DESCRIPTION

Description

[0001] The specification relates to chemical compounds, and pharmaceutically acceptable salts thereof, that inhibit IRAK4 and consequently have potential utility in medicine. The specification also relates to the use of these IRAK4 inhibitors in the treatment of respiratory diseases such as asthma and chronic obstructive pulmonary disease (COPD), of cancer, of inflammatory diseases and of autoinflammatory/autoimmune diseases such as systemic lupus erythematosus, rheumatoid arthritis, myositis, Sjögren's syndrome, systemic sclerosis, gout, endometriosis, atopic dermatitis and psoriasis. The specification also relates to processes and intermediate compounds involved in the preparation of said IRAK4 inhibitors and to pharmaceutical compositions containing them.

[0002] Interleukin-1 receptor (IL-1R)-associated kinase 4 (IRAK4) is a key regulator of immune signaling. IRAK4 is expressed by multiple cell types and mediates signal transduction from Toll-like receptors (TLRs) and receptors of the interleukin-1 (IL-1) family, including IL-1R, IL-18R and the IL-33 receptor ST2. TLRs recognize and respond to ligands derived from microbes, such as lipopolysaccharide (LPS) or microbial RNA or DNA, while receptors of the IL-1 family can be activated by endogenous ligands produced by TLR-activated cells (IL-1 β and IL-18) or by tissue damage (IL-1 α and IL-33). Upon activation of TLRs or IL-1 receptors by their ligands, the adaptor protein myeloid differentiation primary response 88 (MyD88) is recruited to the receptor and forms a multimeric protein complex, called the "Myddosome", together with proteins of the IRAK family (IRAK1, IRAK2 and IRAK4). The Myddosome serves as a signaling platform to induce nuclear factor κ B (NF- κ B) and mitogen-activated protein kinase (MAPK) signal transduction pathways, culminating in the activation of transcription factors NF- κ B, activator protein 1 (AP1), c-AMP response element-binding protein (CREB) and interferon regulatory factor 5 (IRF5), driving transcription of inflammatory cytokines and chemokines. Mice lacking IRAK4 are viable but lack inflammatory cytokine response to IL-1 β , IL-18 and LPS. Humans presenting loss-of-function mutations in IRAK4 display an immunocompromised phenotype and their immune cells show an abrogated cytokine response to TLR agonists and IL-1 receptor ligands.

[0003] IRAK4 is characterized by an N-terminal death domain that mediates the interaction with MyD88 and a centrally located kinase domain. Myddosome formation promotes IRAK4 auto-phosphorylation which modulates the stability and downstream signaling of the Myddosome. The kinase activity of IRAK4 is required for cytokine induction by TLRs and IL-1R, as shown by studies in knock-in mice expressing a kinase-dead IRAK4, as well as in studies using small molecule IRAK4 kinase inhibitors.

[0004] Given its critical role in eliciting an inflammatory response, IRAK4 constitutes a target

for drugs that exert an anti-inflammatory effect.

[0005] Asthma and COPD (chronic obstructive pulmonary disease) are chronic lung diseases constituting a major unmet medical need around the world. Asthma and COPD are characterized by chronic airway inflammation, involving abnormal cytokine release, dysregulated immune cell activation and airway remodeling. In asthma, insults to the airways such as allergenic, viral and bacterial insults activate the TLR receptors via pathogen associated molecular patterns (PAMPs), and the IL-1R and ST2 receptors via the release of alarmins, including IL-33 and IL-1 α , as well as by IL-1 β released upon inflammasome activation. TLRs and receptors of the IL-1 family are present in multiple cell types in the airways, including macrophages, dendritic cells, mast cells, monocytes and epithelial cells, and respond to their ligands by releasing inflammatory cytokines (TNF- α , IL-6, IL-8, GM-CSF, IL-5) leading to airway inflammation, recruitment of inflammatory cells such as neutrophils and eosinophils, airway hyperresponsiveness and mucus production. IRAK4 inhibition has the potential to suppress these inflammatory pathways in the airways. Gene expression analysis of lung samples from asthma and COPD patients, have revealed an upregulated expression of genes associated with the IL-1R and TLR2/4 inflammatory pathways in subsets of severe patients. Although IRAK4 inhibitors have not, to the best of our knowledge, been explored in the clinic for the treatment of respiratory diseases, pre-clinical data from several research groups indicates that interfering with IRAK4-regulated pathways attenuates airway inflammation in animal models of both asthma and COPD. For instance, mice lacking MyD88, the central component of the myddosome, are protected against airway inflammation induced by allergens or IL-33, as are mice treated with a small molecule mimetics blocking the interaction between IRAK2 and IRAK4. Blocking IL-1 β with a monoclonal antibody has also been found to suppress airway inflammation induced by allergens and bacteria in a steroid-resistant mouse model of asthma. Moreover, the treatment of mice with the IL-1R antagonist anakinra at the time of allergen challenge ameliorates asthma-like symptoms in a mouse model of allergic asthma. Chronic exposure to cigarette smoke is a major contributing factor to the development of COPD. In mice exposed to cigarette smoke, IL-1 signaling is central in mediating neutrophilic airway inflammation, and blocking IL-1 signaling with antibodies against IL-1 α , IL-1 β or the IL-1R can ameliorate the neutrophilic inflammation in the lung and reduce bacteria- or virus-induced exacerbations in cigarette smoke-exposed mice. Taken together, IRAK4 inhibition has potential to provide a broad anti-inflammatory effect in inflammatory respiratory diseases by simultaneously blocking several disease-relevant signaling pathways.

[0006] As a central regulator of the Myddosome, IRAK4 is also a promising therapeutic target in other inflammatory diseases driven by IL-1R-, TLR- or ST2-mediated mechanisms. As previously disclosed, IRAK4 plays a role in autoimmune disorders such as rheumatoid arthritis and systemic lupus erythematosus (SLE) (see e.g. WO2017207386 & WO2015150995). In SLE, immunocomplexes composed by autoantibodies and self-antigens, can drive TLR-dependent pathological signaling. In SLE pathogenesis, IRAK4 inhibition reportedly blocks the release of type I interferons and pro-inflammatory cytokines mediated by TLR7 and TLR9 activation in plasmacytoid dendritic cells. Mice expressing a kinase-dead mutant of IRAK4 or treated with IRAK4 kinase inhibitor compounds, are resistant to experimentally induced arthritis

and lupus (see e.g. WO2017207386). The approved use of anakinra (an IL-1 receptor antagonist) for the treatment of rheumatoid arthritis, also support the role of pathogenic IL-1R signaling in this disease. In Sjögren's syndrome, TLRs are upregulated in PBMCs (peripheral blood mononuclear cells) and salivary glands and TLR activation can stimulate release of interferon and other inflammatory cytokines, suggested to be implicated in Sjögren's pathogenesis. MyD88 knockout mice also display reduced disease manifestations in an experimental mouse model of Sjögren's syndrome. Systemic sclerosis is a severe autoimmune disorder where IL-1R, TLR4, TLR8 and ST2-signaling can drive pathogenic mechanisms, including microvascular damage and fibrosis. Inhibition of IRAK4 as a treatment in systemic sclerosis would thus block multiple disease-relevant pathways simultaneously. In myositis, elevated levels of IL-1 α and IL-1 β can contribute to muscle tissue inflammation. Myositis patients have also been characterized with high type I interferon gene signature, that may be partly driven by TLR7/9 activation, and the relevance of IL-1R signaling was supported by an improved clinical outcome in myositis patients treated with anakinra in a smaller mechanistic clinical trial. As a central regulator of the IL-1R pathway, IRAK4 is also a promising target in the treatment of gout. Monosodium urate crystals, characteristically formed in gout sufferers, can trigger the activation of the inflammasome and release of IL-1 β . The use of both canakinumab, an anti IL-1 β monoclonal antibody or anakinra has demonstrated clinical efficacy in the treatment of gout flares. Elevated levels of IL-1 β and IL-33 have also been found in patients with endometriosis. The importance of IRAK4 in the disease process of endometriosis was shown in a mouse model where oral administration of an IRAK4 inhibitor suppressed lesion formation. MyD88 knockout mice were also protected against the development of endometriosis in the same mouse model. IL-33/ST2 signaling is a key mechanism in atopic dermatitis, involved in the regulation of skin inflammation, epithelial barrier integrity and eosinophil recruitment. IL-33 can trigger eczema and dermatitis in mice in a MyD88-dependent manner. As a regulator of ST2 signaling and a central component of the myddosome, IRAK4 inhibition has the potential to inhibit pathogenic IL-33/ST2 signaling in atopic dermatitis. Both TLR7 and IL-1R mediated mechanisms have been suggested to be involved in psoriasis. Imiquimod (TLR8 agonist) can induce psoriasis-like disease in mice in a MyD88-dependent manner. IL-1 β is upregulated in psoriatic skin lesions and the IL-1 β /IL-1R axis has been suggested to contribute to skin inflammation and regulate the production of IL-17, a critical cytokine released from TH17 cells in psoriasis pathogenesis. IRAK4 kinase activity has further been shown to be required for the regulation of TH17 differentiation and TH17-mediated diseases *in vivo*.

[0007] A number of IRAK4 kinase inhibitors are known and have been developed principally for use in oncology or inflammatory disease (see e.g. WO2015150995, WO2017207386, WO2017009806, WO2016174183, WO2018234342). Of the known IRAK4 kinase inhibitors PF-06650833 has recently completed a phase II clinical trial for the treatment of rheumatoid arthritis (see [clinicaltrials.gov](https://clinicaltrials.gov/entry/NCT02996500) entry for NCT02996500). ZHAI WENQIANG ET AL ("Discovery and optimization of a potent and selective indazolumine series of IRAK4 inhibitors", BIOORGANIC & MEDICINAL CHEMISTRY LETTERS, ELSEVIER, AMSTERDAM, NL, vol. 31, 24 November 2020 (2020-11-24), pages) discloses indazole derivatives as IRAK4 inhibitors for the treatment of inflammatory and autoimmune diseases. CHEN YUN ET AL ("Design and

synthesis of Imidazo[1,2-b]pyridazine IRAK4 inhibitors for the treatment of mutant MYD88 L265P diffuse large B-cell lymphoma", EUROPEAN JOURNAL OF MEDICINAL CHEMISTRY, ELSEVIER, AMSTERDAM, NL, vol. 190, 25 January 2020 (2020-01-25)) discloses imidazo[1,2-b]pyridazine derivatives as IRAK4 inhibitors for the treatment of lymphoma. MARIAN C. BRYAN ET AL ("Development of Potent and Selective Pyrazolopyrimidine IRAK4 Inhibitors", JOURNAL OF MEDICINAL CHEMISTRY, vol. 62, no. 13, 13 May 2019 (2019-05-13), pages 6223-6240) discloses pyrazolo[1,5-a]pyrimidine derivatives as IRAK4 inhibitors for the treatment of inflammation, immune related diseases.

[0008] Taken together, IRAK4 inhibitors have potential for the treatment of a number of diseases and conditions albeit to date no such inhibitor has been approved for clinical use. It is an object of the present specification to provide new IRAK4 inhibitors with physicochemical and selectivity profiles that render them suitable for clinical use, for example in the treatment of inflammatory diseases associated with activation of IRAK4-mediated pathways, such as asthma, COPD and chronic autoimmune/autoinflammatory diseases.

[0009] In a first aspect, the present specification provides a compound of Formula (A), or a pharmaceutically acceptable salt thereof,

wherein:

R¹ is selected from

R² is selected from

R³ and R⁴ are each independently selected from H, Me, Et, optionally substituted C₁-C₆ alkyl and optionally substituted C₃-C₆ cycloalkyl;

Y is N(Me)COMe, N(R⁵)COMe, N(Me)COR⁶, N(R⁵)COR⁶, CONMe₂ or a 5-membered N-heterocycle such as 1,2,3-triazole and Z is H, Me, Et and optionally substituted C₁-C₆ alkyl; or

Y and Z combine to form an optionally substituted 4-, 5- or 6-membered ring;

X is selected from OR⁷ and NR⁸R⁹;

R⁵ is selected from H, optionally substituted C₁-C₆ alkyl and optionally substituted C₃-C₆

cycloalkyl;

R^6 is selected from optionally substituted C_1 - C_6 alkyl, optionally substituted C_3 - C_6 cycloalkyl and optionally substituted 5- or 6-membered saturated N-heterocycle;

R^7 is Me, Et, *i*-propyl, *n*-propyl, cyclopropyl, cyclobutyl, an optionally substituted C_1 - C_6 alkyl, C_3 - C_6 cycloalkyl group or 4-, 5- or 6-membered ring containing a heteroatom selected from O and N;

R^8 and R^9 are independently selected from H, Me and optionally substituted C_1 - C_6 alkyl or together form an optionally substituted C_3 - C_6 cycloalkyl or an optionally substituted 4-, 5- or 6-membered ring containing a further heteroatom selected from O and N;

wherein the optional substituents of Z, R^3 , R^4 , R^5 , R^6 , R^7 , R^8 and R^9 , when present, are independently selected from OH, C_1 - C_3 alkyl, C_1 - C_3 alkoxy, C(O)Me, amino, NHMe, NMe₂, For Cl.

