ZIKA VACCINES AND IMMUNOGENIC COMPOSITIONS, AND METHODS OF USING THE SAME
STATEMENT REGARDING FEDERALLY-SPONSORED RESEARCH

[0001] This invention was made with government support under Contract No. HHSO100201600015C with the Department of Health and Human Services, Office of the Assistant Secretary for Preparedness and Response, Biomedical Advanced Research and Development Authority. This invention was created in the performance of a Cooperative Research and Development Agreement with the Centers for Disease Control and Prevention, an Agency of the Department of Health and Human Services. The Government of the United States has certain rights in the invention.

FIELD OF THE INVENTION

[0002] The present disclosure relates to Zika virus vaccines and immunogenic compositions having one or more antigens from a Zika virus (*e.g.*, a Zika virus clonal isolate, a non-human cell adapted Zika virus, *etc.*) and methods of manufacture, formulation, testing, and uses thereof.

BACKGROUND

[0003] Zika virus, *aflavivirus* classified with other mosquito-borne viruses (*e.g.*, yellow fever, dengue, West Nile, and Japanese encephalitis viruses) within the *Flaviviridae* family has spread rapidly in a hemispheric-wide epidemic since the virus was introduced into Brazil in 2013. The virus has reached the Central and North Americas, including territories of the United States, consequently now threatening the continental US. Indeed, Zika virus strain PR.VABC59 was isolated from serum from a person who had traveled to Puerto Rico in 2015. The genome of this strain has been sequenced at least three times (*See* Lanciotti *et al.* *Emerg. Infect. Dis.* 2016 May;22(5):933-5 and GenBank Accession Number KU501215.1; GenBank Accession Number KX087101.3; and Yun *et al.* *Genome Announc.* 2016 Aug 18;4(4) and GenBank Accession Number ANK57897.1).

[0004] Initially isolated in 1947 in Uganda, the virus was first linked to human disease in 1952, and has been recognized sporadically as a cause of mild, self-limited febrile illness in Africa and Southeast Asia (Weaver *et al.* (2016) *Antiviral Res.* 130:69-80; Faria *et al.* (2016) *Science.* 352(6283):345-349). However, in 2007, an outbreak appeared in the North Pacific island of Yap, and then disseminated from island to island across the Pacific, leading to an extensive outbreak in 2013-2014 in French Polynesia, spreading then to New Caledonia, the Cook Islands, and ultimately, to Easter Island. An Asian lineage virus was subsequently transferred to the Western Hemisphere by routes that remain undetermined (Faria *et al.* (2016) *Science.* 352(6283):345-349). The virus may be transmitted zoonotically by *Aedes aegypti*, *A. albopictus*, and possibly by *A. hensii* and *A. polynesiensis* (Weaver *et al.* (2016) *Antiviral Res.* 130:69-80). Additionally, it is thought that other vectors for transmitting the virus may exist, and the virus may be transmitted by blood transfusion, transplacentally, and/or through sexual transmission.

[0005] In late 2015, a significant increase in fetal abnormalities (*e.g.*, microcephaly) and Guillain-Barre syndrome (GBS) in areas of widespread Zika virus infection raised alarm that Zika virus might be much more virulent than originally thought, prompting the World Health Organization (WHO) to declare a Public Health Emergency of International Concern (PHEIC) (Heymann *et al.* (2016) *Lancet* 387(10020): 719-21). While Zika virus poses a substantial public health threat, no FDA-approved vaccine or treatment currently exists, and the only preventative measures for controlling Zika virus involve managing mosquito populations.

[0006] In recent efforts to characterize a recombinant Zika virus for the development of a potential vaccine, a non-human cell adapted Zika virus was identified that harbors a mutation in the viral Envelope protein at position 330 (Weger-Lucarelli *et al.* (2017) *Journal of Virology* 91(1): 1-10). The authors of this study found that full-length infectious cDNA clones of Zika virus strain PRVABC59 were genetically unstable when amplified during cloning, and opted to split the viral genome to address the observed instability, developing and applying a two plasmid system. However, a two plasmid system for the development of a Zika vaccine is less desirable.

BRIEF SUMMARY

[0007] Thus, there is a need to develop vaccines and immunogenic compositions for treating and/or preventing Zika virus infection that utilize a genetically stable Zika virus that does not require a two vector system. To meet the above and other needs, the present disclosure is directed, at least in part, to a genetically stable non-human cell adapted Zika virus harboring an adaptation in the Non-structural protein 1 (with a wild-type Envelope protein), allowing for the use of a single virus/viral genome system for vaccine production. The present disclosure is also directed, at least in part, to a Zika virus clonal isolate that is genetically homogenous and/or has been purified away from one or more adventitious agents. Accordingly, the present disclosure provides vaccines and immunogenic compositions useful for treating and/or preventing Zika virus infection (*e.g.*, in humans) that include one or more Zika virus antigens (*e.g.*, one or more antigens from a whole inactivated Zika virus) from a Zika virus harboring at least one non-human cell adaptation mutation (*e.g.*, a mutation in Zika virus Non-structural protein 1) and/or a Zika virus clonal isolate.

[0008] The present disclosure is based, at least in part, on the surprising finding that both high and low-dose vaccines comprising one or more antigens from separately derived clonal virus populations of non-human cell adapted Zika virus were able to induce robust immune responses and provide significant protection from Zika virus infection (*See Example 2 below*). Clonal isolation of the Zika virus strains also allowed for: 1) the successful purification of the virus away from contaminating agents (*e.g.*, adventitious agents that may be co-purified with the parental strain), and 2) the production of a genetically homogeneous viral population. Moreover, the present disclosure is based, at least in part, on the finding that clonal isolated Zika viruses harboring an adaptation mutation in protein NS1 grew well and predictably in Vera cells to high titer, and surprisingly, were genetically stable/genetically homogenous without any detectable mutations to in the viral envelope protein (*See Examples 1 and 2 below*). While a similar mutation in Zika virus Non-structural protein 3 may have been observed in the genomic sequencing analysis of 1 out of 3 published sequences of Zika virus strain PRVABC59 (Yun *et al.* *Genome Announc.* 2016 Aug 18;4(4)), this reference

fails to teach or suggest that a mutation in NS1 may improve stability of the virus; fails to teach or suggest that a virus harboring the mutation may be used in the development of an effective vaccine against Zika virus; and fails to teach or suggest that such a vaccine may be effective in inducing a robust immune response and providing significant protection from Zika virus infection when used at both low and high doses. Thus, without wishing to be bound by theory, the inventors of the present disclosure have determined that the adaptation mutation in protein NS1 appeared to enhance genetic stability within the Zika virus, resulting in increased replication efficiency. Further, the Zika strain harboring an adaptation mutation in protein NS1 was able to be passaged multiple times without developing further mutations. Such a stable Zika virus strain is advantageous as a master virus seed (MVS), or subsequent seeds derived from the MVS, for vaccine production and manufacturing, as the risk of the master virus seed developing undesirable mutations is reduced. Moreover, without wishing to be bound by theory, the adaptation mutation in protein NS1 of the Zika strain of the present disclosure may also reduce or otherwise inhibit the occurrence of undesirable mutations, such as a mutation within the envelope protein E (Env) of the Zika virus strain.

[0009] Accordingly, certain aspects of the present disclosure relate to a vaccine or immunogenic composition containing one or more antigen from a Zika virus, where the Zika virus contains at least one non-human cell adaptation mutation. In some embodiments, the at least one non-human cell adaptation mutation is in Zika virus Non-structural protein 1 (NS1). In some embodiments, the at least one adaptation mutation occurs at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1. In some embodiments, the at least one adaptation mutation is a Trp98Gly mutation.

[0010] In some embodiments that may be combined with any of the preceding embodiments, the at least one adaptation mutation enhances genetic stability as compared to a Zika virus lacking the at least one adaptation mutation. In some embodiments that may be combined with any of the preceding embodiments, the at least one adaptation mutation enhances viral replication as compared to a Zika virus lacking the at least one adaptation mutation. In some embodiments that may be combined with any of the preceding embodiments, the Zika virus does not comprise a mutation in Envelope protein E (Env).

[0011] In some embodiments that may be combined with any of the preceding embodiments, the non-human cell is a mammalian cell. In some embodiments that may be combined with any of the preceding embodiments, the non-human cell is a monkey cell. In some embodiments, the monkey cell is from a Vera cell line. In some embodiments, the Vera cell line is a WHO Vero T0-87 cell line.

