Abstract: The hydration of clays and shale in drilling operations may be inhibited by employing an aqueous based drilling fluid comprising a shale hydration inhibition agent having the formula: (I). R is an alkyl group having 1 to 6 carbons; R₁ may be the same or different than R and is an alkyl group having 1 to 10 carbons or a hydroxy alkyl group comprising n number of carbons wherein n is an integer from 1 to 10 and n - 1 hydroxyl groups; R₂ is an alkyl group having 1 to 6 carbons; R₃ may be the same or different than R₂ and is an alkyl group having 1 to 10 carbons or a hydroxy alkyl group comprising n number of carbons wherein n is an integer from 1 to 10 and n - 1 hydroxyl groups, with the proviso that R₁ is not the same as R₂; and X is an anion. The shale hydration inhibition agent should be present in the aqueous based drilling fluid in sufficient concentration to reduce the reactivity, such as swelling, of clays and shale when exposed to water-based drilling fluids.
IMPROVED CLAY AND SHALE INHIBITION AGENTS AND METHOD OF USE

FIELD OF THE INVENTION

The present invention relates to shale hydration inhibition agents for the drilling industry, specifically di-quaternary amine alcohol compounds which are effective for the reduction of reactivity, for example the inhibition of swelling, of clay and shale which comes into contact with the fluids used in the drilling and construction of oil and gas wells for the petroleum industry.

BACKGROUND OF THE INVENTION

In the rotary drilling of wells a drilling fluid circulates throughout the underground well to carry cuttings from the bit and to transport these cuttings to the surface. Contemporaneously, the drilling fluid cools and cleans the drill bit, as well as reduces friction between drill string and the drilled hole, and also stabilizes uncased sections of the well. Usually drilling fluids form a low permeability filter cake in order to seal any permeability associated with the surrounding geological formations.

Drilling fluids may be classified according to their fluid base: oil based fluids with solid particles suspended in an oil continuous phase and, possibly, water or brine may be emulsified with the oil. Alternatively, water based fluids contain solid particles suspended in water or brine. Various solids may be added, deliberately or otherwise, to water based drilling fluids: a) organic polymers or clays used to impart viscosity and filtration properties; b) insoluble inorganic minerals to increase the fluid density as well as help decrease fluid loss; c) soluble salts used to increase the mud’s density; and d) during the drilling operation formation solids may disperse into the drilling fluid.

Formation solids that become dispersed in a drilling fluid include cuttings from drilling, soil, and solids from surrounding unstable formation. When the formation yields solids that are clay minerals which are reactive, for example swell, disperse, migrate or undergo swelling-induced migration, this can potentially compromise drilling time and increase costs.

Clays are typically composed of sheets or layers of aluminosilicate minerals having exposed surface hydroxyls. The basal plane of the clay surface is negatively charged and as
such cations are readily adsorbed onto the surface. These cations may be exchangeable. Substitutions within the clay structure and the presence of exchangeable cations affect the tendency of the clay to swell in water. For example, surface hydration gives swelling with water molecules adsorbed on clay surfaces. Many types of clays can swell in this manner.

Another type of swelling is called osmotic swelling, when interlayer ion concentration leaches water between the clay unit layers, swelling the clay. Only some clays can undergo osmotic swelling. All types of clay and shale instability, such as swelling, can cause a series of problems. For example, drag between the drill string and the sides of the borehole may be increased. This can cause loss of fluid circulation and sticking of the drill string and bit.

This is why development of effective clay instability inhibitors is important to the oil and gas exploration industry. The present invention works towards a solution to these difficulties.

Many types of clay inhibitors are known including the use of inorganic salts such as potassium chloride. Numerous patents have been filed which describe techniques or products which can be used to inhibit clay swelling. Without completely summarizing the patent literature, and by way of example, we can cite the inhibitor compositions based on: a) inorganic phosphates, described in USP 4,605,068; b) polyalkoxy diamines and their salts, in USP 6,484,821; 6,609,578; 6,247,543; and US 20030106718; c) choline derivatives described in USP 5,908,814; d) oligomethylene diamines and their salts, in USP 5,771,971 and US Publication No. 20020155956; e) the addition product of carboxymethyl cellulose and an organic amine, in WO 2006/013595; f) 1,2-cyclohexanediامine and/or their salts, in WO 2006/013597; g) salts of phosphoric acid esters of oxyalkylated polyols, in WO 2006/013596; h) the combination of a partially hydrolyzed acrylic copolymer, potassium chloride and polyanionic cellulose, in USP 4,664,818; i) quaternary ammonium compounds, in USP 5,197,544 and 5,380,706; j) polymers based on dialkyl ammonium methacrylate, in USP 7,091,159; k) aqueous solutions containing a polymer with hydrophilic and hydrophobic groups, in USP 5,728,653; and l) the reaction product of a polyhydroxyalkane and an alkylene oxide, in USP 6,544,933.
SUMMARY OF THE INVENTION