[0010] In a second aspect the present specification provides a compound of Formula (I), or a pharmaceutically acceptable salt thereof,

wherein:

R^1 is selected from

R^2 is selected from

R^3 and R^4 are each independently selected from H, Me, Et, optionally substituted C_1 - C_6 alkyl and optionally substituted C_3 - C_6 cycloalkyl;

Y is N(Me)COMe, N(R^5)COMe, N(Me)COR⁶, N(R^5)COR⁶, CONMe₂ or a 5-membered N-heterocycle such as 1,2,3-triazole and Z is H, Me, Et and optionally substituted C_1 - C_6 alkyl; or

Y and Z combine to form an optionally substituted 4-, 5- or 6-membered ring;

X is selected from OR⁷ and NR⁸R⁹;

R⁵ is selected from H, optionally substituted C₁-C₆ alkyl and optionally substituted C₃-C₆ cycloalkyl;

R⁶ is selected from optionally substituted C₁-C₆ alkyl and optionally substituted C₃-C₆ cycloalkyl;

R⁷ is Me, Et, *i*-propyl, *n*-propyl, cyclopropyl, cyclobutyl, an optionally substituted C₁-C₆ alkyl, C₃-C₆ cycloalkyl group or 4-, 5- or 6-membered ring containing a heteroatom selected from O and N;

R⁸ and R⁹ are independently selected from H, Me and optionally substituted C₁-C₆ alkyl or together form an optionally substituted C₃-C₆ cycloalkyl or an optionally substituted 4-, 5- or 6-membered ring containing a further heteroatom selected from O and N;

wherein the optional substituents of Z, R³, R⁴, R⁵, R⁶, R⁷, R⁸ and R⁹, when present, are independently selected from OH, C₁-C₃ alkyl, C₁-C₃ alkoxy, C(O)Me, amino, NHMe, NMe₂, F or Cl.

[0011] References to a compound of Formula (I) herein below should be read to include reference to a compound of Formula (A) as well as to refer to a compound of Formula (I).

[0012] The specification also describes a pharmaceutical composition that comprises a compound of Formula (I), or a pharmaceutically acceptable salt thereof, and at least one pharmaceutically acceptable excipient.

[0013] The specification also describes a compound of Formula (I), or a pharmaceutically acceptable salt thereof, for use as a medicament.

[0014] The specification also describes a compound of Formula (I), or a pharmaceutically acceptable salt thereof, for use in the treatment of respiratory diseases such as asthma and chronic obstructive pulmonary disease (COPD).

[0015] The specification also describes a compound of Formula (I), or a pharmaceutically acceptable salt thereof, for use in the treatment of inflammatory diseases.

[0016] The specification also describes a compound of Formula (I), or a pharmaceutically acceptable salt thereof, for use in the treatment of autoinflammatory/autoimmune diseases such as systemic lupus erythematosus, rheumatoid arthritis, myositis, Sjögren's syndrome, systemic sclerosis, gout, endometriosis, atopic dermatitis and psoriasis.

[0017] The specification also describes a compound of Formula (I), or a pharmaceutically acceptable salt thereof, for use in the treatment of cancer, for example for use in combination with a BTK inhibitor.

[0018] The specification also describes a compound of Formula (I), or a pharmaceutically acceptable salt thereof, for use in the treatment of cancer. In such uses the compound of Formula (I) may be used as a monotherapy, or in combination with a further therapeutic agent, for example for the treatment of a haematologic malignancy. The haematologic malignancy to be treated may be selected from Waldenstrom's macroglobulinemia (WM), non-Hodgkin lymphoma (NHL), diffuse large B-cell lymphoma (DLBCL), primary central nervous system lymphoma (PCNSL), Splenic Marginal Zone Lymphoma (SMZL), small lymphocytic lymphoma (SLL), leukaemias (chronic lymphocytic leukaemia (CLL)) and monoclonal gammopathy of undetermined significance (MGUS-IgM+). Furthermore, the use may be for the treatment of haematologic malignancies that has MYD88 mutation, B-cell receptor (BCR) mutation or both MYD88 and BCR mutations. When the compound is used in combination with a further therapeutic agent the second agent may be selected from group comprising BCR inhibitors such as BTK inhibitors (examples include ibrutinib, acalabrutinib, zanubrutinib or tirabrutinib), PI3K δ inhibitors and SYK inhibitors or immunotherapies.

[0019] The specification also describes the use of a compound of Formula (I) for the manufacture of a medicament, for example wherein the medicament is for use in the treatment of respiratory diseases such as asthma and chronic obstructive pulmonary disease (COPD) or for use in the treatment of cancer or for use in the treatment of autoinflammatory/autoimmune diseases such as systemic lupus erythematosus, rheumatoid arthritis, myositis, Sjögren's syndrome, systemic sclerosis, gout, endometriosis, atopic dermatitis and psoriasis or for use in the treatment of inflammatory disease.

[0020] The specification also describes the compounds for use in methods of treatment comprising administration of an effective amount of a compound of Formula (I) to a patient in need thereof, wherein the patient in need has a respiratory diseases such as asthma and chronic obstructive pulmonary disease (COPD), cancer, an autoinflammatory/autoimmune disease such as systemic lupus erythematosus, rheumatoid arthritis, myositis, Sjögren's syndrome, systemic sclerosis, gout, endometriosis, atopic dermatitis and psoriasis or an inflammatory disease.

[0021] The present specification also relates to processes for the manufacture of a compound of Formula (I). Further aspects of the specification will be apparent to one skilled in the art from reading this specification.

[0022] The specification make reference to the following Figure.

[0023] **Figure 1. *In vivo* dose response of Example 89 in an acute mouse model of LPS-induced lung inflammation.** Example 89 compound was dosed orally to mice 1 h prior to inhaled LPS challenge (1 mg/mL). 4 h after the challenge, the animals were terminated and the

levels of IL-6 and TNF- α released in the bronchoalveolar lavage fluid were measured. Example 89 reduced the levels of IL-6 and TNF- α in a dose-dependent manner. Individual data points represent individual animals, and bars represent the mean value of each group. Statistical differences between groups were calculated with a one-way ANOVA test comparing treatment groups to the vehicle group. ** $p < 0.01$, *** $p < 0.001$. The ability of IRAK4 inhibitors according to the specification to reduce inflammatory cytokines and TNF- α *in vivo* is thus established.

[0024] As noted above, it has been found that compounds of Formula (I), or pharmaceutically acceptable salts thereof, are potent inhibitors of IRAK4 kinase. In addition, preferred compounds of Formula (I) exhibit excellent selectivity over other kinases thus providing a profile that avoids off target effects and toxicities. This desirable combination of IRAK4 inhibitory activity and lack of detrimental off target effect indicates the suitability of compounds of the specification for use in medicine.

[0025] Unless defined otherwise, all technical and scientific terms used herein have the same meaning as that commonly understood by one of ordinary skill in the art to which this disclosure is related. For example, the Concise Dictionary of Biomedicine and Molecular Biology, Juo, Pei-Show, 2nd ed., 2002, CRC Press; The Dictionary of Cell and Molecular Biology, 3rd ed., 1999, Academic Press; and the Oxford Dictionary of Biochemistry and Molecular Biology, Revised, 2000, Oxford University Press, provide one of skill with a general dictionary of many of the terms used in this disclosure.

[0026] So that the present specification may be more readily understood, certain terms are explicitly defined below. In addition, definitions are set forth as appropriate throughout the detailed description.

[0027] Units, prefixes, and symbols are denoted in their Système International de Unites (SI) accepted form. Numeric ranges are inclusive of the numbers defining the range.

[0028] The term "pharmaceutical composition" refers to a preparation which is in such form as to permit the biological activity of the active ingredient, and which contains no additional components which are unacceptably toxic to a subject to which the composition would be administered. Such compositions can be sterile. A pharmaceutical composition according to the present specification will comprise a compound of Formula (I), or a pharmaceutical acceptable salt thereof, and at least one pharmaceutically acceptable excipient.

[0029] Terms such as "treating" or "treatment" or "to treat" or "alleviating" or "to alleviate" refer to both (1) therapeutic measures that cure, slow down, lessen symptoms of, and/or halt progression of a diagnosed pathologic condition or disorder and (2) prophylactic or preventative measures that prevent and/or slow the development of a targeted pathologic condition or disorder. Thus, those in need of treatment include those already with the disorder; those prone to have or develop the disorder; and those in whom the disorder is to be prevented. In certain aspects, a subject is successfully "treated" for respiratory disease according to the methods of the present disclosure if the patient shows, e.g., total, partial, or

transient relief from the symptoms of that respiratory disease.

[0030] The term "subject" refers to any animal (e.g., a mammal), including, but not limited to humans, non-human primates, rodents, and the like, which is to be the recipient of a particular treatment. Typically, the terms "subject" and "patient" are used interchangeably herein in reference to a human subject.

[0031] As used herein and above the symbol * is used to indicate the site of connection of a component of the compound of Formula (I) to other components of the compound. To illustrate this by example, when the compound of Formula (I) has the R¹ motif specified below the compound will be a compound of structure A. Similarly, when the compound of Formula (I) has the R² motif below, the compound will be a compound of structure B.

[0032] As used herein the term "alkyl" refers to both straight and branched chain saturated hydrocarbon radicals having the specified number of carbon atoms. As used herein the term deuterioalkyl refers to an alkyl groups in which one or more, optionally all, hydrogens are replaced with deuterium atoms. The term cycloalkyl refers to a saturated cyclic hydrocarbon.

[0033] In this specification the prefix C_x-C_y, as used in terms such as C_x-C_y alkyl and the like where x and y are integers, indicates the numerical range of carbon atoms that are present in the group. For example, C₁-C₄ alkyl includes methyl, ethyl, *n*-propyl, *i*-propyl, *n*-butyl, *s*-butyl, *i*-butyl and *t*-butyl, while examples of C₁-C₃ alkyl groups include methyl, ethyl, *n*-propyl, and *i*-propyl. C₁-C₄ alkoxy groups include methoxy, ethoxy, *n*-propoxy, *i*-propoxy, *n*-butoxy, *s*-butoxy and *t*-butoxy. Examples of C₁-C₃ alkoxy groups include methoxy, ethoxy, *n*-propoxy and *i*-propoxy.

[0034] Unless specifically stated, the bonding of an atom or group may be any suitable atom of that group; for example, propyl includes prop-1-yl and prop-2-yl.

[0035] As used herein the term cycloalkyl refers to cyclic saturated hydrocarbon radicals having the specified number of carbon atoms. Thus C₃-C₆ cycloalkyl refers to cyclopropyl, cyclobutyl, cyclopentyl and cyclohexyl groups.

[0036] As used herein the term alkoxy refers to a group with an oxygen atom connected to an

alkyl chain wherein, as defined above the alkyl chain is a straight and branched chain saturated hydrocarbon radicals having the specified number of carbon atoms. Thus C₁-C₃ alkoxy refers to methoxy, ethoxy, OⁿPr and OⁱPr groups.

[0037] As described herein and above the group R² may be substituted with a group R⁴. In such cases the group R⁴ may be attached to any available ring carbon, albeit it is preferred that R⁴ is attached to the carbon atom adjacent the carbon atom attached to the indazole ring as shown below.

[0038] As used herein and above the term acetyl refers to a group of formula -C(O)Me. Reference to a *N*-acylated group herein is used to refer to amides with a small alkyl side chain i.e. an optionally substituted C₁-C₆ alkyl side chain or an optionally substituted C₃-C₆ cycloalkyl, in each instance the optional substituents are selected from OH, C₁-C₃ alkoxy, C(O)Me, amino, NHMe, NMe₂, F or Cl, with a preferred *N*-acylated group being an *N*-acetyl group i.e. a group -NRC(O)Me.

