## Description

**[0001]** The present description relates to an (aza)indole derivative substituted in position 5, to a pharmaceutical composition comprising it, to intermediate compounds and to a preparation process therefor.

**[0002]** More particularly, the present description relates to an (aza)indole derivative substituted in position 5, which has inhibitory activity on mPGES-1.

**[0003]** It is known that prostaglandins (PG) are oxygenated fatty acids synthesized and released into the extracellular space, and then into the plasma, urine and other biological fluids.

**[0004]** They are important bioregulators, but also inflammation mediators that modulate intracellular reactions and intercellular communication.

**[0005]** The prostaglandins E<sub>2</sub> (PGE<sub>2</sub>) have an important physiological role of regulating renal function, vascular homeostasis, bone remodeling, induction of fever, gastrointestinal function and pregnancy. Besides these physiological functions, the PGE<sub>2</sub> prostaglandins behave as potent mediators of acute inflammation (inducing hyperalgesia, vasodilatation and discharge of fluids from vessels: Vane J.R. and Botting R.M. 1997 "Anti-inflammatory drugs and their mechanism of action" *Inflamm. Res.* 47 (2): p.78) and chronic inflammation. Specifically, the PGE<sub>2</sub> prostaglandins are particularly abundant in articular inflammatory pathologies. PGE<sub>2</sub> prostaglandins also play a role in pain and are potent pyretic agents (Ayoub S.S. et al., 2004 "Acetaminophen-induced hypothermia in mice is mediated by a prostaglandin endoperoxide synthase 1 gene-derived protein", *PNAS* 101: 11165-11169; Ivanov A. et al. 2002 "Prostaglandin E2 - synthesizing enzymes in fever: differential transcriptional regulation", *Am. J. Physiol. Regul. Integr. Comp. Physiol.* 283: R1104-R1117).

**[0006]** The enzyme responsible for the synthesis of PGE<sub>2</sub> prostaglandins is prostaglandin E synthase (PGES), which converts the endoperoxide PGH<sub>2</sub>, formed from arachidonic acid by the action of cyclooxygenases, into PGE<sub>2</sub>. The activity of PGES has been found both in the cytosolic fraction and membrane-bound in various types of cells.

**[0007]** Three enzymatic forms have been identified (Kudo I. et al. 2005 "Prostaglandin E synthase, a terminal enzyme for prostaglandin E2 biosynthesis", *Journal of Biochemistry and Molecular Biology* 38, 633-638); among these, microsomal PGES-1 (mPGES-1) is a membrane-bound enzyme that requires glutathione as an essential cofactor for its activity.

**[0008]** The expression of mPGES-1 is induced by pro-inflammatory stimuli such as IL-1 $\beta$  or LPS (Proc. Natl. Acad. Sci. 96: 7220, 1999). It is co-localized together with COX-2 on the endoplasmatic reticulum and on the nuclear envelope (Lazarus M. et al. 2002 "Biochemical characterization of mouse microsomal prostaglandin E synthase-1 and its colocalization with cyclooxygenase-2 in peritoneal macrophages" *Arch. Biochem. Biophys.* 397: 336; Murakami M. et al. 2000 "Regulation of prostaglandin E2 biosynthesis by inducible membrane-associated prostaglandin E2 synthase that acts in concert with cyclooxygenase-2" *J. Biol. Chem.* 275: 32783; Yamagata K. et al. 2001 "Coexpression of microsomal-type prostaglandin E synthase with cyclooxygenase-2 in brain endothelial cells of rats during endotoxin-induced fever" *J. Neurosci.* 15;21 (8): 2669-77). Although the two enzymes (COX-2 and mPGES-1) have a functional connection and co-expression, their rate of induction differs in a few cellular systems, indicating different regulatory induction mechanisms (J. Immunol. 167: 469, 2001).

