2-(1 -HETEROARYLPIPERAZIN-4-YL)METHYL-1 ,4-BENZODIOXANE DERIVATIVES AS
ALPHA2C ANTAGONISTS

TECHNICAL FIELD

The present disclosure relates to pharmacologically active aryl piperazines, or
pharmaceutically acceptable salts and esters thereof, as well as to pharmaceutical
5 compositions comprising them and to their use as alpha2C antagonists.

BACKGROUND OF THE INVENTION

It is generally known and accepted in the art that compounds exhibiting alpha adrenergic
activity may be used for the treatment of a wide variety of diseases and conditions of the
peripheric system and the central nervous system (CNS).

10 The alpha adrenergic receptors can be divided on a pharmacological basis into alpha1 and
alpha2 adrenoceptors, which can both be further divided into subtypes. Three genetically
encoded subtypes, namely alpha2A, alpha2B, and alpha2C adrenoceptors, have been
discovered in human. A fourth pharmacologically defined subtype, namely alpha2D
adrenoceptor, is known in some other mammals and in rodents. It corresponds to the
15 genetically defined alpha2A adrenoceptor.

The alpha2 adrenoceptor subtypes have distinct tissue distributions and functional roles. For
instance, while alpha2A adrenoceptors are widely expressed in various tissues, alpha2C
adrenoceptors are concentrated in the CNS and appear to play a role in the modulation of
specific CNS mediated behavioral and physiological responses.

20 Some compounds that are non-specific for any of the above-mentioned alpha2 subtypes and
some compounds that are specific for certain alpha2 subtypes are known in the art. For
example, atipamezole disclosed in EP 183 492 is a non-specific alpha2 antagonist.
Compounds that are selective antagonists for the alpha2C subtype and are thus useful for the
treatment of diseases of the central nervous system, are described, for example in WO
25 2009/013390 and WO 2010/058060.

In order to be able to reduce the risk of adverse events during treatment, an enhanced
selectivity of the alpha2 antagonists would be desirable. For example, the use of non-

selective alpha2 antagonists is attributed with side effects, such as increases in blood pressure, heart rate, salivary secretion, gastrointestinal secretion, and anxiety. Also an enhanced potency of the alpha2C antagonists would be desirable, in order to be able to reduce the dose needed.

- 5 DE 2241991 B2 discloses certain piperazinyl sydnonimide derivatives possessing hypotensive, vasodilatory and antianginous properties.

SUMMARY OF THE INVENTION

An object of the present disclosure is to provide novel alpha2C antagonists that can be used for the treatment of diseases or conditions of the peripheric or central nervous system
10 wherein alpha2C antagonists are indicated to be useful. Accordingly, an object of the present disclosure is to provide further compounds to be used as alpha2C antagonists in the treatment of mammals. Furthermore, pharmaceutical compositions comprising the presently disclosed compounds are also provided.

The alpha2 antagonists of the present disclosure have an improved selectivity for the
15 alpha2C adrenoceptor subtype, an enhanced potency, improved metabolic stability, and/or improved solubility, moreover, more desirable pharmacokinetic and pharmacodynamics.

A flask was charged with 1-benzyl-4-(3-methyl-1-(6-methylpyridin-2-yl)-1H-pyrazol-5-yl)piperazine (0.685 g, 1.971 mmol), ammonium formate (1.243 g, 19.71 mmol), formic acid (0.74 mL, 19.71 mmol) and EtOH (10 mL) under nitrogen. To this was added 10% Pd/C (0.210 g, 0.197 mmol) and reaction was heated to 70 °C under nitrogen atmosphere for 1 h. Mixture was cooled to RT, flushed with nitrogen and filter through celite followed by EtOH (2 x 10 mL) washings. Filtrate was evaporated to dry. Residue was diluted with sat. aq. Na₂CO₃ solution (10 mL) and extract with EtOAc (2 x 20 mL). Combined organic phases were dried with anhydrous Na₂SO₄ and evaporated to dry to give 0.524 g of 1-(3-methyl-1-(6-methylpyridin-2-yl)-1H-pyrazol-5-yl)piperazine as yellow oil. Product was used as such in the next step. LC-MS (ES+) [M+1]: 258.5.

