## BICYCLIC AND TRICYCLIC HETEROAROMATIC COMPOUNDS

Field of the Invention

5 This invention relates to heterocyclic derivatives that bind to the benzodiazepine site of GABA<sub>A</sub> receptors. This invention also relates to pharmaceutical compositions comprising such compounds and to the use of such compounds in the treatment of central nervous system (CNS) diseases. This  
10 invention also relates to the use of these heterocyclic compounds in combination with one or more other CNS agents to potentiate the effects of the other CNS agents. Additionally this invention relates to the use such compounds as probes for the localization of GABA<sub>A</sub> receptors in tissue sections.

Background

The GABA<sub>A</sub> receptor superfamily represents one of the classes of receptors through which the major inhibitory neurotransmitter,  $\gamma$ -aminobutyric acid, or GABA, acts. Widely,  
20 although unequally, distributed through the mammalian brain, GABA mediates many of its actions through a complex of proteins called the GABA<sub>A</sub> receptor, which causes alteration in chloride conductance and membrane polarization.

A number of cDNAs for GABA<sub>A</sub> receptor subunits have been  
25 characterized. To date at least 6 $\alpha$ , 3 $\beta$ , 3 $\gamma$ , 1 $\epsilon$ , 1 $\delta$  and 2 $\rho$  subunits have been identified. It is generally accepted that native GABA<sub>A</sub> receptors are typically composed of 2 $\alpha$ , 2 $\beta$ , and 1 $\gamma$  subunits (Pritchett & Seeburg *Science* 1989; 245:1389-1392 and Knight et. al., *Recept. Channels* 1998; 6:1-18). Evidence such  
30 as message distribution, genome localization and biochemical study results suggest that the major naturally occurring receptor combinations are  $\alpha_1\beta_2\gamma_2$ ,  $\alpha_2\beta_3\gamma_2$ ,  $\alpha_3\beta_3\gamma_2$ , and  $\alpha_5\beta_3\gamma_2$  (Mohler et. al. *Neuroch. Res.* 1995; 20(5): 631 - 636).

Benzodiazepines exert their pharmacological actions by  
35 interacting with the benzodiazepine binding sites associated

with the GABA<sub>A</sub> receptor. In addition to the benzodiazepine site, the GABA<sub>A</sub> receptor contains sites of interaction for several other classes of drugs. These include a steroid binding site, a picrotoxin site, and the barbiturate site. The benzodiazepine site of the GABA<sub>A</sub> receptor is a distinct site on the receptor complex that does not overlap with the site of interaction for GABA or for other classes of drugs that bind to the receptor (see, e.g., Cooper, et al., The Biochemical Basis of Neuropharmacology, 6<sup>th</sup> ed., 1991, pp. 145-148, Oxford University Press, New York). Early electrophysiological studies indicated that a major action of the benzodiazepines was enhancement of GABAergic inhibition. Compounds that selectively bind to the benzodiazepine site and enhance the ability of GABA to open GABA<sub>A</sub> receptor channels are agonists of GABA receptors. Other compounds that interact with the same site but negatively modulate the action of GABA are called inverse agonists. Compounds belonging to a third class bind selectively to the benzodiazepine site and yet have little or no effect on GABA activity, but can block the action of GABA<sub>A</sub> receptor agonists or inverse agonists that act at this site. These compounds are referred to as antagonists.

The important allosteric modulatory effects of drugs acting at the benzodiazepine site were recognized early and the distribution of activities at different receptor subtypes has been an area of intense pharmacological discovery. Agonists that act at the benzodiazepine site are known to exhibit anxiolytic, sedative, and hypnotic effects, while compounds that act as inverse agonists at this site elicit anxiogenic, cognition enhancing, and proconvulsant effects. While benzodiazepines have a long history of pharmaceutical use as anxiolytics, these compounds often exhibit a number of unwanted side effects. These may include cognitive impairment, sedation, ataxia, potentiation of ethanol effects, and a tendency for tolerance and drug dependence.