**[0009]** Drugs that inhibit the enzyme COX-2 have been shown to be effective in alleviating inflammation and pain in chronic inflammatory pathologies such as arthritis, but their prolonged use may induce tissue damage caused by an overproduction of cytokines, for instance TNF $\alpha$  and IL-1 $\beta$  (Stichtenoth D.O. 2001 "Microsomal prostaglandin E synthase is regulated by proinflammatory cytokines and glucocorticoids in primary rheumatoid synovial cells" *J. Immunol.* 167: 469). In addition, the prolonged use of these drugs is associated with cardiovascular side effects. This has led to the withdrawal from the market of a number of selective COX-2 inhibitors and to a revision of the indications for the entire class of these drugs.

**[0010]** Recent research efforts are directed towards overcoming the side effects of COX-2 inhibitors by studying mPGES-1 inhibitors for the purpose of developing drugs that are active in the treatment of inflammation and pain (B. Samuelsson et al. "Membrane Prostaglandin E Synthase-1: A Novel Therapeutic Target" *Pharmacol. Rev.* 59:207-224,2007).

**[0011]** In addition, numerous studies have demonstrated that the PGE<sub>2</sub> prostaglandins are tumor-promoting factors (L.R. Howe, "Inflammation and breast cancer. Cyclooxygenase/prostaglandin signaling and breast cancer", *Breast cancer research* 2007, 9:210; Castellone M.D. et al. 2005 "Prostaglandin E2 promotes colon cancer growth through a novel Gs-Axin-B-catenin", *Science* 310, 1504-1510; Mehrotra S., et al. 2006 "Microsomal prostaglandin E2 in breast cancer: a potential target for therapy", *J. Pathol.* 208(3): 356-63; Nakano et al. 2006 "Induction of macrophagic prostaglandin E2 synthesis by glioma cells" *J. Neurosurgery* 104(4), 574-582) that are involved in angiogenesis, cell proliferation and cell migration functions. Selective FANS and COX-2 inhibitors are also found to inhibit various types of tumors, including colonrectal, oesophageal, breast, lung and bladder tumors by means of inhibiting PGE<sub>2</sub>. PGE<sub>2</sub> prostaglandins derived from COX-2 induce tumor growth by means of binding to the actual receptors and activating signals for controlling cell proliferation, migration, apoptosis and angiogenesis (Wang D. et al. 2006 "Prostaglandin and cancer" *Gut.* 55 (1):115-22; Han C. et al. 2006 "Prostaglandin E2 receptor EP1 transactivates EGFR/MET receptor tyrosine kinases and enhances

invasiveness in human hepatocellular carcinoma cells", Journal of Cellular Physiology 207: 261-270).

Additionally, the following example comprises steps 1 and 2 to prepare the starting compound B1 of the process of the present description because intermediate A1 is first prepared *in situ* without separation from the preparative resin.

**[0168]** Step (1): 15 g of PL-FMP resin (0.9 mmol/g) in a solution 1% AcOH in DMF (300 ml) was stirred at room temperature for 2h. Then, *N*-(4-amino-2-iodophenyl)alkylsulfonamide (54 mmol) and 11.5 g of sodium triacetoxyborohydride (54 mmol) were added. PL-FMP Resin (manufactured by Polymer Laboratories, UK) is an aldehyde-based resin suitable for attachment of amines via reductive amination. The resin was dried under vacuum at room temperature to give 18.3 g of resin (A1) which was used without any further purification.

**[0169]** Step (2): 1.172 g of resin (A1) (0.8 mmol, theoretical) were added to a mixture of DMF (10 ml), the B2 alkyne (5 mmol), CuI (32 mg, 0.17 mmol), 58 mg of dichlorobis(triphenylphosphine)palladium(II) [Cl<sub>2</sub>(PPh<sub>3</sub>)<sub>2</sub>Pd] (0.8 mmol) and 2 ml of triethylamine (22 mmol). To the solution, HCl 2N (2.5 ml) has been added, and the mixture has been left at room temperature for 3 hours. The solvent has been then evaporated under reduced pressure, and the residue dissolved in DCM and washed with a saturated solution of NaHCO<sub>3</sub>. After evaporation of the organic solvent, the residue has been purified to give the compound (I) where Y, Z, G<sub>1</sub>, G<sub>2</sub>, and G<sub>3</sub> have the meanings indicated above, W is an amidic bond, and R<sub>2</sub> is a phenyl group.