Step 5: (S)-1-((2,3-Dihydrobenzo[b][1,4]dioxin-2-yl)methyl)-4-(3-methyl-1-(6-methylpyridin-2-yl)-1H-pyrazol-5-yl)piperazine

Reaction was heated to 110-120 °C for 4 h. Mixture was cooled to RT and 1 M HCl (30 mL) was added. Mixture was washed with MTBE (2 x 15 mL). MTBE phase was back extracted with 1 M HCl (10 mL) and org. phase was discarded. Aq. phases were basified with Na₂CO₃ and the extracted with EtOAc (2 x 30 mL). Combined organic phases were washed with brine (20 mL), dried with anhydrous Na₂SO₄ and evaporated to dry. As already mentioned hereinbefore, the compounds of formula I show interesting
5 pharmacological properties, namely they exhibit an improved selectivity for the alpha2C adrenoceptor subtype and/or an enhanced potency. Said properties are demonstrated with the pharmacological test presented below.

EXPERIMENT 1: Determination of alpha2A and alpha2C antagonistic activity *in*
10 ***vitro***

Chinese hamster ovary (CHO) cells stably transfected with human alpha2A or alpha2C receptors (University of Turku, Finland) were cotransfected with the expression vector pCEP-Gα16 (Molecular Devices, CA, USA) were used in this experiment. The cells were
15 maintained at 37 °C in a 5 % CO₂ / 95 % air atmosphere. The cells were cultured in HAM F-12 medium supplemented with 10 % FCS, 25 mM HEPES, 100 IU/ml penicillin, 100 µg/ml streptomycin, 500 µg/ml geneticin and 240 µg/ml hygromycin B. The cells were subcultured twice weekly with 0.25 % trypsin and 1 mM EDTA. The subculture ratio was 1:5-1:20. The growth medium was changed every 2 or 3 days. All cell culture reagents were
20 from Gibco. The day before the experiment the cells were plated into black-walled, clear bottom 384-well plates at a density of 10,000 cells/well.

The growth medium was removed and the cells were incubated with the test compounds and the FLIPR™ Calcium 6 Assay reagent (Molecular Devices, CA, USA) for 2 h at 37 °C
25 in dark. The test compounds (concentrations in cells 100 pM - 10 µM) were dissolved in Probenecid-Ringer consisting of 150 mM NaCl, 3 mM KCl, 1.2 mM MgCl₂, 1 mM CaCl₂, 5 mM glucose, 20 mM HEPES and 2.5 mM probenecid (pH 7.4 adjusted with 1.0 M NaOH). The osmolarity was adjusted to 322 milliosmoles with Osmostat® OM-6020 osmometer (DIC Kyoto Daiichi Kagaku Co. Ltd, Japan). The changes in intracellular calcium were
30 monitored using FLIPR Tetra high throughput cellular screening system (Molecular Devices, CA, USA) and displayed using ScreenWorks version 4.0 software. All experiments were performed at 37 °C. For agonism measurements the test compounds dissolved in Probenecid-Ringer were applied by FLIPR Tetra at 15 s time point. In order to

determine antagonism, the cells were stimulated either with 100 nM adrenaline or noradrenaline and the test compounds were added to the cells 2h before the experiment with the FLIPR Calcium 6 Assay reagent. The IC₅₀ value for a given test compound was determined from dose-response curves, which ranged from 0.01 nM to 10 μM. Typically, there were four replicates at each concentration and six different dose levels. For example, if the number of plates from which results were obtained was three, 72 (4 * 6 * 3) wells were thus measured to construct dose-response relationship. The samples were excited at 485 nm and emission was detected at 525 nm with a 515 nm cut-off filter. The minimum fluorescence value subtracted from the maximum value for each well was used in the calculations. ScreenWorks™ version 4.0 software was used for analyzing the results. Fitting of the antagonist dose-response results was performed with the free Hill equation and the IC₅₀ values were fitted with IDBS XE software using model 200: $y = \frac{A + (B / (1 + ((x/C)^D)))}{1 + ((x/C)^D)}$, where A is the curve maximum, B the curve minimum and C equals the EC₅₀ value. D is slope factor (Hill). Kb was calculated with the Cheng-Prusoff equation $K_b = A / ((B/C) + 1)$, where A is the IC₅₀ of antagonist, B the concentration of agonist and C the EC₅₀ of the agonist. The results are shown in Table 1.