[0039] As described herein and above the compounds of Formula (I) comprise a group R² that can be a cyclohexyl ring substituted with two groups Y and Z that combine to form a 4-, 5- or 6-membered ring. In such cases the 4-, 5- or 6-membered ring is a saturated hydrocarbon ring system optionally wherein one or two ring carbons are replaced with a heteroatom selected from O and N. In the case wherein two ring carbons are replaced with heteroatoms, the heteroatoms are not directly bound, i.e. the heteroatoms replace non-adjacent ring carbons, nor are they separated in the ring by a CH₂ group but may for example be joined by a carbonyl group to deliver e.g. a carbonate or carbamate motif. The hydrocarbon ring may incorporate a carbonyl group as is the case when Y and Z combine to form a cyclic amide. In preferred instances, the 4-, 5- or 6-membered ring is a cyclic amide or carbamate such as a pyrrolidin-2-one, oxazolidin-2-one, piperidin-2-one and 1,3-oxazinan-2-one. Alternatively, the groups Y and Z may combine to form an azetidine substituted with an acyl group at nitrogen. In addition, the 4-, 5- or 6-membered ring may be substituted with a group selected from OH, C₁-C₃ alkyl, C₁-C₃ alkoxy, C(O)Me, amino, NHMe, NMe₂, F or Cl. These optional substituents may advantageously be used to modulate physicochemical properties of the molecule, such as solubility, or further optimize the interaction with IRAK4 kinase, for example relative to other kinases, thus delivering more potent and selective IRAK4 kinase inhibitors.

[0040] As described herein compounds of Formula (A) comprise a group Y that can be selected from N(R⁵)COMe, N(Me)COR⁶ and N(R⁵)COR⁶. In such cases, the group R⁶ may be an optionally substituted 5- or 6-membered saturated *N*-heterocycle, for instance a pyrrolidine

or piperidine connected to the carbonyl group of Y via the nitrogen atom of the heterocycle to provide a urea moiety. For example, Y may be a group N(Me)COR⁶ in which R⁶ is 3-hydroxypyrrolidine as shown below.

[0041] As described herein and above the group R⁷ may be an optionally substituted 4-, 5- or 6-membered ring containing a heteroatom selected from O and N. For the avoidance of doubt "containing an heteroatom" means that one of the atoms of the ring will be a heteroatom selected from O or N. In such instances saturated 4-, 5- or 6-membered rings containing a heteroatom selected from O and N are preferred. Examples of preferred 4-, 5- or 6-membered rings containing a heteroatom selected from O and N are azetidine, oxetane, tetrahydrofuran, pyrrolidine, tetrahydropyran and piperidine. As described herein and above the substituents R⁸ and R⁹ may combine to form an optionally substituted 4-, 5- or 6-membered ring containing a further heteroatom selected from O and N. In the case wherein a further heteroatom is present, the heteroatom is not directly bound to N, *i.e.* the heteroatoms in the ring are non-adjacent, nor are they separated by a CH₂ group. In such instances it is preferred that the resultant ring is saturated, for example the resultant ring may be a morpholine or piperazine ring.

[0042] As will be apparent to the skilled reader, the compounds of Formula (I) and in particular the groups R² can exist in various stereochemical forms. It will be understood that the claims encompass all stereochemical forms of the compounds of Formula (I), albeit the compounds with highest activity as inhibitors of IRAK4 are preferred. It will be recognised that the compounds of Formula (I), may be prepared, isolated and/or supplied with or without the presence, of one or more of the other possible stereoisomeric forms of the compound of Formula (I) in any relative proportions. The preparation of stereoenriched or stereopure compounds may be carried out by standard techniques of organic chemistry that are well known in the art, for example by synthesis from stereoenriched or stereopure starting materials, use of an appropriate stereoenriched or stereopure catalysts during synthesis, and/or by resolution of a racemic or partially enriched mixture of stereoisomers, for example via chiral chromatography.

[0043] As an example, in the case below the substituent R² is a 1,3-substituted cyclohexanol group. In this system the relative (*rel*) stereochemistry of the alcohol and the indazole group on the ring may be *cis* or *trans* and each of the *cis* and *trans* isomers will in turn exist in two enantiomeric forms reflecting the (*R*) or (*S*) configuration of the chiral centres (*i.e.* of the carbons attached to the hydroxyl group and indazole group). In certain cases described herein the compounds will be referred to as Isomers 1 and 2 of compounds having the relative (*rel*) stereochemical arrangement, thus in the case of a compound referred to as *rel*-(1*S*, 3*R*) it will

be understood that the two possible isomers are the (1*S*,3*R*) isomer and the (1*R*,3*S*) isomer that have the same relative stereochemistry, but that are enantiomers of each other. Thus reference to a compound below that has *cis* relative stereochemistry refers to the two possible compounds with this relative stereochemistry. Structures of known relative stereochemistry and undetermined absolute stereochemistry herein are drawn as a single enantiomer with the qualifier "or enantiomer".

[0044] As described herein and above, certain components of the compounds of Formula (I) are optionally substituted. As used herein the term optionally substituted means that the structural element of the compound may or may not be substituted with one or more of the specified optional substituents. In instances wherein an optional substituent is present in one or more of the groups Z, R³, R⁴, R⁵, R⁶, R⁷, R⁸ and R⁹ it is general preferred that zero, one or two substituents are present per each substituted group, for example zero or one substituent is present. In the case wherein the two hydroxyl substituents are present it will be understood that the two hydroxyl groups are not attached to the same carbon atom. In the case where the optional substituent is F it is preferred that one, two or three F substituents are present and, in addition, where two or three substituents are present they are directly bound to the same carbon atom. These optional substituents may be used to modulate physicochemical properties of the molecule, such as solubility, modulate metabolism, or further optimize the interaction with IRAK4 kinase, for example relative to other kinases, thus delivering more potent and selective IRAK4 kinase inhibitors.

[0045] As noted above, in a first embodiment the specification provides a compound of Formula (A), or a pharmaceutically acceptable salt thereof,

[0065] The IRAK4 inhibitors of the present invention can be prepared from readily available starting materials, either available from commercial suppliers, such as Merck KGaA or by methods comprised in the common general knowledge of those skilled in the art. The reaction schemes below describe a variety of methods for the synthesis of the IRAK4 inhibitors. Typical or preferred reaction conditions might be given for the synthesis but those skilled in the art will be able to suggest modifications of these conditions to obtain analogues not described herein. Schemes presented below are therefore representative methods for the synthesis of the compounds of this specification. In addition, the order of reactions can be modified to change the overall synthesis to allow for variations at different positions of the molecule at different stages of the synthesis.

[0066] The informed reader will recognize that the compounds described in the schemes below might in some cases be obtained as mixtures of regioisomers and stereoisomers, which can be separated at different stages of the synthesis using techniques such as silica/C18 chromatography, HPLC, SFC, crystallization etc. that are well known to those skilled in the art.

General synthesis of scaffolds/building blocks:

[0067]

Scheme 1: Synthesis of scaffold I-6 with Hal = halide.

[0068] Scaffold I-6 as shown in Scheme 1 can be prepared from commercially available 2,4-difluorobenzaldehyde (I-1). I-1 can be nitrated using standard nitrating conditions, e.g. using a mixture of concentrated sulfuric acid and concentrated nitric acid or, as described in e.g. WO2017/009798, using a mixture of concentrated sulfuric acid and potassium nitrate, to give nitro compound I-2. Treatment of I-2 with cyclopropanol, in the presence of a base (e.g.

DIPEA) and a suitable solvent (e.g. DMF) under elevated temperature forms the isopropyl ether I-3. The indazole I-4 can be obtained from I-3 by its reaction with hydrazine in a suitable solvent at elevated temperature (e.g. 80 °C). Subsequently, the aromatic amine I-5 can be obtained by reducing the nitro compound I-4 e.g. by treatment with Fe and ammonium chloride in an ethanol/water mixture (alternatively Pd on carbon (or Pd(OH)₂ on carbon) in MeOH under an H₂ atmosphere can be used). Amine I-5 can be converted into the corresponding bromide I-6 (Hal = Br) by e.g. treatment with *tert*-butyl nitrite and copper (I) bromide in a suitable solvent (e.g. acetonitrile). Protection of the indazole NH of I-4, with e.g. a PMB-protecting group, before the reduction of the nitro group followed by deprotection after the introduction of the bromide increases the yield of these transformations. Amine I-5 can be converted into the corresponding iodide I-6 (Hal = I) by e.g. treatment with sodium nitrite and potassium iodide in water/acetic acid.

Scheme 2: General synthesis of building block II-4 with R¹ as defined in the claims and R⁷ = -Me or -cyclopropyl.

[0069] The halide II-1 (Hal = Br or I) can be used as the starting material for the synthesis of building block II-4, as depicted in Scheme 2. The halide II-1 is either commercially available or can be obtained using the steps described in Scheme 1 above. Treatment of II-1 with a Pd-catalyst (e.g. Pd(dppf)Cl₂) under an atmosphere of CO (optionally generated *in situ* with the help of COware[®] and SilaCOgen[®]) in the presence of an alcohol as the solvent yields the ester II-2 (here shown as the methyl ester, when using MeOH as the solvent). Subsequent cleavage of the ester with e.g. lithium hydroxide or potassium hydroxide in a suitable solvent (e.g. water) yields carboxylic acid II-3. Amide formation of this acid II-3 with amines R¹-NH₂ can be performed with a variety of amide coupling reagents (e.g. HATU) in the presence of a base (e.g. DIPEA) and DMF and/or THF as the solvent to yield the desired building block II-4.

[0070] The conversion of halide II-1 into amide II-4 can also be performed in a one step fashion using an aminocarbonylation reaction. Stirring II-1 (Hal = Br or I) with a Pd-source (e.g.

$\text{Pd}(\text{OAc})_2$) and a suitable ligand (e.g. 1,3-bis(diphenylphosphino)propane) in a solvent (e.g. CH_3CN) in the presence of a base (e.g. TEA) and amine $\text{R}^1\text{-NH}_2$ under an atmosphere of CO (optionally generated *in situ*) affords amide II-4 in one step.

Scheme 3: General synthesis of building block III-2 with Hal = halide (Br, I); $\text{R} = \text{R}^2$ (as defined in the claims) or a protected precursor of R^2 as defined below; $\text{R}^7 = \text{-Me}$ or -cyclopropyl etc.

[0071] Indazole III-2, shown in Scheme 3, can be obtained from compound III-1 (commercially available or obtained by the synthesis shown in Scheme 1 above) by treating with a base (e.g. K_2CO_3 , Cs_2CO_3 , NaHCO_3 , NaOH , KOH , Na^+OBu , K^+OBu , KOEt , KHMDS , DIPEA , pyridine, TEA) in a suitable solvent (e.g. DMF, THF, dioxane, xylene, MeCN) and an alkylating reagent R-Y , e.g. the mesylate, tosylate or halide of R^2 at elevated temperature. Alternatively, the alkylation can be performed by Michael reaction of compound III-1 and an α,β -unsaturated carbonyl precursor of R^2 . In case R^2 contains a functionality which requires to be protected by a suitable protection group for this synthetic step a suitable protected precursor of R^2 should be used. In addition, the alkylation reaction as shown in Scheme 3, can be performed with a suitable precursor of R^2 which can be converted into R^2 later in the synthesis towards the target compound. For example, if R^2 contains an amine or amide functionality, the amine can be protected in the alkylating agent with a suitable protecting group (e.g. Boc), which is cleaved after the alkylation reaction. Subsequently, the amine can be alkylated or converted into an amide. If R^2 contains an alcohol functionality, this functionality can be protected with a suitable alcohol protection group, which withstands the reaction conditions of the alkylation reaction and is cleaved at a later stage in the synthesis of the target compound. Protecting groups are well known in the art (see e.g. Greene's Protective Groups in Organic Synthesis, Ed P.G.M. Wuts, Wiley, NY 2014, 5th Edition). Alternatively, the alkylating agent could contain a precursor of the amine/amide/alcohol functionality in form of a suitable protected carbonyl functionality which can be deprotected and converted to the desired amine/amide/alcohol functionality of the target compound in a later stage in the synthesis by synthetic methods known to the one skilled in the art.

