypertriglyceridemia (Type VI), and a group of less well characterized dyslipemias (e.g. heterozygous LPL deficiency, defects in apoA & apoC genes, defects in fatty acid binding and transport proteins).
Acquired causes of hypertriglyceridemia include comorbid diseases (e.g. type 2 diabetes, obesity, insulin resistance, lipodystrophy, hypothyroidism), medications (e.g. beta blockers, thiazide diuretics, estrogen, glucocorticoids, transplant medications), and other factors (e.g. pregnancy, alcohol intake).

The primary goal of therapy in Type V patients is to reduce the triglyceride levels, and therefore reduce the risk of pancreatitis. Most patients can be successfully treated by addressing the underlying acquired cause(s) of the elevated triglycerides, such as reducing the amount of dietary fat intake, treating uncontrolled co-morbid diseases such as T2DM (Type 2 diabetes mellitus), discontinuing offending medications, and initiating lipid lowering medications such as fibrates, omega-3 fatty acids, or nicotinic acid derivatives (niacin) [Chylomicronemia Syndrome. Chait A., Brunzell J. Adv Intern Med 5 1992. 37:249-73.].

Despite optimal therapy, some Type V patients continue to have elevated triglyceride levels. There is thus a need for new methods of treating Type V hyperlipoproteinemia.

Therapeutic definitions

As used herein, "treatment" includes curative and prophylactic treatment. As used herein, a "patient" means an animal, preferably a mammal, preferably a human, in need of treatment.

The amount of the compound of the invention administered should be a therapeutically effective amount where the compound or derivative is used for the treatment of a disease or condition and a prophylactically effective amount where the compound or derivative is used for the prevention of a disease or condition.

The term "therapeutically effective amount" used herein refers to the amount of compound needed to treat or ameliorate a targeted disease or condition. The term "prophylactically effective amount" used herein refers to the amount of compound needed to prevent a targeted disease or condition. The exact dosage will generally be dependent on the patient's status at the time of administration. Factors that may be taken into consideration when determining dosage include the severity of the disease state in the patient, the general health of the patient, the age, weight, gender, diet, time, frequency and route of administration, drug combinations, reaction sensitivities and the patient's tolerance or response to therapy. The precise amount can be determined by routine experimentation, but may ultimately lie with the judgement of the clinician. Generally, an effective dose will be from 0.01 mg/kg/day (mass of drug compared to mass of patient) to 1000 mg/kg/day, e.g. 1 mg/kg/day to 100 mg/kg/day. Compositions may be administered individually to a patient or may be administered in combination with other agents, drugs or hormones.

For pharmaceutical use, the compounds of the invention may be administered as a medicament by enteral or parenteral routes, including intravenous, intramuscular, subcutaneous, transdermal, airway (aerosol), oral, intranasal, rectal, vaginal and topical (including buccal and sublingual) administration. The compounds of formula (I) should be assessed for their biopharmaceutical properties, such as solubility and solution stability (across pH), permeability, etc., in order to select the most appropriate dosage form and route of administration for treatment of the proposed indication.

The compounds of the invention may be administered as crystalline or amorphous products. The compounds of the invention may be administered alone or in combination with one or more other compounds of the invention or in combination with one or more other drugs (or as any combination thereof). Generally, they will be administered as a formulation in association with one or more pharmaceutically acceptable excipients. The term "excipient" includes any ingredient other than the compound(s) of the invention which may impart either a functional (e.g. drug release rate controlling) and/or a non-functional (e.g. processing aid or diluent) characteristic to the formulations. The choice of excipient will to a large extent depend on factors such as the particular mode of administration, the effect of the excipient on solubility and stability, and the nature of the dosage form.

Typical pharmaceutically acceptable excipients include:

- diluents, e.g. lactose, dextrose, sucrose, mannitol, sorbitol, cellulose and/or glycine;
- lubricants, e.g. silica, talcum, stearic acid, its magnesium or calcium salt and/or polyethylene glycol;

In another aspect, the present invention provides a pharmaceutical composition comprising a compound of the present invention, or a pharmaceutically acceptable salt thereof, and a pharmaceutically acceptable carrier. The pharmaceutical composition can be formulated for particular routes of administration such as oral administration, parenteral administration, and rectal administration, etc. In addition, the pharmaceutical compositions of the present invention can be made up in a solid form (including without limitation capsules, tablets, pills, granules, powders or suppositories), or in a liquid form (including without limitation solutions, suspensions or emulsions). The pharmaceutical compositions can be subjected to conventional pharmaceutical operations such as sterilization and/or can contain conventional inert diluents, lubricating agents, or buffering agents, as well as adjuvants, such as preservatives, stabilizers, wetting agents, emulsifiers and buffers, etc.

