Title: STEROID DERIVATIVES ACTING AS GLUCOCORTICOSTEROID RECEPTOR AGONISTS

Abstract: The present invention provides compounds of formula (I) wherein n, p, R1, R2, X1, X2, X3, R5, R6, R7 and R8 are as defined in the specification, a process for their preparation, pharmaceutical compositions containing them and their use in therapy.
Steroid derivatives acting as glucocorticosteroid receptor agonists

The present invention relates to compounds having glucocorticosteroid receptor agonist activity, processes for their preparation, pharmaceutical compositions containing them and their therapeutic use, particularly for the treatment of inflammatory and allergic conditions.

Glucocorticosteroids (GCs) that have anti-inflammatory properties are known and are widely used for the treatment of diseases such as inflammatory arthritides (e.g. rheumatoid arthritis, ankylosing spondylitis and psoriatic arthropathy), other rheumatoid diseases such as systemic lupus erythematosus, scleroderma, vasculitides including temporal arteritis and polyarteritis nodosa, inflammatory bowel disease such as Crohn's disease and ulcerative colitis, lung diseases such as asthma and chronic obstructive airways disease, as well as many other conditions such as polymyalgia rheumatica. GCs have also been used very extensively for their immunosuppressive properties in the prevention and treatment of transplant rejection. Finally GCs have been used for their anti-tumour effects in a number of malignancies.

GCs act via specific glucocorticoid receptors (GR) that are members of the nuclear receptor superfamily. Ligand binding promotes receptor dimerisation, DNA binding, and transcriptional activation. This mechanism of GC action is well defined in vitro and is critical for regulation of the hypothalamic-pituitary-adrenal axis, gluconeogenesis as well as transcription of anti-inflammatory genes such as mitogen-activated protein kinase phosphatase-1 (MKP-I) and secretory leukocyte protease inhibitor (SLPI) in vivo. Ligand-bound receptor is also able to suppress gene transcription in a dimerisation-independent manner by interfering with the activity of transcription factors, such as AP-I and NFkB, which are critically involved in the inflammatory reaction.

After ligand binding, the GR translocates from the cytoplasm of the cell to the nucleus and binds to glucocorticoid response elements in regulator regions of target genes. The activated GR then recruits co-factors, including the glucocorticoid receptor interacting
protein 1 (GRIP-I) and steroid receptor co-activator 1 (SRC1). These accessory proteins bind to the receptor and link the GR with the general transcription machinery to drive transcription of target genes.

Glucocorticoid effects on transcription may be mediated by both the direct binding of activated GR to target DNA, homodimerisation and recruitment of co-activators (known as "transactivation") but also by GR interfering with other transcription factor function, including AP-I and NFκB, by complexing with these other transcription factors and preventing them from binding to their target genes leading to repression of the genes normally upregulated by AP-I or NFκB (known as "transrepression"). These two modes of receptor activity are dissociable and negative effects on NFκB activity can be retained in the absence of transactivation. It appears that transrepression is largely responsible for mediating the therapeutically desirable anti-inflammatory activity of the GR. Interestingly, the IC50 for inhibition of AP-I or NFκB (0.04nM) is lower than the EC50 for activation of target genes (5nM) and yet high doses of GCs are frequently required to treat patients with inflammatory disease. One explanation is that cytokines expressed at the site of inflammation may induce relative glucocorticoid resistance, for instance by activating AP-I or NFκB. This is of importance as many pro-inflammatory cytokines signal by activation of NFκB and a major anti-inflammatory action of GCs is thought to be mediated by opposing NFκB action.

It has now surprisingly been found a new series of glucocorticosteroids having a long duration of action which have potential for once daily administration.

In accordance with the present invention, there is therefore provided a compound of formula
wherein

$X^1$, $X^2$, and $X^3$ each represent CH or, alternatively, one of $X^1$, $X^2$, and $X^3$ may additionally represent a nitrogen atom;

$n$ and $p$ each independently represent 0 or 1;

$R^1$ represents a halogen atom or a methyl or a methoxy group;

$R^2$ represents -CO2CH3, a halogen atom, or a methyl group optionally substituted by a hydroxy or a -NR7R8 group;

$R^3a$ represents a hydrogen atom and $R^3b$ represents a hydrogen or fluorine atom;

$R^4$ represents -C(O)CH2OH or -C(O)-Y-CH2R9;

$R^5$ and $R^6$ together with the carbon atoms to which they are attached form a 1,3-dioxolanyl group which is optionally substituted by at least one substituent selected from C1-C3 alkyl and C3-C8 cycloalkyl;

$R^7$ and $R^8$ each independently represent a hydrogen atom, or a C1-C3 alkyl or a Ci-C3 hydroxyalkyl group, or

$R^7$ and $R^8$ together with the nitrogen atom to which they are attached form a 3- to 8-membered saturated or partially saturated heterocyclic ring optionally containing a further ring heterogroup selected from nitrogen, S(O)m and oxygen, the heterocyclic ring being optionally substituted by at least one substituent selected from hydroxyl, C1-C3 alkyl and C1-C3 hydroxyalkyl;
m is 0, 1 or 2;

Y represents an oxygen or sulphur atom or a group >NH; and

R represents a hydrogen or a halogen atom or a methyl or a cyano group; or a pharmaceutically acceptable salt thereof.

In the context of the present specification, unless otherwise stated, an alkyl substituent group or an alkyl moiety in a substituent group may be linear or branched. Examples of C\textsubscript{1}-C\textsubscript{6} alkyl groups/moieties include methyl, ethyl, propyl, 2-methyl-1-propyl, 2-methyl-2-propyl, 2-methyl-1-butyl, 3-methyl-1-butyl, 2-methyl-3-butyl, 2,2-dimethyl-1-propyl, 2-methyl-pentyl, 3-methyl-1-pentyl, 4-methyl-1-pentyl, 2-methyl-2-pentyl, 2,2-dimethyl-1-butyl, 2-ethyl-1-butyl, n-butyl, isobutyl, tert-butyl, n-pentyl, isopentyl, neopentyl and n-hexyl. Similarly, an alkylene group/moiety may be linear or branched. Examples of C\textsubscript{i}-C\textsubscript{g} alkylene groups/moieties include methylene, ethylene, n-propylene, n-butylene, n-pentylene, n-hexylene, 1-methylethylene, 2-methylethylene, 1,2-dimethylethylene, 1-ethylethylene, 2-ethylethylene, 1-, 2- or 3-methylpropylene and 1-, 2- or 3-ethylpropylene. A Ci-C\textsubscript{6} hydroxyalkyl substituent group/moiety will comprise at least one hydroxyl group, e.g. one, two, three or four hydroxyl groups, examples of which include -CH\textsubscript{2}OH, -CH\textsubscript{2}CH\textsubscript{2}OH, -CH\textsubscript{2}CH\textsubscript{2}CH\textsubscript{2}OH and -CH(CH\textsubscript{2}OH\textsubscript{2}). For the avoidance of doubt, it should be understood that when R\textsuperscript{7} and R\textsuperscript{8} are defined as representing a heterocyclic ring, the definition is not intended to include unstable structures or any O-O, O-S or S-S bonds and that a substituent, if present, may be attached to any suitable ring atom.

When any chemical moiety or group in formula (I) is described as being optionally substituted, it will be appreciated that the moiety or group may be either unsubstituted or substituted by one or more of the specified substituents. It will be appreciated that the number and nature of substituents will be selected so as to avoid sterically undesirable combinations.
In formula (I), $X^1$, $X^2$ and $X^3$ each represent CH (so as to form a phenyl ring) or, alternatively, one of $X^1$, $X^2$ and $X^3$ may additionally represent a nitrogen atom (so as to form a pyridyl ring).

In an embodiment of the invention, $X^1$, $X^2$ and $X^3$ each represent CH.

In an embodiment of the invention n is 1 and p is 0 or 1.

$R^1$ represents a halogen atom (e.g. fluorine, chlorine, bromine or iodine) or a methyl or a methoxy group.

In an embodiment of the invention, $R^1$ represents a fluorine atom.