[0012] In some embodiments that may be combined with any of the preceding embodiments, the Zika virus is an African lineage virus or an Asian lineage virus. In some embodiments, the Zika virus is an Asian lineage virus. In some embodiments, the Zika virus is from strain PRVABC59.

[0013] In some embodiments that may be combined with any of the preceding embodiments, the vaccine or immunogenic composition is a purified antigen vaccine or immunogenic composition, a subunit vaccine or immunogenic composition, an inactivated whole virus vaccine or immunogenic composition, or an attenuated virus vaccine or immunogenic composition. In some embodiments, the vaccine or immunogenic

composition is an inactivated whole virus vaccine or immunogenic composition. In some embodiments, the vaccine or immunogenic composition comprises a purified inactivated whole Zika virus. In some embodiments, the vaccine or immunogenic composition comprises a purified inactivated whole Zika virus comprising a mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1. In some embodiments, the vaccine or immunogenic composition comprises a purified inactivated whole Zika virus comprising a Trp98Gly mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1. In some embodiments, the vaccine or immunogenic composition comprises a purified inactivated whole Zika virus comprising a Trp98Gly mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1, wherein the Zika virus is derived from strain PRVABC59. In some embodiments, the vaccine or immunogenic composition comprises a purified inactivated whole Zika virus comprising a Trp98Gly mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1, wherein the Zika virus is derived from strain PRVABC59 comprising the genomic sequence according to SEQ ID NO:2. In some embodiments, the vaccine or immunogenic composition comprises a purified inactivated whole Zika which differs from strain PRVABC59 in a Trp98Gly mutation at position 98 of SEQ ID NO: 1.

[0014] In some embodiments that may be combined with any of the preceding embodiments, the virus was chemically inactivated. In some embodiments, the virus was chemically inactivated with one or more of a detergent, formalin, hydrogen peroxide, beta-propiolactone (BPL), binary ethylamine (BEI), acetyl ethyleneimine, methylene blue, and psoralen. In some embodiments, the virus was chemically inactivated with formalin.

[0015] In some embodiments that may be combined with any of the preceding embodiments, the vaccine or immunogenic composition further contains an adjuvant. In some embodiments, the adjuvant is selected from aluminum salts, toll-like receptor (TLR) agonists, monophosphoryl lipid A (MLA), synthetic lipid A, lipid A mimetics or analogs, MLA derivatives, cytokines, saponins, muramyl dipeptide (MDP) derivatives, CpG oligos, lipopolysaccharide (LPS) of gram-negative bacteria, polyphosphazenes, emulsions, virosomes, cochleates, poly(lactide-co-glycolides) (PLG) microparticles, poloxamer particles, microparticles, liposomes, Complete Freund's Adjuvant (CPA), and/or Incomplete Freund's Adjuvant (IFA). In some embodiments, the adjuvant is an aluminum salt. In some embodiments, the adjuvant is selected from the group consisting of alum, aluminum phosphate, aluminum hydroxide, potassium aluminum sulfate, and Alhydrogel 85. In some embodiments, at least 75%, at least 85%, at least 90%, at least 95%, at least 96%, at least 97%, at least 98%, at least 99%, or 100% of the one or more antigens are adsorbed to the adjuvant.

[0016] In some embodiments that may be combined with any of the preceding embodiments, the vaccine or immunogenic composition is a low dose vaccine or immunogenic composition (e.g., containing from about 1 µg to about 5 µg antigen). In some embodiments that may be combined with any of the preceding embodiments, the vaccine or immunogenic composition is a high dose vaccine or immunogenic composition (e.g., containing about 10 µg antigen). In some embodiments that may be combined with any of the preceding embodiments, the vaccine or immunogenic composition contains from about 0.1 µg to about 25 µg of the one or more antigens. In certain such embodiments the antigen is a purified inactivated whole virus, such as a Zika

vims with a mutation which is a tryptophan to glycine substitution at position 98 of SEQ ID NO: 1 or at a position corresponding to position 98 of SEQ ID NO: 1 as described herein. In some embodiments, the vaccine or immunogenic composition comprises a purified inactivated whole Zika vims comprising a Trp98Gly mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO:1, wherein the Zika vims is derived from strain PRVABC59. In some embodiments, the vaccine or immunogenic composition comprises a purified inactivated whole Zika vims comprising a Trp98Gly mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO:1, wherein the Zika vims is derived from strain PRVABC59 comprising the genomic sequence according to SEQ ID NO:2. In certain such embodiments the Zika vims is a plaque purified clonal Zika vims isolate. In some embodiments that may be combined with any of the preceding embodiments, the vaccine or immunogenic composition contains from about 0.1 µg Zika virus or Env to about 100 µg Zika vims or Env. In some embodiments, the vaccine or immunogenic composition is inactivated. In some embodiments that may be combined with any of the preceding embodiments, the Zika virus is a clonal isolate. In some embodiments, the clonal isolate is substantially free of one or more adventitious agents (*e.g.*, free of one or more adventitious agents that may be co-purified with the parental strain).

[0017] Other aspects of the present disclosure relate to a vaccine comprising a Zika vims having a mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1. In some embodiments, the vaccine comprises a purified inactivated whole Zika vims comprising a Trp98Gly mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1, wherein the Zika virus is derived from strain PRVABC59. In some embodiments, the vaccine comprises a purified inactivated whole Zika vims comprising a Trp98Gly mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1, wherein the Zika virus is derived from strain PRVABC59 comprising the genomic sequence according to SEQ ID NO:2. In certain such embodiments the Zika vims is a plaque purified clonal Zika vims isolate.

[0018] Other aspects of the present disclosure relate to a vaccine or immunogenic composition containing: a) an aluminum salt adjuvant; and b) a purified inactivated whole Zika vims, where the Zika vims contains a non-human cell adaptation mutation, and where the non-human cell adaptation mutation is a Trp98Gly mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1.

[0019] Other aspects of the present disclosure relate to a method of treating or preventing Zika virus infection in a subject in need thereof, including administering to the subject a therapeutically effective amount of any of the vaccines or immunogenic compositions described herein.

[0020] Other aspects of the present disclosure relate to a method for inducing an immune response in a subject in need thereof, including administering to the subject an immunogenic amount of any of the vaccines or immunogenic compositions described herein. In some embodiments that may be combined with any of the preceding embodiments, the subject is a human. In some embodiments, the subject is pregnant or intends to become pregnant.

[0021] In some embodiments that may be combined with any of the preceding embodiments, administration of the vaccine or immunogenic composition induces a protective immune response in the subject. In some embodiments, the protective immune response induced in the subject is greater than a protective immune response induced in a corresponding subject administered a vaccine or immunogenic composition containing one or more antigens from a Zika virus lacking the at least one non-human cell adaptation mutation. In some embodiments that may be combined with any of the preceding embodiments, administration of the vaccine or immunogenic composition induces the generation of neutralizing antibodies to Zika virus in the subject. In some embodiments, the concentration of neutralizing antibodies generated in the subject is higher than a concentration of neutralizing antibodies generated in a corresponding subject administered a vaccine or immunogenic composition comprising one or more antigens from a Zika virus lacking the at least one non-human cell adaptation mutation.

[0022] In some embodiments that may be combined with any of the preceding embodiments, the vaccine or immunogenic composition is administered by a route selected from subcutaneous administration, transcutaneous administration, intradermal administration, subdermal administration, intramuscular administration, peroral administration, intranasal administration, buccal administration, intraperitoneal administration, intravaginal administration, anal administration and/or intracranial administration. In some embodiments that may be combined with any of the preceding embodiments, the vaccine or immunogenic composition is administered one or more times. In some embodiments, the vaccine or immunogenic composition is administered as a first (prime) and a second (boost) administration. In some embodiments, the second (boost) administration is administered at least 28 days after the first (prime) administration.

[0023] Other aspects of the present disclosure relate to a method for inactivating a Zika virus preparation, including (a) isolating the Zika virus preparation from one or more non-human cells, where the cells are used to produce the virus preparation, and where the Zika virus contains at least one non-human cell adaptation mutation; and (b) treating the virus preparation with an effective amount of formalin. In some embodiments, the method further includes (c) neutralizing the formalin-treated virus preparation with sodium metabisulfite. In some embodiments, the virus preparation is neutralized at least five, at least seven, at least nine, at least 11, or at least 14 days after formalin treatment. In some embodiments, the method further includes (d) purifying the neutralized virus preparation. In some embodiments, the neutralized virus preparation is purified by a process selected from cross flow filtration (CFF), multimodal chromatography, size exclusion chromatography, cation exchange chromatography, and/or anion exchange chromatography.