GABA<sub>A</sub> selective ligands may also act to potentiate the effects of other CNS active compounds. For example, there is

**WO 01/34603****PCT/US00/30905**

evidence that selective serotonin reuptake inhibitors (SSRIs) may show greater antidepressant activity when used in combination with GABA<sub>A</sub> selective ligands than when used alone.

Summary of the Invention

This invention provides heterocyclic derivatives, particularly imidazoquinoline and 1,2,4-triazoloquinoline derivatives, that bind to the benzodiazepine site of the GABA<sub>A</sub> receptor, including human GABA<sub>A</sub> receptors. Preferably, these compounds also bind with high affinity to such receptors. More preferably, these compounds bind with high selectivity to such receptors.

The invention provides compounds of Formula I (shown below), and pharmaceutical compositions comprising compounds of Formula 1.

The invention further provides methods of treating patients suffering from CNS disorders with a therapeutically effective amount of a compound of the invention. The patient may be a human or other mammal. Treatment of humans, domesticated companion animals (pets) and livestock animals suffering from CNS disorders with a therapeutically effective amount of a compound of the invention is contemplated by the invention.

In a separate aspect, the invention provides a method of potentiating the actions of other CNS active compounds. This method comprises administering a therapeutically effective amount of a compound of the invention with another CNS active compound.

Additionally this invention provides for the use of the compounds of the invention as probes for the localization of GABA<sub>A</sub> receptors in tissue samples, in particular, tissue sections.

The invention also provides intermediate compounds that are useful in the preparation of compounds of Formula 1.

Other preferred JR<sub>9</sub>R<sub>10</sub> groups include pyrrolyl and imidazolyl, each of which is optionally mono- or disubstituted with C<sub>1</sub>-C<sub>3</sub> alkyl or hydroxy (C<sub>1</sub>-C<sub>6</sub>) alkyl, and preferably monosubstituted with methyl, ethyl, or hydroxymethyl.

Where the nature of the substituents permits, the groups represented by JR<sub>9</sub>R<sub>10</sub> encompass various stereoisomers. While the invention encompasses racemic mixtures and mixtures of enantiomers in which one enantiomer is present in an enantiomeric excess, the preferred compounds of the invention are those where only a single, at least relatively pure, stereoisomer is present. Examples of preferred JR<sub>9</sub>R<sub>10</sub> stereoisomers include the following:

As used herein, monocyclic and bicyclic rings include both carbocyclic rings where J is, e.g., CH, and, for those rings formed by  $\text{NR}_4\text{R}_5$  and  $\text{NR}_9\text{R}_{10}$ , nitrogen-containing carbocyclic ring systems of the type having at least one nitrogen, e.g., the nitrogen in  $\text{NR}_4\text{R}_5$ . Thus, in  $\text{NR}_4\text{R}_5$  and  $\text{NR}_9\text{R}_{10}$ , the  $\text{R}_4\text{R}_5$  and  $\text{R}_9\text{R}_{10}$  groups together represent, for example, a  $\text{C}_4\text{-C}_6$  straight chain alkylene group which together with the nitrogen atom to which, e.g.,  $\text{R}_9$  and  $\text{R}_{10}$  are attached form a 5- to 7-membered ring system. This ring system may be further substituted with, e.g.,  $\text{C}_1\text{-C}_6$  alkyl or may contain one or two double bonds, O, and/or a substituted nitrogen as defined herein. In situations where J is, for example, CH, the resulting ring can contain hetero atoms such as oxygen or nitrogen giving rise to, e.g., a 4-piperidiny1 group.