In another embodiment, when n is 1 and $X^3$ represents CH, $X^3$ is substituted by $R^1$.

$R^2$ represents $-\text{CO}_2\text{CH}_3$, a halogen atom (e.g. fluorine, chlorine, bromine or iodine) or a methyl group optionally substituted by a hydroxyl or a $-\text{NR}_7\text{R}_8$ group.

In one embodiment, $R^2$ represents $-\text{CO}_2\text{CH}_3$.

In another embodiment, $R^2$ represents a methyl group substituted by one hydroxyl group, i.e. $-\text{CH}_2\text{OH}$.

In a further embodiment, $R^2$ represents a methyl group substituted by one $-\text{NR}_7\text{R}_8$ group, i.e. $-\text{CH}_2\text{NR}_7\text{R}_8$. 
In a still further embodiment, $R^2$ represents a methyl group substituted by two hydroxyl groups or two $-\text{NR}^7 R^8$ groups or by one hydroxyl group and one $-\text{NR}^7 R^8$ group.

In an embodiment of the invention $R^{3a}$ and $R^{3b}$ each represent a hydrogen atom.

$R^4$ represents $-\text{C(O)}\text{CH}_2\text{OH}$ or $-\text{C(O)}-\text{Y-CH}_2 R^9$.

In an embodiment of the invention, $R^4$ represents $-\text{C(O)}\text{CH}_2\text{OH}$.

In another embodiment, $R^4$ represents $-\text{C(O)}-\text{Y-CH}_2 R^9$ where $Y$ represents an oxygen or sulphur atom and $R^9$ represents a hydrogen or a halogen (e.g. fluorine, chlorine, bromine or iodine) atom or a methyl or a cyano group.

In yet another embodiment, $R^4$ represents $-\text{C(O)}-\text{Y-CH}_2 R^9$ where $Y$ represents an oxygen or sulphur atom and $R^9$ represents a fluorine atom or a methyl or a cyano group. In a further aspect, $Y$ represents an oxygen or, particularly, sulphur atom and $R^9$ represents a cyano group.

$R^5$ and $R^6$ together with the carbon atoms to which they are attached form a 1,3-dioxolanyl group which is optionally substituted by at least one substituent (particularly one or two substituents independently) selected from Q-C3 alkyl (methyl, ethyl, n-propyl or isopropyl) and C3-C8 cycloalkyl (e.g. cyclopropyl, cyclobutyl, cyclopentyl or cyclohexyl).

In one aspect, $R^5$ and $R^6$ together with the carbon atoms to which they are attached form a 1,3-dioxolanyl group which is substituted by one or two C1-C3 alkyl groups.
In another aspect, $R^5$ and $R^6$ together with the carbon atoms to which they are attached form a 1,3-dioxolanyl group which is substituted by one or two methyl or n-propyl groups.

In still another aspect, $R^5$ and $R^6$ together with the carbon atoms to which they are attached form a 1,3-dioxolanyl group which is substituted by a C3-C8, preferably C3-C6, cycloalkyl group, in particular a cyclohexyl group.

The substituent(s) in the 1,3-dioxolanyl group is/are preferably attached at the 2-position, i.e., attached to the carbon atom between the two ring oxygen atoms.

$R^7$ and $R^8$ each independently represent a hydrogen atom, or a C1-C3 alkyl (methyl, ethyl, n-propyl or isopropyl) or a Q-C3 hydroxyalkyl (e.g. hydroxymethyl, -(CH2)2OH, -(CH2)3OH or -CH(CH2OH)2) group, or $R^7$ and $R^8$ together with the nitrogen atom to which they are attached form a 3- to 8-membered, preferably 5- to 6-membered, saturated or partially saturated heterocyclic ring optionally containing a further ring heterogroup selected from nitrogen, S(0)m and oxygen, the heterocyclic ring being optionally substituted by at least one substituent, e.g. one, two, three or four substituents independently, selected from hydroxyl, Q-C3 alkyl (methyl, ethyl, n-propyl or isopropyl) and C1-C3 hydroxyalkyl (e.g. hydroxymethyl, -(CH2)2OH, -(CH2)3OH or -CH(CH2OH)2).

Examples of 3- to 8-membered saturated or partially saturated heterocyclic rings include morpholine, azetidine, pyrrolidine, piperidine, piperazine, 3-pyrroline, isoindoline, tetrahydroquinoline and thiomorpholine.

In one embodiment, $R^7$ and $R^8$ each independently represent a hydrogen atom or a C1-C2 alkyl (particularly ethyl) or C2-C3 hydroxyalkyl group.
In another embodiment, \( R^7 \) and \( R^8 \) together with the nitrogen atom to which they are attached form a 5- to 6-membered saturated or partially saturated heterocyclic ring optionally containing a further ring heterogroup selected from nitrogen, \( S(O)_m \) and oxygen, the heterocyclic ring being optionally substituted by one or two substituents independently selected from hydroxyl, \( \text{C}_1\text{C}_3 \text{alkyl} \) and \( \text{C}_1\text{C}_3 \text{hydroxyalkyl} \).

In yet another embodiment, \( R^7 \) and \( R^8 \) together with the nitrogen atom to which they are attached form a 5- to 6-membered saturated heterocyclic ring optionally containing a further ring heterogroup selected from nitrogen, sulphur and oxygen (e.g. pyrrolidinyl, piperidinyl, piperazinyl, thiomorpholinyl or morpholinyl), the heterocyclic ring being optionally substituted by one or two substituents independently selected from hydroxyl, \( \text{C}_1\text{C}_3 \text{alkyl} \) and \( \text{C}_1\text{C}_3 \text{hydroxyalkyl} \).

In a still further embodiment, \( R^7 \) and \( R^8 \) together with the nitrogen atom to which they are attached form a 5- to 6-membered saturated heterocyclic ring optionally containing a further ring heterogroup selected from nitrogen, sulphur and oxygen, the heterocyclic ring being optionally substituted by one or two substituents independently selected from hydroxyl, methyl and hydroxymethyl.

In an embodiment of the invention, \( m \) is 0.

In an embodiment of the invention, \( Y \) represents a sulphur atom.

In an embodiment of the invention, \( R^9 \) represents a fluorine atom or a methyl or a cyano group.

In an embodiment of the invention,
\[
X^1, X^2 \text{ and } X^3 \text{ each represent CH;}
\]
\( n \) is 1:
p is 0 or 1;
R represents a fluorine atom;
2
R represents -CO2CH3, or a methyl group optionally substituted by a hydroxyl or a
-NR7R8 group;
5
R3a and R3b each represent a hydrogen atom;
R4 represents -(O)CH2OH or -(O)-S-CH2CN;
R5 and R6 together with the carbon atoms to which they are attached form a 1,3-
dioxolanyl group which is optionally substituted by at least one substituent selected from
10 Ci-C3 alkyl and cyclohexyl;
R7 and R8 each independently represent a hydrogen atom, or a Ci-C3 alkyl or a
Ci-C3 hydroxy alkyl group, or
R7 and R8 together with the nitrogen atom to which they are attached form a 5- to 6-
membered saturated heterocyclic ring optionally containing a further ring heterogroup
selected from nitrogen, S(0)m and oxygen, the heterocyclic ring being optionally
substituted by at least one substituent selected from hydroxyl, methyl and
hydroxymethyl; and
m is o.

(4aR,4bS,5S,6aS,6bS,8R,9aR,10aS,10bS)-8-cyclohexyl-6b-(cyanomethylthiocarbonyl)-l-(4-fluorophenyl)-5-hydroxy-4a,6a-dimethyl-4a,4b,5,6,6a,9a,10,10a,10b,11,12-dodecahydro[1,3]dioxolol[3',4']cyclopenta[r,2':5,6]naphtho[1,2-f]indazol;

and pharmaceutically acceptable salts of any one thereof.
It should be noted that each of the chemical compounds listed above represents a particular and independent aspect of the invention.