Typically, the pharmaceutical compositions are tablets or gelatin capsules comprising the active ingredient together with

a) diluents, e.g., lactose, dextrose, sucrose, mannitol, sorbitol, cellulose and/or glycine;
b) lubricants, e.g., silica, talcum, stearic acid, its magnesium or calcium salt and/or polyethyleneglycol; for tablets also
c) binders, e.g., magnesium aluminum silicate, starch paste, gelatin, tragacanth, methylcellulose, sodium carboxymethylcellulose and/or polyvinylpyrrolidone; if desired
d) disintegrants, e.g., starches, agar, alginic acid or its sodium salt, or effervescent mixtures; and/or
e) absorbents, colorants, flavors and sweeteners.

Tablets may be either film coated or enteric coated according to methods known in the art. Suitable compositions for oral administration include an effective amount of a compound of the invention in the form of tablets, lozenges, aqueous or oily suspensions, dispersible powders or granules, emulsion, hard or soft capsules, or syrups or elixirs. Compositions intended for oral use are prepared according to any method known in the art for the manufacture of pharmaceutical compositions and such compositions can contain one or more agents selected from the group consisting of sweetening agents, flavoring agents, coloring agents and preserving agents in order to provide pharmaceutically elegant and palatable preparations. Tablets may contain the active ingredient in admixture with nontoxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets. These excipients are, for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating
agents, for example, corn starch, or alginic acid; binding agents, for example, starch, gelatin or acacia; and lubricating agents, for example magnesium stearate, stearic acid or talc. The tablets are uncoated or coated by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate can be employed. Formulations for oral use can be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredient is mixed with water or an oil medium, for example, peanut oil, liquid paraffin or olive oil.

Certain injectable compositions are aqueous isotonic solutions or suspensions, and suppositories are advantageously prepared from fatty emulsions or suspensions. Said compositions may be sterilized and/or contain adjuvants, such as preserving, stabilizing, wetting or emulsifying agents, solution promoters, salts for regulating the osmotic pressure and/or buffers. In addition, they may also contain other therapeutically valuable substances. Said compositions are prepared according to conventional mixing, granulating or coating methods, respectively, and contain about 0.1-75%, or contain about 1-50%, of the active ingredient.

Suitable compositions for transdermal application include an effective amount of a compound of the invention with a suitable carrier. Carriers suitable for transdermal delivery include absorbable pharmacologically acceptable solvents to assist passage through the skin of the host. For example, transdermal devices are in the form of a bandage comprising a backing member, a reservoir containing the compound optionally with carriers, optionally a rate controlling barrier to deliver the compound of the skin of the host at a controlled and predetermined rate over a prolonged period of time, and means to secure the device to the skin.

Such topical delivery systems will in particular be appropriate for dermal application, e.g., for the treatment of skin cancer, e.g., for prophylactic use in sun creams, lotions, sprays and the like. They are thus particularly suited for use in topical, including cosmetic, formulations well-known in the art. Such may contain solubilizers, stabilizers, tonicity enhancing agents, buffers and preservatives.

As used herein a topical application may also pertain to an inhalation or to an intranasal application. They may be conveniently delivered in the form of a dry powder (either alone, as a mixture, for example a dry blend with lactose, or a mixed component particle, for example with phospholipids) from a dry powder inhaler or an aerosol spray presentation.
from a pressurised container, pump, spray, atomizer or nebuliser, with or without the use of a suitable propellant.

Dosage Forms

The pharmaceutical composition or combination of the present invention can be in unit dosage of about 1-1000 mg of active ingredient(s) for a subject of about 50-70 kg, or about 1-500 mg or about 1-250 mg or about 1-150 mg or about 0.5-100 mg, or about 1-50 mg of active ingredients. The therapeutically effective dosage of a compound, the pharmaceutical composition, or the combinations thereof, is dependent on the species of the subject, the body weight, age and individual condition, the disorder or disease or the severity thereof being treated. A therapeutically effective amount in vivo may range depending on the route of administration, between about 0.1-500 mg/kg, or between about 1-100 mg/kg.

The activity of a compound according to the present invention can be assessed by the following in vitro & in vivo methods.

Step 1. Synthesis of methyl 1-(4-bromophenyl)-4-oxocyclohexanecarboxylate

The title compound was prepared analogous to the literature procedure (J. Org. Chem., 72, 7455, 2007) starting from methyl 2-(4-bromophenyl)acetate (5.78 g, 25.2 mmol) and methyl acrylate (4.78 g, 55.5 mmol). Column purification afforded the title compound as clear oil (4.64 g, 59% yield). LC/MS, ESI-MS(+): 311.1, RT: 1.26 (Condition E).