[0072] Depending on the reaction conditions used in the alkylation reaction described above, a mixture of *N*1 and *N*2-regioisomers can be obtained. The *N*1 isomer can be separated from the *N*2 isomer by e.g. column chromatography either directly after the alkylation reaction described above or at a later stage in the synthesis of the target compound.

Scheme 4: General synthesis of building blocks IV-2 and IV-7 with $\text{R} = \text{R}^2$ (as defined in the claims or a suitably protected precursor thereof as described under Scheme 3; $\text{R}^7 = \text{-Me}$, -cyclopropyl , etc.

[0073] Scheme 4 describes the regioselective synthesis of the *N*-2 indazole isomers IV-2 and IV-7. Treatment of the commercially available starting material IV-1 for the synthesis of IV-2 with an amine R-NH₂ in a suitable solvent (e.g. *i*PrOH) at elevated temperature, followed by addition of tri-*n*-butylphosphine results in the formation of IV-2. The starting material IV-3 for the synthesis of IV-7 is commercially available (IV-3, R⁷ = Me, CAS 586412-86-4) or can be obtained as shown in the synthesis sequence outlined in Scheme 1 (for R⁷ = cyclopropyl). Treatment of benzaldehyde IV-3 with an amine R-NH₂ in a suitable solvent (e.g. EtOH) to form the corresponding imine, followed by stirring of the crude imine IV-4 with sodium azide in a suitable solvent (e.g. DMF) yields the bicyclic intermediate IV-5. Reduction of the nitro group of IV-5 (with e.g. Pd(OH)₂ on carbon under H₂ atmosphere) yields the aromatic amine IV-6. Subsequent treatment of IV-6 with e.g. sodium nitrite and potassium iodide in acetic acid leads to the corresponding iodo compound IV-7.

General synthesis of compounds of formula (I):

[0074]

Scheme 5: General synthesis of compounds of formula (I), Method 1:

[0075] The compounds of Formula (I) can be prepared as shown in Scheme 5 from compound II-4 ($R^7 = -\text{Me}$, $-\text{cyclopropyl}$, etc; R^1 as defined in the claims). A reaction sequence to prepare compound II-4 is shown in Scheme 2.

[0076] Indazole II-4 can be alkylated by treatment with a base (e.g. KOH, KHMDS, Cs_2CO_3) and a suitable alkylating reagent R-Y ($Y = \text{mesylate}$, tosylate , halide , $R = R^2$ or a suitable protected precursor of R^2 as defined above under Scheme 3) in a solvent compatible with the base. In case an R-Y with $R = \text{a suitable precursor of } R^2$ is used in the alkylation reaction the steps described under Scheme 3 can be performed after the alkylation to convert R into R^2 of the target compound.

[0077] Depending on the reaction conditions used in the alkylation reaction described above, a mixture of *N*1 and *N*2-regioisomers can be obtained. The *N*1 isomer can be separated from the *N*2 isomer by e.g. column chromatography to obtain the compound of formula (I).

Scheme 6: General synthesis of compounds of formula (I), Method 2:

[0078] Another method to prepare compounds of Formula (I) is shown in Scheme 6. A suitable starting material for this route is indazole III-2 ($\text{Hal} = \text{halide (Br, I)}$; $R = R^2$ as defined in the

claims or a suitable precursor of thereof as described under Scheme 3; R^7 = -Me, -cyclopropyl, etc). Halide III-2 can be obtained as described in Schemes 3 and 4 and can be first treated with a Pd-catalyst (e.g. $\text{Pd}(\text{dppf})\text{Cl}_2$) under an atmosphere of CO (at elevated pressure) in the presence of an alcohol as the solvent to yield ester VI-1 (if MeOH is used as the solvent the Me-ester VI-1 is formed). Subsequent cleavage of the ester by e.g. lithium hydroxide or potassium hydroxide in a suitable solvent (e.g. water) yields the carboxylic acid VI-2. Amide formation of this acid VI-2 with an amine $R^1\text{-NH}_2$ (R^1 as defined in the claims) can be performed with a variety of amide coupling reagents (e.g. HATU, T3P) to yield the desired compound of Formula (I).

[0079] If the reaction sequence shown in Scheme 6 starts with compound III-2 (R = a protected precursor of R^2), the transformations to convert R into R^2 (as described under Scheme 3) can be performed at different stages of the synthesis sequence shown in Scheme 6, depending on the nature of the transformation and the compatibility of the functional groups present in the sequence intermediates with the reaction conditions (a person skilled in the art will be able to decide the order of steps).

[0080] The conversion of halide III-2 ($R = R^2$) into the compound of Formula (I) can also be performed in a one pot aminocarbonylation protocol. Stirring III-2 ($R = R^2$) with a Pd-source (e.g. $\text{Pd}(\text{OAc})_2$) and a suitable ligand (e.g. 1,3-bis(diphenylphosphino)propane or di(adamantan-1-yl)butylphosphane) in a solvent (e.g. CH_3CN) in the presence of a base (e.g. TEA) and the coupling amine $R^1\text{-NH}_2$ under an atmosphere of CO (at elevated pressure) yields the compound of formula (I) in one step.

[0081] If the aminocarbonylation reaction is performed with compound III-2 (R = a suitable protected precursor of R^2), the transformations to convert R into R^2 (as described under Scheme 3) can be performed after the aminocarbonylation reaction shown in Scheme 6, to afford the compound of Formula (I).

Scheme 7: General synthesis of compounds of formula (I), Method 3:

[0082] Scheme 7 shows a method to change the substituent R^7 late in the synthesis to obtain the compound of Formula (I). Starting with compound VII-1 the methoxy ether can be cleaved with e.g. BBr_3 in DCM to yield phenol VII-2. Subsequent reaction of VII-2 with an alkylating reagent $R^7\text{-Y}$, e.g. the mesylate, tosylate or halide or an alcohol $R^7\text{-OH}$ in either an alkylation

reaction or a Mitsunobu coupling yields compounds of formula (I).

[0083] In embodiments of the specification there are provided methods of synthesizing compounds of Formula (I) or pharmaceutically acceptable salts thereof, intermediates in the synthesis of the compounds of Formula (I), for example methods and intermediates described herein and above.

[0084] In embodiments there is provided a pharmaceutical composition which comprises a compound of Formula (I) or a pharmaceutically acceptable salt thereof, in association with a pharmaceutically acceptable excipient. In such embodiments the compound of Formula (I) is preferably used as a single enantiomeric form. Minor impurities, for example up to 1% by mass of other stereoisomeric forms may be optionally be present. The pharmaceutical compositions can be used for the treatment of conditions in which IRAK4 kinase inhibition can be beneficial as described in more detail herein and above.

[0085] In embodiments there is provided a compound of Formula (I) for use in the production of a medicine, optionally wherein the medicines is for use in the treatment or prevention of a condition in which IRAK4 kinase inhibition can be beneficial as described in more detail herein and above.

[0086] The compounds of Formula (I) and pharmaceutically acceptable salts thereof may be prepared, used or supplied in amorphous form, crystalline form, or semi-crystalline form and any given compound of Formula (I) or pharmaceutically acceptable salt thereof may be capable of being formed into more than one crystalline and/or polymorphic form, including hydrated (e.g. hemi-hydrate, a mono-hydrate, a di-hydrate, a tri-hydrate or other stoichiometry of hydrate) and/or solvated forms. It is to be understood that the present specification encompasses any and all such solid forms of the compound of Formula (I) and pharmaceutically acceptable salts thereof.

[0087] In further embodiments of the present specification there is provided a compound of Formula (I), which is obtainable by the methods described in the 'Examples' section hereinafter.

[0088] The present specification is intended to include all isotopes of atoms occurring in the present compounds. Isotopes will be understood to include those atoms having the same atomic number but different mass numbers. For example, isotopes of hydrogen include tritium and deuterium. Isotopes of carbon include ^{13}C and ^{14}C . Isotopically labelled compounds of Formula (I) can generally be prepared by conventional techniques known to those skilled in the art or by processes analogous to those described in the accompanying Examples using appropriate isotopically labelled reagents in place of the non-labelled reagents previously employed.

[0089] A suitable pharmaceutically acceptable salt of a compound of the Formula (I) may be, for example, an acid addition salt. A suitable pharmaceutically acceptable salt of a compound

of the Formula (I) may be, for example, an acid addition salt of a compound of the Formula (I), for example an acid-addition salt with an inorganic or organic acid. The compounds of the specification may be provided as the free base compound, i.e. in the non-salified state.

[0090] A further suitable pharmaceutically acceptable salt of a compound of the Formula (I) may be, for example, a salt formed within the human or animal body after administration of a compound of the Formula (I) to said human or animal body.

[0091] The compound of Formula (I) or pharmaceutically acceptable salt thereof may be prepared as a co-crystal solid form. It is to be understood that a pharmaceutically acceptable co-crystal of a compound of the Formula (I) or pharmaceutically acceptable salts thereof, form an aspect of the present specification.

[0092] For use in a pharmaceutical context it may be preferable to provide a compound of Formula (I) or a pharmaceutically acceptable salt thereof without large amounts of the other stereoisomeric forms being present.

[0093] The compound of Formula (I), or a pharmaceutically acceptable salt thereof, will normally be administered via the oral route though parenteral, intravenous, intramuscular, subcutaneous or in other injectable ways, buccal, rectal, vaginal, transdermal and/or nasal route and/or via inhalation, in the form of pharmaceutical preparations comprising the active ingredient or a pharmaceutically acceptable salt or solvate thereof, or a solvate of such a salt, in a pharmaceutically acceptable dosage form may be possible. Depending upon the disorder and patient to be treated and the route of administration, the compositions may be administered at varying doses, for example in an oral dose of from 1 mg to 1,000 mg or from 100 mg to 2,000 mg.

[0094] The pharmaceutical formulations of the compound of Formula (I) described above may be prepared e.g. for parenteral, subcutaneous, intramuscular or intravenous administration.

[0095] The pharmaceutical formulations of the compound of Formula (I) described above may conveniently be administered in unit dosage form and may be prepared by any of the methods well-known in the pharmaceutical art, for example as described in Remington's Pharmaceutical Sciences, 17th ed., Mack Publishing Company, Easton, PA., (1985).

[0096] Pharmaceutical formulations suitable for oral administration may comprise one or more physiologically compatible carriers and/or excipients and may be in solid or liquid form. Tablets and capsules may be prepared with binding agents; fillers; lubricants; and surfactants. Liquid compositions may contain conventional additives such as suspending agents; emulsifying agents; and preservatives. Liquid compositions may be encapsulated in, for example, gelatin to provide a unit dosage form. Solid oral dosage forms include tablets, two-piece hard shell capsules and soft elastic gelatin (SEG) capsules. An exemplary oral composition according to the specification comprises a compound of Formula (I) and at least one pharmaceutically acceptable excipient filled into a two-piece hard shell capsule or a soft elastic gelatin (SEG)

capsule.

[0097] According to a further embodiment there is provided a compound of the Formula (I), or a pharmaceutically acceptable salt thereof, as defined hereinbefore, for use as a medicament in a warm-blooded animal such as man.

[0098] According to a further embodiment, there is provided a compound of the Formula (I), or a pharmaceutically acceptable salt thereof, as defined hereinbefore for use in the production of an antiproliferative effect in a warm-blooded animal such as man.

[0099] According to a further embodiment, there is provided a compound of the Formula (I), or a pharmaceutically acceptable salt thereof, as defined hereinbefore for use in a warm-blooded animal such as man as an anti-invasive agent in the containment and/or treatment of solid tumour disease.

[0100] According to a further embodiment, there is provided the use of a compound of the Formula (I), or a pharmaceutically acceptable salt thereof, as defined hereinbefore, for the production of an antiproliferative effect in a warm-blooded animal such as man.

[0101] According to a further embodiment, there is provided the use of a compound of the Formula (I), or a pharmaceutically acceptable salt thereof, as defined hereinbefore, in the manufacture of a medicament for use in a warm-blooded animal such as man as an anti-invasive agent in the containment and/or treatment of solid tumour disease.

[0102] In embodiments where the compound of Formula (I) is for use in the treatment of conditions characterized by hyperproliferative diseases or solid tumour disease, and related methods of treatment and use in the manufacture of a medicament intended for the treatment of such diseases it will be understood that in preferred embodiments the disease is melanoma and, furthermore, that the use in combination with a Bruton's Tyrosine Kinase inhibitor is preferred.