The present invention further provides a process for the preparation of a compound of formula (I) or a pharmaceutically acceptable salt thereof as defined above which comprises reacting a compound of formula (II)

wherein $R^{3a}$, $R^{3b}$, $R^4$, $R^5$ and $R^6$ are as defined in formula (I), with a compound of formula (III) or an acid addition salt (e.g. hydrochloride salt) thereof

wherein $n$, $p$, $R^1$, $R^2$, $X^1$, $X^2$ and $X^3$ are as defined in formula (I), and optionally thereafter carrying out one or more of the following procedures:

- converting a compound of formula (I) into another compound of formula (I)
- removing any protecting groups
- forming a pharmaceutically acceptable salt.

The above process is conveniently carried out in the presence of an organic solvent such as acetic acid/water mixture at room temperature ($20^\circ C$) or, alternatively, in the presence of an organic solvent such as ethanol at a temperature in the range from room temperature ($20^\circ C$) to $90^\circ C$. Preferably, the reaction is carried out in the presence of a base, e.g. an alkali metal acetate such as potassium acetate.
The compounds of formula (II) may be prepared by reacting a compound of formula (IV)

![Chemical Structure](image)

wherein \( R^{3a}, R^{3b}, R^{4}, R^{5} \) and \( R^{6} \) are as defined in formula (II), with methyl or ethyl formate in the presence of a base such as sodium hydride, in a manner analogous to the method described in the journal article by Wuest, F et al, *Steroids*, 68 (2003), 177-191.

Compounds of formulae (III) and (IV) are either commercially available, are well known in the literature or may be prepared easily using known techniques.

It will be appreciated by those skilled in the art that in the processes of the present invention certain functional groups such as hydroxyl or amino groups in the reagents may need to be protected by protecting groups. Thus, the preparation of the compounds of formula (I) may involve, at an appropriate stage, the removal of one or more protecting groups.

The compounds of formula (I) above may be converted to a pharmaceutically acceptable salt thereof, preferably an acid addition salt such as a hydrochloride, hydrobromide, trifluoroacetate, sulphate, phosphate, acetate, fumarate, maleate, tartrate, lactate, citrate, pyruvate, succinate, oxalate, methanesulphonate or \( \alpha \)-toluenesulphonate.
The compounds of formula (I) and pharmaceutically acceptable salts thereof may exist in solvated, for example hydrated, as well as unsolvated forms, and the present invention encompasses all such solvated forms.

Compounds of formula (I) are capable of existing in stereoisomeric forms. It will be understood that the invention encompasses the use of all geometric and optical isomers (including atropisomers) of the compounds of formula (I) and mixtures thereof including racemates. The use of tautomers and mixtures thereof also form an aspect of the present invention. Enantiomerically pure forms are particularly desired.

The compounds of formula (I) and their pharmaceutically acceptable salts have activity as pharmaceuticals, in particular as modulators of glucocorticoid receptor activity, and thus may be used in the treatment of:

1. respiratory tract: obstructive diseases of the airways including: asthma, including bronchial, allergic, intrinsic, extrinsic, exercise-induced, drug-induced (including aspirin and NSAID-induced) and dust-induced asthma, both intermittent and persistent and of all severities, and other causes of airway hyper-responsiveness; chronic obstructive pulmonary disease (COPD); bronchitis, including infectious and eosinophilic bronchitis; emphysema; bronchiectasis; cystic fibrosis; sarcoidosis; farmer's lung and related diseases; hypersensitivity pneumonitis; lung fibrosis, including cryptogenic fibrosing alveolitis, idiopathic interstitial pneumonias, fibrosis complicating anti-neoplastic therapy and chronic infection, including tuberculosis and aspergillosis and other fungal infections; complications of lung transplantation; vasculitic and thrombotic disorders of the lung vasculature, and pulmonary hypertension; antitussive activity including treatment of chronic cough associated with inflammatory and secretory conditions of the airways, and iatrogenic cough; acute and chronic rhinitis including rhinitis medicamentosa, and vasomotor rhinitis; perennial and seasonal allergic rhinitis including rhinitis nervosa (hay fever); nasal polyposis; acute viral infection including the common cold, and infection due to respiratory syncytial virus, influenza, coronavirus (including SARS) and adenovirus;

2. skin: psoriasis, atopic dermatitis, contact dermatitis or other eczematous dermatoses, and delayed-type hypersensitivity reactions; phyto- and photodermatitis; seborrhoeic dermatitis, dermatitis herpetiformis, lichen planus, lichen sclerosus et atrophica, pyoderma
gangrenosum, skin sarcoid, discoid lupus erythematosus, pemphigus, pemphigoid, epidermolysis bullosa, urticaria, angioedema, vasculitides, toxic erythemas, cutaneous eosinophilias, alopecia areata, male-pattern baldness, Sweet's syndrome, Weber-Christian syndrome, erythema multiforme; cellulitis, both infective and non-infective; panniculitis; cutaneous lymphomas, non-melanoma skin cancer and other dysplastic lesions; drug-induced disorders including fixed drug eruptions; eyes: blepharitis; conjunctivitis, including perennial and vernal allergic conjunctivitis; iritis; anterior and posterior uveitis; choroiditis; autoimmune, degenerative or inflammatory disorders affecting the retina; ophthalmitis including sympathetic ophthalmitis; sarcoidosis; infections including viral, fungal, and bacterial; genitourinary: nephritis including interstitial and glomerulonephritis; nephrotic syndrome; cystitis including acute and chronic (interstitial) cystitis and Hunner's ulcer; acute and chronic urethritis, prostatitis, epididymitis, oophoritis and salpingitis; vulvo-vaginitis; Peyronie's disease; erectile dysfunction (both male and female); allograft rejection: acute and chronic following, for example, transplantation of kidney, heart, liver, lung, bone marrow, skin or cornea or following blood transfusion; or chronic graft versus host disease; other auto-immune and allergic disorders including rheumatoid arthritis, irritable bowel syndrome, systemic lupus erythematosus, multiple sclerosis, Hashimoto's thyroiditis, Graves' disease, Addison's disease, diabetes mellitus, idiopathic thrombocytopenic purpura, eosinophilic fasciitis, hyper-IgE syndrome, antiphospholipid syndrome and Sazary syndrome; oncology: treatment of common cancers including prostate, breast, lung, ovarian, pancreatic, bowel and colon, stomach, skin and brain tumors and malignancies affecting the bone marrow (including the leukaemias) and lymphoproliferative systems, such as Hodgkin's and non-Hodgkin's lymphoma; including the prevention and treatment of metastatic disease and tumour recurrences, and paraneoplastic syndromes; and, infectious diseases: virus diseases such as genital warts, common warts, plantar warts, hepatitis B, hepatitis C, herpes simplex virus, molluscum contagiosum, variola, human immunodeficiency virus (HIV), human papilloma virus (HPV), cytomegalovirus (CMV), varicella zoster virus (VZV), rhinovirus, adenovirus, coronavirus, influenza, para-influenza; bacterial diseases such as tuberculosis and mycobacterium avium, leprosy; other
infectious diseases, such as fungal diseases, chlamydia, Candida, aspergillus, cryptococcal meningitis, Pneumocystis carinii, cryptosporidiosis, histoplasmosis, toxoplasmosis, trypanosome infection and leishmaniasis.

Thus, the present invention provides a compound of formula (I) or a pharmaceutically acceptable salt thereof as hereinbefore defined for use in therapy.

In a further aspect, the present invention provides the use of a compound of formula (I) or a pharmaceutically acceptable salt thereof as hereinbefore defined in the manufacture of a medicament for use in therapy.

In the context of the present specification, the term "therapy" also includes "prophylaxis" unless there are specific indications to the contrary. The terms "therapeutic" and "therapeutically" should be construed accordingly.

Prophylaxis is expected to be particularly relevant to the treatment of persons who have suffered a previous episode of, or are otherwise considered to be at increased risk of, the disease or condition in question. Persons at risk of developing a particular disease or condition generally include those having a family history of the disease or condition, or those who have been identified by genetic testing or screening to be particularly susceptible to developing the disease or condition.

In particular, the compounds of the invention (including pharmaceutically acceptable salts) may be used in the treatment of asthma {such as bronchial, allergic, intrinsic, extrinsic or dust asthma, particularly chronic or inveterate asthma (for example late asthma or airways hyper-responsiveness)}, chronic obstructive pulmonary disease (COPD) or allergic rhinitis.

