ABSTRACT

It has now been found that reduced-calorie, freezable beverages can be made using a small amount of alcohol and a reduced amount of sorbitol or other soluble solids. Surprisingly, one embodiment of the invention is a reduced-calorie, freezable beverage that can be adequately slushed using a standard soft-serve ice cream machine. Freezable coffee beverages and fruit beverages that are reduced-calorie, sugar-free, and low-fat are preferred embodiments of the invention.
REduced-calorie Freezable Beverage

Cross-reference to Related Applications

This application is a Divisional of application Ser. No. 10/628,383, filed on Jul. 29, 2003, which claims priority to application Ser. No. 60/399,437, wherein the contents of these two earlier applications are incorporated by reference in their entirety.

Field of the invention

The invention relates to reduced-calorie, freezable beverages and sugar-free creamers that can be used therewith.

Background of the Invention

There is great demand for products that are low-calorie, low sugar (or sugar-free), and/or low fat. Manufacturing “frozen” drinks with such properties, however, has not yet been successfully achieved.

Commercially available frozen coffee drinks, for example, are typically made using a coffee concentrate that is diluted with water then “slushed” in a machine, such as a soft-serve ice cream machine. The product can then be consumed alone or with a creamer.

These soft-serve ice cream machines typically require a minimum of 11-12° Brix. Brix is the percentage of soluble solids, which are commonly sugars. A high Brix value is associated with depressing the freezing point of the beverage. Typically, a low molecular weight sugar alcohol, such as sorbitol, is added to depress the freezing point of the beverage. Unfortunately, however, sorbitol adds a substantial amount of calories to the beverage. Thus, there is a need for a palatable frozen beverage that is low in calories.

Summary of the Invention

Beverage concentrates, freezable beverages, and frozen beverages are described. A preferred embodiment of the invention is a 3x concentrate comprising about 0.01 to about 0.4% by weight high-potency sweetener, about 1 to about 30% by weight flavoring, about 1 to about 35% by weight sugar substitute, and about 1 to about 12% by weight alcohol, wherein the concentrate has less than about 33° Brix. Preferred embodiments also contain about 0.01 to about 3% texture modifier.

A preferred embodiment of the 3x concentrate comprises about 0.01 to about 0.4% by weight high-potency sweetener, about 1 to about 30% by weight flavoring, about 1 to about 32% by weight sugar substitute, and about 0.3 to about 12% by weight alcohol, wherein the concentrate has less than about 32° Brix.

A more preferred embodiment of the 3x concentrate comprises about 0.02 to about 0.2% by weight high-potency sweetener, about 2 to about 15% by weight sugar substitute, about 2 to about 25% by weight sugar substitute, and about 0.3 to about 9% by weight alcohol, wherein the concentrate has less than about 32° Brix. Another embodiment of the invention is a freezable beverage which preferably comprises one part of the 3x concentrate and about two parts water, wherein the freezable beverage has less than about 11° Brix. A preferred embodiment of the freezable beverage also contains about 0.01 to about 3% texture modifier, preferably about 0.03 to about 0.5% texture modifier. It may also contain up to about 0.2% salt. Preferable the freezable beverage also contains about 0.1 to about 2% alcohol, preferably about 0.2 to about 1% alcohol, more preferably about 0.3 to about 0.5% alcohol. Preferably the freezable beverage has less than about 10° Brix, preferably from about 1.5° to about 7° Brix. Preferably the freezable beverage contains less than about 12.5 calories/ounce. Preferably the freezable beverage contains about 0.01 to about 3% sugar substitute and about 0.3 to about 3% alcohol. One preferred freezable beverage comprises coffee extract. Another embodiment is a frozen beverage that is the freezable beverage in frozen form.

Another preferred embodiment of the invention is a 2x concentrate comprising about 0.002 to about 0.04% by weight high-potency sweetener, about 2 to about 60% by weight flavoring, about 1 to about 22% by weight sugar substitute, about 0.2 to about 12% by weight alcohol, wherein the beverage has less than 22° Brix.