[0103] In this specification, unless otherwise stated, the phrase "effective amount" means an amount of a compound or composition which is sufficient enough to significantly and positively modify the symptoms and/or conditions to be treated (e.g., provide a positive clinical response). The effective amount of an active ingredient for use in a pharmaceutical composition will vary with the particular condition being treated, the severity of the condition, the duration of the treatment, the nature of concurrent therapy, the particular active ingredient(s) being employed, the particular pharmaceutically-acceptable excipient(s)/carrier(s) utilized, and like factors within the knowledge and expertise of the attending physician. The effective amount will generally be in the range of 0.1 mg to 1,000 mg.

[0104] According to a further embodiment, there is provided a compound of the Formula (I), or a pharmaceutically acceptable salt thereof, as defined hereinbefore for use in providing an inhibitory effect on IRAK4 kinase.

[0105] According to a further embodiment, there is provided the use of a compound of the Formula (I), or a pharmaceutically acceptable salt thereof, as defined hereinbefore in the manufacture of a medicament for use in providing an inhibitory effect on IRAK4 kinase.

[0106] According to a further embodiment, there is also provided a method for providing an inhibitory effect on IRAK4 kinase which comprises administering an effective amount of a compound of the Formula (I), or a pharmaceutically acceptable salt thereof, as defined hereinbefore, to a patient in need thereof.

[0107] According to a further embodiment, there is provided a compound of the Formula (I), or a pharmaceutically acceptable salt thereof, as defined hereinbefore, for use in providing a selective inhibitory effect on IRAK4 kinase. In such cases the selective inhibitory effect indicates that the concentration of the compound of Formula (I) required to effect 50% inhibition in IRAK4 kinase activity *in vitro* is 10-fold, 100-fold or 1000-fold or more lower than that required to effect 50% inhibition of another kinase, for example another kinase that if inhibited gives rise to a toxic side effect.

[0108] According to a further embodiment, there is provided the use of a compound of the Formula (I), or a pharmaceutically acceptable salt thereof, as defined hereinbefore, in the manufacture of a medicament for use in providing a selective inhibitory effect on IRAK4 kinase.

[0109] According to a further embodiment, there is also provided a method for providing a selective inhibitory effect on IRAK4 kinase which comprises administering an effective amount of a compound of the Formula (I), or a pharmaceutically acceptable salt thereof, to a patient in need thereof.

[0110] Described herein are compounds that can inhibit IRAK4 kinase. In biochemical and cell based assays the compounds of the present specification are shown to be potent IRAK4 kinase inhibitors and may therefore be useful in the treatment of disorders mediated by IRAK4 kinase activity, in particular in the treatment of respiratory diseases such as asthma and chronic obstructive pulmonary disease (COPD), of inflammatory diseases and of autoinflammatory/autoimmune diseases such as systemic lupus erythematosus, rheumatoid arthritis, myositis, Sjögren's syndrome, systemic sclerosis, gout, endometriosis, atopic dermatitis and psoriasis.

[0111] In embodiments there is provided the use of a compound Formula (I) for the treatment of respiratory disease, optionally wherein the respiratory disease is asthma and chronic obstructive pulmonary disease (COPD).

[0112] In embodiments there is provided the use of a compound Formula (I) for the treatment of inflammatory diseases or autoinflammatory/autoimmune diseases such as systemic lupus erythematosus, rheumatoid arthritis, myositis, Sjögren's syndrome, systemic sclerosis, gout, endometriosis, atopic dermatitis and psoriasis.

[0113] In embodiments there is provided a method of treatment comprising administration of an effective amount of a compound of Formula (I) to a patient in need thereof, wherein the patient has a respiratory diseases, optionally wherein the respiratory disease is asthma and chronic obstructive pulmonary disease (COPD).

[0114] In embodiments there is provided a method of treatment comprising administration of an effective amount of a compound of Formula (I) to a patient in need thereof, wherein the patient has an inflammatory diseases or autoinflammatory/autoimmune diseases such as systemic lupus erythematosus, rheumatoid arthritis, myositis, Sjögren's syndrome, systemic sclerosis, gout, endometriosis, atopic dermatitis and psoriasis.

[0115] According to a further aspect of the specification, there is provided the use of a compound of the Formula (I), or a pharmaceutically acceptable salt thereof, as defined hereinbefore, in the manufacture of a medicament for use in the treatment of disorders mediated by IRAK4 kinase activity, in particular in the treatment of respiratory diseases such as asthma and chronic obstructive pulmonary disease (COPD), of inflammatory diseases and of autoinflammatory/autoimmune diseases such as systemic lupus erythematosus, rheumatoid arthritis, myositis, Sjögren's syndrome, systemic sclerosis, gout, endometriosis, atopic dermatitis and psoriasis.

[0116] It will be appreciated that the following examples are provided so that the nature of the invention may be fully understood. It will also be appreciated that the following examples are not intended to limit the scope of the description in any way.

PREPARATION OF INTERMEDIATES

Synthesis of Intermediate Int I-1: 5-Bromo-4-methoxy-2-nitrobenzaldehyde

5-Bromo-4-fluoro-2-nitrobenzaldehyde

[0120]

[0121] A solution of fuming nitric acid (12.0 mL, 0.3 mol) in concentrated sulfuric acid (25 mL)

was added dropwise to 3-bromo-4-fluorobenzaldehyde (19.3 g, 95.1 mmol) in concentrated sulfuric acid (75 mL) at 0 °C. The resulting yellow solution was slowly warmed to rt and stirred for 4 d. Then the reaction mixture was poured on crushed ice and the resulting precipitation was collected by filtration to afford 5-bromo-4-fluoro-2-nitrobenzaldehyde (22.6 g, 96%) as a yellow solid. m/z (ESI-), $[M-H]^- = 245/247$.

5-Bromo-4-methoxy-2-nitrobenzaldehyde (Int I-1)

[0122]

[0123] Sodium methoxide (10.9 g, 60.6 mmol) in MeOH (46 mL) was added to 5-bromo-4-fluoro-2-nitrobenzaldehyde (10.0 g, 40.3 mmol) in MeOH (150 mL) at rt. After stirring for 16 h the reaction was quenched with water (300 mL), the formed solid was filtered off and washed with water (100 mL) to afford 5-bromo-4-methoxy-2-nitrobenzaldehyde (6.6 g, 63%) as a pale-yellow solid. ^1H NMR (300 MHz, DMSO- d_6) δ 10.03 (s, 1H), 8.15 (s, 1H), 7.78 (s, 1H), 4.04 (s, 3H).

Synthesis of Intermediate Int I-2: 6-Cyclopropoxy-5-nitro-1H-indazole

2,4-Difluoro-5-nitrobenzaldehyde

[0124]

[0125] To a solution of 2,4-difluorobenzaldehyde (50.0 g, 351.9 mmol) in sulfuric acid (180 mL) was slowly added a mixture of nitric acid (15 M) (30.5 mL, 457.4 mmol) and sulfuric acid (900 mL) over a period of 1 h at 0 °C under N_2 atmosphere. The reaction mixture was stirred at rt for additional 3 h before the mixture was poured on ice/water and extracted with EtOAc (400 mL $\times$ 3). The combined organic layers were dried over Na_2SO_4 , filtered and concentrated under reduced pressure to afford 2,4-difluoro-5-nitrobenzaldehyde (50.0 g, 76%) as a yellow oil.

4-Cyclopropoxy-2-fluoro-5-nitrobenzaldehyde

[0126]

[0127] 2,4-Difluoro-5-nitrobenzaldehyde (20.0 g, 106.9 mmol), cyclopropanol (6.2 g, 106.9 mmol) and DIPEA (37.3 mL, 213.8 mmol) in DMF (25 mL) were stirred at 100 °C for 2 h. The reaction mixture was allowed to cool to rt, poured into ice/water (750 mL) and extracted with EtOAc (350 mL). The organic layer was dried over Na₂SO₄, filtered and concentrated under reduced pressure. The residue was purified by silica gel chromatography (eluting with PE/EtOAc (6:1)) to afford crude 4-cyclopropoxy-2-fluoro-5-nitrobenzaldehyde (12.0 g) as a yellow solid. MS ESI, m/z = 226 [M+H]⁺.

6-Cyclopropoxy-5-nitro-1H-indazole (Int I-2)

[0128]

[0129] 4-Cyclopropoxy-2-fluoro-5-nitrobenzaldehyde (37.0 g, 164.3 mmol) was slowly added into hydrazine hydrate (80% in water) (32.9 g, 525.8 mmol) in EtOH (100 mL). The resulting mixture was stirred at rt for 15 min, and then stirred at 80 °C for 2 h. The reaction mixture was allowed to cool to rt and concentrated under reduced pressure to afford 6-cyclopropoxy-5-nitro-1H-indazole (34.0 g, 94%) as a red solid. MS ESI, m/z = 220 [M+H]⁺.

Synthesis of Intermediate Int I-3: 6-Cyclopropoxy-5-iodo-1H-indazole

6-Cyclopropoxy-1H-indazol-5-amine

[0130]

[0131] To a suspension of 6-cyclopropoxy-5-nitro-1*H*-indazole (**Int I-2**) (35.0 g, 159.7 mmol) and NH₄Cl (42.7 g, 798.4 mmol) in EtOH (100 mL) / water (100 mL) was added iron (44.6 g, 798.4 mmol). The resulting mixture was stirred at 80 °C for 2 h, cooled to rt, filtered, and the filtrate was concentrated under reduced pressure. The residue was purified by silica gel chromatography (eluting with PE/EtOAc (2:1)) to afford 6-cyclopropoxy-1*H*-indazol-5-amine (15.3 g, 51%) as a red solid. MS ESI, *m/z* = 190 [M+H]⁺.

6-Cyclopropoxy-5-iodo-1*H*-indazole (**Int I-3**)

[0132]

[0133] To a solution of 6-cyclopropoxy-1*H*-indazol-5-amine (5.0 g, 26.4 mmol) in acetic acid (100 mL) was slowly added a solution of sodium nitrite (2.7 g, 39.6 mmol) in water (10 mL) at 0 °C. The resulting mixture was stirred at rt for 1 h. Then a solution of potassium iodide (8.8 g, 52.9 mmol) in water (10 mL) was added dropwise and the mixture was stirred at 60 °C for 4 h. The reaction mixture was cooled to rt, poured into water (400 mL) and extracted with EtOAc (500 mL). The organic layer was dried over Na₂SO₄, filtered and concentrated under reduced pressure. The residue was purified by silica gel chromatography (eluting with PE/EtOAc (2:1)) to afford 6-cyclopropoxy-5-iodo-1*H*-indazole (4.0 g, 50%) as a red solid. ¹H NMR (300 MHz, DMSO-*d*₆) δ 12.95 (s, 1H), 8.16 (s, 1H), 7.89 (s, 1H), 7.28 (s, 1H), 3.94 - 4.02 (m, 1H), 0.61 - 0.95 (m, 4H). MS ESI, *m/z* = 301 [M+H]⁺.

Synthesis of Intermediate **Int I-4**: 5-Bromo-6-cyclopropoxy-1*H*-indazole

6-Cyclopropoxy-1-(4-methoxybenzyl)-5-nitro-1*H*-indazole

[0134]

[0135] NaH (60 wt%) (2.6 g, 63.9 mmol) was slowly added to 1-(chloromethyl)-4-

methoxybenzene (7.5 g, 47.9 mmol) and 6-cyclopropoxy-5-nitro-1*H*-indazole (**Int I-2**) (7.0 g, 31.9 mmol) in DMF (20 mL). The resulting mixture was stirred at rt for 2 h. The mixture was poured into water (750 mL) and extracted with EtOAc (1 × 400 mL). The organic layer was dried over Na₂SO₄, filtered and concentrated to yield the crude product, which was purified by silica gel chromatography (eluting with PE/EtOAc 2/1) to afford 6-cyclopropoxy-1-(4-methoxybenzyl)-5-nitro-1*H*-indazole (6.0 g, 55%) as a red solid. MS ESI, *m/z* = 340 [M+H]⁺.