The present invention is an aqueous based drilling fluid composition and method of using said aqueous based drilling fluid composition for reducing the reactivity such as swelling of clays and shale in drilling operations wherein the aqueous based drilling fluid comprises an aqueous based continuous phase, a reactive clay or shale material, and a shale hydration inhibition agent comprising a di-quaternary amine alcohol compound having the following formula:

![Chemical Structure]

wherein

R is an alkyl group having 1 to 6 carbons, preferably an alkyl group having 1, 2, 3, 4, 5, or 6 carbons, more preferably methyl;

R₁ may be the same or different than R and is an alkyl group having 1 to 10 carbons, more preferably an alkyl group having 1, 2, 3, 4, 5, 6, 7, 8, 9, or 10 carbons; or a hydroxy alkyl group comprising n number of carbons wherein n is an integer from 1 to 10 and m hydroxy groups wherein m is an integer from 1 to 5, preferably a hydroxy alkyl group having the following structure: \(-\text{CH}_2\text{-CH}_2\text{-CH}_2\text{-OH}, \text{-CH}\text{-(CH}_2\text{-CH}_2\text{OH)}_2, \text{or-C-(CH}_2\text{-CH}_2\text{OH)}_3\); more preferably a hydroxy alkyl group comprising n number of carbons wherein n is an integer from 1 to 10 and n - 2 hydroxyl groups, more preferably a hydroxy alkyl group having the following structure: \(-\text{CH}_2\text{-CH-(CH}_2\text{-OH)}_2, \text{or}-\text{CH}_2\text{-C-(CH}_2\text{-OH)}_3\); more preferably a hydroxy alkyl group comprising n number of carbons wherein n is an integer from 1 to 10 and n - 1 hydroxyl groups, most preferably a hydroxy alkyl group having the following structure: \(-\text{CH}_2\text{-CH}_2\text{-OH}, \text{-CH-(CH}_2\text{-OH)}_2, \text{or-C-(CH}_2\text{-OH)}_3\);

R₂ is an alkyl group having 1 to 6 carbons, preferably an alkyl group having 1, 2, 3, 4, 5, or 6 carbons, more preferably methyl;

R₃ may be the same or different than R₂ and is an alkyl group having 1 to 10 carbons, more preferably an alkyl group having 1, 2, 3, 4, 5, 6, 7, 8, 9, or 10 carbons or a hydroxy alkyl group comprising n number of carbons wherein n is an integer from 1 to 10 and n - 1 hydroxyl groups, more preferably a hydroxy alkyl group having the following structure:
-CH₂-CH₂-OH; -CH-(CH₂-OH)₂; or -C-(CH₂-OH)₃ with the proviso that R₁ is not the same as Rᵢ; and
X is an anion, preferably a halide, sulfate, phosphate, carbonate, or hydroxide anion, most preferably chloride.

In a preferred embodiment of the present invention, R in the di-quaternary amine alcohol described herein above is -CH₃.

In a preferred embodiment of the present invention, R₁ in the di-quaternary amine alcohol described herein above is -CH₃.

In a preferred embodiment of the present invention, R₂ in the di-quaternary amine alcohol described herein above is -CH₂-CH₂-OH; -CH(CH₂-OH)₂; or -C(CH₂-OH)₃.

Preferably, the shale hydration inhibition compound of the present invention is 2-hydroxy-N¹-(2-hydroxyethyl)-N¹,N³,N³,N³-pentamethylpropane-1,3-diaminium chloride; N¹-(1,3-dihydroxypropan-2-yl)-2-hydroxy-N¹,N³,N³,N³-pentamethylpropane-1,3-diaminium chloride; or N¹-(1,3-dihydroxy-2-(hydroxymethyl)propan-2-yl)-2-hydroxy-N¹,N³,N³,N³-pentamethylpropane-1,3-diaminium chloride.