The invention also provides a method of treating, or reducing the risk of, an obstructive airways disease or condition (e.g. asthma or COPD) which comprises administering to a patient in need thereof a therapeutically effective amount of a compound of formula (I) or a pharmaceutically acceptable salt thereof as hereinbefore defined.
For the above-mentioned therapeutic uses the dosage administered will, of course, vary with the compound employed, the mode of administration, the treatment desired and the disorder indicated. For example, the daily dosage of the compound of the invention, if inhaled, may be in the range from 0.05 micrograms per kilogram body weight (µg/kg) to 100 micrograms per kilogram body weight (µg/kg). Alternatively, if the compound is administered orally, then the daily dosage of the compound of the invention may be in the range from 0.01 micrograms per kilogram body weight (µg/kg) to 100 milligrams per kilogram body weight (mg/kg).

The compounds of formula (I) and pharmaceutically acceptable salts thereof may be used on their own but will generally be administered in the form of a pharmaceutical composition in which the formula (I) compound/salt (active ingredient) is in association with a pharmaceutically acceptable adjuvant, diluent or carrier. Conventional procedures for the selection and preparation of suitable pharmaceutical formulations are described in, for example, "Pharmaceuticals - The Science of Dosage Form Designs", M. E. Aulton, Churchill Livingstone, 1988.

Depending on the mode of administration, the pharmaceutical composition will preferably comprise from 0.05 to 99 %w (per cent by weight), more preferably from 0.05 to 80 %w, still more preferably from 0.10 to 70 %w, and even more preferably from 0.10 to 50 %w, of active ingredient, all percentages by weight being based on total composition.

The present invention also provides a pharmaceutical composition comprising a compound of formula (I) or a pharmaceutically acceptable salt thereof as hereinbefore defined in association with a pharmaceutically acceptable adjuvant, diluent or carrier.

The invention further provides a process for the preparation of a pharmaceutical composition of the invention which comprises mixing a compound of formula (I) or a pharmaceutically acceptable salt thereof as hereinbefore defined with a pharmaceutically acceptable adjuvant, diluent or carrier.
The pharmaceutical compositions may be administered topically (e.g. to the skin or to the lung and/or airways) in the form, e.g., of creams, solutions, suspensions, heptafiuoroalkane (HFA) aerosols and dry powder formulations, for example, formulations in the inhaler device known as the Turbuhaler®, or systemically, e.g. by oral administration in the form of tablets, capsules, syrups, powders or granules; or by parenteral administration in the form of a sterile solution, suspension or emulsion for injection (including intravenous, subcutaneous, intramuscular, intravascular or infusion); or by rectal administration in the form of suppositories.

Dry powder formulations and pressurized HFA aerosols of the compounds of the invention (that is, compounds of formula (I) and pharmaceutically acceptable salts thereof) may be administered by oral or nasal inhalation. For inhalation, the compound is desirably finely divided. The finely divided compound preferably has a mass median diameter of less than 10 micrometres (µm), and may be suspended in a propellant mixture with the assistance of a dispersant, such as a Cg-C20 fatty acid or salt thereof, (for example, oleic acid), a bile salt, a phospholipid, an alkyl saccharide, a perfluorinated or polyethoxylated surfactant, or other pharmaceutically acceptable dispersant.

The compounds of the invention may also be administered by means of a dry powder inhaler. The inhaler may be a single or a multi dose inhaler, and may be a breath actuated dry powder inhaler.

One possibility is to mix the finely divided compound of the invention with a carrier substance, for example, a mono-, di- or polysaccharide, a sugar alcohol, or another polyol. Suitable carriers are sugars, for example, lactose, glucose, raffinose, melezitose, lactitol, maltitol, trehalose, sucrose, mannitol; and starch. Alternatively the finely divided compound may be coated by another substance. The powder mixture may also be dispensed into hard gelatine capsules, each containing the desired dose of the active compound.

Another possibility is to process the finely divided powder into spheres which break up during the inhalation procedure. This spheronized powder may be filled into the drug
reservoir of a multidose inhaler, for example, that known as the Turbuhaler® in which a
dosing unit meters the desired dose which is then inhaled by the patient. With this system
the active ingredient, with or without a carrier substance, is delivered to the patient.

For oral administration the compound of the invention may be admixed with an adjuvant or
a carrier, for example, lactose, saccharose, sorbitol, mannitol; a starch, for example, potato
starch, corn starch or amylopectin; a cellulose derivative; a binder, for example, gelatine or
polyvinylpyrrolidone; and/or a lubricant, for example, magnesium stearate, calcium
stearate, polyethylene glycol, a wax, paraffin, and the like, and then compressed into
tablets. If coated tablets are required, the cores, prepared as described above, may be
coated with a concentrated sugar solution which may contain, for example, gum arabic,
gelatine, talcum and titanium dioxide. Alternatively, the tablet may be coated with a
suitable polymer dissolved in a readily volatile organic solvent.

For the preparation of soft gelatine capsules, the compound of the invention may be
admixed with, for example, a vegetable oil or polyethylene glycol. Hard gelatine capsules
may contain granules of the compound using either the above-mentioned excipients for
tables. Also liquid or semisolid formulations of the compound of the invention may be
filled into hard gelatine capsules.

Liquid preparations for oral application may be in the form of syrups or suspensions, for
example, solutions containing the compound of the invention, the balance being sugar and
a mixture of ethanol, water, glycerol and propylene glycol. Optionally such liquid
preparations may contain colouring agents, flavouring agents, saccharine and/or
carboxymethylcellulose as a thickening agent or other excipients known to those skilled in
art.

The compounds of the invention (that is, compounds of formula (I) and pharmaceutically
acceptable salts thereof) may also be administered in conjunction with other compounds
used for the treatment of the above conditions.
The invention therefore further relates to combination therapies wherein a compound of the invention or a pharmaceutical composition or formulation comprising a compound of the invention is administered concurrently or sequentially or as a combined preparation with another therapeutic agent or agents, for the treatment of one or more of the conditions listed.

In particular, for the treatment of the inflammatory diseases such as (but not restricted to) rheumatoid arthritis, osteoarthritis, asthma, allergic rhinitis, chronic obstructive pulmonary disease (COPD), psoriasis, and inflammatory bowel disease, the compounds of the invention may be combined with the following agents: non-steroidal anti-inflammatory agents (hereinafter NSAIDs) including non-selective cyclo-oxygenase COX-1 / COX-2 inhibitors whether applied topically or systemically (such as piroxicam, diclofenac, propionic acids such as naproxen, flurbiprofen, fenoprofen, ketoprofen and ibuprofen, fenamates such as mefenamic acid, indomethacin, sulindac, azapropazone, pyrazolones such as phenylbutazone, salicylates such as aspirin); selective COX-2 inhibitors (such as meloxicam, celecoxib, rofecoxib, valdecoxib, lumarocoxib, parecoxib and etoricoxib); cyclo-oxygenase inhibiting nitric oxide donors (CINODs); glucocorticosteroids (whether administered by topical, oral, intramuscular, intravenous, or intra-articular routes); methotrexate; leflunomide; hydroxychloroquine; d-penicillamine; auranofin or other parenteral or oral gold preparations; analgesics; diacerein; intra-articular therapies such as hyaluronic acid derivatives; and nutritional supplements such as glucosamine.

The present invention still further relates to the combination of a compound of the invention together with a cytokine or agonist or antagonist of cytokine function, (including agents which act on cytokine signalling pathways such as modulators of the SOCS system) including alpha-, beta-, and gamma-interferons; insulin-like growth factor type I (IGF-I); interleukins (IL) including IL1 to 17, and interleukin antagonists or inhibitors such as anakinra; tumour necrosis factor alpha (TNF-α) inhibitors such as anti-TNF monoclonal antibodies (for example infliximab; adalimumab, and CDP-870) and TNF receptor antagonists including immunoglobulin molecules (such as etanercept) and low-molecular-weight agents such as pentoxyfylline.
In addition the invention relates to a combination of a compound of the invention with a monoclonal antibody targeting B-Lymphocytes (such as CD20 (rituximab), MRA-aIL16R and T-Lymphocytes, CTLA4-Ig, HuMax 11-15).