[0024] Other aspects of the present disclosure relate to a method for inactivating a Zika virus preparation, including (a) isolating the Zika virus preparation from one or more non-human cells, wherein the cells are used to produce the virus preparation, and wherein the Zika virus comprises a mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1; and (b) treating the virus preparation with an effective amount of formalin. In some embodiments, the method further includes (c) neutralizing the formalin-treated virus preparation with sodium metabisulfite. In some embodiments, the virus preparation is neutralized at least five, at least seven, at least nine, at least 11, or at least 14 days after formalin treatment. In some embodiments, the method further includes (d) purifying the neutralized virus preparation.

In some embodiments, the neutralized vims preparation is purified by process selected from cross flow filtration (CFF), multimodal chromatography, size exclusion chromatography, cation exchange chromatography, and/or anion exchange chromatography.

[0025] In some embodiments that may be combined with any of the preceding embodiments, the vims preparation is mixed with an adjuvant. In some embodiments, the adjuvant is selected from aluminum salts, toll-like receptor (TLR) agonists, monophosphoryl lipid A (MLA), synthetic lipid A, lipid A mimetics or analogs, MLA derivatives, cytokines, saponins, muramyl dipeptide (MDP) derivatives, CpG oligos, lipopolysaccharide (LPS) of gram-negative bacteria, polyphosphazenes, emulsions, virosomes, cochleates, poly(lactide-co-glycolides) (PLG) microparticles, poloxamer particles, microparticles, liposomes, Complete Freund's Adjuvant (CPA), and/or Incomplete Freund's Adjuvant (IFA). In some embodiments, the adjuvant is an aluminum salt. In some embodiments, the adjuvant is selected from alum, aluminum phosphate, aluminum hydroxide, potassium aluminum sulfate, and/or Alhydrogel 85. In some embodiments, at least 75%, at least 85%, at least 90%, at least 95%, at least 96%, at least 97%, at least 98%, at least 99%, or 100% of one or more antigens in the vims preparation are adsorbed to the adjuvant.

[0026] In some embodiments that may be combined with any of the preceding embodiments, the at least one non-human cell adaptation mutation is in Zika virus NS1. In some embodiments, the at least one adaptation mutation occurs at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1. In some embodiments, the at least one adaptation mutation is a Trp98Gly mutation. In some embodiments that may be combined with any of the preceding embodiments, the at least one adaptation mutation enhances genetic stability as compared to a Zika virus lacking the at least one adaptation mutation. In some embodiments that may be combined with any of the preceding embodiments, the at least one adaptation mutation enhances viral replication as compared to a Zika virus lacking the at least one adaptation mutation. In some embodiments that may be combined with any of the preceding embodiments, the Zika virus does not comprise a mutation in Envelope protein E (Env).

[0027] Other aspects of the present disclosure relate to a method of purifying Zika virus, including the steps: (a) inoculating a plurality of cells with an inoculum containing a population of Zika viruses, and (b) obtaining a Zika virus clonal isolate by plaque purification from one or more of the inoculated cells. In some embodiments, the cells are non-human cells. In some embodiments, the cells are insect cells. In some embodiments, the cells are mosquito cells. In some embodiments, the cells are mammalian cells. In some embodiments, the mammalian cells are monkey cells. In some embodiments, the monkey cells are from a Vero cell line. In some embodiments, the Vero cell line is a WHO Vero 10-87 cell line.

[0028] In some embodiments that may be combined with any of the preceding embodiments, the population of Zika viruses is heterogeneous. In some embodiments that may be combined with any of the preceding embodiments, the population of Zika viruses comprises a Zika virus clinical isolate. In some embodiments, the Zika virus clinical isolate is from strain PRVABC59. In some embodiments that may be combined with any of the preceding embodiments, the population of Zika viruses comprises a Zika virus that has been previously passaged one or more times in cell culture. In some embodiments that may be combined

with any of the preceding embodiments, the inoculum comprises human serum. In some embodiments that may be combined with any of the preceding embodiments, the inoculum comprises one or more adventitious agents. In some embodiments, the Zika virus clonal isolate is substantially free of the one or more adventitious agents.

[0029] In some embodiments that may be combined with any of the preceding embodiments, the methods further include one or more additional plaque purifications of the Zika virus clonal isolate. In some embodiments, the Zika virus clonal isolate is further plaque purified two or more times. In some embodiments that may be combined with any of the preceding embodiments, the methods further include passaging the Zika virus clonal isolate one or more times in cell culture. In some embodiments, the Zika virus clonal isolate is passaged two or more times.

[0030] In some embodiments that may be combined with any of the preceding embodiments, the methods further include formulating a vaccine or immunogenic composition comprising one or more antigens from the Zika virus clonal isolate. In some embodiments, the vaccine or immunogenic composition is a purified antigen vaccine or immunogenic composition, a subunit vaccine or immunogenic composition, an inactivated whole virus vaccine or immunogenic composition, or an attenuated virus vaccine or immunogenic composition. In some embodiments, the vaccine or immunogenic composition is a purified inactivated whole virus vaccine or immunogenic composition. In some embodiments, the Zika virus clonal isolate was chemically inactivated. In some embodiments, the Zika virus clonal isolate was chemically inactivated with one or more of a detergent, formalin, hydrogen peroxide, beta-propiolactone (BPL), binary ethylamine (BET), acetyl ethyleneimine, methylene blue, and psoralen. In some embodiments, the Zika virus clonal isolate was chemically inactivated with formalin.

[0031] In some embodiments that may be combined with any of the preceding embodiments, the methods further include admixing the vaccine or immunogenic composition with an adjuvant. In some embodiments, the adjuvant is selected from aluminum salts, toll-like receptor (TLR) agonists, monophosphoryl lipid A (MLA), synthetic lipid A, lipid A mimetics or analogs, MLA derivatives, cytokines, saponins, muramyl dipeptide (MDP) derivatives, CpG oligos, lipopolysaccharide (LPS) of gram-negative bacteria, polyphosphazenes, emulsions, virosomes, cochleates, poly(lactide-co-glycolide) (PLG) microparticles, poloxamer particles, microparticles, liposomes, Complete Freund's Adjuvant (CFA), and Incomplete Freund's Adjuvant (IFA). In some embodiments, the adjuvant is an aluminum salt. In some embodiments, the adjuvant is selected from alum, aluminum phosphate, aluminum hydroxide, potassium aluminum sulfate, and Alhydrogel 85. In some embodiments, at least 75%, at least 85%, at least 90%, at least 95%, at least 96%, at least 97%, at least 98%, at least 99%, or 100% of the one or more antigens are adsorbed to the adjuvant. In some embodiments that may be combined with any of the preceding embodiments, the vaccine or immunogenic composition comprises from about 0.1 µg Env to about 100 µg Env. In certain such embodiments the Zika virus is a plaque purified clonal Zika virus isolate. In some embodiments, the vaccine or immunogenic composition is unadjuvanted.

[0032] In some embodiments **that may** be combined with any of the preceding embodiments, the **Zika virus** clonal isolate is a homogenous genetic population. **In** some embodiments, the Zika virus clonal isolate does not contain a mutation in Envelope protein E (Env). In some embodiments, the Zika virus clonal isolate contains at least one mutation. In some embodiments, the at least one mutation is in Zika virus **Non-structural protein 1** (NS1). In some embodiments, the **at** least one mutation **occurs** at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1. **In** some embodiments, **the** at least one **mutation** is a Trp98Gly mutation. **In** some embodiments the at least one mutation is not **in** Envelope protein E (Env). **In** some **embodiments**, the at least one mutation **enhances** genetic stability as compared to a Zika virus lacking the at least one mutation. **In** some embodiments, the at least one mutation **enhances** viral replication as compared to a Zika virus lacking the at least one mutation.