Another embodiment of the invention is a freezable beverage which preferably comprises one part of the 2x concentrate and about one part water, wherein the freezable beverage has less than 11° Brix. Preferred embodiments of the freezable beverage also contain about 0.01 to about 3% texture modifier, more preferably about 0.03 to about 0.5% texture modifier. Preferably the freezable beverage of the invention also contains up to about 0.2% salt. Another preferred freezable beverage of the invention comprises about 0.001 to about 0.2% high-potency sweetener; about 1 to about 10% flavoring; about 0.5 to about 5% sugar substitute, and about 0.2 to about 4% alcohol. Preferably the freezable beverage contains about 0.2 to about 1% alcohol, more preferably about 0.3 to about 0.5% alcohol.

Another embodiment of the invention is a water-based creamer comprising about 0.1 to about 10% by weight emulsifier, about 0.001 to about 2% by weight stabilizer, about 1 to about 15% by weight sweetener, and about 0.01 to about 12% by weight fat. Preferably the amount of emulsifier is about 2.5 to about 5% by weight. Preferably the amount of stabilizer is about 0.02 to about 0.1% by weight. Preferably the amount of sweetener is about 3 to about 8% by weight. Preferably the amount of fat is preferably about 0.1 to about 3% by weight. Preferably the fat is palm kernel oil.

A preferred embodiment of the water-based creamer comprises about 2.5 to about 5% by weight emulsifier, about 0.02 to about 1% by weight stabilizer, about 3 to about 8% by weight sweetener, and about 0.1 to about 3% by weight fat. Another preferred embodiment of the water-based creamer comprises 4% by weight emulsifier, about 0.1% by weight stabilizer, about 3% by weight sweetener, and about 2% by weight fat. Preferably the fat comprises palm kernel oil. Preferably the emulsifier comprises sodium caseinate. Preferably the sweetener comprises sorbitol.

Another embodiment of the invention is a process of making a water-based creamer comprising mixing water, sweetener, emulsifier, stabilizer, fat, and optionally flavoring, wherein the water-based creamer comprises about 0.1 to about 10% by weight emulsifier, about 0.001 to about 2% by weight stabilizer, about 1 to about 15% by weight sweetener, and about 0.01 to about 12% by weight fat. A preferred
embodiment of the process comprises preparing a premix comprising emulsifier and stabilizer, mixing water and optionally flavoring at 150-160°F to form a first mix, maintaining the temperature of said first mix at above 140°F, mixing fat to said first mix at a temperature above 140°F to form a second mix, mixing the premix and optionally the sweetener to the second mix, mixing at high shear at 140-155°F until lumps are gone, and mixing at 140-165°F for up to 2 hours. Preferably the sweetener is mixed to the second mix together with the premix. Preferably an antifoam is added to the first mix after the fat. Preferably the fat comprises palm kernel oil. Preferably the emulsifier comprises sorbitol.

DETAILED DESCRIPTION OF THE INVENTION

[0014] The invention is directed to freezeable beverages, such as frozen coffee or tea drinks, smoothies, slushies, bar mixes, ice cream products, and the like; as used herein, the term “beverage” is used broadly to cover these types of products. As used herein, the term “fruit” includes fruit solids and fruit juice.

[0015] One embodiment of the invention is a 3x concentrate that can be diluted and slushed prior to consumption. The concentrate contains water, a sweetener (preferably a reduced-calorie and/or high potency sweetener such as Sucralose, Acesulfame K, Aspartame, Neotame, Saccharin, etc.), a sugar substitute (such as polyols such as sorbitol, lactitol, maltitol, xylitol, mannitol, etc.), and one or more consumable alcohols (preferably ethanol). Generally, the concentrate will also contain flavoring agents (such as fruit, coffee extracts, tea extracts, etc.), coloring agents (such as caramel color), and texture modifiers (such as carboxymethylcellulose, pectin, carrageenan, guar gum, locust bean gum, xanthan gum, etc.) to control ice crystal growth and/or to modify texture. Other common ingredients that can be used are those well known in the art, such as antifoam agents.