Step 2. Synthesis of methyl 8-(4-bromophenyl)-1,4-dioxaspiro[4.5]decane-8-
carboxylate

To a round bottom flask containing methyl 1-(4-bromophenyl)-4-oxocyclohexanecarboxylate (4.64 g, 14.91 mmol) was added toluene (33 ml), ethylene glycol (8.32 ml, 149 mmol) and p-toluenesulfonic acid (85 mg, 0.45 mmol) at room temperature. The mixture was heated to 80°C for 2 hours. The content was then cooled to room temperature and quenched with a saturated solution of sodium bicarbonate. The organic portion was washed with saturated sodium bicarbonate and the aqueous portion extracted with MTBE twice. The combined organic portion was dried over sodium sulfate and concentrated to afford a crude oil. Column purification afforded the title compound as viscous oil (5.30 g, quantitative yield). LC/MS, ESI-MS(+): 357.1, RT: 1.38 (Condition E).
Step 3. Synthesis of (8-(4-bromophenyl)-1,4-dioxaspiro[4.5]decan-8-yl)methanol

To a round bottom flask containing methyl 8-(4-bromophenyl)-1,4-dioxaspiro[4.5]decane-8-carboxylate (5.30 g, 14.92 mmol) was added anhydrous dichloromethane (60 ml) at room temperature. The content was then cooled to -78°C under a dry ice-acetone bath and DIBAL-H (31.1 ml, 37.30 mmol) in toluene was added dropwise slowly. When the addition was completed, the mixture was stirred at -78°C for 30 minutes or until the consumption of the starting material as indicated by thin layer chromatography (TLC). The reaction was then quenched by the slow addition of a pH 8 buffered solution (prepared by mixing 0.53 ml ammonium hydroxide solution and 8.8 ml of saturated ammonium chloride solution) at -78°C. The mixture was then allowed to warm back up to room temperature and stirred for a further 45 minutes. Solid magnesium sulfate (8 g) was added and the mixture stirred at room temperature for another 30 minutes to afford free flowing slurry. The content was filtered and concentrated to afford the title compound as clear oil, which was used in the next step without purification (4.88 g). LC/MS, ESI-MS: non-ionizable, RT: 1.05 (Condition E).

The content was cooled to room temperature and concentrated under reduced pressure to remove the excess acetone. The resulting aqueous mixture was extracted with EtOAc twice. The combined organic portion was dried over sodium sulfate and concentrated to afford the title compound as white solid. (4.22 g) LC/MS, ESI-MS: non-ionizable, RT: 1.05 (Condition E).

Trimethyl phosphonoacetate (2.58 ml, 17.88 mmol) was added drop-wise and the resulting mixture was stirred at room temperature for 30 minutes. To this mixture was then added 4-(4-bromophenyl)-4-(hydroxymethyl)cyclohexanone (4.22 g, 14.90 mmol) in several portions and stirred at room temperature for overnight. The reaction mixture was then quenched with a saturated solution of ammonium chloride and subsequently concentrated to remove excess methanol. The residue was taken in saturated ammonium chloride solution and extracted twice with EtOAc. The combined organic portion was dried over sodium sulfate and concentrated to afford a crude product. Column purification afforded the title compound as viscous oil (4.36 g, 86% yield). LC/MS, ESI-MS: non-ionizable, RT: 1.32 (Condition E).

10 Biological Assays

The activity of compounds according to the invention can be assessed by the following inhibition assay.

DGAT1 Inhibition Assay

The enzyme preparation used in this assay is a membrane preparation from Sf9 cells overexpressing human (His)_6DGAT1. During all steps samples were chilled to 4°C. Sf9 cells expressing human (His)_6DGAT1 were thawed at room temperature and re-suspended at a 10:1 ratio (ml. buffer/g of cells) in 50 mM HEPES, 1x Complete Protease Inhibitor, pH 7.5. The re-suspended pellet was homogenized for 1 min using a Brinkman PT 10/35 homogenizer with a 20 mm generator. Cells were lysed using Avestin Emulsiflex (chilled to 4°C) at 10000-15000 psi. Lysate was centrifuged at 100,000 x g for 1 h at 4°C. Supernatant was removed and pellets were re-suspended in 50 mM HEPES, 1x Complete Protease Inhibitor, pH 7.5 at 1/6 the volume of supernatant. Re-suspended pellets were pooled and homogenized with 10 strokes of a Glas-Col motor driven teflon pestle on setting 70. The protein concentration of the membrane preparation was quantified using BCA protein assay with 1% SDS. The membrane preparation was aliquoted, frozen on dry ice, and stored at -80°C.