[0033] Other aspects of the present disclosure relate to a method of purifying Zika virus for the preparation of a vaccine or immunogenic composition, including one or more (*e.g.*, one or more, two or more, three or more, four or more, five or more, or all six) steps selected from: (a) passing a sample containing a Zika virus through a depth filter to produce an eluate, where the eluate contains the Zika virus; (b) buffer exchanging **and/or** diluting a sample containing a Zika virus by cross flow filtration (CFF) to produce a retentate, where the retentate contains the Zika virus; (c) binding a sample containing a Zika virus to an ion exchange membrane to produce a bound fraction, where the bound fraction contains the Zika virus, and eluting the bound fraction from the ion exchange membrane; (d) treating a sample containing a Zika virus with an effective amount of a chemical inactivator; (e) neutralizing a sample containing a chemically inactivated Zika virus with sodium metabisulfite; and/or (f) purifying a naturalized sample containing a chemically inactivated Zika virus by cross flow filtration (CFF). In some embodiments, the method includes **all of** the steps of: (a) passing a sample containing a Zika virus through a depth filter to produce an eluate, where the eluate contains the Zika virus; (b) buffer exchanging **and/or** diluting a sample containing a Zika virus by cross flow filtration (CFF) to produce a retentate, where the retentate contains the Zika virus; (c) binding a sample containing a Zika virus to an ion exchange membrane to produce a bound fraction, where the bound fraction contains the Zika virus, and eluting the bound fraction from the ion exchange membrane; (d) treating a sample containing a Zika virus with an effective amount of a chemical inactivator; (e) neutralizing a sample containing a chemically inactivated Zika virus with sodium metabisulfite; and/or (f) purifying a naturalized sample containing a chemically inactivated Zika virus by cross flow filtration (CFF), in any order. In some embodiments, the method includes the steps of: (a) passing a sample containing a Zika virus through a first depth filter to produce a first eluate, where the first eluate contains the Zika virus; (b) buffer exchanging **and/or** diluting the first eluate by cross flow filtration (CFF) to produce a first retentate, where the first retentate contains the Zika virus; (c) binding the first retentate to an ion exchange membrane to produce a first bound fraction, where the first bound fraction contains the Zika virus, and eluting the first bound fraction from the ion exchange membrane to produce a second eluate, where the second eluate contains the Zika virus; (d) passing the second eluate through a second depth filter to produce a second retentate, where the second retentate contains the Zika virus; (e) treating the second retentate with an effective amount of a chemical inactivator; (f) neutralizing the treated second retentate with sodium metabisulfite; and (g) purifying the neutralized second retentate by cross flow filtration (CFF). **In** some embodiments **that may** be combined

with any of the preceding embodiments, the ion exchange membrane is an anion exchange membrane. In some embodiments that may be combined with any of the preceding embodiments, the anion exchange membrane comprises **quaternary ammonium ligands**.

[0034] In some embodiments that may be combined with any of the preceding embodiments, the bound fraction of step (c) is **eluted** in multiple steps, where each step includes an increasing salt concentration. In some embodiments that may be combined with any of the preceding embodiments, the salt is sodium chloride. In some embodiments that may be combined with any of the preceding embodiments, the salt concentration increases from 250 mM to 750 mM. In some embodiments that may be combined with any of the preceding embodiments, the chemical inactivator is one or more of a detergent, **formalin**, hydrogen peroxide, **beta-propiolactone (BPL)**, **binary ethylamine (BE1)**, acetyl **ethyleneimine**, methylene blue, and psoralen. In some embodiments that may be combined with any of the preceding embodiments, the chemical inactivator is formalin. In some embodiments that may be combined with any of the preceding embodiments, the neutralization occurs for at least five, at least seven, at least nine, at least 11, or at least 14 days. In some embodiments that may be combined with any of the preceding embodiments, the Zika virus is a Zika virus clonal isolate produced by any of the methods described herein.

[0035] Other aspects of the present disclosure relate to a vaccine or immunogenic composition containing one or more antigens from a **plaque purified clonal Zika virus isolate**. In some embodiments, the plaque purified clonal Zika virus isolate was plaque purified from cells contacted with an inoculum comprising a population of Zika viruses. In some embodiments, the cells are non-human cells. In some embodiments, the cells are insect cells. In some embodiments, the insect cells are mosquito cells. In some embodiments, the cells are mammalian cells. In some embodiments, the **mammalian** cells are monkey cells. In some embodiments, the monkey cells are from a Vero cell line. In some embodiments, the **Vero** cell line is a **WHO Vero 10-87** cell line.

[0036] In some embodiments that may be combined with any of the preceding embodiments, the population of Zika viruses was heterogeneous. In some embodiments that may be combined with any of the preceding embodiments, the population of Zika viruses comprised a Zika virus clinical isolate. In some embodiments, the Zika virus clinical isolate is from strain PRVABC59. In some embodiments that may be combined with any of the preceding embodiments, the population of Zika viruses comprised a Zika virus that had been previously passaged one or more times in cell culture. In some embodiments that may be combined with any of the preceding embodiments, the inoculum comprised human **serum**. In some embodiments that may be combined with any of the preceding embodiments, the inoculum comprised one or more adventitious agents. In some embodiments, the plaque purified clonal Zika virus isolate is substantially free of the one or more adventitious agents.

[0037] In some embodiments that may be combined with any of the preceding embodiments, the plaque purified clonal Zika virus isolate is modified as compared to a wild-type Zika virus. In some embodiments that may be combined with any of the preceding embodiments, the plaque purified clonal Zika virus isolate is a homogenous genetic population. In some embodiments that may be combined with any of the preceding

embodiments, the plaque purified clonal Zika virus isolate does not include a mutation in Envelope protein E (*Em*). In some embodiments that may be combined with any of the preceding embodiments, the plaque purified clonal Zika virus isolate comprises at least one mutation. In some embodiments, the at least one mutation is in Zika virus Non-structural protein 1 (NS1). In some embodiments, the at least one mutation occurs at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1. In some embodiments, the at least one mutation is a Trp98Gly mutation. In some embodiments, the at least one mutation is not in Zika virus Envelope protein E (Env). In some embodiments, the at least one mutation enhances genetic stability as compared to a Zika virus lacking the at least one mutation. In some embodiments, the at least one mutation enhances viral replication as compared to a Zika virus lacking the at least one mutation. In some embodiments that may be combined with any of the preceding embodiments, the plaque purified clonal Zika virus isolate is an African lineage virus or an Asian lineage virus. In some embodiments, the plaque purified clonal Zika virus isolate is an Asian lineage virus.

[0038] In some embodiments that may be combined with any of the preceding embodiments, the vaccine or immunogenic composition is a purified antigen vaccine or immunogenic composition, a subunit vaccine or immunogenic composition, an inactivated whole virus vaccine or immunogenic composition, or an attenuated virus vaccine or immunogenic composition. In some embodiments, the vaccine or immunogenic composition is an inactivated whole virus vaccine or immunogenic composition. In some embodiments that may be combined with any of the preceding embodiments, the plaque purified clonal Zika virus isolate was chemically inactivated. In some embodiments, the plaque purified Zika virus was chemically inactivated with one or more of a detergent, formalin, hydrogen peroxide, beta-propiolactone (BPL), binary ethylamine (BEI), acetyl ethyleneimine, methylene blue, and psoralen. In some embodiments, the plaque purified clonal Zika virus isolate was chemically inactivated with formalin.

[0039] In some embodiments that may be combined with any of the preceding embodiments, the vaccine or immunogenic composition further comprises an adjuvant. In some embodiments, the adjuvant is selected from aluminum salts, toll-like receptor (TLR) agonists, monophosphoryl lipid A (MLA), synthetic lipid A, lipid A mimetics or analogs, MLA derivatives, cytokines, saponins, muramyl dipeptide (MDP) derivatives, CpG oligos, lipopolysaccharide (LPS) of gram-negative bacteria, polyphosphazenes, emulsions, virosomes, cochleates, poly(lactide-co-glycolides) (PLG) microparticles, poloxamer particles, microparticles, liposomes, Complete Freund's Adjuvant (CPA), and Incomplete Freund's Adjuvant (IFA). In some embodiments, the adjuvant is an aluminum salt. In some embodiments, the adjuvant is selected from aluminum phosphate, aluminum hydroxide, potassium aluminum sulfate, and Alhydrogel 85. In some embodiments, at least 75%, at least 85%, at least 90%, at least 95%, at least 96%, at least 97%, at least 98%, at least 99%, or 100% of the one or more antigens are adsorbed to the adjuvant. In some embodiments that may be combined with any of the preceding embodiments, the vaccine or immunogenic composition contains from about 0.1 µg Env to about 100 µg Env. In certain such embodiments the Zika virus is a plaque purified clonal Zika virus isolate. In some embodiments, the vaccine or immunogenic composition is unadjuvanted.

[0040] It is to be understood that one, some, or all of the properties of the various embodiments described above and herein may be combined to form other embodiments of the present disclosure. These and

other aspects of the present disclosure **will** become apparent to one of skill in the art. These and other embodiments of the present disclosure are further described by the detailed description that follows.

BRIEF DESCRIPTION OF THE DRAWINGS

[0041] **FIG. 1** shows bright field **microscopy** images of Vero cell monolayers mock **infected** (top) or infected with **ZIKAV** strain PRVABC59 (bottom).

