George I Brontiss of Smithfield Rhode Island

Letters Patent

The Schedule referred to in these Letters Patent and making part of the same containing a description in the words of the said George I Brontiss himself of his improvement in the construction of Cooking Stoves to burn anthracite Coal with a circular revolving oven.

To all to whom these presents shall come, Be it known that I George I Brontiss of Smithfield in the County of Providence and State of Rhode Island, and Providence Plantations have invented a new and useful improvement in the Construction of Cooking Stoves to burn anthracite coal with a circular revolving oven. called Brontiss' Cooking Stove "with a circular revolving oven" and the following is a full and exact description of the construction and operation of the said Stove as invented or improved by me, to wit. — The improvement in the construction and formation of this Stove consists in the circular revolving oven made of cast iron resting on the centre, at one end and on two wheels at the other end. It may also be made of sheet iron, and cased with a lining of tile, or fire brick which will contain a sufficient quantity of heat to bake bread, or other articles after all the fire is taken out of the Stove. The exterior part of the oven when over heated is turned by means of a crank. So that the heat may be applied when necessary, to it, or cooler parts, and by means of a damper when the heat is too great it may be excluded or applied as heat may be required. For the purpose of boiling a few quantities of water, a small cast iron cylinder is inserted in the side of the Stove, with a screw at the end to be inserted in the vessel containing the water. So heat flat iron or iron plate is inserted or fitted to go into the mouth of stove on the top of the oval.

In testimony that the above is a true specification of my said improvement I have hereunto set my hand and seal this twenty second day of May in the year of our Lord one thousand Eight hundred and thirty four

George I Brontiss