[0180] The compounds of the present description shown in Table 1 below were thus prepared. In Table 1 the following abbreviations with the following meanings are used:

Purification A = Crystallization

Purification B = Flash chromatography on silica gel

Purification C = Preparative HPLC (X Bridge prep. C18; 5 μm, 30 x 150 mm)

EtOAc = Ethyl acetate

Hex = Hexane

MeOH = Methanol

EtOH = Ethanol

CH<sub>3</sub>CN = Acetonitrile

H<sub>2</sub>O = Water

HCOOH = Formic acid

iPrOH = Isopropanol

Pr<sub>2</sub>O = Propyl ether

EXAMPLE 3*In vitro* biological activity

**[0181]** The test used makes it possible to evaluate the inhibitory capacity of the test compounds on the production of PGE<sub>2</sub> and the selectivity relative to the production of PGF<sub>2α</sub>. The human pulmonary adenocarcinoma cell line A549 was used, which is particularly sensitive to stimulation with proinflammatory cytokines, for instance IL-1<sub>β</sub>, and, in response to this stimulation, is particularly active in the production and release of two prostanoids: PGE<sub>2</sub> and PGF<sub>2α</sub> (Thoren S. Jakobsson P-J, 2000).

**[0182]** The cells were stimulated with IL-1<sub>β</sub> (10 ng/ml) and simultaneously treated with the test compound for 22 hours in a suitable culture medium (DMEM - Dulbecco's Modified Eagles Medium) enriched with 5% fetal calf serum and L-glutamine (4 mM final) in an incubator at 37°C and with a CO<sub>2</sub> concentration of 5%.

**[0183]** At the end of the incubation, the amount of PGE<sub>2</sub> and PGF<sub>2α</sub> produced and released into the supernatant were assayed using an EIA kit (produced and sold by Cayman Chemicals, Ann Arbor, MI, USA).

**[0184]** The comparative compound used was indomethacin at a concentration of 10 nM (Sigma-Aldrich), which is a non-steroidal antiinflammatory drug that inhibits in equal measure both PGE<sub>2</sub> and PGF<sub>2α</sub>.

**[0185]** The results, expressed as a percentage of inhibition of the production of PGE<sub>2</sub> and of PGF<sub>2α</sub> at a concentration of 10 μM, are given in Table 2, in which "ia" (inactive) indicates an inhibitory activity of less than 20%.

**[0186]** For illustrative purposes, Table 3 collates the pIC<sub>50</sub> values of a number of compounds of the description, where pIC<sub>50</sub> represents the negative logarithm of the IC<sub>50</sub>, which, in turn, represents the concentration of compound that inhibits the production of PGE<sub>2</sub> or PGF<sub>2α</sub> by 50% relative to cells that are stimulated but not treated with the same compound.

**[0187]** In Table 3, "nd" means not determinable.

**EXAMPLE 4***In vivo* biological activity

**[0188]** The test compound was evaluated in the model of acetic acid-induced stretching in mice (Stock J.L. et al., J Clin Inv 2001, 107: 325-331). This test makes it possible to evaluate the antinociceptive activity of the compounds of the description in a model of inflammatory pain.

**[0189]** Female CD-1 mice weighing 25-30 g were used for the test. The animals were treated intraperitoneally with the test compound (0.1-10 mg/kg) suspended in methylcellulose (MTC). The control animals were treated with the vehicle alone (MTC) via the same route.

**[0190]** 30 minutes after the treatment, the animals received an intraperitoneal injection of acetic acid (0.7 v/v in physiological solution, 16 µl/g of body weight) in order to induce inflammatory pain and to check the effects of the test compound on the nociceptive response.

**[0191]** Immediately after the administration of acetic acid and for the following 20 minutes, the number of stretches, which represents the parameter for evaluation of the nociceptive response, was measured.

**[0192]** As reported in Table 4, the compound of the description induced, in a dose-dependent manner, a reduction in stretching in the 20 minutes following the administration of acetic acid, compared with the animals treated with MTC alone.