6-Cyclopropoxy-1-(4-methoxybenzyl)-1*H*-indazol-5-amine

[0136]

[0137] Iron (4.9 g, 88.4 mmol) was added to NH₄Cl (4.7 g, 88.4 mmol) and 6-cyclopropoxy-1-(4-methoxybenzyl)-5-nitro-1*H*-indazole (6.0 g, 17.7 mmol) in EtOH (20 mL) and water (20.00 mL). The resulting mixture was stirred at 80 °C for 2 h, cooled to rt and then filtered and concentrated. The crude product was purified by silica gel chromatography (eluting with PE/EtOAc 2/1) to afford 6-cyclopropoxy-1-(4-methoxybenzyl)-1*H*-indazol-5-amine (4.8 g, 88%) as a red gum. MS ESI, *m/z* = 310 [M+H]⁺.

5-Bromo-6-cyclopropoxy-1-(4-methoxybenzyl)-1*H*-indazole

[0138]

[0139] Copper bromide (464 mg, 3.2 mmol) was added to *tert*-butylnitrite (333 mg, 3.2 mmol) and 6-cyclopropoxy-1-(4-methoxybenzyl)-1*H*-indazol-5-amine (500 mg, 1.6 mmol) in MeCN (5 mL) at 16 °C over a period of 20 min under N₂ atmosphere. The resulting mixture was stirred at 50 °C for 0.5 h. The mixture was cooled to rt, then poured into water (400 mL) and extracted with EtOAc (2 × 400 mL). The organic phase was dried over Na₂SO₄, filtered and concentrated. The crude product was purified by silica gel chromatography (eluting with EtOAc/PE (1:3)) to afford 5-bromo-6-cyclopropoxy-1-(4-methoxybenzyl)-1*H*-indazole (68 mg, 11%) as a pale-yellow solid. MS ESI, *m/z* = 373/375 [M+H]⁺.

5-Bromo-6-cyclopropoxy-1*H*-indazole (Int I-4)

[0140]

[0141] TFA (3.0 mL, 39.0 mmol) was added to 5-bromo-6-cyclopropoxy-1-(4-methoxybenzyl)-1*H*-indazole (400 mg, 1.1 mmol) in DCE (1 mL). The resulting mixture was stirred at 100 °C for 12 h, cooled to rt and then concentrated. The crude product was purified by flash C18-flash chromatography (eluting with 0 to 100% MeCN in water (5% NH₄OH)) to afford 5-bromo-6-cyclopropoxy-1*H*-indazole (156 mg, 58%) as a grey solid. ¹H NMR (300 MHz, DMSO-*d*₆) δ 13.00 (s, 1H), 7.99 (s, 1H), 7.94 (s, 1H), 7.36 (s, 1H), 4.00 (tt, 1H), 0.83 - 0.92 (m, 2H), 0.70 - 0.80 (m, 2H). MS ESI, *m/z* = 253/255 [M+H]⁺.

Synthesis of Intermediate Int I-5: Pyrazolo[1,5-*a*]pyrimidin-3-amine

[0142]

[0143] An aq. NH₃ solution (25%) (34.9 mL, 403.0 mmol) was added to a solution of the TFA salt of pyrazolo[1,5-*a*]pyrimidin-3-amine (20.0 g, 80.6 mmol) in EtOH (300 mL). The resulting mixture was stirred at rt for 2 h before the mixture was concentrated under reduced pressure. The residue was purified by silica gel chromatography (eluting with 50 - 90% EtOAc in PE) to afford pyrazolo[1,5-*a*]pyrimidin-3-amine (9.9 g, 92%) as an orange solid. MS ESI, *m/z* = 135 [M+H]⁺.

Synthesis of Intermediate Int II-1: *N*-(Imidazo[1,2-*b*]pyridazin-3-yl)-6-methoxy-1*H*-indazole-5-carboxamide

[0144]

[0145] Pd(OAc)₂ (89 mg, 0.4 mmol) was added to TEA (3.7 mL, 26.4 mmol), dppp (165 mg, 0.4 mmol), 5-bromo-6-methoxy-1*H*-indazole (2.0 g, 8.8 mmol) and imidazo[1,2-*b*]pyridazin-3-amine (1.3 g, 9.7 mmol) in degassed MeCN (30 mL). The resulting mixture was stirred under CO atmosphere at 4 bar at 100 °C for 23 h. After cooling of the mixture to rt, the formed precipitate was collected by filtration, washed with MeCN (2 mL) and dried under vacuum to afford *N*-(imidazo[1,2-*b*]pyridazin-3-yl)-6-methoxy-1*H*-indazole-5-carboxamide (2.4 g, 87%) as a grey solid, which was used without further purification. ¹H NMR (500 MHz, DMSO-*d*₆) δ 12.86 (s, 1H), 10.79 (s, 1H), 8.50 - 8.65 (m, 2H), 8.15 (s, 1H), 8.01 - 8.12 (m, 2H), 7.23 (s, 1H), 7.18 (dd, 1H), 4.18 (s, 3H). *m/z* (ESI+) [M+H]⁺ = 309.

Synthesis of Intermediate Int II-2: 6-Methoxy-*N*-(pyrazolo[1,5-*a*]pyrimidin-3-yl)-1*H*-indazole-5-carboxamide

Methyl 6-methoxy-1*H*-indazole-5-carboxylate

[0146]

[0147] A solution of Pd(dppf)Cl₂ (9.7 g, 13.2 mmol), DIPEA (77 mL, 440.4 mmol) and 5-bromo-6-methoxy-1*H*-indazole (20.0 g, 88 mmol) in MeOH (500 mL) was stirred under CO atmosphere at 15 atm and 110 °C for 12 h. After cooling of the mixture to rt, the reaction mixture was filtered through silica and the solvent was removed under reduced pressure. The crude was purified by silica gel chromatography (eluting with 0 to 30% EtOAc in PE) to afford methyl 6-methoxy-1*H*-indazole-5-carboxylate (8.0 g, 44%) as a brown solid. *m/z* (ESI+), [M+H]⁺ = 207.

6-Methoxy-1*H*-indazole-5-carboxylic acid

[0148]

[0149] LiOH (732 mg, 30.5 mmol) in water (5 mL) was added to methyl 6-methoxy-1*H*-indazole-5-carboxylate (2.1 g, 10.2 mmol) in MeOH (5 mL) at rt under N₂ atmosphere. The reaction mixture was stirred at rt for 3 h and then acidified with aq. HCl (0.1 M). The formed precipitate was collected by filtration, washed with MeOH and dried under vacuum to afford 6-methoxy-1*H*-indazole-5-carboxylic acid (1.6 g, 80%) as a grey solid, which was used without further purification. *m/z* (ESI+), [M+H]⁺ = 193.

6-Methoxy-*N*-(pyrazolo[1,5-*a*]pyrimidin-3-yl)-1*H*-indazole-5-carboxamide (Int II-2)

[0150]

[0151] Pyrazolo[1,5-*a*]pyrimidin-3-amine (**Int I-5**) (7.3 g, 54.0 mmol) was added to HATU (20.6 g, 54.0 mmol), DIPEA (36 mL, 208.0 mmol) and 6-methoxy-1*H*-indazole-5-carboxylic acid (8.0 g, 42.0 mmol) in THF (20 mL) at rt under N₂ atmosphere. The resulting solution was stirred for 2 h. The reaction mixture was poured into water (20 mL) and the formed solid was collected via filtration, washed with water (100 mL) and dried under vacuum to afford 6-methoxy-*N*-(pyrazolo[1,5-*a*]pyrimidin-3-yl)-1*H*-indazole-5-carboxamide (10.0 g) as a yellow solid, which was used without further purification. ¹H NMR (300 MHz, DMSO-*d*₆) δ 13.13 (s, 1H), 10.32 (s, 1H), 9.01 - 9.12 (m, 1H), 8.74 (s, 1H), 8.53 - 8.56 (m, 1H), 8.48 (s, 1H), 8.16 (s, 1H), 7.18 (s, 1H), 7.00 - 7.11 (m, 1H), 4.10 (s, 3H). *m/z* (ESI+), [M+H]⁺ = 309.

Synthesis of Intermediate Int II-3: 6-Cyclopropoxy-*N*-(pyrazolo[1,5-*a*]pyrimidin-3-yl)-1*H*-indazole-5-carboxamide

Methyl 6-cyclopropoxy-1*H*-indazole-5-carboxylate

[0152]

[0153] A suspension of 5-bromo-6-cyclopropoxy-1*H*-indazole (**Int I-4**) (5.5 g, 21.7 mmol),

DIPEA (2.1 g, 16.6 mmol) and Pd(dppf)Cl₂ (15.9 g, 21.7 mmol) in MeOH (30 mL) was stirred under CO atmosphere at 15 atm and 110 °C for 12 h. The mixture was cooled to rt, concentrated and was purified by silica gel chromatography (eluting with 0 - 50% EtOAc in PE) to afford methyl 6-cyclopropoxy-1*H*-indazole-5-carboxylate (4.4 g, 87%) as a yellow solid. MS ESI, *m/z* = 233 [M+H]⁺.

6-Cyclopropoxy-1*H*-indazole-5-carboxylic acid

[0154]

[0155] To a solution of methyl 6-cyclopropoxy-1*H*-indazole-5-carboxylate (4.4 g, 19.0 mmol) in MeOH (5 mL) at rt was added a solution of LiOH (1.4 g, 56.8 mmol) in water (5 mL). The resulting solution was stirred at 30 °C for 12 h. The reaction mixture was cooled to rt, diluted with water (25 mL) and washed with EtOAc (10 mL × 3). The aq. layer was acidified to pH 4 - 5 with 0.1N HCl and the formed precipitate was collected by filtration to obtain 6-cyclopropoxy-1*H*-indazole-5-carboxylic acid (2.7 g, 65%). MS ESI, *m/z* = 219 [M+H]⁺.

6-Cyclopropoxy-*N*-(pyrazolo[1,5-*a*]pyrimidin-3-yl)-1*H*-indazole-5-carboxamide (Int II-3)

[0156]

[0157] To a solution of 6-cyclopropoxy-1*H*-indazole-5-carboxylic acid (5.5 g, 25.2 mmol), HATU (14.4 g, 37.8 mmol) and DIPEA (22.0 mL, 126.0 mmol) in DMF (6 mL) and THF (54 mL) at rt was added pyrazolo[1,5-*a*]pyrimidin-3-amine (**Int I-5**) (5.1 g, 37.8 mmol) was added. The resulting solution was stirred at rt for 12 h. The reaction mixture was poured into water (1 L) and the formed precipitate was collected by filtration. The solid was suspended in MeOH (150 mL), followed by the addition of K₂CO₃ (15 g) and the resulting mixture was stirred at rt for 2 h. Subsequently, the suspension was poured into water (1 L) and filtered to give 6-cyclopropoxy-*N*-(pyrazolo[1,5-*a*]pyrimidin-3-yl)-1*H*-indazole-5-carboxamide (6.9 g, 81%) as a yellow solid. ¹H

NMR (300 MHz, DMSO- d_6) δ 13.14 (s, 1H), 10.26 (s, 1H), 8.97 - 9.17 (m, 1H), 8.76 (s, 1H), 8.42 - 8.64 (m, 2H), 8.18 (s, 1H), 7.48 (s, 1H), 6.95 - 7.10 (m, 1H), 4.17 - 4.39 (m, 1H), 1.06 - 0.90 (m, 2H), 0.90 - 1.20 (m, 2H). MS ESI, m/z = 335 $[M+H]^+$.

Synthesis of Intermediate Int III-1: 1-Methyl-2-oxo-1-azaspiro[4.5]decan-8-yl 4-methylbenzenesulfonate

8-Hydroxy-1-azaspiro[4.5]decan-2-one

[0158]

[0159] To 1-azaspiro[4.5]decane-2,8-dione (4.5 g, 26.9 mmol) in MeOH (100 mL) at 0 °C was added NaBH₄ (2.0 g, 53.8 mmol) in one portion and the resulting solution was stirred at rt. After 14 h the reaction mixture was quenched with EtOAc (50 mL), the solvent was removed *in vacuo*, and the resulting residue was purified using silica gel chromatography (eluting with EtOAc) to afford 8-hydroxy-1-azaspiro[4.5]decan-2-one (2.5 g, 55%) as a colourless oil. m/z (ESI+), $[M+H]^+$ = 170.