For 50 mL, 25 mL of 0.2 M HEPES stock buffer, 0.5 mL of 1 M MgCl2 (5 mM final concentration), and 24.5 mL of milli-Q H2O are added to the 55 mL Wheaton Potter-Elvehjem homogenizer. Enzyme preparation (0.1 mL) is added to buffer and the mixture is homogenized with 5 strokes on ice using the Glas-Col variable speed homogenizer system on setting 70.

For 50 mL, 0.5 mL 10 mM diolein is added to 9.5 mL of EtOH in a 50 mL Falcon screw cap conical centrifuge tube. Five mL of 10 mM sodium acetate pH 4.5 is added followed by 0.5 mL of 10 mM oleoyl-CoA. Finally, the remaining 4.5 mL of 10 mM sodium acetate pH 4.5 is added followed by 30 mL of milli-Q H2O. The solution should be gently agitated by hand to
induce mixing. The final concentrations of EtOH and sodium acetate are 20% and 2 mM, respectively.

Dry compounds are dissolved in the appropriate volume of DMSO to a final concentration of 10 mM. A 10-point, 3-fold dose response is used to evaluate compound potency. All dilutions are performed in DMSO in a Greiner 384-well microplate.

1. 2 µL of compound in DMSO is added to the appropriate wells. 2 µL of DMSO is added to 100% activity and 100% inhibition controls.
2. 25 µL of enzyme mix is added to all wells and plate(s) are incubated for 10 min at RT.
3. 10 µL of 20% acetic acid quench is added to 100% inhibition control wells. Plate(s) are vortexed using Troemner multi-tube vortexer (setting 7 for 10 sec).
4. 25 µL of substrate mix is added to all wells. Plate(s) are vortexed using Troemner multi-tube vortexer (setting 7 for 10 sec). Plate(s) are incubated for 30 min at RT.
5. 10 µL of 20% acetic acid quench is added to all wells. Plate(s) are vortexed using Troemner multi-tube vortexer (setting 7 for 10 sec).
6. 50 µL of 1-butanol w/ glyceryl tripalmitoleate internal standard is added to all wells.
7. Plate(s) are sealed with super pierce strong plate sealer using the thermo-sealer.
8. Plate(s) are vortexed using Troemner multi-tube vortexer (setting 10 for 5 min).
9. Plate(s) are centrifuged at 162 x g (1000 rpm for GH-3.8 rotor) for 5 min using Beckman GS-6R tabletop centrifuge.

Samples were analyzed by LC/MS/MS using a Waters 1525 µ LC and Quattro Micro API MS. Where indicated, tripalmitolein was used as an internal standard to control for instrument variation.

**Cellular assay to measure activity of DGAT1 inhibitors in mammalian cells.**

C2C12 cells are an immortal mouse skeletal muscle cell line showing an 8-fold enrichment forM DGAT1 versus DGAT2. C2C12 cells were routinely cultured in 150 cm² flasks with DMEM (25 mM glucose) containing 10% FBS, 4m M L-glutamine, 100 U/ml penicillin and 100 μg/ml streptomycin (30 ml per flask), at 37°C, 5%C02 and 95% humidity. All studies were performed on cells at passage 10 or less.

C2C12 cells were seeded in 96-well plates in DMEM containing 4.5 mM glucose and 10% FBS, 18 h (at 37°C) prior to assay (all wells of the plate are used). Following 18 h incubation, seeding medium was then replaced with DMEM (5 mM glucose) containing 250 μM olate (complexed to BSA) and compounds or DMSO, for 2 h (at 37°C). Compounds were added at 1:3 dilution, 11 points and DMSO control, the starting concentration was usually 40 μM. Each point was dosed in quadruplicate allowing 2 compounds to be dosed per plate. The medium was removed at the end of the incubation and 200 μl/well of 1-butanol added. The 1-butanol contained an internal standard, tripalmitolein (2 μM). The plates were sealed with an adhesive plate sealer and left at room temperature for at least 30 min, then spun down at 209 x g for 5 min.

Butanolic extracts were transferred to 384-well LC-MS plates (80 μl/well) and the plate heatsealed with a foil plate sealer. The 384-well plates containing sample were spun down at 209xg for 5 min prior to loading on the LC-MS.

Samples were analyzed by LC/MS using a Waters 1525μ LC and Quattro Micro API MS. Where indicated, tripalmitolein was used as an internal standard to control for instrument variation. HPLC conditions as above.