The present invention still further relates to the combination of a compound of the invention with a modulator of chemokine receptor function such as an antagonist of CCR1, CCR2, CCR2A, CCR2B, CCR3, CCR4, CCR5, CCR6, CCR7, CCR8, CCR9, CCR10 and CCR11 (for the C-C family); CXCR1, CXCR2, CXCR3, CXCR4 and CXCR5 (for the C-X-C family) and CX3CR1 for the C-X3-C family.

The present invention further relates to the combination of a compound of the invention and a leukotriene biosynthesis inhibitor, 5-lipoxygenase (5-LO) inhibitor or 5-lipoxygenase activating protein (FLAP) antagonist such as; zileuton; ABT-761; fenleuton; tepoxalin; Abbott-79175; Abbott-85761; aN-(5-substituted)-thiophene-2-alkylsulfonamide; 2,6-di-tert-butylphenolhydrazones; a methoxytetrahydropyrans such as Zeneca ZD-2138; the compound SB-210661; a pyridinyl-substituted 2-cyanonaphthalene compound such as L-739,010; a 2-cyanoquinoline compound such as L-746,530; or an indole or quinoline compound such as MK-591, MK-886, and BAY x 1005.

The present invention further relates to the combination of a compound of the invention and a receptor antagonist for leukotrienes (LT) B4, LTC4, LTD4, and LTE4 selected from the group consisting of the phenothiazin-3-1s such as L-651,392; amidino compounds such as CGS-25019c; benzoxalamines such as ontazolast; benzenecarboximidamides such as BIIL 284/260; and compounds such as zafirlukast, ablukast, montelukast, pranlukast, verlukast (MK-679), RG-12525, Ro-245913, iralukast (CGP 45715A), and BAY x 7195.
The present invention still further relates to the combination of a compound of the invention and a phosphodiesterase (PDE) inhibitor such as a methylxanthanine including theophylline and aminophylline; a selective PDE isoenzyme inhibitor including a PDE4 inhibitor an inhibitor of the isoform PDE4D, or an inhibitor of PDE5.

The present invention further relates to the combination of a compound of the invention and a histamine type 1 receptor antagonist such as cetirizine, loratadine, desloratadine, fexofenadine, acrivastine, terfenadine, astemizole, azelastine, levocabastine, chlorpheniramine, promethazine, cyclizine, or mizolastine; applied orally, topically or parenterally.

The present invention still further relates to the combination of a compound of the invention and a proton pump inhibitor (such as omeprazole) or a gastroprotective histamine type 2 receptor antagonist.

The present invention further relates to the combination of a compound of the invention and an antagonist of the histamine type 4 receptor.

The present invention still further relates to the combination of a compound of the invention and an alpha-1/alpha-2 adrenoceptor agonist vasoconstrictor sympathomimetic agent, such as propylhexedrine, phenylephrine, phenylpropanolamine, ephedrine, pseudoephedrine, naphazoline hydrochloride, oxymetazoline hydrochloride, tetrahydrozoline hydrochloride, xylometazoline hydrochloride, tramazoline hydrochloride or ethylnorepinephrine hydrochloride.

The present invention further relates to the combination of a compound of the invention and an anticholinergic agents including muscarinic receptor (M1, M2, and M3) antagonist such as atropine, hyoscine, glycopyrrolate, ipratropium bromide, tiotropium bromide, oxitropium bromide, pirenzepine or telenzepine.
The present invention still further relates to the combination of a compound of the invention and a beta-adrenoreceptor agonist (including beta receptor subtypes 1-4) such as isoprenaline, salbutamol, formoterol, salmeterol, terbutaline, orciprenaline, bitolterol mesylate, or pirbuterol, or a chiral enantiomer thereof.

The present invention further relates to the combination of a compound of the invention and a chromone, such as sodium cromoglycate or nedocromil sodium.

The present invention still further relates to the combination of a compound of the invention with an agent that modulates a nuclear hormone receptor such as PPARs.

The present invention further relates to the combination of a compound of the invention together with an immunoglobulin (Ig) or Ig preparation or an antagonist or antibody modulating Ig function such as anti-IgE (for example omalizumab).

The present invention further relates to the combination of a compound of the invention and another systemic or topically-applied anti-inflammatory agent, such as thalidomide or a derivative thereof, a retinoid, dithranol or calcipotriol.

The present invention still further relates to the combination of a compound of the invention and combinations of aminosalicylates and sulfapyridine such as sulfasalazine, mesalazine, balsalazide, and olsalazine; and immunomodulatory agents such as the thiopurines.

The present invention further relates to the combination of a compound of the invention together with an antibacterial agent such as a penicillin derivative, a tetracycline, a macrolide, a beta-lactam, a fluoroquinolone, metronidazole, an inhaled aminoglycoside; an
antiviral agent including acyclovir, famciclovir, valaciclovir, ganciclovir, cidofovir, amantadine, rimantadine, ribavirin, zanamivir and oseltamivir; a protease inhibitor such as indinavir, nelfinavir, ritonavir, and saquinavir; a nucleoside reverse transcriptase inhibitor such as didanosine, lamivudine, stavudine, zalcitabine or zidovudine; or a non-nucleoside reverse transcriptase inhibitor such as nevirapine or efavirenz.

The present invention still further relates to the combination of a compound of the invention and a cardiovascular agent such as a calcium channel blocker, a beta-adrenoceptor blocker, an angiotensin-converting enzyme (ACE) inhibitor, an angiotensin-2 receptor antagonist; a lipid lowering agent such as a statin or a fibrate; a modulator of blood cell morphology such as pentoxyfylline; thrombolytic, or an anticoagulant such as a platelet aggregation inhibitor.

The present invention further relates to the combination of a compound of the invention and a CNS agent such as an antidepressant (such as sertraline), an anti-Parkinsonian drug (such as deprenyl, L-dopa, ropinirole, pramipexole, a MAOB inhibitor such as selegine and rasagiline, a comP inhibitor such as tasmar, an A-2 inhibitor, a dopamine reuptake inhibitor, an NMDA antagonist, a nicotine agonist, a dopamine agonist or an inhibitor of neuronal nitric oxide synthase), or an anti-Alzheimer's drug such as donepezil, rivastigmine, tacrine, a COX-2 inhibitor, propentofylline or metrifonate.

The present invention still further relates to the combination of a compound of the invention and an agent for the treatment of acute or chronic pain, such as a centrally or peripherally-acting analgesic (for example an opioid or derivative thereof), carbamazepine, phenytoin, sodium valproate, amitryptiline or other anti-depressant agent-s, paracetamol, or a non-steroidal anti-inflammatory agent.

The present invention further relates to the combination of a compound of the invention together with a parenterally or topically-applied (including inhaled) local anaesthetic agent such as lignocaine or a derivative thereof.
A compound of the present invention can also be used in combination with an anti-osteoporosis agent including a hormonal agent such as raloxifene, or a biphosphonate such as alendronate.