The aqueous based drilling fluid described herein above may optionally further comprise one or more of a fluid loss control agent, a weighting material, a viscosifying agent, a dispersant, a lubricant, a corrosion inhibitor, a defoamer, salts, or a surfactant.

The aqueous phase of the aqueous based drilling fluid described herein above preferably is fresh water, sea water, brine, mixtures of water and water soluble organic compounds, or mixtures thereof.

**DETAILED DESCRIPTION OF THE INVENTION**

The present invention is directed to a water-based drilling fluid for use in drilling wells through a formation containing a clay or shale which is unstable (sometimes referred to as reactive clay or shale material) and for example may swell, in the presence of water. Generally the drilling fluid of the present invention includes a shale hydration inhibition agent and an aqueous continuous phase. As disclosed below, the drilling fluids of the
present invention may also include additional components, such as a weight material, fluid loss control agents, bridging agents, lubricants, anti-bit balling agents, corrosion inhibition agents, salts, surfactants and suspending agents and the like which may be added to an aqueous based drilling fluid.

During the drilling of wells, a drilling fluid is circulated down the drill string, through the drill bit and back to the surface for reconditioning and reuse. The drilling fluid suspends the drill cuttings originating from the drilling process and transports the cuttings to the surface. At the same time the drilling fluid cools and cleans the drill bit, reduces the friction between the drill pipe and the borehole walls and stabilizes the sections of the well that are prone to collapse.

Normally the drilling fluids form a filter cake of low permeability which prevents leaking into the surrounding geological formations and avoids excessive losses of the liquid phase of the drilling fluid itself. Drilling fluids can be classified according to the nature of their continuous liquid phase. There are oil-based drilling fluids, sometimes referred to as oil-based muds (OBM), in which the solids are suspended in a continuous oleaginous phase and optionally water or a brine phase is emulsified into the oleaginous phase. Alternatively, water-based drilling fluids, sometimes referred to as water-based muds (WBM), contain solids suspended in water or brine or solutions of silicates.

Various chemicals can be added, deliberately or not, to water-based drilling fluids:

A) organic polymers or clays, used to impart viscosity and fluid loss reduction; B) insoluble inorganic minerals to increase the fluid density; and/or C) solids that originate from the drilling process. The solids, which disperse into the fluid, include cuttings from the drilling operation and from the unstable geological surrounding formations.

When the drilling operation encounters swellable or reactive clay-like materials, they can compromise drilling time and increase costs. There are different kinds of clays and shale that swell, disperse, and/or migrate and they can cause numerous operational problems. For the purposes of this application, the term "clay" is defined as a variety of phyllosilicate minerals rich in silicon and aluminum oxides and hydroxides which include variable amounts of structural water, illustratively including kaolinite, bentonite, dickite, halloysite, chrysotile, lizardite, amesite, talc, montmorillonite, beidellite, saponite, hectorite, sauconite, vermiculite, muscovite, paragonite, phlogopite, biotite, lepidolite, margarite, clintonite, anandite, donbassite, cookeite, sudoite, clinoclilore, chamosite, nimite, hydrotalcite, meixnerite, stevensite, nontronite, nacrite, hydrobiotite, glauconite, illite,
bramallite, chlorite, attapulgite and sepiolite. The clay content of the formations can be comprised substantially of a single species of clay mineral, or of several species, including the mixed layer types of clay.

Also, for the purposes of this application, the term "shale" is defined to mean a fine-grained sedimentary rock formed by the consolidation of clay, silt, or mud. It is characterized by a finely laminated structure which imparts fissures parallel to the bedding along which the rock may easily break. As used herein, the term "shale" is also defined to mean materials that may "swell" or increase in volume or disperse or migrate, when exposed to water. Reactive shale may be problematic during drilling operations because of, inter alia, their tendency to degrade when exposed to aqueous media such as aqueous-based drilling fluids. This degradation, of which swelling is one example, can result in undesirable drilling conditions and undesirable interference with the drilling fluid. For instance, the degradation of the shale may interfere with attempts to maintain the integrity of drilled cuttings traveling up the well-bore until such time as the cuttings can be removed by solids control equipment located at the surface.

Further, for the purpose of this application, the term "shale hydration inhibition agent" refers to an agent that positively affects (e.g., reduces) the reactivity of a reactive clay or shale by reducing one or more of the amount of swelling, dispersing, migration, swelling-induced migration, and the like when in the presence of water.