When J is a  $\text{C}_1\text{-C}_8$  alkylene group, that group is attached at one terminus to the parent carbonyl and the groups  $\text{R}_9$  and  $\text{R}_{10}$  are attached at any position along the alkylene chain. For example,  $\text{JR}_9\text{R}_{10}$  represents groups such as neopentyl, t-butyl, isopropyl, 2-ethylhexyl and n-octyl. Further,  $\text{R}_9\text{R}_{10}$  may represent an alkylene group, e.g., a  $\text{C}_5$  alkylene group attached to the terminus of J where is n-propyl giving rise to a cyclohexylpropyl group.

10 from oxygen, sulfur, or nitrogen. The hetero sulfur atom may be oxidized to a sulfone or sulfoxide. The hetero nitrogen is optionally substituted with  $R_8$  where  $R_8$  represents hydrogen or  $C_1$ - $C_8$  alkyl.

### 10 Definitions

If the compounds of the present invention have asymmetric centers, then this invention includes all of the optical isomers and mixtures thereof.

15 In addition, compounds with carbon-carbon double bonds may occur in Z- and E- forms, with all isomeric forms of the compounds being included in the present invention.

Compounds of Formula I may contain one or more asymmetric carbon atoms, so that the compounds can exist in different stereoisomeric forms. These compounds can be present as, for example, racemic mixtures, mixtures of diastereomers, and optically active forms including mixtures having one stereoisomer in enantiomeric excess and essentially pure stereoisomers, i.e., individual stereoisomers. In these latter  
20 situations, the single enantiomers can be obtained by asymmetric synthesis or by resolution of the racemates. Resolution of the racemates can be accomplished, for example, by conventional methods such as crystallization in the presence of a resolving agent, or chromatography, using, for example a  
25 chiral HPLC column.  
30

35 invention is obtained as an acid addition salt, the free base can be obtained by basifying a solution of the acid salt.

Conversely, if the product is a free base, an addition salt, particularly a pharmaceutically acceptable addition salt, may be produced by dissolving the free base in a suitable organic solvent and treating the solution with an acid, in accordance  
5 with conventional procedures for preparing acid addition salts from base compounds.

Non-toxic pharmaceutically acceptable salts include, but are not limited to salts of inorganic acids such as hydrochloric, sulfuric, phosphoric, diphosphoric, hydrobromic,

The present invention also encompasses the acylated prodrugs of the compounds of Formula I. Those skilled in the  
20 art will recognize various synthetic methodologies which may be employed to prepare non-toxic pharmaceutically acceptable addition salts and acylated prodrugs of the compounds encompassed by Formula I.

When any variable (e.g. C<sub>1</sub>-C<sub>6</sub> alkyl, C<sub>1</sub>-C<sub>8</sub> alkyl, R<sub>1</sub>-R<sub>8</sub>, W, X, Ar, G or Q) occurs more than one time in any formula herein,  
25 its definition on each occurrence is independent of its definition at every other occurrence.

30 be straight, or branched. Examples of "alkyl" include methyl, ethyl, propyl, isopropyl, butyl, iso-, sec- and tert-butyl, pentyl, hexyl, heptyl, 3-ethylbutyl, and the like. Where the number of carbon atoms in the alkyl group is unspecified, the group is a C<sub>1</sub>-C<sub>6</sub> alkyl groups.

35 The term "alkoxy" represents an alkyl group of indicated number of carbon atoms attached to the parent molecular moiety

through an oxygen bridge. Examples of alkoxy groups include, for example, methoxy, ethoxy, propoxy and isopropoxy. Where the number of carbon atoms in the alkoxy group is unspecified the group is C<sub>1</sub>-C<sub>6</sub> alkoxy.

5       The term "aryl" refers to an aromatic hydrocarbon ring system containing at least one aromatic ring. The aromatic ring may optionally be fused or otherwise attached to other aromatic hydrocarbon rings or non-aromatic hydrocarbon rings. Examples of aryl groups include, for example, phenyl, naphthyl, anthryl, phenanthryl, 1,2,3,4-tetrahydronaphthyl and biphenyl. Preferred examples of aryl groups include phenyl and naphthyl.

