UNITED STATES PATENT OFFICE.

EDWARD V. WETZEL, OF NEW YORK, N. Y.

TOY.

No. 901,762.

Specification of Letters Patent.

Patented Oct. 20, 1908.

Application filed February 5, 1908. Serial No. 414,372.

To all whom it may concern:

Be it known that I, EDWARD V. WETZEL, a subject of the German Emperor, and a resident of New York, county of New York, State of New York, have invented certain new and useful Improvements in Toys, of which the following is a specification.

The present invention relates to a toy which consists of a doll or any other figure secured to a semispherical base to be capable of rocking in any direction.

The body of the figure and the body of the base are of light material, the base being weighted, so as to prevent the body from entirely tilting over and to cause it when swung to always rise into vertical position.

To make my invention more clear the same is illustrated in the accompanying drawing in which similar reference letters denote corresponding parts and in which

Figure 1 is an elevation and Fig. 2 a vertical section through the lower part of the toy, the upper part being broken away; Figs. 3 and 4 are details.

a denotes the figure and *b* the semispherical base thereof. This base may be made of wood or of a cushion *c* of sawdust or the like contained in a covering *d* of soft mate-

rial. In the latter case the cushion may be covered on top by a circular wooden disk *e*. The body of the figure is suitably secured upon the said disk *e* by means of a wire ring *f* attached to said disk.

The base *c* is weighted by a piece *g* of lead or other heavy material, which weight will when the body is swung prevent the latter from entirely tilting over and will cause it to rise into vertical position.

In the hollow body *a* a hammer, as a metal ring *h*, or the like is suitably suspended which, when the body is swung, will strike either one of the musical pins or tongues *i* projecting upward in a circle from a metal plate *j* secured upon the disk *e* and produce different sounds.

What I claim and desire to secure by Letters Patent is:

A toy comprising a hollow figure, a semispherical weighted base, a hammer suspended in said figure and a number of musical pins or tongues arranged in a circle upon the base in the path of said hammer.

EDWARD V. WETZEL.