The swelling increases the friction between the drill pipe and the borehole walls, causes drilling fluid losses and sticking between the drill pipe and the borehole walls. Other forms of shale instability, such as dispersing, migration, swelling-induced migration, and the like, further adversely impact drilling operations. For this reason the development of swelling inhibitors for clays and shale is important for the oil and gas industry. The invention works in this direction to solve these problems.

Water-based drilling fluids comprising the shale hydration inhibition agent of the present invention have been revealed to be excellent shale hydration inhibitors for the petroleum industry, being able to effectively inhibit clay and shale swelling in drilling processes and subterranean formations. WO 2008/112481 disclosed the use of di-quaternary amine alcohols as shale hydration inhibition agents. Quaternary amine alcohol compounds and methods to make said compounds are well known, for example see WO 2008/058111 and USP 7,541,496 and 6,177,577, both of which are incorporated by reference herein in its entirety. Surprisingly, we found that certain di-quaternary amine
alcohol compounds demonstrate unexpected and improved performance as shale hydration inhibition agents as compared to the broad teachings found in WO 2008/112481.

Shale hydration inhibition agents of the present invention are quaternary amine alcohol compounds having the following formula:

\[
\begin{array}{c}
\text{N}^+ \\
\text{R}_1 \\
\text{R}_2 \\
\text{R}_3 \\
\text{OH} \\
\text{N}^+ \\
\end{array}
\]

wherein

- \( R \) is an alkyl group having 1 to 6 carbons, preferably an alkyl group having 1, 2, 3, 4, 5, or 6 carbons, more preferably methyl;
- \( R_1 \) may be the same or different than \( R \) and is an alkyl group having 1 to 10 carbons, more preferably an alkyl group having 1, 2, 3, 4, 5, 6, 7, 8, 9, or 10 carbons; or a hydroxy alkyl group comprising \( n \) number of carbons wherein \( n \) is an integer from 1 to 10 and \( m \) hydroxyl groups wherein \( m \) is an integer from 1 to 5, preferably a hydroxy alkyl group having the following structure: \(-\text{CH}_2\text{-CH}_2\text{-CH}_2\text{-OH}, -\text{CH}_2\text{-CH}_2\text{-OH}_2\), or \(-\text{C}\text{-CH}_2\text{-CH}_2\text{-OH}_3\); more preferably a hydroxy alkyl group comprising \( n \) number of carbons wherein \( n \) is an integer from 1 to 10 and \( n - 2 \) hydroxyl groups, more preferably a hydroxy alkyl group having the following structure: \(-\text{CH}_2\text{-CH}_2\text{-OH}, -\text{CH}_2\text{-CH}_2\text{-OH}_2\); or \(-\text{CH}_2\text{-C}\text{-CH}_2\text{-OH}_3\); more preferably a hydroxy alkyl group comprising \( n \) number of carbons wherein \( n \) is an integer from 1 to 10 and \( n - 1 \) hydroxyl groups, most preferably a hydroxy alkyl group having the following structure: \(-\text{CH}_2\text{-CH}_2\text{-OH}, -\text{CH}_2\text{-CH}_2\text{-OH}_2\); or \(-\text{C}\text{-CH}_2\text{-OH}_3\);
- \( R_2 \) is an alkyl group having 1 to 6 carbons, preferably an alkyl group having 1, 2, 3, 4, 5, or 6 carbons, more preferably methyl;
- \( R_3 \) may be the same or different than \( R_2 \) and is an alkyl group having 1 to 10 carbons, more preferably an alkyl group having 1, 2, 3, 4, 5, 6, 7, 8, 9, or 10 carbons or a hydroxy alkyl group comprising \( n \) number of carbons wherein \( n \) is an integer from 1 to 10 and \( n - 1 \) hydroxyl groups, more preferably a hydroxy alkyl group having the following structure: \(-\text{CH}_2\text{-CH}_2\text{-OH}, -\text{CH}_2\text{-CH}_2\text{-OH}_2\); or \(-\text{C}\text{-CH}_2\text{-OH}_3\) with the proviso that \( R_3 \) is not the same as \( R_i \); and
- \( X \) is an anion, preferably a halide, sulfate, phosphate, carbonate, or hydroxide anion, most preferably chloride.
Preferably, the shale hydration inhibition compound of the present invention is a diquaternary amine alcohol compound wherein:

\[ R \text{ is CH}_3; \]
\[ R_1 \text{ is CH}_3; \]
\[ R_2 \text{ is CH}_3; \]
\[ R_3 \text{ is CH}_2\text{CH}_2\text{OH}; \]
and
\[ X \text{ is CI}. \]