2-Oxo-1-azaspiro[4.5]decan-8-yl 4-methylbenzenesulfonate

[0160]

[0161] TsCl (6.8 g, 35.8 mmol) was slowly added to a solution of 8-hydroxy-1-azaspiro[4.5]decan-2-one (2.8 g, 16.3 mmol), DMAP (199 mg, 1.6 mmol) and TEA (9.1 mL, 65.0 mmol) in DCM (15 mL) at rt under N₂ atmosphere. The resulting mixture was stirred at rt for 3 h. The reaction mixture was quenched with water (100 mL), extracted with DCM (15 mL $\times$ 3), dried over Na₂SO₄, filtered and concentrated under reduced pressure. The residue was purified by silica gel chromatography (eluting with 30 - 60% EtOAc in PE) to afford 2-oxo-1-azaspiro[4.5]decan-8-yl 4-methylbenzenesulfonate (2.00 g, 38%) as a colorless solid. ¹H NMR (300 MHz, DMSO- d_6) δ 7.79 (d, 2H), 7.47 (d, 2H), 4.39 - 4.59 (m, 1H), 2.42 (s, 3H), 2.07 - 2.19 (m, 2H), 1.48 - 1.83 (m, 8H), 1.35 - 1.48 (m, 2H). m/z (ESI+), $[M+H]^+$ = 324.

1-Methyl-2-oxo-1-azaspiro[4.5]decan-8-yl 4-methylbenzenesulfonate (Int III-1)**[0162]**

[0163] To a solution of 2-oxo-1-azaspiro[4.5]decan-8-yl 4-methylbenzenesulfonate (1.9 g, 5.9 mmol) in DMF (8 mL) at 0 °C under N₂ atmosphere was added NaH (60 wt.%) (352 mg, 8.8 mmol). The resulting suspension was stirred at 0 °C for 30 min, followed by the addition of iodomethane (1.5 mL, 23.5 mmol). The reaction mixture was stirred at rt for another 6 h and then quenched with water (10 mL). The mixture was purified directly by C18-flash chromatography (eluting with 0 - 60% MeCN in water (0.5% NH₄OH)) to afford 1-methyl-2-oxo-1-azaspiro[4.5]decan-8-yl 4-methylbenzenesulfonate (1.8 g, 91%) as a colorless solid. ¹H NMR (400 MHz, DMSO-*d*₆) (3 : 1 mixture of isomers) δ 7.78 - 7.86 (m, 2H), 7.48 (d, 2H), 4.61 - 4.70/4.43 - 4.53 (m, 1H) (isomers), 2.59/2.55 (s, 3H) (isomers), 2.42 (s, 3H), 2.13 - 2.23 (m, 2H), 1.54 - 1.89 (m, 8H), 1.15 - 1.26/1.26 - 1.37 (m, 2H) (isomers). *m/z* (ESI+), [M+H]⁺ = 338.

8-Amino-1-azaspiro[4.5]decan-2-one

[0235]

[0236] 1-azaspiro[4.5]decane-2,8-dione (1.0 g, 6.0 mmol) was mixed with 4N NH_3 in MeOH (46.0 mL, 0.18 mol) and stirred at rt. After 1 h the resulting solution was added to a suspension of NaBH_4 (256 mg, 6.8 mmol) in THF (20 mL) at -50°C and allowed to warm to rt. The reaction was quenched with water (10 mL) and the organic solvents were removed *in vacuo*. Then, an aq. 4M NaOH solution (40 mL) and sodium chloride (10 g) was added. The resulting suspension was extracted with DCM (4×70 mL), the combined organic phases were dried over MgSO_4 and the solvent was removed *in vacuo* to give crude 8-amino-1-azaspiro[4.5]decan-2-one (0.9 g), which was used without further purification.

(5*r*,8*r*)-8-(5-Bromo-6-methoxy-2*H*-indazol-2-yl)-1-azaspiro[4.5]decan-2-one

[0237]

[0238] To crude 8-amino-1-azaspiro[4.5]decan-2-one (600 mg) in i-PrOH (25 mL) was added 5-bromo-4-methoxy-2-nitrobenzaldehyde (**Int I-1**) (1.1 g, 2.2 mmol) and the resulting mixture was stirred at 80 °C. After 4 h, tri-*n*-butylphosphine (1.6 mL, 6.5 mmol) was added and the mixture was stirred overnight at 80 °C. Then the reaction mixture was allowed to cool to rt and filtered. The collected solid was washed with heptane (3 × 10 mL) and purified using ion exchange chromatography, washing with 250 mL DCM/MeOH (1:1) and eluting with DCM / 4N NH₃-MeOH solution (1/1). The isolated solid was then recrystallized using i-PrOH to remove undesired (5*s*,8*s*)-8-(5-bromo-6-methoxy-2H-indazol-2-yl)-1-azaspiro[4.5]decan-2-one. The filtrate was further purified by silica gel chromatography (eluting with 50-100% EtOAc in heptane, then EtOAc, followed by 0-3% NH₃-MeOH in DCM) to afford (5*r*,8*r*)-8-(5-bromo-6-methoxy-2H-indazol-2-yl)-1-azaspiro[4.5]decan-2-one (320 mg, 39%). *m/z* (ESI+), [M+H]⁺ = 378/380.

(5*r*,8*r*)-8-(5-Bromo-6-methoxy-2H-indazol-2-yl)-1-methyl-1-azaspiro[4.5]decan-2-one

[0240] To a stirred solution of (5*r*,8*r*)-8-(5-bromo-6-methoxy-2H-indazol-2-yl)-1-azaspiro[4.5]decan-2-one (310 mg, 0.7 mmol) in DMF (5 mL) / THF (5 mL) was added NaH (60 wt.%) (93 mg, 2.1 mmol) at 0 °C. After 20 min, methyl iodide (130 μL, 2.1 mmol) was slowly added at 0 °C. The resulting mixture was warmed to rt and stirred overnight. The reaction mixture was then quenched with ice water (250 mL) and extracted with DCM (4 × 25 mL). The combined organic phases were concentrated *in vacuo* and the resulting residue was purified using silica gel chromatography (eluting with DCM (300 mL), EtOAc (2 L), then with 2% NH₃-MeOH in DCM (150 mL)) to give (5*r*,8*r*)-8-(5-bromo-6-methoxy-2H-indazol-2-yl)-1-methyl-1-azaspiro[4.5]decan-2-one (225 mg, 78%) as a beige solid. *m/z* (ESI+), [M+H]⁺ = 392/394.

[0241]

[0242] Methylphenylsilanecarboxylic acid (193 mg, 0.8 mmol) and KF (46 mg, 0.8 mmol) were added to chamber A of a dried and N₂-flushed COware gas reactor. (5*r*,8*r*)-8-(5-Bromo-6-methoxy-2*H*-indazol-2-yl)-1-methyl-1-azaspiro[4.5]decan-2-one (116 mg, 0.3 mmol), imidazo[1,2-*b*]pyridazin-3-amine (121 mg, 0.9 mmol), dppp (41 mg, 0.1 mmol), Pd(OAc)₂ (27 mg, 0.1 mmol) and TEA (223 μ L, 1.6 mmol) in degassed anhydrous MeCN (2 mL) were added to chamber B. Then, DMSO (350 μ L) was added to chamber A and chamber B was stirred at 85 °C overnight. The reaction mixture was allowed to cool to rt. The reaction in chamber B was quenched with saturated NaHCO₃, the solvent was removed *in vacuo*, and the resulting residue was purified using ion exchange chromatography, washing with DCM/MeOH (1/1; 200 mL), and eluting with 4N NH₃ in MeOH (200 mL). The resulting dark-brown solid was further purified using silica gel chromatography (eluting with EtOAc (2 L) and then with 0-3% NH₃-MeOH in DCM) to give an orange-yellow solid. The orange-yellow solid was triturated with EtOAc (20 mL) to give a bright-yellow solid, which was slurried in *i*-PrOH (3 mL) overnight. The slurry solution was filtered, and the collected precipitate was washed with *i*-PrOH (4 $\times$ 500 μ L) and pentane (3 $\times$ 1 mL) to give *N*-(imidazo[1,2-*b*]pyridazin-3-yl)-6-methoxy-2-((5*r*,8*r*)-1-methyl-2-oxo-1-azaspiro[4.5]decan-8-yl)-2*H*-indazole-5-carboxamide (93 mg, 74%) as a light-yellow solid. ¹H NMR (500 MHz, DMSO-*d*₆) δ 11.05 (s, 1H), 8.65 (dd, 1H), 8.64 (d, 1H), 8.59 (s, 1H), 8.16 (dd, 1H), 8.05 (s, 1H), 7.29 (s, 1H), 7.23 (dd, 1H), 4.49 - 4.61 (m, 1H), 4.12 (s, 3H), 2.68 (s, 3H), 2.28 (t, 2H), 2.07 - 2.18 (m, 4H), 1.94-2.03 (m, 4H), 1.53 - 1.59 (m, 2H). *m/z* (ESI+), [M+H]⁺ = 474.

tert-Butyl 7-methyl-8-oxo-2-azaspiro[4.5]decane-2-carboxylate

[0473]

[0474] To a solution of *tert*-butyl 8-oxo-2-azaspiro[4.5]decane-2-carboxylate (15.0 g, 59.2 mmol) in THF (150 mL) was added 1M LiHMDS in THF (118.5 mL, 118.5 mmol) dropwise over a period of 20 min at -78 °C under N₂ atmosphere. The resulting mixture was stirred at -78 °C for 2 h. Subsequently, iodomethane (7.4 mL, 118.5 mmol) was added slowly. The reaction mixture was allowed to warm to rt and stirred for 15 h. Then, the reaction was quenched with aq. saturated NH₄Cl solution (300 mL) and extracted with EtOAc (250 mL × 3). The combined organic layers were washed with brine (30 mL), dried over Na₂SO₄, filtered and concentrated under reduced pressure. The residue was purified by silica gel chromatography (eluting with 5 - 20% EtOAc in PE) to afford *tert*-butyl 7-methyl-8-oxo-2-azaspiro[4.5]decane-2-carboxylate (6.6 g, 42%) as a yellow semi-solid. MS ESI, *m/z* = 212 [M-*t*Bu]⁺.

(4-(5-Bromo-6-methoxy-2*H*-indazol-2-yl)cyclohexyl)methanol

[0491]

[0492] To a solution of (4-aminocyclohexyl)methanol (2.0 g, 15.5 mmol) in *i*-PrOH (20 mL) at rt was added 5-bromo-4-methoxy-2-nitrobenzaldehyde (**Int I-1**) (4.0 g, 15.5 mmol) under N₂ atmosphere. The resulting mixture was stirred at 80 °C for 1 h, then cooled to rt, followed by the addition of tri-*n*-butylphosphine (15.7 g, 77.4 mmol). The reaction mixture was stirred at 80

°C for 15 h. The mixture was cooled to rt and concentrated under reduced pressure. The residue was purified by silica gel chromatography (eluting with 20 - 50% EtOAc in PE) to yield a yellow oil. The oil was subsequently crystallized from EtOAc (2 mL) / PE (12 mL) to afford (4-(5-bromo-6-methoxy-2*H*-indazol-2-yl)cyclohexyl)methanol (900 mg, 17%) as a colorless solid. The filtrate from the crystallization was concentrated under reduced pressure to give (4-(5-bromo-6-methoxy-2*H*-indazol-2-yl)cyclohexyl)methanol (5.0 g, 47 wt.%) as a solid, which was used in the next step without further purification. MS ESI, m/z = 339/341 $[M+H]^+$.

rac-(7*R*,8*R*)-*N*-Benzyl-7-methyl-1,4-dioxaspiro[4.5]decan-8-amine

[0545]

And Enantiomer

[0546] To a solution of 7-methyl-1,4-dioxaspiro[4.5]decan-8-one (3.0 g, 17.6 mmol) and phenylmethanamine (2.8 g, 26.4 mmol) in toluene (50 mL) under N₂ atmosphere was added 4-methylbenzenesulfonic acid monohydrate (335 mg, 1.8 mmol). The resulting solution was stirred at 120 °C for 15 h. Subsequently, the reaction mixture was allowed to cool to rt and was concentrated under reduced pressure to give the crude imine intermediate. To a solution of the imine in MeOH (60 mL) at -60 °C was added NaBH₄ (0.6 g, 15.8 mmol) portionwise over a period of 5 min under N₂ atmosphere. The resulting mixture was stirred at -60 °C for 1 h, then slowly warmed up to rt and stirred for 3 h. Five batches of crude product solution were prepared in parallel as described above and combined before the purification. The reaction mixture was concentrated under reduced pressure, dissolved with EtOAc (500 mL) and washed with brine (300 mL × 3). The organic layer was dried over Na₂SO₄, filtered and was concentrated under reduced pressure. The residue was purified by C18-flash chromatography (eluting with 0 - 100% MeCN in water (0.05% NH₄HCO₃)) to afford *rac*-(7*R*,8*R*)-*N*-benzyl-7-methyl-1,4-dioxaspiro[4.5]decan-8-amine (8.1 g, 35%) as an orange oil. MS ESI, *m/z* = 262 [M+H]⁺.

