(54) Title: EMISSION OF VISIBLE LIGHT IN RESPONSE TO ABSORPTION OF EXCITATION LIGHT

(57) Abstract: Viewable images (15, 16) may be created in glass (14) by using a projector (18) which projects ultraviolet light to excite light emitting material. Clear images may be created in glass because the size of the light emitting particles in the glass is less than 400 nanometers. The visible illumination of a transparent substrate to display an image is possible, while the transparent substrate remains transparent. For example, drivers of automobiles may view images (e.g. map images) on their windshields while they are driving.
