INVENTOR

JOSEPH H. SHEELY,

by *Arthur C. Eckert* ATTORNEY.

UNITED STATES PATENT OFFICE.

JOSEPH H. SHEELY, OF ST. LOUIS, MISSOURI.

CONTAINER.

Application filed February 24, 1925. Serial No. 11,234.

To all whom it may concern:

Be it known that JOSEPH H. SHEELY, a citizen of the United States of America, residing in the city of St. Louis and State of Missouri, has invented certain new and useful Improvements in Containers, of which the following is a specification.

The object of my device is to fabricate a container for drugs, perfumes, antiseptics, and other liquids, etc.

A further and more specific object is to devise a capsule having a brush or swab contained therein, which brush or swab is made of a highly absorbent material for absorbing the liquid.

A still further object is to make a small capsule made of a fragile material such as paraffine, coated with collodion or other suitable substance, which container may be easily broken by manual pressure.

A further object is to make a capsule which is made of two parts, in one of which is secured the brush or swab. My capsule may be easily made of cheap material. It is used in several ways. It may be filled with perfume and carried by a lady. When the perfume is to be used, the container may be broken with the hand in a handkerchief and the perfume applied locally, by means of the brush or swab. The base of the capsule in which the brush or swab is secured forms a handle for the brush or swab. A disinfectant or drug may be applied locally in the same manner.

With these and other objects in view, my invention has relation to certain novel fea-

tures of construction and arrangement of parts, as will be hereinafter more fully described, pointed out in the claim, and illustrated in the drawings, in which,

Fig. 1 is a front elevation of my device.

Fig. 2 is a longitudinal, sectional elevation of my device, and

Fig. 3 is a transverse, sectional elevation on the line 3—3 of Fig. 2.

Numeral 4 designates my container, preferably made of paraffine or other similar material. It is made in two parts which when assembled, are formed integral by fusing or welding on the breaking circle 5. Numeral 6 designates a brush or swab made of highly absorbent material such as cotton, celutone, or fabric which is secured to the base 7 at 8 in a conventional manner. The end of the base 7 is countersunk as at 9 in order to conserve material. The cap 9' is secured to the base 7 at the welding or breaking circle 5, after the brush, saturated with the desired liquid, is placed in the position best shown in Fig. 2. The entire surface of the container is then coated with collodion or other similar material.

What I claim and mean to secure by Letters Patent is,

A paraffine container comprising a solid base, having its outer end countersunk and having a brush permanently secured at its other end, a cap, said cap secured to said base with a breakable joint.

In testimony whereof I affix my signature.

JOSEPH H. SHEELY.