[0016] Preferably, the 3x concentrate contains about 0.01-0.4% high potency sweetener, preferably about 0.02-0.4%, preferably about 0.03-0.2%, preferably about 0.05-0.2%, about 1-30% flavoring, preferably about 2-18%, preferably about 2-15%; about 1-35% sugar substitute, preferably about 1-32%, preferably about 1 to about 25%, preferably about 1 to about 9%, preferably about 1 to about 4%, about 0.3-12% alcohol, preferably about 1-10%, preferably about 1 to about 6% (for alcoholic beverages, preferably about 4-10% for non-alcoholic beverages, preferably less than about 3% and preferably less than about 1.5%).

[0017] In a preferred coffee-flavored embodiment of the 3x concentrate, the flavoring comprises coffee extract. In addition, a preferred coffee-flavored embodiment contains preferably about 0.0001-0.001% antifoam agent, preferably about 0.0002-0.0006%; preferably about 0.01-3% texture modifier, preferably about 0.08-0.5%, and/or preferably up to about 1% salt, preferably up to about 0.6%. As used herein, “salt” refers to edible salts, preferably sodium chloride.

[0018] In a preferred sweetmee embodiment, a 2x concentrate preferably contains about 0.01-0.4% high potency sweetener, preferably about 0.02-0.4%, preferably about 0.02-0.2%, preferably about 0.05-0.2%, about 1-60% fruit, preferably about 3-40%, preferably about 12-22%; about 1-25% sugar substitute, preferably about 2 to about 10%; about 0.2-12% alcohol, preferably about 1-10% (for alcoholic beverages, preferably about 4-10%; for non-alcoholic beverages, preferably less than about 3%, preferably less than about 1.5%). In a particularly preferred smoothie embodiment preferably contains about 0.01-3% texture modifier, preferably about 0.02-0.1%, preferably about 0.01-1% salt, preferably about 0.02-1% and/or preferably about 0.05-2% additional flavoring, preferably about 0.1-1.2%.

[0019] Alternatively, the concentrate could range from just over 1x to 5x or greater. The relative amounts of each ingredient could be easily recalculated accordingly.

[0020] Preferably, the concentrate is aseptically manufactured and shelf-stable at room temperature until opened when ready for use.

[0021] Another embodiment of the invention is a freezeable beverage comprising a concentrate that has been diluted to a palatable beverage. For a 3x concentrate, 1 part concentrate would be added to about 2 parts water. The freezeable beverage comprises an effective amount of alcohol to produce a beverage that can be slushed using machines commonly used in the art for such purpose. Preferably, the amount of alcohol is about 0.2%-1%. For some applications, the amount of alcohol used is preferably less than 0.5%, thereby qualifying the product as “alcohol free” according to certain governmental regulations. However, if the freezeable beverage is intended as an alcoholic beverage, then more than 0.5% alcohol may be desirable.

[0022] Generally, within the alcohol range of 0.0-5%, the higher part of this range is preferred because less other soluble solids, such as sugar alcohols, is then required to achieve adequate slushing. Preferably, a coffee beverage embodiment, for example, contains about 0.1-0.5% alcohol, more preferably about 0.2-0.5% alcohol, more preferably about 0.3-0.5%.

[0023] Preferred embodiments of the freezeable beverage of the invention are low in calories, preferably less than 12.5 calories/oz, more preferably less than about 10 calories/oz, more preferably less than about 8 calories/oz, more preferably about 7 calories/oz or less.

[0024] Typically, the low-calorie, freezeable beverage will have a low Brix value, such as less than about 10° Brix, preferably less than about 7° Brix, and more preferably as low as 3° Brix or lower. Advantageously, a freezeable beverage with a lower Brix value is generally lower in calories. Surprisingly, a preferred embodiment of the invention has a lower Brix value than the equipment manufacturer’s assumptions for what is required to produce an adequate slush in their equipment, which is generally at least 11-12° Brix. Preferably, the various composition embodiments of the invention are made aseptically.