The pharmaceutical compositions containing compounds of general Formula I may be in a form suitable for oral use, for example, as tablets, troches, lozenges, aqueous or oily suspensions, dispersible powders or granules, emulsion, hard or soft capsules, or syrups or elixirs.

Compositions intended for oral use may be prepared according to any method known to the art for the manufacture of pharmaceutical compositions and such compositions may contain one or more agents selected from the group consisting of sweetening agents, flavoring agents, coloring agents and preservative agents in order to provide pharmaceutically elegant and palatable preparations. Tablets contain the active ingredient in admixture with non-toxic pharmaceutically acceptable excipients that are suitable for the manufacture of tablets. These excipients may be for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn starch, or alginic acid; binding agents, for example starch, gelatin or acacia, and lubricating agents, for example magnesium stearate, stearic acid or talc. The tablets may be uncoated or they may be coated by known techniques. In some cases such coatings may be prepared by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate may be employed.

Formulations for oral use may also be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredient is mixed with water or an oil medium, for example peanut oil, liquid paraffin or olive oil.

Aqueous suspensions contain the active materials in admixture with excipients suitable for the manufacture of

aqueous suspensions. Such excipients are suspending agents, for example sodium carboxymethylcellulose, methylcellulose, hydropropyl-methylcellulose, sodium alginate, polyvinylpyrrolidone, gum tragacanth and gum acacia; dispersing  
5 or wetting agents may be a naturally-occurring phosphatide, for example, lecithin, or condensation products of an alkylene oxide with fatty acids, for example polyoxyethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or

Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water provide the  
30 active ingredient in admixture with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents or suspending agents are exemplified by those already mentioned above. Additional excipients, for example sweetening, flavoring and coloring  
35 agents, may also be present.

Pharmaceutical compositions of the invention may also be in the form of oil-in-water emulsions. The oily phase may be a vegetable oil or a mineral oil or mixtures of these. Suitable emulsifying agents may be naturally-occurring gums, for example  
5 gum acacia or gum tragacanth, naturally-occurring phosphatides, for example soy bean, lecithin, and esters or partial esters derived from fatty acids and hexitol, anhydrides, for example sorbitan monooleate, and condensation products of the said partial esters with ethylene oxide, for example polyoxyethylene

25 water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono-or diglycerides. In addition, fatty acids such as oleic acid find  
30 use in the preparation of injectables.

The compounds of general Formula I may also be administered in the form of suppositories, e.g., for rectal administration of the drug. These compositions can be prepared by mixing the drug with a suitable non-irritating excipient  
35 that is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release

the drug. Such materials include cocoa butter and polyethylene glycols.

Compounds of general Formula I may be administered parenterally in a sterile medium. The drug, depending on the vehicle and concentration used, can either be suspended or dissolved in the vehicle. Advantageously, adjuvants such as local anesthetics, preservatives and buffering agents can be dissolved in the vehicle.

Dosage levels of the order of from about 0.1 mg to about 140 mg per kilogram of body weight per day are useful in the treatment of the above-indicated conditions (about 0.5 mg to about 7 g per patient per day). The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated and the particular mode of administration. Dosage unit forms will generally contain between from about 1 mg to about 500 mg of an active ingredient.

It will be understood, however, that the specific dose level for any particular patient will depend upon a variety of factors including the activity of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, route of administration, and rate of excretion, drug combination and the severity of the particular disease undergoing therapy.

For administration to non-human animals, the composition may also be added to the animal feed or drinking water. It may be convenient to formulate the animal feed and drinking water compositions so that the animal takes in a therapeutically appropriate quantity of the composition along with its diet. It may also be convenient to present the composition as a premix for addition to the feed or drinking water.

Representative illustrations of the preparation of compounds of Formula 1 in the present invention are given in Schemes 1-3.