[0042] **FIG. 2** shows growth kinetics of ZIKAV **PRVABC59 P1** on Vero cell monolayers, as **determined** by TCTD50.

[0043] **FIG. 3** shows potency **assay** testing (TCID₅₀) of Zika virus **PRVABC59 P5** clones **a-f**.

[0044] **FIG. 4** shows bright-field microscopy images depicting **the** cytopathic effect (CPE) of growth of **Zika virus** PRVABC59 P6 clones **a-f** on Vero cell monolayers.

[0045] **FIG. 5** shows potency assay testing (TCID₅₀) of Zika **virus** PRVABC59 P6 clones **a-f**

[0046] **FIG. 6** shows an amino acid sequence alignment comparing (he envelope glycoprotein sequence of Zika vims near residue 330 from **Zika vims** strains **PRVABC59 P6e** (SEQ ID NO: 8) and **PRVABC59** (SEQ ID NO: 9) with several other flavivimses (**WNV** (SEQ ID NO: 10); **JEV** (SEQ ID NO: 11); **SLEV** (SEQ ID NO: 12); **YFV** (SEQ ID NO: 13); **DENV 1 16007** (SEQ ID NO: 14); **DENV 2 16681** (SEQ ID NO: 15); **DENV 3 16562** (SEQ IDNO: 16); and **DENV 4 1036** (SEQ ID NO: 17)).

[0047] **FIG. 7** shows an amino acid sequence alignment comparing (he **NS1** protein sequence of Zika vims near residue 98 from Zika vims strains PRVABC59 P6e (SEQ ID NO: 18) and PRVABC59 (SEQ ID NO: 19) **with** several other flavivimses (**WNV** (SEQ ID NO: 20); **JEV** (SEQ ID NO: 21); **SLEV** (SEQ ID NO: 22); **YFV** (SEQ ID NO: 23); **DENV 1 16007** (SEQ ID NO: 24); **DENV 2 16681** (SEQ ID NO: 25); **DENV 3 16562** (SEQ IDNO: 26); and **DENV 4 1036** (SEQ ID NO: 27)).

[0048] **FIG. 8** shows the plaque **phenotype** of ZIKAV PRVABC59 P6 **virus** clones a-f compared to ZIKAV **PRVABC59 P1** virus.

[0049] **FIG. 9** shows the mean plaque size of ZIKAV PRVABC59 **P6** virus clones compared to ZIKAV **PRVABC59 P1** virus.

[0050] **FIG. 10** shows the growth kinetics of ZIKAV **PRVABC59 P6** clones **a-f** in Vero cells under serum-free growth conditions.

[0051] **FIG. 11** shows a schematic of the steps taken to prepare **PRVABC59 P6b** and **P6e** formulated dmg product for the immunization experiments.

[0052] FIG. 12A shows the schedule of dosing of CD-I mice with vaccine formulations derived from the ZIKAV PRVABC59 P6b and P6e clones. PBS was used as placebo.

[0053] FIG. 12B shows the serum ZIKAV neutralizing antibody titers of CD-I mice immunized as described in FIG. 12A using vaccine formulations derived from ZIKAV PRVABC59 P6b and P6e clones. ZIKAV neutralizing antibody titers were determined by Reporter Virus Particle (RVP) neutralization assay. Solid lines represent the geometric mean of a group. The limit of detection (1.93 log₁₀) is represented by a dashed line.

[0054] FIG. 13A shows the schedule of dosing of AG129 mice with vaccine formulations derived from the ZIKAV PRVABC59 P6b and P6e clones. PBS was used as a placebo.

[0055] FIG. 13B shows the serum ZIKAV neutralizing antibody titers of AG129 mice immunized as described in FIG. 13A using vaccine formulations derived from ZIKAV PRVABC59 P6b and P6e clones. Solid lines represent the geometric mean of a group. The limit of detection (1.30 log₁₀) is represented by a dashed line. Animals with no detectable titer (<1.30) were assigned a titer of 0.5.

[0056] FIG. 14 shows the mean weight of AG129 test groups post-challenge, represented as a percentage of starting weight. Error bars represent standard deviation.

[0057] FIG. 15 shows the serum viremia of individual AG129 mice two days post-challenge, reported as PFU/nL. Solid lines represent the mean of a group. The limit of detection (2.0 log₁₀) is represented by a dashed line.

[0058] FIG. 16 shows the survival analysis of AG129 test groups post-challenge.

[0059] FIG. 17 shows the pre-challenge serum circulating ZIKAV neutralizing antibody (Nab) titers following passive transfer of pooled sera from vaccinated and challenged AG129 mice.

[0060] FIG. 18 shows the mean body weight of passive transfer and control mice challenged with Zika virus.

[0061] FIG. 19 shows the serum viremia of individual AG129 mice three days post-challenge, reported as PFU/mL.

[0062] FIG. 20 shows the survival analysis of passive transfer and control mice challenged with Zika virus.

[0063] FIG. 21 shows the correlation between ZIKAV neutralizing antibody titers and viremia observed in passive transfer mice.

[0064] FIG. 22 shows the survival analysis of AG129 mice after infection with Zika virus preMVS stocks of P6a and P6e using a Kaplan Meier survival curve.

[0065] FIG. 23 shows the mean body weight as expressed in percentage of starting weight at time of invention after infection with Zika virus preMVS stocks of P6a and P6e. The dashed line represents 100% of starting weight for reference.

[0066] FIG. 24 shows the serum viremia of individual AG129 mice three days post-infection with Zika virus preMVS stocks of P6a and P6e, reported as PFU/mL. The dashed line represents the limit of detection of the assay.

[0067] Fig. 25 shows a summary of the Clinical Study Design for Example 4.

[0068] FIG. 26 shows the Geometric Mean Titers (GMTs) determined using PRNT of the Subjects in Example 4

[0069] FIG. 27 shows the percentage of subjects achieving seroconversion determined using PRNT at Day 29 (day 28 after prime dose) and Day 57 (28 days after boost dose) of the study described in Example 4.

[0070] FIG. 28 shows the plot of the percentage of subjects achieving a particular Geometric Mean Titer (determined using PRNT) on day 29 (day 28 after prime dose) of the study described in Example 4.

[0071] FIG. 29 shows the plot of the percentage of subjects achieving a particular Geometric Mean Titer (determined using PRNT) on day 57 (day 56 after prime dose) of the study described in Example 4.

DETAILED DESCRIPTION

General Techniques

[0072] The techniques and procedures described or referenced herein are generally well understood and commonly employed using conventional methodology by those skilled in the art, such as, for example, the widely utilized methodologies described in Sambrook et al., *Molecular Cloning: A Laboratory Manual* 3rd edition (2001) Cold Spring Harbor Laboratory Press, Cold Spring Harbor, N.Y.; *Current Protocols in Molecular Biology* (F.M. Ausubel, et al. eds., (2003)); the series *Methods in Enzymology* (Academic Press, Inc.); *PCR 2: A Practical Approach* (M.J. MacPherson, B.D. Hames and G.R. Taylor eds. (1995)), *Antibodies, A Laboratory Manual* (Harlow and Lane, eds. (1988), and *Animal Cell Culture* (R.I. Freshney, ed. (1987)); *Oligonucleotide Synthesis* (M.J. Gait, ed., 1984); *Methods in Molecular Biology* (J. M. Walker, ed. Humana Press (1983)); *Cell Biology: A Laboratory Notebook* (J.E. Cells, ed., Academic Press (1998)) Academic Press; *Animal Cell Culture* (R.I. Freshney), ed., 1987); *Introduction to Cell and Tissue Culture* (J.P. Mather and P.E. Roberts, eds. Plenum Press (1998)); *Cell and Tissue Culture: Laboratory Procedures* (A. Doyle, J.B. Griffiths, and D.G. Newell, eds., J. Wiley and Sons (1993-8)); *Handbook of Experimental Immunology* (D.M. Weir and C.C. Blackwell, eds.); *Gene Transfer Vectors for Mammalian Cells* (J.M. Miller and M.P. Calos, eds., Cold Spring Harbor Laboratory (1987)); *PCR: The Polymerase Chain Reaction*, (Mullis et al., eds., Springer (1994)); *Current Protocols in Immunology* (J.E. Coligan et al., eds., Wiley (1991)); *Short Protocols in Molecular Biology* (Wiley and Sons, 1999); *immunobiology* (C.A. Janeway and P. Travers, (1997)); *Antibodies* (P. Finch, 1997); *Antibodies: A Practical Approach* (D. Catty., ed., JUL Press, (1988-1989));

Lane (Cold Spring Harbor Laboratory Press, (1999)); and *The Antibodies* (M. Zanetti and J.D. Capra, eds., Harwood Academic Publishers, (1995)).