[0025] Another embodiment of the invention is a creamer, preferably sugar-free, that can be mixed with the freezeable beverage. The freezeable beverage, however, can be used alone or with other creamers. The use of skim milk, for example, would largely retain the benefit of a low calorie product. Preferably, 1 part creamer is mixed with about 3 parts slushed beverage.
Preferably, the creamer contains water; about 0.1-10% emulsifier, more preferably about 2.5-5%; about 0.001-2% stabilizer, more preferably about 0.02-1%; about 1-15% sweetener (preferably a sugar substitute), more preferably about 3-8%; about 0.01-25% fat, preferably about 0.01-12%, more preferably about 0.1-3%. In a preferred embodiment, the creamer also contains 0.0001-0.01% antifoam agent, more preferably 0.0002-0.005%; about 0.001-1.0 flavoring, more preferably 0.01-0.2%; and about 0.01-0.8% stabilizer salt; more preferably about 0.03-0.1%.

Suitable emulsifiers include, for example, mono and diglycerides, sodium stearoyl lactylate, sucrose esters, DATEM, or other known emulsifiers. Suitable sugar substitutes include, for example, polyols such as sorbitol, lactitol, maltitol, xylitol, mannitol, etc. Suitable fats include animal-based fats, such as butterfat, or, preferably, vegetable oils, such as palm kernel oil, butterfat, coconut oil, soybean oil, canola oil, sunflower oil, etc. Other common ingredients that can be used are those well known in the art, such as antifoam agents and salts.

The present invention will now be described in detail with respect to showing how certain specific representative embodiments thereof may be made, apparatus and process steps being understood as examples that are intended to be illustrative only. In particular, the invention is not intended to be limited to the methods, ingredients, conditions, process parameters, apparatus and the like specifically recited herein.

The water (cold) was mixed with the carboxymethylcellulose (CMC) in a high shear mixer. This slurry was added to all of the other ingredients which are mixed at room temperature. Sweep mixer at 70%. The mixture, which was produced aseptically, contained about 18° Brix, about 1.2% alcohol, and about 22 calories per fluid ounce.

The mixing procedure is as follows: Add water at 150-160° F; sweep mixer at 70%; high shear off. Maintain temperature above 140° F. Add palm kernel oil with same mixing as above. Add antifoam with same mixing as above. 3.8342% of a premix (the final percentages shown above) is very slowly sprinkled into the mix. This can be added with the sorbitol. Sweep mixer 70%; high shear mixer 80%; temperature 140-155° F. The product must be mixed until lumps are completely gone. When the product is thoroughly mixed, turn the high shear mixer off and reduce the sweep mixer to 60%. Hold mix at 140-165° F. for no more than 2 h. The mixture, which was made aseptically, contained about 6° Brix, about 0.5% alcohol, and about 7 calories per fluid ounce.

**EXAMPLE 3**

Frozen Coffee Beverage

A frozen coffee beverage was prepared by diluting 1 part of the concentrate from Example 1 with 2 parts water. The mixture was then added to a soft-serve ice cream machine and slushed according to the normal operating guidelines for the machine. The product formed a semi-liquid slush that could be easily dispensed using the standard dispensing valves of the machine. The mixture contained about 6° Brix, about 0.5% alcohol, and about 7 calories per fluid ounce.

The coffee concentrate was prepared by the method described in Example 1. The mixture contained about 9° Brix, about 2.1% alcohol, and about 12 calories per fluid ounce.

**EXAMPLE 5**

Frozen Coffee Beverage

A frozen coffee beverage was prepared by diluting 1 part of the concentrate from Example 4 with 2 parts water. The mixture was then added to a Taylor-type soft-serve ice cream machine and slushed according to the normal operating guidelines for the machine. The product formed a semi-liquid slush that could be easily dispensed using the standard dispensing valves of the machine. The mixture contained about 5.5° Brix, about 1.05% alcohol, and about 7 calories per fluid ounce.