### Example 1

Preparation of 1-[(3-Phenylimidazo[5,1-a]isoquinolin-6-yl)carbonyl]piperidine

(1) 4-[(Dimethylamino)methylene]-1H-2-benzopyran-1,3(4H)-dione

100 ml of anhydrous DMF in a 1 liter round-bottomed, three necked flask (fitted with a drying tube containing drierite, and a 125 ml dropping funnel) is cooled in an ice-salt bath, and 31 ml of POCl<sub>3</sub> is subsequently added over a period of half an hour while stirring the DMF. The 125 ml dropping funnel is replaced with a 150 ml dropping funnel, and a solution of 54 g of homophthalic acid in 100 ml of DMF is added to the flask over a period of one hour at < 10 °C. The reaction mixture is then stirred at room temperature until a yellow paste was formed,

and then poured into ice water. The solid is collected by filtration, washed with water and dried to give 54 g of the title compound as a yellow solid, m.p. 137-40 °C.

5 (2) Methyl 1H-2-benzopyran-1-oxo-4-carboxylate

Anhydrous HCl gas is continuously bubbled into a stirred solution of the product from part 1 (54 g) in 500 ml of methanol at slowly refluxing temperature for 6 hours. The reaction mixture is concentrated under vacuum. A NaHCO<sub>3</sub> solution is added to the residue. The solid was collected by filtration, washed and dried to yield 29.4 g of the title compound as a solid, m.p. 88-90 °C.

15 (3) Methyl 1,2-dihydro-1-oxo-4-isoquinolinecarboxylate

A mixture of the product from part 2 (29 g) and ammonium acetate (50 g) in 100 ml of acetic acid is stirred at 80 °C overnight, and then cooled and poured into water. The solid is collected by filtration, washed with water and dried to yield the title compound (25 g) as a white solid, m.p. 258-60 °C.

20 (4) Methyl 1-chloroisoquinoline-4-carboxylate

A mixture of the product from part 3 (12.5 g) in 50 ml of POCl<sub>3</sub> is stirred at 100 °C for about two hours then cooled and concentrated under vacuum. The residue is dissolved in 300 ml of CHCl<sub>3</sub>, and the resulting solution is washed with aqueous NaHCO<sub>3</sub> and water, dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and then concentrated to give the title compound, m.p. 53-55 °C.

25 (5) Methyl 1-isoquinolinecarbonitrile-4-carboxylate

30 A mixture of the product from part 4 (16 g) and potassium cyanide (5.4 g) in 50 ml of DMF was stirred at 90 °C for 4 hours. The mixture is cooled and poured into water. The solid is then collected by filtration, washed with water, and dried to give the title compound as a tan solid (11 g), m.p. 91-94  
35 °C.

(6) Methyl 1-isoquinolinemethanamine-4-carboxylate dihydrochloride

A mixture of the product from part 5 (2 g) and 10% Pd on carbon (800 mg) in 50 ml of methanol containing 4 ml of conc. HCl is hydrogenated with a balloon of hydrogen for about half an hour. The mixture is filtered through celite and concentrated under vacuum to a solid. Recrystallization from EtOAc and methanol yields the title compound (1.8 g) as a white solid, m.p. 234-237 °C (dec).

(7) N-[(4-methoxycarbonylisoquinolin-1-yl)methyl]benzamide

Benzoyl chloride (0.78 ml) is added dropwise to a stirred mixture of the product from part 6 (1.87 g) in 10 ml EtOAc and 10 ml of saturated aqueous NaHCO<sub>3</sub> solution. After stirring for 15 minutes, the layers are separated, the organic layer is washed with water, dried, filtered and concentrated to a solid. The solid is washed with hexanes and dried to yield 1.97 g of the desired product as a white solid, m.p. 140-142 °C.

(8) Methyl 3-phenylimidazo[5,1-a]isoquinolin-6-carboxylate

A mixture of the product from part 7 (1.97 g) in 10 ml of POCl<sub>3</sub> is stirred at 105 °C for two hours, then cooled and concentrated under vacuum. The residue is treated with EtOAc and washed with saturated aqueous NaHCO<sub>3</sub> solution and water. The organic solution is dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and then concentrated to afford a solid. Recrystallization from 2-propanol yields the title compound as a yellow solid (0.7 g).