Zika virus

[0073] Certain aspects of the present disclosure relate to at least one Zika virus (*e.g.*, a Zika virus clonal isolate, a Zika virus purified by the methods described herein, a Zika virus comprising one or more non-human cell adaptation mutations, *etc.*) that may be useful in vaccines and/or immunogenic compositions including, without limitation, purified viruses, inactivated viruses, attenuated viruses, recombinant viruses, or purified and/or recombinant viral proteins for submit vaccines.

[0074] Zika virus (ZIKV) is a mosquito-borne flavivirus first isolated from a sentinel rhesus monkey in the Zika Forest in Uganda in 1947. Since that time, isolations have been made from humans in both Africa and Asia, and more recently, the Americas. ZIKV is found in two (possibly three) lineages: an African lineage (possibly separate East and West African lineages) and an Asian lineage. Accordingly, examples of suitable Zika viruses of the present disclosure include, without limitation, viruses from the African and/or Asian lineages. In some embodiments, the Zika virus is an African lineage virus. In some embodiments, the Zika virus is an Asian lineage virus. Additionally, multiple strains within the African and Asian lineages of Zika virus have been previously identified. Any one or more suitable strains of Zika virus known in the art may be used in the present disclosure, including, for examples, strains Mr 766, ArD 41519, IbH 30656, P6-740, EC-Yap, FSS13025, ArD 7117, ArD 9957, ArD 30101, ArD 30156, ArD 30332, HD 78788, ArD 127707, ArD 127710, ArD 127984, ArD 127988, ArD 127994, ArD 128000, ArD 132912, 132915, ArD 141170, ArD 142623, ArD 149917, ArD 149810, ArD 149938, ArD 157995, ArD 158084, ArD 165522, ArD 165531, ArA 1465, ArA 27101, ArA 272.90, ArA 27106, ArA 27096, ArA 27407, ArA 27433, ArA 506/96, ArA 975-99, Ara 982-99, AxA 986-99, ArA 2718, ArB 1362, Nigeria68, Malaysia66, Kedougou84, Suriname, MR1429, PRVABC59, ECMN2007, DakAr4 1524, RYPF/2013, R103451, 103344, 8375, JMB-185, ZIKV/H, sapiens/Brazil/Natal/2015, SPH2015, ZIKV/Hu/Chiba/S36/2016, and/or Cuba2017. In some embodiments, strain PRVABC59 is used in the present disclosure.

[0075] In some embodiments, an example of a Zika virus genome sequence is set forth below as SEQ ID NO: 2:

[0076] In some embodiments, the Zika virus may comprise the genome sequence of GenBank Accession number KU501215.1. In some embodiments, the Zika virus is from strain PRVABC59. In some embodiments the genome sequence of GenBank Accession number KU501215.1 comprises the sequence of SEQ ID NO: 2. In some embodiments, the Zika virus may comprise a genomic sequence that has at least 70%, at least 71%, at least 72%, at least 73%, at least 74%, at least 75%, at least 76%, at least 77%, at least 78%, at least 79%, at least 80%, at least 81%, at least 82%, at least 83%, at least 84%, at least 85%, at least

86%, at least 87%, at least 88%, at least 89%, at least 90%, at least 91%, at least 92%, at least 93%, at least 94%, at least 95%, at least 96%, at least 97%, at least 98%, at least 99%, or 100% sequence identity with the sequence of SEQ ID NO: 2.

[0077] In some embodiments, the Zika virus may comprise at least one polypeptide encoded by the sequence of SEQ ID NO: 2. In some embodiments, the Zika virus may comprise at least one polypeptide having an amino acid sequence that has at least 85%, at least 86%, at least 87%, at least 88%, at least 89%, at least 90%, at least 91%, at least 92%, at least 93%, at least 94%, at least 95%, at least 96%, at least 97%, at least 98%, at least 99%, or 100% sequence identity with an amino acid sequence encoded by the sequence of SEQ ID NO: 2.

[0078] Accordingly, in some embodiments, Zika viruses of the present disclosure may be used in any of the vaccines and/or immunogenic compositions disclosed herein. For example, Zika viruses of the present disclosure may be used to provide one or more antigens useful for treating or preventing Zika virus infection in a subject in need thereof and/or for inducing an immune response, such as a protective immune response, against Zika virus in a subject in need thereof.

Viral Antigens

[0079] In some embodiments, the present disclosure relates to one or more antigens from any Zika virus described herein useful in vaccines and/or immunogenic compositions including, without limitation, purified viruses, inactivated viruses, attenuated viruses, recombinant viruses, or purified and/or recombinant viral proteins for subunit vaccines. In some embodiments, the vaccines and/or immunogenic compositions include purified inactivated whole viruses. In some embodiments the virus is a plaque purified clonal Zika virus isolate.

[0080] Antigens of the present disclosure may be any substance capable of eliciting an immune response. Examples of suitable antigens include, but are not limited to, whole virus, attenuated virus, inactivated virus, proteins, polypeptides (including active proteins and individual polypeptide epitopes within proteins), glycopolypeptides, lipopolypeptides, peptides, polysaccharides, polysaccharide conjugates, peptide and non-peptide mimics of polysaccharides and other molecules, small molecules, lipids, glycolipids, and carbohydrates.

[0081] Antigens of the present disclosure may be from any Zika virus (*e.g.*, a Zika virus clonal isolate) produced from one or more cells in cell culture (*e.g.*, via plaque purification). Any suitable cells known in the art for producing Zika virus may be used, including, for example, insect cells (*e.g.*, mosquito cells such as CCL-125 cells, Aag-2 cells, RML-12 cells, C6/36 cells, C7-10 cells, AP-61 cells, A.t. GRIP-1 cells, A.t. GRIP-2 cells, A.t. GRIP-3 cells, UM-AVE1 cells, Mos.55 cells, SuaIB cells, 4a-3B cells, Mos.42 cells, MSQ43 cells, LSB-AA695BB cells, NIID-CTR cells, TRA-171 cells, and additional cells or cell lines from mosquito species such as *Aedes aegypti*, *Aedes albopictus*, *Aedes pseudoscutellaris*, *Aedes triseriatus*, *Aedes vexans*, *Anopheles gambiae*, *Anopheles stephensi*, *Anopheles alhimus*, *Culex quinquefasciatus*, *Culex theileri*, *Culex tritaeniorhynchus*, *Culex bitaeniorhynchus*, and/or *Toxorhynchites amboinensis*), and mammalian cells

(*e.g.*, VERO cells (from monkey kidneys), LLC-MK2 cells (from monkey kidneys), MDBK cells, MDCK cells, ATCC CCL34 MDCK (NBL2) cells, MDCK. 33016 (deposit number DSM ACC 2219 as described in WO97/37001) cells, BHK21-F cells, HKCC cells, or Chinese hamster ovary cells (CHO cells). In some embodiments, antigens of the present disclosure are from a Zika virus (*e.g.*, a Zika virus clonal isolate) produced from a non-human cell (*e.g.*, via plaque purification). In some embodiments, antigens of the present disclosure are from a Zika virus (*e.g.*, a Zika virus clonal isolate) produced from an insect cell (*e.g.*, via plaque purification). In some embodiments, antigens of the present disclosure are from a Zika virus (*e.g.*, a Zika virus clonal isolate) produced from a mosquito cell (*e.g.*, via plaque purification). In some embodiments, antigens of the present disclosure are from a Zika virus (*e.g.*, a Zika virus clonal isolate) produced from a mammalian cell (*e.g.*, via plaque purification). In some embodiments, antigens of the present disclosure are from a Zika virus (*e.g.*, a Zika virus clonal isolate) produced from a VERO cell (*e.g.*, via plaque purification). Methods of purifying a virus by performing plaque purification are known to one of ordinary skill in the art (*See e.g.*, Example 1 below).