The present invention still further relates to the combination of a compound of the invention together with a: (i) tryptase inhibitor; (ii) platelet activating factor (PAF) antagonist; (iii) interleukin converting enzyme (ICE) inhibitor; (iv) IMPDH inhibitor; (v) adhesion molecule inhibitors including VLA-4 antagonist; (vi) cathepsin; (vii) kinase inhibitor such as an inhibitor of tyrosine kinase (such as Btk, Itk, Jak3 or MAP, for example Gefitinib or Imatinib mesylate), a serine / threonine kinase (such as an inhibitor of a MAP kinase such as p38, JNK, protein kinase A, B or C, or IKK), or a kinase involved in cell cycle regulation (such as a cyclin dependent kinase); (viii) glucose-6 phosphate dehydrogenase inhibitor; (ix) kinin-B.subl. - or B.sub2. -receptor antagonist; (x) anti-gout agent, for example colchicine; (xi) xanthine oxidase inhibitor, for example allopurinol; (xii) uricosuric agent, for example probenecid, sulfipryrazone or benz bromarone; (xiii) growth hormone secretagogue; (xiv) transforming growth factor (TGFβ); (xv) platelet-derived growth factor (PDGF); (xvi) fibroblast growth factor for example basic fibroblast growth factor (bFGF); (xvii) granulocyte macrophage colony stimulating factor (GM-CSF); (xviii) capsaicin cream; (xix) tachykinin NK.sub1. or NK.sub3. receptor antagonist such as NKP-608C, SB-233412 (talnetant) or D-4418; (xx) elastase inhibitor such as UT-77 or ZD-0892; (xxi) TNF-alpha converting enzyme inhibitor (TACE); (xxii) induced nitric oxide synthase (iNOS) inhibitor; (xxiii) chemoattractant receptor-homologous molecule expressed on TH2 cells, (such as a CRTH2 antagonist); (xxiv) inhibitor of P38; (xxv) agent modulating the function of Toll-like receptors (TLR), (xxvi) agent modulating the activity of purinergic receptors such as P2X7; (xxvii) inhibitor of transcription factor activation such as NFkB, API, or STATS; or (xxviii) a glucocorticoid receptor agonist.

In a further aspect the present invention provides a combination (for example for the treatment of COPD, asthma or allergic rhinitis) of a compound of formula (I) or a pharmaceutically acceptable salt thereof as hereinbefore defined and one or more agents independently selected from:

- a non-steroidal glucocorticoid receptor (GR-receptor) agonist;
• a selective β2 adrenoceptor agonist (such as metaproterenol, isoproterenol, isoprenaline, albuterol, salbutamol, formoterol, salmeterol, terbutaline, orciprenaline, bitolterol mesylate, pirbuterol or indacaterol);
• a phosphodiesterase inhibitor (such as a PDE4 inhibitor);
• a protease inhibitor (such as a neutrophil elastase or matrix metalloprotease MMP-12 inhibitor);
• a glucocorticoid;
• an anticholinergic agent;
• a modulator of chemokine receptor function (such as a CCR1 receptor antagonist);
and
• an inhibitor of kinase function (such as the kinases p38 or IKK).

The invention also provides a pharmaceutical product comprising, in combination, a preparation of a first active ingredient which is a compound of formula (I) or a pharmaceutically acceptable salt thereof as hereinbefore defined, and a preparation of a second active ingredient which is
• a non-steroidal glucocorticoid receptor (GR-receptor) agonist;
• a selective β2 adrenoceptor agonist;
• a phosphodiesterase inhibitor;
• a protease inhibitor;
• a glucocorticoid;
• an anticholinergic agent;
• a modulator of chemokine receptor function; or
• an inhibitor of kinase function;
for simultaneous, sequential or separate use in therapy.

In another aspect, the invention provides a kit comprising a preparation of a first active ingredient which is a compound of formula (I) or a pharmaceutically acceptable salt thereof as hereinbefore defined, and a preparation of a second active ingredient which is
• a non-steroidal glucocorticoid receptor (GR-receptor) agonist;
• a selective β2 adrenoceptor agonist;
• a phosphodiesterase inhibitor;
• a protease inhibitor;
• a glucocorticoid;
• an anticholinergic agent;
• a modulator of chemokine receptor function; or
• an inhibitor of kinase function;

and instructions for the simultaneous, sequential or separate administration of the preparations to a patient in need thereof.

A compound of the invention can also be used in combination with an existing therapeutic agent for the treatment of cancer, for example suitable agents include:
(i) an antiproliferative/antineoplastic drug or a combination thereof, as used in medical oncology, such as an alkylating agent (for example cis-platin, carboplatin, cyclophosphamide, nitrogen mustard, melphalan, chlorambucil, busulphan or a nitrosourea); an antimetabolite (for example an antifolate such as a fluoropyrimidine like 5-fluorouracil or tegafur, raltitrexed, methotrexate, cytosine arabinoside, hydroxyurea, gemcitabine or paclitaxel); an antitumour antibiotic (for example an anthracycline such as adriamycin, bleomycin, doxorubicin, daunomycin, epirubicin, idarubicin, mitomycin-C, dactinomycin or mithramycin); an antimitotic agent (for example a vinca alkaloid such as vincristine, vinblastine, vindesine or vinorelbine, or a taxoid such as taxol or taxotere); or a topoisomerase inhibitor (for example an epipodophyllotoxin such as etoposide, teniposide, amsacrine, topotecan or a camptothecin);
(ii) a cytostatic agent such as an antioestrogen (for example tamoxifen, toremifene, raloxifene, droloxifene or iodoxyfene), an oestrogen receptor down regulator (for example fulvestrant), an antiandrogen (for example bicalutamide, flutamide, nilutamide or cyproterone acetate), a LHRH antagonist or LHRH agonist (for example goserelin, leuprorelin or buserelin), a progestogen (for example megestrol acetate), an aromatase inhibitor (for example as anastrozole, letrozole, vorazole or exemestane) or an inhibitor of 5α-reductase such as finasteride;
(iii) an agent which inhibits cancer cell invasion (for example a metalloproteinase inhibitor like marimastat or an inhibitor of urokinase plasminogen activator receptor function);
(iv) an inhibitor of growth factor function, for example: a growth factor antibody (for example the anti-erb2 antibody trastuzumab, or the anti-erbbl antibody cetuximab [C225]), a farnesyl transferase inhibitor, a tyrosine kinase inhibitor or a serine/threonine kinase inhibitor, an inhibitor of the epidermal growth factor family (for example an EGFR family tyrosine kinase inhibitor such as N-(3-chloro-4-fluorophenyl)-7-methoxy-6-(3-morpholinopropoxy)quinazolin-4-amine (gefitinib, AZD1839), N-(3-ethynylphenyl)-6,7-bis(2-methoxyethoxy)quinazolin-4-amine (erlotinib, OSI-774) or 6-acrylamido-N-(3-chloro-4-fluorophenyl)-7-(3-morpholinopropoxy)quinazolin-4-amine (CI 1033)), an inhibitor of the platelet-derived growth factor family, or an inhibitor of the hepatocyte growth factor family;
(v) an antiangiogenic agent such as one which inhibits the effects of vascular endothelial growth factor (for example the anti-vascular endothelial cell growth factor antibody bevacizumab, a compound disclosed in WO 97/22596, WO 97/30035, WO 97/32856 or WO 98/13354), or a compound that works by another mechanism (for example linomide, an inhibitor of integrin αvβ3 function or an angiotatin);
(vi) a vascular damaging agent such as combretastatin A4, or a compound disclosed in WO 99/02166, WO 00/40529, WO 00/41669, WO 01/92224, WO 02/04434 or WO 02/08213;
(vii) an agent used in antisense therapy, for example one directed to one of the targets listed above, such as ISIS 2503, an anti-ras antisense;
(viii) an agent used in a gene therapy approach, for example approaches to replace aberrant genes such as aberrant p53 or aberrant BRCA1 or BRCA2, GDEPT (gene-directed enzyme pro-drug therapy) approaches such as those using cytosine deaminase, thymidine kinase or a bacterial nitroreductase enzyme and approaches to increase patient tolerance to chemotherapy or radiotherapy such as multi-drug resistance gene therapy; or
(ix) an agent used in an immunotherapeutic approach, for example ex-vivo and in-vivo approaches to increase the immunogenicity of patient tumour cells, such as transfection with cytokines such as interleukin 2, interleukin 4 or granulocyte-macrophage colony stimulating factor, approaches to decrease T-cell anergy, approaches using transfected immune cells such as cytokine-transfected dendritic cells, approaches using cytokine-transfected tumour cell lines and approaches using anti-idiotypic antibodies.
The present invention will now be further explained by reference to the following illustrative examples in which the following abbreviations are used:

The text mentions some chemical reactions and methods, including the use of various solvents and reagents, as well as conditions such as temperature and time. The abbreviations used are described for clarity in the context of the invention's explanation.
NMR spectroscopy was recorded on a Varian Mercury-VX 300 MHz instrument or a Varian Inova 400 MHz instrument. The central peaks of chloroform-J (H 7.26 ppm), acetone-$d_6$ (H 2.05 ppm), acetonitrile-$d_3$ ($5_H$ 1.94 ppm) or OMSO-$d_6$ (H 2.50 ppm) were used as internal references.