[0547]

And Enantiomer

[0548] To a solution of *rac*-(7*R*,8*R*)-*N*-benzyl-7-methyl-1,4-dioxaspiro[4.5]decan-8-amine (8.1 g, 31.0 mmol) in MeOH (100 mL) under N₂ atmosphere was added Pd(OH)₂ on carbon (20 wt.%) (872 mg, 1.2 mmol). The resulting suspension was stirred at rt under hydrogen at 2 atm for 15 h. The reaction mixture was filtered through celite, and the celite cake was washed with MeOH (150 mL). The combined MeOH solution was concentrated under reduced pressure to afford crude *rac*-(7*R*,8*R*)-7-methyl-1,4-dioxaspiro[4.5]decan-8-amine (5.0 g) as a brown oil, which was used without further purification.

5-Bromo-6-methoxy-2-((7*R*,8*R*)-7-methyl-1,4-dioxaspiro[4.5]decan-8-yl)-2H-indazole

[0549]

[0550] To a solution of 5-bromo-4-methoxy-2-nitrobenzaldehyde (**Int I-1**) (10.6 g, 40.9 mmol) in *i*-PrOH (200 mL) at rt was added crude *rac*-(7*R*,8*R*)-7-methyl-1,4-dioxaspiro[4.5]decan-8-amine (7.0 g) under N₂ atmosphere. The resulting mixture was stirred at 80 °C for 2 h, then cooled to rt and followed by the addition of tri-*n*-butylphosphine (41.4 g, 204.4 mmol). The reaction mixture was stirred at 80 °C for 24 h. The mixture was allowed to cool to rt and concentrated under reduced pressure. The residue was purified by silica gel chromatography (eluting with 0 - 10% MeOH in DCM) and further by C18-flash chromatography (eluting with 0 - 100% MeCN in water (0.05% NH₄OH)) to afford *rac*-5-bromo-6-methoxy-2-((7*R*,8*R*)-7-methyl-1,4-dioxaspiro[4.5]decan-8-yl)-2*H*-indazole as a yellow solid. This material was purified by chiral prep. SFC (Chiralpak[®] IG, 5 µm 50 × 250 mm; isocratic with 50% MeOH (0.1% 2*N* NH₃-MeOH) in CO₂ (35 °C, 100 bar)) to afford 5-bromo-6-methoxy-2-((7*R*,8*R*)-7-methyl-1,4-dioxaspiro[4.5]decan-8-yl)-2*H*-indazole (3.0 g, 19%, 100°/ee) as a gray solid. ¹H NMR (300 MHz, DMSO-*d*₆) δ 8.25 (d, 1H), 7.96 (s, 1H), 7.12 (s, 1H), 4.13 (td, 1H), 3.87 - 3.99 (m, 4H), 3.87 (s, 3H), 2.26 - 2.43 (m, 1H), 2.19 (td, 1H), 1.75-1.96 (m, 3H), 1.68 (td, 1H), 1.46 (t, 1H), 0.52 (d, 3H). Potency of IRAK4 inhibitor compounds in IRAK4 enzyme assay

[0640] The inhibitory activity of compounds against IRAK4 were determined in an enzymatic assay using mass spectrometry readout. Ten point half-log compound concentration response curves, with a top concentration of 1 μ M or 10 μ M, were generated from 10 mM stocks of compound solubilized in DMSO using an Echo 655 (Labcyte Inc) and added to 384 well assay plates (Greiner #781280). To the assay plates, 10 μ L of human recombinant IRAK4 protein (Life Technologies #PV4002) diluted to a final concentration of 0.2 nM in assay buffer (50 mM Tris-HCl pH 7.4, 10 mM MgCl₂, 5 mM glutathione, 0.01% BSA, 3 mM ATP) was added. The enzyme was incubated with the compounds at room temperature for 15 minutes before a peptide substrate (KKARFSRFAGSSPSQSSMVAR, Innovagen custom synthesis, 10 mM in DMSO) was added to each well to a final concentration of 10 μ M using an Echo 655 (Labcyte Inc). After two hours at room temperature, the reaction was stopped with 90 μ L of 0.4 % formic acid (Merck #33015). The unphosphorylated and phosphorylated peptide were measured by LC-MS/MS on a Waters TQ-S mass spectrometer. Peaks were integrated using the TargetLynx software and the ratios between phosphorylated and unphosphorylated peptides were calculated. Curves were fitted and compound potencies determined in Genedata Screener 15 (Genedata AG). Data presented are the geometric mean of at least n=2, or as denoted by an * are obtained from a single experiment.

IRAK4 phosphorylation cell assay

[0641] The activation of IRAK4 by TLR or IL-1R ligands leads to IRAK4 auto-phosphorylation, which can be prevented by IRAK4 kinase inhibitors. The effect of IRAK4 inhibitor compounds on IRAK4 auto-phosphorylation was assessed in IL-1 β -stimulated Karpas-299 cells as a measurement of cellular potency. Karpas-299 cells were cultured in RPMI 1640 (Gibco 61870-010) containing 10 % FBS (Gibco #10270). Cells were plated at 2×10^4 cells per well in poly-D-lysine coated 384 well plates (Corning #356663) to which compounds had been added at various concentrations (10 point half log dose response with a final top concentration of 30 μ M) using an Echo 655 (Labcyte Inc). Cells were centrifuged (250g, 4 mins), incubated at 37 °C for 1 h, then stimulated with 22.7 ng/mL recombinant IL-1 β (R&D Systems, #201-LB-025) at 37 °C for 10 mins, followed by fixation in 4 % paraformaldehyde for 10 mins and permeabilization in ice-cold 70 % MeOH for 30 mins. Cells were washed twice with phosphate-buffered saline (PBS) on a BlueWasher (BlueCatBio) then blocked with PBS containing 10 % FBS for 20 mins. Blocking solution was removed with a BlueWasher and cells were stained with anti-pIRAK4 (Thr345/Ser346) (CST, #11927, 1:400) in blocking buffer with 0.05 % Tween-20 for 1 h, then washed twice with PBS containing 0.05 % Tween-20 on a BlueWasher, followed by staining with a Alexa 647-conjugated secondary anti-rabbit IgG antibody (CST, #4414, 1:2,000) and Hoechst 33342 (Sigma, 1:2,000) in blocking buffer with 0.05 % Tween-20 for 30 mins. Finally, the cells were washed twice with PBS containing 0.05 % Tween-20 and imaged on an ImageXpress Micro (Molecular Devices) with a 10X air objective using the appropriate filters. Images were analysed in Columbus (PerkinElmer) and the fluorescence intensity per cell from

the secondary antibody was quantified. The quantified data were analysed in Genedata Screener 15 (Genedata AG). Results obtained in this assay are presented in **Table 1** and demonstrate the ability of the compounds of the present specification to inhibit IRAK4 in cells. IC₅₀ values are the geometric mean of at least 2 experiments.

Effect of IRAK4 inhibitors on IL-1 β -induced cytokine release in human THP-1 monocyte cell line

[0642] THP-1 cells were cultured in RPMI 1640 (Gibco 72400-021) containing 10 % FBS (Gibco 10270-106), 1 mM Na-pyruvate (Gibco 11360-070) and 100 U/mL Penicillin-Streptomycin (Gibco 15140-122). Cells were plated at 5×10^4 cells per well in 384 well Echo certified plates (Labcyte PPT-0200) to which compounds had been added at various concentrations (10 point half log dose response with a final top concentration of 10 μ M) using an Echo 655 (Labcyte Inc). The plate was incubated for 1h at 37°C, then recombinant IL-1 β (R&D Systems 201-LB-025/CF) was added to a final concentration of 1.8 ng/mL. The plates were incubated at 37°C for 18h. The plates were centrifuged at 250x g for four minutes, then 1.6 μ L of the cell supernatant was transferred to a white low volume 384 well plate (Greiner #784075) using acoustic dispensing on an Echo 655. Next, 200 nL of acceptor bead (5 mg/mL) and biotinylated anti-IL-8 antibody (500 nM) was added using acoustic dispensing (beads and antibody were from a PerkinElmer I8 AlphaLISA detection kit, AL224C). The plate was sealed, briefly centrifuged, then incubated at room temperature for 1h. Afterwards, 200 nL of donor bead solution (5 mg/mL) was added, the plate sealed and briefly centrifuged, then incubated for 1h before being read on an Envision plate reader to allow determination the concentration of IRAK4 inhibitor required to effect a 50% reduction in the amount of IL-8 released following IL-1 β stimulation in THP1 cells (**Table 2**). The quantified data were analysed in Genedata Screener 15 (Genedata AG). Data presented are the geometric mean of at least n=2, or as denoted by an * are obtained from a single experiment.

In vitro effect of IRAK4 inhibitors on LPS- and IL-1 β -induced cytokine release in human PBMCs

[0643] To evaluate the effect and potency of IRAK4 inhibitors on blocking disease-relevant pathways in human primary immune cells, we stimulated human PBMCs (peripheral blood mononuclear cells) with LPS (TLR4 agonist) or IL-1 β (IL-1R ligand) and measured the release of the proinflammatory cytokines IL-6 and TNF- α . Briefly, PBMCs were isolated from human blood, donated from healthy individuals, using LymphoPrep density gradient and plated at a cell density of 200 000 cells/well (for LPS assay) or 300 000 cells/well (for IL-1 β assay) in 96-well culture plates. Cells were incubated for 1 h with serial dilutions of IRAK4 inhibitor or vehicle (DMSO) prior to stimulation of cells with 0.11 ng/mL LPS (derived from *E. coli*) or 1 ng/mL

recombinant human IL-1 β . After 4 h of LPS stimulation or 20 h of IL-1 β stimulation, the supernatant was collected and the levels of the proinflammatory cytokines TNF- α , IL-8 and IL-6 were measured by Mesoscale Discovery (MSD) multiplex assay. Dose-response curves were plotted and IC₅₀ values were calculated with 4-parameter curve fit using GraphPad Prism 8 (see **Table 3**). IRAK4 inhibitors according to the present specification proved to be highly active in inhibiting proinflammatory cytokine release and TNF- α .

***In vivo* effect of IRAK4 inhibition in a mouse model of LPS-induced airway inflammation**

[0644] TLRs act as a first sensor of microbes and allergens in the airways and can mediate a rapid inflammatory response. A mouse model of inhaled LPS challenge was used to study the effect of IRAK4 inhibition on the processes of an acute TLR4-driven airway inflammation. Briefly, 9-week old C57Bl/6NCrl female mice were dosed with 5, 15 and 50 mg/kg of test compound (Example 89) or vehicle alone (5% DMSO, 95% SBE-B-CD (30% w/v) in water) by oral administration. After 0.5h, the animals were challenged by whole body exposure to an aerosol of 1 mg/mL LPS (*E. coli* 0111:B4 from Sigma L2630) in saline, or saline only, for 0.5h at a 6 L/min compressed air flow. Following exposure, the boxes were ventilated and the animals returned to their housing cages. After 4 h, animals were euthanized with a single intraperitoneal injection of 0.3 mL pentobarbital (100 mg/mL) and manual bronchoalveolar lavage (BAL) was performed from the whole lung using 1 mL of PBS. The collected BAL fluid (BALF) was centrifuged at 300 $\times$ g for 10 min at 4°C and the supernatant was collected and stored at -80°C. The levels of proinflammatory cytokines were measured in the BALF supernatant using MSD multiplex assay 8 mice per treatment group were used, except for the LPS/vehicle group where 20 mice were used. The levels of IL-6 and TNF- α in the BALF supernatant in the different treatment groups are represented in **Figure 1**. Example 89 reduced the levels of IL-6 and TNF- α upon inhaled LPS challenge, in a dose-dependent manner.