[0082] Antigens of the present disclosure may include at least one non-human cell adaptation mutation. Adaptation mutations may be generated by adapting a virus to growth in a particular cell line. For example, a cell may be transfected or electroporated with a virus, RNA transcribed from a virus (*e.g.*, an infectious virus, or infectious clone), and/or RNA purified from a whole virus and passaged such that the virus and/or viral RNA replicates and its nucleic acid mutates. Nucleic acid mutations may be point mutations, insertion mutations, or deletion mutations. Nucleic acid mutations may lead to amino acid changes within viral proteins that facilitate growth of the virus in a non-human cell. Adaptation mutations may facilitate phenotypic changes in the virus, including altered plaque size, growth kinetics, temperature sensitivity, drug resistance, virulence, and virus yield in cell culture. These adaptive mutations may be useful in vaccine manufacture by increasing the speed, yield, and consistency of virus cultured in a cell line. Adaptive mutations may change (*e.g.*, enhance or decrease) immunogenicity of viral antigens by altering the structure of immunogenic epitopes. In addition, adaptive mutations may also increase the genetic stability of the virus and/or reduce or otherwise inhibit the development of undesirable mutations in the virus through multiple (*e.g.*, at least five, at least six, at least seven, at least eight, at least nine, at least 10, at least 11, at least 12, at least 13, at least 14, at least 15, at least 16, at least 17, at least 18, at least 19, at least 20, or more) passages.

[0083] Accordingly, in certain embodiments, antigens of the present disclosure include at least one non-human cell adaptation mutation. In certain embodiments, the adaptation mutation is a mutation of a viral antigen to a non-human cell. In some embodiments, the non-human cell is a mammalian cell. Any suitable mammalian cell known in the art may be used, including, without limitation, VERO cells (from monkey kidneys), LLC-MK2 cells (from monkey kidneys), MDBK cells, MDCK cells, ATCC CCL34 MDCK (NBL2) cells, MDCK 33016 (deposit number DSM ACC 2219 as described in WO97/37001) cells, BHK21-F cells, HKCC cells, or Chinese hamster ovary cells (CHO cells). In some embodiments, the non-human cell is a monkey cell. In some embodiments, the monkey cell is from a Vero cell line. Any suitable Vero cell line known in the art may be used, including, without limitation, WHO Vero 10-87, ATCC CCL-81, Vero 76 (ATCC Accession No. CRL-1587), or Vero C1008 (ATCC Accession No. CRL-1586). In some embodiments, the Vero cell line is WHO Vero 10-87.

[0084] Zika **viruses** possess a positive **sense**, single-stranded RNA genome encoding both structural and nonstructural polypeptides. The genome also contains non-coding sequences at both the 5'- and 3'- terminal regions that play a role **in** virus replication. Structural **polypeptides** encoded by these **viruses** include, without limitation, capsid (C), precursor membrane (prM), and envelope (**E**). Non-structural (NS) polypeptides encoded by these viruses include, without limitation, NS1, NS2A, NS2B, NS3, NS4A, NS4B, and NS5.

[0085] In certain embodiments, antigens of the present **disclosure** may contain at least one (*e.g.*, at least one, at least two, at least three, at least four, at least five, at least six, at least seven, at least eight, at least nine, at least 10, at least 11, at least 12, at least 13, at least 14, at least 15, at least 16, at least 17, at least 18, at least 19, at least 20, *etc.*) non-human cell adaptation mutations within one or more (*e.g.*, one or more, two or more, three or more, four or more, five or more, six or more, seven or more, eight or more, nine or more, or all ten) viral antigens/polypeptides, including, without limitation, C, prM, E, NS1, NS2A, **NS2B**, NS3, NS4A, NS4B, and NS5. In some embodiments, antigens of the present disclosure include at least one non-human cell adaptation mutation in Zika vims **Non-structural protein 1 (NS1)**. **In** some embodiments, antigens of the present disclosure include whole, inactivated vims **that** may contain at least one (*e.g.*, at least one, at least two, at least **three**, at least four, at least five, at least six, at least **seven**, at least eight, at least nine, at least **10**, *etc.*) non-human cell adaptation mutations. **In** some **embodiments**, antigens of the present disclosure include whole, **inactivated** vims **that** may contain at least one **non-human** cell adaptation mutation **in** Zika virus Non-structural protein 1 (**NS1**). **In** some embodiments, antigens of the present disclosure include whole, inactivated **viruses** **that** may contain a **Trp98Gly** mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1.

[0086] In some embodiments, the at least one non-human cell adaptation mutation is within the NS1 polypeptide. The amino acid sequence of a wild-type, non-cell adapted NS1 polypeptide from an **exemplary** Zika **virus** strain is set **forth** as:

**DVGCSDVDFSKKETRCGTGVFVTNDVEAWRDRYKYHPDSPRRLAAAVKQAWEDGICGISSVSRMENI

YGMEIRPRKEPESNLVRSMT (SEQ ID NO: 1).**

[0087] In some embodiments, the amino acid sequence of the NS1 polypeptide has at least 80%, at least **81%**, at least 82%, at least 83%, at least **84%**, at least 85%, at least 86%, at least 87%, at least 88%, at least 89%, at least 90%, at least **91%**, at least 92%, at least 93%, at least 94%, at least 95%, at least 96%, at least 97%, at least 98%, at least 99%, or 100% sequence identity **with** the sequence of SEQ ID NO: 1. **In** some embodiments, the amino acid sequence of the NS1 polypeptide may be from the amino acid sequence encoded by the sequence of **GenBank** Accession number **KU501215.1** (SEQ ID NO: 2). In some embodiments, the amino acid sequence of the NS1 polypeptide may be amino acid positions 795 to 1145 of the amino acid sequence encoded by the sequence of **GenBank** Accession number **KU501215.1**. **In** some embodiments, the amino acid sequence of the NS1 polypeptide may be from Zika vims strain **PRVABC59**.

[0088] "Sequence Identity", "% sequence identity", "% identity", "% identical" or "sequence alignment" means a comparison of a first amino acid sequence to a second amino acid sequence, or a comparison of a first nucleic acid sequence to a second nucleic acid sequence and is calculated as a percentage based on the comparison. The result of this calculation can be described as "percent identical" or "percent ID."

[0089] Generally, a sequence alignment can be used to calculate the sequence identity by one of two different approaches. In the first approach, both mismatches at a single position and gaps at a single position are counted as non-identical positions in final sequence identity calculation. In the second approach, mismatches at a single position are counted as non-identical positions in final sequence identity calculation; however, gaps at a single position are not counted (ignored) as non-identical positions in final sequence identity calculation. In other words, in the second approach gaps are ignored in final sequence identity calculation. The difference between these two approaches, i.e. counting gaps as non-identical positions vs ignoring gaps, at a single position can lead to variability in the sequence identity value between two sequences.

[0090] A sequence identity is determined by a program, which produces an alignment, and calculates identity counting both mismatches at a single position and gaps at a single position as non-identical positions in final sequence identity calculation. For example program Needle (EMBOS), which has implemented the algorithm of Needleman and Wunsch (Needleman and Wunsch, 1970, J. Mol. Biol. 48: 443-453), and which calculates sequence identity per default settings by first producing an alignment between a first sequence and a second sequence, then counting the number of identical positions over the length of the alignment, then dividing the number of identical residues by the length of an alignment, then multiplying this number by 100 to generate the % sequence identity [% sequence identity = (# of Identical residues / length of alignment) x 100].

[0091] A sequence identity can be calculated from a pairwise alignment showing both sequences over the full length, so showing the first sequence and the second sequence in their full length ("Global sequence identity"). For example, program Needle (EMBOSS) produces such alignments; % sequence identity = (# of identical residues / length of alignment) x 100].

[0092] A sequence identity can be calculated from a pairwise alignment showing only a local region of the first sequence or the second sequence ("Local Identity"). For example, program Blast (NCBI) produces such alignments; % sequence identity = (# of Identical residues / length of alignment) x 100].

[0093] The sequence alignment is preferably generated by using the algorithm of Needleman and Wunsch (J. Mol. Biol. (1979) 48, p. 443-453). Preferably, the program "NEEDLE" (The European Molecular Biology Open Software Suite (EMBOSS)) is used with the programs default parameter (gap open=T0.0, gap extend=0.5 and matrix=EBLOSUM62 for proteins and matrix=EDNAFULL for nucleotides). Then, a sequence identity can be calculated from the alignment showing both sequences over the full length, so

showing the first sequence and **the** second sequence in their full length ("Global sequence identity"). For example: % sequence identity = (# of identical residues / **length** of alignment) x 100].

[0094] **In** some embodiments, **the at least one non-human cell adaptation mutation** occurs at one or more amino acid positions within the **NSI** polypeptide. In some embodiments, the mutation occurs at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1 when aligned to SEQ ID NO: 1 using a pairwise alignment algorithm. In some embodiments, the mutation at position 98 is a **tryptophan to glycine** substitution.