Preferably, the shale hydration inhibition compound of the present invention is a diquaternary amine alcohol compound wherein:

\[ R \text{ is CH}_3; \]
\[ R_1 \text{ is CH}_3; \]
\[ R_2 \text{ is CH}_3; \]
\[ R_3 \text{ is CH}(\text{CH}_2\text{OH})_2; \]
and
\[ X \text{ is CI}. \]

Preferably, the shale hydration inhibition compound of the present invention is a diquaternary amine alcohol compound wherein:

\[ R \text{ is CH}_3; \]
\[ R_1 \text{ is CH}_3; \]
\[ R_2 \text{ is CH}_3; \]
\[ R_3 \text{ is C(CH}_2\text{OH})_3; \]
and
\[ X \text{ is CI}. \]

Preferably, the shale hydration inhibition compound of the present invention is 2-hydroxy-N\(^1\)-(2-hydroxyethyl)-N\(^1\),N\(^3\),N\(^3\),N\(^3\),N\(^3\)-pentamethylpropane-1,3-diaminium chloride; N\(^1\)-(1,3-dihydroxypropan-2-yl)-2-hydroxy-N\(^1\),N\(^3\),N\(^3\),N\(^3\)-pentamethylpropane-1,3-diaminium chloride; or N\(^1\)-(1,3-dihydroxy-2-(hydroxymethyl)propan-2-yl)-2-hydroxy-N\(^1\),N\(^1\),N\(^3\),N\(^3\),N\(^3\)-pentamethylpropane-1,3-diaminium chloride.

The shale hydration inhibition agent should be present in sufficient concentration to reduce either or both the surface hydration based swelling and/or the osmotic based swelling of the clay or shale. The exact amount of the shale hydration inhibition agent present in a particular drilling fluid formulation can be determined by a trial and error method of testing.
The combination of drilling fluid and shale formation encountered. Generally however, the shale hydration inhibition agent of the present invention may be used in drilling fluids in a concentration from about 1 to about 18 pounds per barrel (lbs/bbl or ppb) and more preferably in a concentration from about 2 to about 12 pounds per barrel of drilling fluid.

The aqueous based drilling mud contains an aqueous based continuous phase and may contain one or more of normally used additives well known by those skilled in the art, such as fluid loss control agents, weighting materials, viscosifying agents, dispersants, lubricants, corrosion inhibitors, defoamers and surfactants. Useful fluid loss control agents are organic polymers, starches, and mixtures thereof. Useful weighting materials may be selected from: barite, hematite, iron oxide, calcium carbonate, magnesium carbonate, magnesium organic and inorganic salts, calcium chloride, calcium bromide, magnesium chloride, zinc halides, alkali metal formates, alkali metal nitrates and combinations thereof.

The aqueous based continuous phase may generally be any water based fluid phase that is compatible with the formulation of a drilling fluid and is compatible with the shale hydration inhibition agents disclosed herein. In one preferred embodiment, the aqueous based continuous phase is selected from: fresh water, sea water, brine, mixtures of water and water soluble organic compounds, and mixtures thereof. The amount of the aqueous based continuous phase should be sufficient to form a water based drilling fluid. This amount may range from nearly 100 per cent of the drilling fluid to less than 30 percent of the drilling fluid by volume. Preferably, the aqueous based continuous phase is from about 95 percent to about 30 percent by volume and preferably from about 90 percent to about 40 percent by volume of the drilling fluid.

EXAMPLES

Synthesis of di-quaternary amine alcohols

Comparative Example A. 1,3-Bis(trimethylammonium chloride)-2-hydroxypropane:

39.66 g 3-chloro-2-hydroxypropyltrimethylammonium chloride (0.21 mole) is added to a 500 mL round bottom flask equipped with a stir bar, condenser, and thermometer. 180 mL of 25% trimethylamine (0.71 mole) is added to the reactor and the stirrer is started. The reaction is allowed to proceed for 3 hours with temperatures fluctuating between 30 and 60°C. The solution is then kept at 60°C overnight to remove the unreacted trimethylamine. The next morning a nitrogen sparge is placed in the reactor for one hour to assist in
removing the residual trimethylamine. The solution is then placed on a rotovap with a water bath of 75°C and a vacuum pump at 30 in of Hg. The solid precipitate that formed is redissolved in methanol and that is then rotovapped off. The solid is then placed in a 60°C oven overnight to dry. The isolated product has the following structure:

\[
\begin{align*}
\text{N}^+ \text{Cl} \quad \text{OH} \quad \text{N}^+ \text{Cl}
\end{align*}
\]

with the following \(^{13}\)C NMR spectra acquired from a Bruker 300 MHz spectrometer (samples prepared as -30 wt% in D\(_2\)O) confirmed the title compound: DEPT NMR (250 MHz, D\(_2\)O) 54.4, 61.9, 67.5.

**Example 1.** 2-hydroxy-N\(^1\)-(2-hydroxyethyl)-N\(^1\),N\(^2\),N\(^3\),N\(^3\)-pentamethylypropane-1,3-diaminium chloride:

102.86 g of 69% 3-chloro-2-hydroxypropyltrimethylammonium chloride (0.377 mole) is added to a 500 mL jacketed round bottom flask equipped with a stir bar, condenser, thermometer, and pH probe. The pH is increased from 5 to 11.25 using a 20% solution of sodium hydroxide; 73.76 g of sodium hydroxide is added. The reaction temperature is 19°C after the addition of sodium hydroxide. 35 mL of dimethylethanolamine (0.348 mole) is added to an addition funnel. The dimethylethanolamine is added drop wise to the quat epoxide solution; the pH is maintained between 11-12 during the dimethylethanolamine addition by the addition of concentrated HCl. After the dimethylethanolamine is added the reactor jacket solution temperature is set to 52°C and the reaction solution is allowed to stir for three days. The reaction solution is taken out of the reactor and the pH is adjusted from II. 4 to 6.0 using concentrated HCl. The solution is placed on a rotovap with a bath temperature of 66°C and a reduced pressure of greater than 29 in of Hg for one hour. The solution became very thick but did not precipitate. Isopropanol is added to the viscous reaction solution and then rotovapped again. The rotovapped solution is placed in an ice bath where the solid product then precipitated. The solid is filtered using Whatman 42 filter paper under partial vacuum and a nitrogen pad. The isolated product has the following structure:
with the following $^{13}$C NMR spectra acquired from a Bruker 300 MHz spectrometer
(samples prepared as -30 wt% in D$_2$O) confirmed the title compound: DEPT NMR
(250 MHz, D$_2$O) 39.4, 54.3, 54.6, 58.7, 61.9, 67.6, 73.5.

Example 2. N$^1$-(1,3-dihydroxy-2-(hydroxymethyl)propan-2-yl)-2-hydroxy-
N$^1$,N$^3$,N$^3$,N$^3$-,pentamethylpropane-1,3-diaminium chloride:

In a 2 L reactor system, 559.11 g of 3-chloro-2-hydroxypropyltrimethylammonium
chloride (Quat 188, 69.19 wt%, 2.06 mole) is added and brought to 15°C. Sodium
hydroxide, 163.43 g of 50.1 wt%, is added over 30 minutes to the reaction solution; the pH
is 12.4. 422.97 g of 60% 2-(dimethylamino)-2-(hydroxymethyl)propane-1,3-diol
(1.70 mole) is added while the reaction is stirring. 5.56 g of sodium hydroxide, 50.1 wt%,
is added. The reaction temperature is increased to 25°C and maintained for one hour. The
reaction temperature is increased to 50°C and maintained for 3.5 hours. The temperature is
decreased to ambient and the solution is stirred for 16 hours. Concentrated hydrochloric
acid is added to reduce the pH from 12.8 to 6.4. 71.66 g of distilled water is added to the
solution. The solution is filtered through Whatman 42 filter paper using a Buchner funnel
and partial vacuum. The isolated product has the following structure:

\[
\text{HO} \quad \text{OH} \quad \text{N}^+ \quad \text{Cl}^- \quad \text{OH} \quad \text{OH} \quad \text{Cl}^- \quad \text{N}^+ \quad \text{Cl}^- \\
\text{HO} \quad \text{OH} \quad \text{N}^+ \quad \text{Cl}^- \quad \text{OH} \quad \text{OH} \quad \text{Cl}^- \quad \text{N}^+ \quad \text{Cl}^- 
\]