**EXAMPLE 6**

Strawberry 2X Concentrate

The strawberry concentrate was prepared by the method described in Example 1, except all mixing was done with a sweep mixer without high shear. The concentrate can be prepared isopically. The mixture contained about 11° Brix, about 2.1% alcohol, and about 14 calories per fluid ounce.

**EXAMPLE 7**

Frozen Strawberry Smoothie

A frozen strawberry smoothie beverage was prepared by diluting 1 part of the concentrate from Example 6 with 1 part water. The mixture was then added to a Bunn smoothie machine and slushed according to the normal operating guidelines for the machine. The product formed a semi-liquid slush that could be easily dispensed using the standard dispensing valves of the machine. The mixture contained about 5.5° Brix, about 1.05% alcohol, and about 7 calories per fluid ounce.

What is claimed is:

1. A water-based creamer comprising:
   - about 0.1 to about 10% by weight emulsifier;
   - about 0.001 to about 2% by weight stabilizer;
   - about 1 to about 15% by weight sweetener; and
   - about 0.01 to about 12% by weight fat.
2. The water-based creamer of claim 1, wherein the amount of emulsifier is about 2.5 to about 5% by weight.
3. The water-based creamer of claim 1, wherein the amount of stabilizer is about 0.02 to about 1% by weight.
4. The water-based creamer of claim 1, wherein the amount of sweetener is about 3 to about 8% by weight.
5. The water-based creamer of claim 1, wherein the amount of fat is about 0.1 to about 3% by weight.
6. The water-based creamer of claim 1, wherein the fat is palm kernel oil.
7. A water-based creamer comprising:
   - about 2.5 to about 5% by weight emulsifier;
   - about 0.02 to about 1% by weight stabilizer;
   - about 3 to about 8% by weight sweetener; and
   - about 0.1 to about 3% by weight fat.
8. The water-based creamer of claim 7, wherein the fat is palm kernel oil.
9. The water-based creamer of claim 7, wherein the emulsifier comprises sodium caseinate.
10. The water-based creamer of claim 7, wherein the sweetener comprises sorbitol.
11. The water-based creamer of claim 7, comprising:
    - about 4% by weight emulsifier;
    - about 0.1% by weight stabilizer;
    - about 3% by weight sweetener; and
    - about 2% by weight fat.
12. The water-based creamer of claim 11, wherein the fat is palm kernel oil.
13. The water-based creamer of claim 11, wherein the emulsifier comprises sodium caseinate.
14. The water-based creamer of claim 11, wherein the sweetener comprises sorbitol.
15. A process of making a water-based creamer comprising mixing water, sweetener, emulsifier, stabilizer, fat, and optionally flavoring, wherein the water-based creamer comprises about 0.1 to about 10% by weight emulsifier, about 0.001 to about 2% by weight stabilizer, about 1 to about 15% by weight sweetener, and about 0.01 to about 12% by weight fat.
16. The process of claim 15, comprising:
    preparing a premix comprising emulsifier and stabilizer; mixing water and optionally flavoring at 150-160° F. to form a first mix; maintaining the temperature of said first mix at above 140° F.; mixing fat with said first mix at a temperature above 140° F. to form a second mix;
mixing the premix and optionally the sweetener with the second mix to form a third mix;
mixing the third mix at high shear at 140-155°F. until lumps are gone to form a fourth mix;
mixing the fourth mix at 140-165°F. for up to 2 hours.

17. The process of claim 16, wherein the sweetener is mixed to the second mix together with the premix.

18. The process of claim 16, wherein an antifoam is added to the first mix after the fat.
19. The process of claim 16, wherein the fat comprises palm kernel oil.
20. The process of claim 16, wherein the emulsifier comprises sodium caseinate.
21. The process of claim 16, wherein the sweetener comprises sorbitol.