(9) 3-Phenylimidazo[5,1-a]isoquinolin-6-carboxylic acid

A slurry of the product from part 8 (488 mg) and NaOH (226 mg) in 15 ml of methanol and 10 ml of water is stirred at 60 °C until a solution forms. The methanol is then evaporated in vacuo, and the remaining mixture is diluted with water. After adjusting the pH to 5-6 with 1N HCl, the solid is collected by filtration, washed with water and dried to give the title compound (450 mg) as a yellow solid, m.p. 187-90 °C.

(10) 1-[(3-Phenylimidazo[5,1-a]isoquinolin-6-yl)carbonyl]-piperidine

A mixture of the product from part 9 (95 mg), BOP (220 mg), piperidine (56 mg) and TEA (67 mg) in 2 ml of DMF is stirred at room temperature for 18 hours. The mixture is added to aqueous NaHCO<sub>3</sub> solution and extracted with EtOAc. The organic layer is washed with brine and water, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered and concentrated to afford a foam. Purification on a silica gel column, eluting with 5% methanol in methylene chloride, gives the title compound. <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 1.38-1.50 and 1.60-1.80 (6H, m), 3.18-3.36 (2H, m), 3.65-3.95 (2H, m), 7.40-7.60 (6H, m), 7.75 (2H, d), 7.95 (1H, s), 8.05 (1H, s), 8.10 (1H, d). The hydrochloride salt was prepared by treating the free base in EtOAc with a solution of hydrogen chloride in ether and collecting by filtration.

##### **Binding Assay**

The high affinity and high selectivity of compounds of this invention for the benzodiazepine site of the GABA<sub>A</sub> receptor is demonstrated using the following binding assay. This assay is carried out essentially as described by Thomas and Tallman (*J. Bio. Chem.* 1981; 156:9838-9842, and *J. Neurosci.* 1983; 3:433-440).

Rat cortical tissue is dissected and homogenized in 25 volumes (w/v) of Buffer A (0.05 M Tris HCl buffer, pH 7.4 at 4 °C). The tissue homogenate is centrifuged in the cold (4 °C) at 20,000 x g for 20 minutes. The supernatant is decanted, the  
5 pellet rehomogenized in the same volume of buffer, and centrifuged again at 20,000 x g. The supernatant of this centrifugation step is decanted and the pellet stored at -20 °C overnight. The pellet is then thawed and resuspended in 25 volumes of Buffer A (original wt/vol), centrifuged at 20,000 x  
10 g and the supernatant decanted. This wash step is repeated once. The pellet is finally resuspended in 50 volumes of Buffer A.

Incubations contained 100 µl of tissue homogenate, 100 µl of radioligand, (0.5 nM <sup>3</sup>H-Ro15-1788 [<sup>3</sup>H-Flumazenil], specific  
15 activity 80 Ci/mmol), and test compound or control (see below), and are brought to a total volume of 500 µl with Buffer A. Incubations are carried for 30 min at 4°C and then rapidly filtered through Whatman GFB filters to separate free and bound ligand. Filters are washed twice with fresh Buffer A and  
20 counted in a liquid scintillation counter. Nonspecific binding (control) is determined by displacement of <sup>3</sup>H Ro15-1788 (<sup>3</sup>H-Flanazenil) with 10 µM Diazepam (Research Biochemicals International, Natick, MA). Data are collected in triplicate, averaged, and percent inhibition of total specific binding  
25 (Total Specific Binding = Total - Nonspecific) is calculated for each compound.