Shale inhibition tests

Examples 3 and 4 are di-quaternary amine alcohol shale inhibitors of the present
invention (Examples 1 and 2) tested on a base sample of mud material. The base sample of
mud material comprises fresh water (348 ml), xanthan polymer (1.2 pound per barrel (ppb)),
polyanionic cellulose (1.5 ppb), an amount of sodium hydroxide to provide a pH of 10. 50 g
of 2 to 4 mm sized London clay cuttings (from an outcrop in the UK), and 350 ml of water to generate one barrel equivalent (i.e., 1 g per 350 ml = 1 pound per barrel (ppb)) of base mud. Four percent of a given di-quaternary amine alcohol shale inhibitor is added to a bottle containing a sample of the well-bore material. Comparative Example B is the base sample of mud material with no shale inhibitor added and Comparative Example C comprises 4 percent of a quaternary amine alcohol shale inhibitor which is not an example of the present invention (Comparative Example A). Percent are based on weight of the total composition.

Cutting Recovery Test.

The bottles are capped and rolled at 185°F for 16 hours. After rolling, the bottles are cooled to ambient temperature (68°F to 77°F), and the cuttings are carefully poured onto a 2 mm sieve and gently washed with fresh water. The cuttings are blotted dry and placed in a tared boat, and the wet mass measured ("water content weight"). The cuttings are then dried overnight, and the dry mass content is measured ("recovery weight"): 

\[
\text{recovery weight/water content weight} \times 100 = \text{percent recovery.}
\]

Cutting Hardness Test.

Using the same procedure described above, but with a duplicate set of bottles, the cuttings isolated just before oven drying are transferred to a hardness tester, and the amount of torque (pound force-inch (lbf-in)) needed to extrude the cuttings through small apertures located in the bottom of the test cell is recorded for every full rotation. The hardness tester used is custom built, but such devices are well known, for example see: Aston, M. S.; Elliot, G. P. Water-Based Glycol Drilling Muds: Shale Inhibition Mechanisms, Paper 28818; Presented at the SPE European Petroleum Conference, London, 25-27 October 1994 and Patel, A. D. Design and Development of Quaternary Amine Compounds: Shale Inhibition with Improved Environmental Profile, Paper 121737; Presented at the SPE International Symposium on Oilfield Chemistry, The Woodlands, 20-22 April 2009. The maximum gauge reading of the hardness tester is 300 lbf-in. Hardness values reported in Table 1 are reported as the maximum torque (max. torque) reached and the number of turns required to reach the maximum torque.

The cutting recovery, hardness performance, and water content for Comparative Examples B and C and Examples 3 and 4 are summarized in Table 1. Additives which are
able to maintain shale hardness, and thus, provide greater resistance to extrusion are favored. Higher recovery means that the shale is rendered less reactive (e.g. dispersive) and more stable. More resistance, or recovery, means that the integrity or strength of the shale has been better preserved when exposed to the drilling fluid. Water content is determined by comparing the wet mass with the dry mass.

CLAIMS:

1. An aqueous based drilling fluid composition comprising:
   i) an aqueous based continuous phase;
   ii) a reactive clay or shale material;
   and
   iii) a shale hydration inhibition agent having the formula:

\[
\begin{align*}
R \text{ is an alkyl group having 1 to 6 carbons;}
R_i \text{ may be the same or different than } R \text{ and is an alkyl group having 1 to 10 carbons or a hydroxy alkyl group comprising } n \text{ number of carbons wherein } n \text{ is an integer from 1 to 10 and } n-1 \text{ hydroxyl groups;}
R_2 \text{ is an alkyl group having 1 to 6 carbons;}
R_3 \text{ may be the same or different than } R_2 \text{ and is an alkyl group having 1 to 10 carbons or a hydroxy alkyl group comprising } n \text{ number of carbons wherein } n \text{ is an integer from 1 to 10 and } n-1 \text{ hydroxyl groups, with the proviso that } R_3 \text{ is not the same as } R_i; \text{ and}
X \text{ is an anion;}
\end{align*}
\]

wherein the shale hydration inhibition agent is present in sufficient concentration to reduce the reactivity of the clay or shale.

2. The composition of Claim 1 wherein:
   R is -CH\(_3\);
   R\(_i\) is -CH\(_3\);
   R\(_2\) is -CH\(_3\);
   R\(_3\) is -CH\(_2\)CH\(_2\)OH; -CH(CH\(_2\)OH)\(_2\); or -C(CH\(_2\)OH)\(_3\);
   and
   X is chloride.