The following method was used for LC/MS analysis:

Instrument Agilent 1100; Column Waters Symmetry 2.1 x 30 mm; Mass APCI; Flow rate 0.7 mL/min; Wavelength 254 nm; Solvent A: water + 0.1% TFA; Solvent B: acetonitrile + 0.1% TFA; Gradient 15-95%/B 2.7 min, 95% B 0.3 min.

Column chromatography was carried out using silica gel (0.040-0.063 mm, Merck). For preparative HPLC either a Kromasil KR-100-5-C18 column (250 x 20 mm, Akzo Nobel) and mixtures of acetonitrile/water (0.1% TFA) at a flow rate of 10 mL/min or a XTerra® Prep MS C$_8$ OBD™ Column, 5μm, 19 x 50 mm (acetonitrile/water/0.1% NH$_3$) at a flow rate of 20 mL/min was used. UV=254 nm or 220 nm was used for detection.

Unless stated otherwise, starting materials were commercially available. All solvents and commercial reagents were of laboratory grade and were used as received.

Intramolecular 1

$\{(4aR,4bS,5S,6aS,6bS,9aR,10aS,10bS)-6b-Glcocoloyl-5-hydroxy-4a,6a-dimethyl-8-propyl-S,4,4a,4b,S-e.6a.eb.ga.IO.IoA.IoB.II.^-tetradecahydro^H-naphthor2M':4,51indenori,2-diri,31dioxol-2-one\}$
(4aR,4bS,5S,6aS,6bS,9aR,10aS,10bS)-6b-Glycoloyl-5-hydroxy-4a,6a-dimethyl-8-propyl-4a,4b,5,6,6a,6b,9a,10,10a,10b,11,12-dodecahydro-2H-naphtho[2',1':4,5]indeno[1,2-d][1,3]dioxol-2-one (budesonide) (7 g, 16.3 mmol) was dissolved in a mixture of 200 ml ethanol and 100 ml toluene. Tris(triphenylphosphine)rhodium(I)chloride (2.1 g, 2.3 mmol) was added and the mixture was stirred under a hydrogen atmosphere for 40 h. After completion, monitored by LC-MS, the solvent was evaporated and the residue was redissolved in CH₂Cl₂. Heptane was added and the mixture was stirred for 1 h. The precipitate was filtered off and washed with C⁷CVheptane. The crude product was used directly in the next step. APCI-MS m/z: 433 [MH⁺].

Intermediate 2

(4aR,4bS,5S,6aS,6bS,9aR,10aS,10bS)-6b-(tert-Butyl(dimethyl)silylloxy)acetyl)-5-hydroxy-4a,6a-dimethyl-8-propyl-3A4a,4b,5,6,6a,6b,9a,10,10a,10b,11,12-tetradecahydro-2H-naphtho[2M':4,5lindenol[1,2-d][1,3]dioxol-2-one

The crude product of intermediate 1 (7.03 g, 16.3 mmol) was dissolved in a mixture of C⁷CVpyridine (2:1, 90 ml) and tert-butyldimethylchlorosilane (9.7 ml, 61.8 mmol) was added. The mixture was stirred over night. The solvent was evaporated and the crude product was purified on silica (EtOAc/heptane, gradient from 10 to 70% EtOAc) to give the title compound (7.3 g, 82%). APCI-MS m/z: 547 [MH⁺].

Intermediate 3
(4aR,4bS,5S,6aS,6bS,9aR,10aS,10bS)-6b-(’{t-Butyl(dimethyl)silyloxy)acetyl)-5-hydroxy-4a,6a-dimethyl-2-oxo-8-propyl-3A4a,5,6,6a,6b,9a,10,10a,10b,ll,12-tetradecahydro-2H-naphtho[2M_A 51indeno[l,2-d][l,31dioxole-3-carbaldehyde

Intermediate 2 (1 g, 1.8 mmol) dissolved in toluene (20 ml) were mixed under argon in a dry vessel with 55% NaH in oil (1.5 g, 36.6 mmol). Ethyl formate (2.2 ml, 27.5 mmol) was added. After the hydrogen evolution had ceased it was heated under microwave irradiation at 45°C for 60 minutes. The mixture was partitioned between water and EtOAc. The organic phase was washed with brine, dried with MgSO₄ and evaporated. The crude product contained mostly product and was used in the next step without further purification.

APCI-MS m/z: 575 [MH⁺].

Intermediate 4

(2-Fluoro-5-hydrazinylphenyl)methanol hydrochloride

(5-Amino-2-fluorophenyl)methanol (3.6 g, 25.8 mmol) was dissolved in cone. HCl (39 ml) and cooled to 0°C. A solution of NaNO₂ (1.89 g, 27.4 mmol) in water (9.4 ml) was added dropwise during 20 minutes at O°C. The mixture was stirred for 15 minutes and a solution of SnCl₂ (1.1 g, 57.4 mmol) in cone. HCl (11.5 ml) was added dropwise. The mixture was allowed to stir for 60 minutes at O°C and basified by addition of aqueous 14N NaOH and extracted with EtOAc. The organic phase was washed with brine and extracted with a solution of HCl (1 M). The water phase was freeze-dried to give the title compound (1.65 g, 33%). APCI-MS m/z: 157 [MH⁺].
Intermediate 5

2-{tert-Butyl(dimethyl)silylloxy)-l-r(4aR,4bS,5S,6aS,6bS,9aR,10aS,10bS)-l-r4-fluoro-3-(hydrxymethyl)phenyll-5-hydroxy-4a,6a-dimethyl-8-propyl-

r,2':5,61naphthori,2-flindazol-6b(lH)-yll-2-hydroxyethanone

Intermediate 3 (1.05 g, 1.83 mmol) was dissolved in ethanol (10 ml). (2-Fluoro-5-
hydrazinylphenyl)methanol hydrochloride (0.42 g, 2.20 mmol) and potassium acetate
(0.23 g, 2.29 mmol) were added and the mixture was heated under microwave irradiation
at 90°C for 10 minutes. The crude product was purified on silica (EtOAc/heptane 1:3) to
give the title compound (1.2 g, 92%). APCI-MS m/z: 695 [MH⁺].

Intermediate 6

5-r(4aR,4bS,5S,6aS,6bS,9aR,10aS,10bS)-6b-(  ′{tert-butyl′(dimethyl)silylloxy)acetyl)-5-
hydroxy-4a,6a-dimethyl-8-propyl-4a,4b,5,6a,6b,9a,10,10a,10b,12-
dodecahydro,31dioxolor3',4'lcvclopenta,βnaphthori^'-flindazol-l^HV vll-2-
fluorobenzyl methanesulfonate
Intermediate 5 (1.29 g, 1.86 mmol), Et$_3$N (0.28 ml, 2.04 mmol) and methanesulfonyl chloride were stirred in CH$_2$Cl$_2$ (20 ml) overnight. The mixture was partitioned between CH$_2$Cl$_2$ and brine and the organic phase was dried over MgSO$_4$ and evaporated to give the crude title compound (I g, 70%) which was used in the next step without further purification. APCI-MS m/z: 773 [MH$^+$].

**Example 1**

1r(4aR,4bS,5S,6aS,6bS,8R,9aR,10aS,10bS)-l-r4-fluoro-3-(morpholin-4-ylmethyl)phenyll-5-hydroxy-4a,6a-dimethyl-8-propyl-4,4a,4b,5,6,6a,9a,10,10a,10b,11,12-dodecahydro-3,12-dioxolor3',4'lcyclopenta-ri\2':5,61naphthori,2-flindazol-6b(IH)-yll-2-hydroxyethanone trifluoroacetic acid

Intermediate 6 (200 mg, 0.26 mmol) was dissolved in DMF (4 ml) and morpholine (100 mg, 1.15 mmol) was added. The mixture was stirred for 2h. TFA/water (1:1) was added until the protection group was removed. The sample was purified on preparative HPLC (MeCN/water/0.1% TFA) to give the title compound (43 mg, 25%).