A competition binding curve is obtained with up to 11 points spanning the compound concentration range from 10<sup>-12</sup>M to 10<sup>-5</sup>M obtained per curve by the method described above for  
30 determining percent inhibition. K<sub>i</sub> values are calculated according the Cheng-Prusoff equation. Each of the compounds shown and described in Examples 1 through 46, and tested in this assay was found to have a K<sub>i</sub> of <1µM.

**Example 51****Electrophysiology**

The following assay is used to determine if a compound of the invention act as an agonist, an antagonist, or an inverse  
5 agonist at the benzodiazepine site of the GABA<sub>A</sub> receptor.

Assays are carried out as described in White and Gurley (NeuroReport 6: 1313-1316, 1995) and White, Gurley, Hartnett, Stirling, and Gregory (Receptors and Channels 3: 1-5, 1995) with modifications. Electrophysiological recordings are carried  
10 out using the two electrode voltage-clamp technique at a membrane holding potential of -70 mV. *Xenopus Laevis* oocytes are enzymatically isolated and injected with non-polyadenylated cRNA mixed in a ratio of 4:1:4 for  $\alpha$ ,  $\beta$  and  $\gamma$  subunits, respectively. Of the nine combinations of  $\alpha$ ,  $\beta$  and  $\gamma$  subunits  
15 described in the White et al. publications, preferred combinations are  $\alpha_1\beta_2\gamma_2$ ,  $\alpha_2\beta_3\gamma_2$ ,  $\alpha_3\beta_3\gamma_2$ , and  $\alpha_5\beta_3\gamma_2$ . Preferably all of the subunit cRNAs in each combination are human clones or all are rat clones. The sequence of each of these cloned subunits is available from GENBANK, e.g., human  $\alpha_1$ , GENBANK  
20 accession no. X14766, human  $\alpha_2$ , GENBANK accession no. A28100; human  $\alpha_3$ , GENBANK accession no. A28102; human  $\alpha_5$ , GENBANK accession no. A28104; human  $\beta_2$ , GENBANK accession no. M82919; human  $\beta_3$ , GENBANK accession no. Z20136; human  $\gamma_2$ , GENBANK accession no. X15376; rat  $\alpha_1$ , GENBANK accession no. L08490, rat  
25  $\alpha_2$ , GENBANK accession no. L08491; rat  $\alpha_3$ , GENBANK accession no. L08492; rat  $\alpha_5$ , GENBANK accession no. L08494; rat  $\beta_2$ , GENBANK accession no. X15467; rat  $\beta_3$ , GENBANK accession no. X15468; and rat  $\gamma_2$ , GENBANK accession no. L08497. For each subunit combination, sufficient message for each constituent subunit is  
30 injected to provide current amplitudes of >10 nA when 1  $\mu$ M GABA is applied.

Compounds are evaluated against a GABA concentration that evokes <10% of the maximal evokable GABA current (e.g. 1  $\mu$ M - 9  $\mu$ M). Each oocyte is exposed to increasing concentrations of

compound in order to evaluate a concentration/effect relationship. Compound efficacy is calculated as a percent-change in current amplitude:  $100 * ((I_c/I) - 1)$ , where  $I_c$  is the GABA evoked current amplitude observed in the presence of test  
5 compound and  $I$  is the GABA evoked current amplitude observed in the absence of the test compound.

Specificity of a compound for the benzodiazepine site is determined following completion of a concentration/effect curve. After washing the oocyte sufficiently to remove  
10 previously applied compound, the oocyte is exposed to GABA + 1  $\mu$ M R015-1788, followed by exposure to GABA + 1  $\mu$ M R015-1788 + test compound. Percent change due to addition of compound is calculated as described above. Any percent change observed in the presence of R015-1788 is subtracted from the percent  
15 changes in current amplitude observed in the absence of 1  $\mu$ M R015-1788. These net values are used for the calculation of average efficacy and  $EC_{50}$  values by standard methods. To evaluate average efficacy and  $EC_{50}$  values, the concentration/effect data are averaged across cells and fit to  
20 the logistic equation.