3. The composition of Claim 1 wherein the shale inhibition agent is 2-hydroxy-N\(_1\)-(2-hydroxyethyl)-N\(_1\),N\(_3\),N\(_3\),N\(_3\)-pentamethy propane-1,3-diaminium chloride; N\(_1\)-(1,3-dihydroxypropan-2-yl)-2-hydroxy-N\(_1\),N\(_1\),N\(_3\),N\(_3\),N\(_3\)
pentamethylpropane-1,3-diaminium chloride; or N\textsubscript{1}-(1,3-dihydroxy-2-(hydroxymethyl)propan-2-yl)-2-hydroxy-N\textsubscript{1},N\textsubscript{1},N\textsubscript{3},N\textsubscript{3}-pentamethylpropane-1,3-diaminium chloride.

4. The composition of Claim 1 further comprising one or more of a fluid loss control agent, a weighting material, a viscosifying agent, a dispersant, a lubricant, a corrosion inhibitor, a defoamer, or a surfactant.

5. The composition of Claim 1 wherein the aqueous based continuous phase is fresh water, sea water, brine, mixtures of water and water soluble organic compounds, or mixtures thereof.

6. A method for reducing the reactivity of clays and shale in drilling operations comprising the use of an aqueous based drilling fluid comprising a shale hydration inhibition agent having the following formula:

\[ R_{i} R_{i} R_{3} \begin{array}{c} N' \end{array} OH \begin{array}{c} X \end{array} R_{1} R_{1} X R \]

R is an alkyl group having 1 to 6 carbons; 
R\textsubscript{i} may be the same or different than R and is an alkyl group having 1 to 10 carbons or a hydroxy alkyl group comprising n number of carbons wherein n is an integer from 1 to 10 and n - 1 hydroxy groups; 
R\textsubscript{2} is an alkyl group having 1 to 6 carbons; 
R\textsubscript{3} may be the same or different than R\textsubscript{2} and is an alkyl group having 1 to 10 carbons or a hydroxy alkyl group comprising n number of carbons wherein n is an integer from 1 to 10 and n - 1 hydroxy groups, with the proviso that R\textsubscript{3} is not the same as R\textsubscript{i}; and 
X is an anion, preferably a halide, sulfate, phosphate, carbonate, or hydroxide anion, most preferably chloride. 
wherein the shale hydration inhibition agent is present in sufficient concentration to reduce the reactivity of the clay or shale.

7. The method of Claim 6 wherein:
R is -CH\textsubscript{3}; 
R\textsubscript{i} is -CH\textsubscript{3}.
R₂ is -CH₃;
R₃ is -CH₂CH₂OH; -CH(CH₂OH)₂; or -C(CH₂OH)₃;
and
X is chloride.

8. The method of Claim 6 wherein the shale inhibition agent is 2-hydroxy-N¹-(2-
hydroxyethyl)-N¹,N¹,N³,N³,N³-pentamethylpropane-1,3-diaminium chloride; N¹-
(l,3-dihydroxypropan-2-yl)-2-hydroxy-N¹,N¹,N³,N³,N³-pentamethylpropane-1,3-
diaminium chloride; or N¹-(1,3-dihydroxy-2-(hydroxymethyl)propan-2-yl)-2-
hydroxy-N¹,N¹,N³,N³,N³-pentamethylpropane-1,3-diaminium chloride.

9. The method of Claim 6 further comprising one or more of a fluid loss control
agent, a weighting material, a viscosifying agent, a dispersant, a lubricant, a
corrosion inhibitor, a salt, a defoamer, or a surfactant.

10. The method of Claim 6 wherein the aqueous based continuous phase is fresh
water, sea water, brine, mixtures of water and water soluble organic compounds,
or mixtures thereof.
INTERNATIONAL SEARCH REPORT

A. CLASSIFICATION OF SUBJECT MATTER
INV. C09K8/22
ADD.

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbol)
C09K

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)
EPO-Internal, WPI Data

C. DOCUMENTS CONSIDERED TO BE RELEVANT

* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance
"E" earlier application or patent but published on or after the international filing date
"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
"O" document referring to an oral disclosure, use, exhibition or other means
"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
"X" document of particular relevance: the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
"Y" document of particular relevance: the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

"A" document member of the same patent family

Date of the actual completion of the international search
20 August 2013