Human Glucocorticoid Receptor (GR) Assay

The assay is based on a commercial kit from Panvera/Invitrogen (Part number P2893). The assay technology is fluorescence polarization. The kit utilises recombinant human GR (Panvera, Part number P2812), a Fluoromone™ labelled tracer (GS Red, Panvera, Part number P2894) and a Stabilizing Peptide 10X (Panvera, Part number P2815). The GR and Stabilizing Peptide reagents are stored at -70°C while the GS Red is stored at -20°C. Also included in the kit are 1M DTT (Panvera, Part number P2325, stored at -20°C) and GR Screening buffer 10X (Panvera, Part number P2814, stored at -70°C initially but once thawed stored at room temperature). Avoid repeated freeze/thaws for all reagents. The GR Screening buffer 10X comprises 100mM potassium phosphate, 200mM sodium molybdate, 1mM EDTA and 20% DMSO.

Test compounds (1µL) and controls (1µL) in 100% DMSO were added to black polystyrene 384-well plates (Greiner low volume black flat-bottom, part number 784076). 0% control was 100% DMSO and 100% control was 1µM Dexamethasone. Background solution (8µL; assay buffer 10X, Stabilizing Peptide, DTT and ice cold MQ water) was added to the background wells. GS Red solution (7µL; assay buffer 10X, Stabilizing Peptide, DTT, GS Red and ice cold water) was added to all wells except background wells. GR solution (7µL; assay buffer 10X, Stabilizing Peptide, DTT, GR and ice cold water) was added to all wells. The plate was sealed and incubated in a dark at room temperature for 2 hours. The plate was read in an Analyst plate reader (LJL Biosystems/Molecular Devices Corporation) or other similar plate reader capable of recording fluorescence polarization (excitation wavelength 530 nm, emission wavelength 590 nm and a dichroic mirror at 561 nm). The IC50 values were calculated using XLfit model 205 and are shown in Table 1.

wherein

\(X^1, X^2, X^3\) each represent CH or, alternatively, one of \(X^1, X^2, X^3\) may additionally represent a nitrogen atom;

\(n, p\) each independently represent 0 or 1;

\(R^1\) represents a halogen atom or a methyl or a methoxy group;

\(R^2\) represents \(-\text{CO}_2\text{CH}_3\), a halogen atom, or a methyl group optionally substituted by a hydroxy or a \(-\text{NR}^7 \text{R}^8\) group;

\(R^{3a}\) represents a hydrogen atom and \(R^{3b}\) represents a hydrogen or fluorine atom;

\(R^4\) represents \(-\text{C(O)CH}_2\text{OH}\) or \(-\text{C(O)}-\text{Y-CH}_2\text{R}^9\);

\(R^5\) and \(R^6\) together with the carbon atoms to which they are attached form a 1,3-dioxolanyl group which is optionally substituted by at least one substituent selected from C1-C3 alkyl and C3-C8 cycloalkyl;

\(R^7\) and \(R^8\) each independently represent a hydrogen atom, or a C1-C3 alkyl or a Ci-C3 hydroxy alkyl group, or

\(R^7\) and \(R^8\) together with the nitrogen atom to which they are attached form a 3- to 8-membered saturated or partially saturated heterocyclic ring optionally containing a further ring heterogroup selected from nitrogen, \(\text{S(O)}_m\) and oxygen, the heterocyclic ring being
optionally substituted by at least one substituent selected from hydroxyl, C1-C3 alkyl and C1-C3 hydroxyalkyl;

\[ m \text{ is 0, 1 or 2;} \]

\[ Y \text{ represents an oxygen or sulphur atom or a group } \succ \text{NH; and} \]

\[ R^9 \text{ represents a hydrogen or a halogen atom or a methyl or a cyano group; or a pharmaceutically acceptable salt thereof.} \]

2. A compound according to claim 1, wherein \( X^1, X^2 \) and \( X^3 \) each represent CH.

3. A compound according to claim 1 or claim 2, wherein \( n \) is 1 and \( R^1 \) represents a halogen atom.

4. A compound according to any one of claims 1 to 3, wherein \( p \) is 1 and \( R^2 \) represents a methyl group optionally substituted by a hydroxyl or a \( -\text{NR}^7 \; R^8 \) group.

5. A compound according to any one of claims 1 to 4, wherein \( R^4 \) represents \( -\text{C(O)CH}_2\text{OH}. \)

6. A compound according to any one of claims 1 to 4, wherein \( R^4 \) represents \( -\text{C(O)-S-CH}_2\text{CN}. \)

7. A compound according to any one of claims 1 to 6, wherein \( R^5 \) and \( R^6 \) together with the carbon atoms to which they are attached form a 1,3-dioxolanyl group which is substituted by one or two \( Q\text{-C3} \) alkyl groups.
8. A compound according to any one of claims 1 to 7, wherein $R^7$ and $R^8$ each independently represent a hydrogen atom, or a C1-C3 alkyl or a C1-C3 hydroxyalkyl group.

9. A compound according to any one of claims 1 to 7, wherein $R^7$ and $R^8$ together with the nitrogen atom to which they are attached form a 5- to 6-membered saturated heterocyclic ring optionally containing a further ring heterogroup selected from nitrogen, $\text{S(O)}_n$ and oxygen, the heterocyclic ring being optionally substituted by at least one substituent selected from hydroxyl, methyl and hydroxymethyl.

10. A compound according to claim 1 being:

or a pharmaceutically acceptable salt thereof.

11. A process for the preparation of a compound of formula (I) or a pharmaceutically acceptable salt thereof as defined in claim 1 which comprises reacting a compound of formula (II)

![Chemical Structure](image)

wherein $\text{R}^{3a}$, $\text{R}^{3b}$, $\text{R}^{4}$, $\text{R}^{5}$ and $\text{R}^{6}$ are as defined in formula (I), with a compound of formula (III) or an acid addition salt thereof
wherein \( n, p, R^1, R^2, X^1, X^2 \) and \( X^3 \) are as defined in formula (I), and optionally thereafter carrying out one or more of the following procedures:

- converting a compound of formula (I) into another compound of formula (I)
- removing any protecting groups
- forming a pharmaceutically acceptable salt.

12. A pharmaceutical composition comprising a compound of formula (I) as claimed in any one of claims 1 to 10 or a pharmaceutically acceptable salt thereof in association with a pharmaceutically acceptable adjuvant, diluent or carrier.

13. A compound of formula (I) as claimed in any one of claims 1 to 10 or a pharmaceutically acceptable salt thereof for use in treating asthma, chronic obstructive pulmonary disease or allergic rhinitis.

14. Use of a compound of formula (I) as claimed in any one of claims 1 to 10 or a pharmaceutically acceptable salt thereof in the manufacture of a medicament for use in treating asthma, chronic obstructive pulmonary disease or allergic rhinitis.

15. A combination of a compound of formula (I) as claimed in any one of claims 1 to 10 or a pharmaceutically acceptable salt thereof and one or more agents independently selected from:

- a non-steroidal glucocorticoid receptor agonist;
- a selective \( \beta_2 \) adrenoceptor agonist;
- a phosphodiesterase inhibitor;
- a protease inhibitor;
- a glucocorticoid;
- an anticholinergic agent;
• a modulator of chemokine receptor function; and
• an inhibitor of kinase function.
INTERNATIONAL SEARCH REPORT

International application No.
PCT/SE2008/051489

A. CLASSIFICATION OF SUBJECT MATTER

IPC: see extra sheet
According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC: C07J, A61K

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

SE, DK, FI, NO classes as above

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

EPQ-INTERNAL, WPI DATA, TXTE, CHEM.ABS DATA, BEILSTEIN

* Special categories of cited documents:
  "A" document defining the general state of the art which is not considered to be of particular relevance
  "E" earlier application or patent but published on or after the international filing date
  "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
  "O" document referring to an oral disclosure, use, exhibition or other means
  "P" document published prior to the international filing date but later than the priority date claimed

T later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

X document of particular relevance: the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

Y document of particular relevance: the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