[0095] In some embodiments, the Zika virus comprises a mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1. A position corresponding to position 98 of SEQ ID NO: 1 can be determined by aligning the amino acid sequence of an **NS-1** protein to SEQ ID NO: 1 using a pairwise alignment algorithm. Amino acid residues **in viruses other than Zika virus** which correspond to the tryptophan residue at position 98 of SEQ ID NO: 1 are shown **in** Figure 7 of the present application where these residues are boxed. In some embodiments, the mutation at position 98 is a tryptophan to glycine substitution. In some embodiments, the **mutation** at position 98 is a tryptophan **to** glycine substitution at position 98 of SEQ ID NO: 1.

[0096] In some embodiments, antigens of the present disclosure contain at least one **non-human cell adaptation mutation within** the **NSI** proteia and contain **at least one mutation** (*e.g.*, at least one adaptation mutation) **within one or more of the C, prM, E, NSI, NS2A, NS2B, NS3, NS4A, NS4B, and NS5 viral proteins.** **In** some embodiments, antigens of **the present disclosure contain** one or more **non-human cell adaptation mutations within the NSI** prote in, and do **not** contain at least one mutation (*e.g.*, at least one non-human cell adaptation mutation) within one or more of the C, prM, E, NSI, NS2A, NS2B, NS3, NS4A, NS4B, and NS5 viral proteins. In some embodiments, antigens of the present disclosure contain at least one non-human cell adaptation mutation within **the NSI** protein and do not contain **at least one mutation** (*e.g.*, **at least one non-human cell adaptation mutation**) within the envelope protein **E.** **In** some embodiments, antigens of the present disclosure include whole, inactivated virus **that** contains at least one non-human cell adaptation mutation in Zika vims Non-structural protein 1 (NSI), and do not include a mutation in Zika virus envelope protein E (Env). In some embodiments, antigens of the present disclosure contain a mutation at position 98 of SEQ ID NO: 1, or at a position **corresponding to** position 98 of SEQ ID NO: 1 and do not contain **any** mutation within the envelope protein E. In some embodiments, antigens of the present disclosure include whole, inactivated **virus that** contains a mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1 and do not include a mutation in Zika virus envelope protein E (Env). In some embodiments, whole, inactivated **virus** contains at least one mutation **in Zika virus Non-structural protein 1 (NSI)** and the sequence encoding the envelope protein is the same as the corresponding sequence **in** SEQ ID No. 2. **In** some embodiments, **the Zika virus** contains a mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1 and the sequence encoding the envelope protein is the same as the **corresponding** sequence in SEQ ID No. 2. In some embodiments, whole, **inactivated Zika virus** contains a **mutation at** position 98 of SEQ ID NO: 1, or at a position corresponding **to**

position 98 of SEQ ID NO: 1 and the sequence encoding the envelope protein is the same as the corresponding sequence in SEQ ID No. 2.

[0097] In some embodiments, antigens of the present disclosure, such as Zika virus, contain at least one non-human cell adaptation mutation that enhances genetic stability as compared to a Zika virus lacking the at least one adaptation mutation. In some embodiments, antigens of the present disclosure, such as Zika virus, contain at least one non-human cell adaptation mutation that enhances viral replication as compared to a Zika virus lacking the at least one adaptation mutation. In some embodiments, antigens of the present disclosure, such as Zika virus, contain at least one non-human cell adaptation mutation reduces or otherwise inhibits the occurrence of undesirable mutations, such as within the envelope protein E (Env) of the Zika virus.

[0098] In the above embodiments of the present disclosure, an exemplary pairwise alignment algorithm is the Needleman-Wunsch global alignment algorithm, using default parameters (e.g. with Gap opening penalty=10.0, and with Gap extension penalty=0.5, using the EBLOSUM62 scoring matrix). This algorithm is conveniently implemented in the needle tool in the EMBOSS package.

[0099] In some embodiments, antigens of the present disclosure from a Zika virus may be used in any of the vaccines and immunogenic compositions of the present disclosure. For example, the antigens of the present disclosure may be useful for treating or preventing Zika virus infection in a subject in need thereof and/or inducing an immune response, such as a protective immune response, against Zika virus in a subject in need thereof.

Production of Vaccines and Immunogenic Compositions

[00100] Other aspects of the present disclosure relate to Zika virus vaccines and immunogenic compositions containing one or more antigens of the present disclosure from at least one Zika virus in particular in the form of a purified inactivated whole virus, such as a Zika virus with a mutation which is a tryptophan to glycine substitution at position 98 of SEQ ID NO: 1 or at a position corresponding to position 98 of SEQ ID NO: 1 as described herein. In some embodiments, the vaccine or immunogenic composition comprises a purified inactivated whole Zika virus comprising a Trp98Gly mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1, wherein the Zika virus is derived from strain PRVABC59. In some embodiments, the vaccine or immunogenic composition comprises a purified inactivated whole Zika virus comprising a Trp98Gly mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1, wherein the Zika virus is derived from strain PRVABC59 comprising the genomic sequence according to SEQ ID NO:2. In one embodiment, the vaccines and immunogenic compositions contain a plaque purified clonal Zika virus isolate. Such vaccines and immunogenic compositions may be useful, for example, for treating or preventing Zika virus infection in a subject in need thereof and/or inducing an immune response, such as a protective immune response, against Zika virus in a subject in need thereof. Vaccines and/or immunogenic compositions of the present disclosure may include, without limitation, purified viruses, inactivated viruses, attenuated viruses, recombinant viruses, purified and/or recombinant viral proteins for subunit vaccines. Vaccines and/or immunogenic compositions

of the present disclosure may further include a purified antigen vaccine or immunogenic composition, a subunit vaccine or immunogenic composition, an inactivated whole virus vaccine or immunogenic composition, or an attenuated virus vaccine or immunogenic composition.

[00101] Production of vaccines and/or immunogenic compositions of the present disclosure includes growth of Zika virus, with antigens being prepared from the grown virus. Growth in cell culture is a method for preparing vaccines and/or immunogenic compositions of the present disclosure. Cells for viral growth may be cultured in suspension or in adherent conditions.

[00102] Cell lines suitable for growth of the at least one virus of the present disclosure are preferably of mammalian origin, and include, but are not limited to: insect cells (*e.g.*, mosquito cells as described herein. VERO cells (from monkey kidneys), horse, cow (*e.g.* MDBK cells), sheep, dog (*e.g.* MDCK cells from dog kidneys, ATCC CCL34 MDCK (NBL2) or MDCK 33016, deposit number DSM ACC 2219 as described in WO97/37001), cat, and rodent (*e.g.* hamster cells such as BHK21-F, HKCC cells, or Chinese hamster ovary cells (CHO cells)), and may be obtained from a wide variety of developmental stages, including for example, adult, neonatal, fetal, and embryo. In certain embodiments, the cells are immortalized (*e.g.* PERC.6 cells, as described in WO 01/38362 and WO 02/40665, and as deposited under ECACC deposit number 96022940). In preferred embodiments, mammalian cells are utilized, and may be selected from and/or derived from one or more of the following non-limiting cell types: fibroblast cells (*e.g.* dermal, lung), endothelial cells (*e.g.* aortic, coronary), pulmonary, vascular, dermal microvascular, umbilical), hepatocytes, keratinocytes, immune cells (*e.g.* T cell, B cell, macrophage, NK, dendritic), mammary cells (*e.g.* epithelial), smooth muscle cells (*e.g.* vascular, aortic, coronary, arterial, uterine, bronchial, cervical, retinal pericytes), melanocytes, neural cells (*e.g.* astrocytes), prostate cells (*e.g.* epithelial, smooth muscle), renal cells (*e.g.* epithelial, mesangial, proximal tubule), skeletal cells (*e.g.* chondrocyte, osteoclast, osteoblast), muscle cells (*e.g.* myoblast, skeletal, smooth, bronchial), liver cells, retinoblasts, and stromal cells. WO97/37000 and WO97/37001 describe production of animal cells and cell lines that are capable of growth in suspension and in serum free media and are useful in the production and replication of viruses.

[00103] Culture conditions for the above cell types are known and described in a variety of publications. Alternatively culture medium, supplements, and conditions may be purchased commercially, such as for example, described in the catalog and additional literature of Cambrex Bioproducts (East Rutherford, N.J.).

[00104] In certain embodiments, the cells used in the methods described herein are cultured in serum free and/or protein free media. A medium is referred to as a serum-free medium in the context of the present disclosure in which there are no additives from serum of human or animal origin. Protein-free is understood to mean cultures in which multiplication of the cells occurs with exclusion of proteins, growth factors, other protein additives and non-serum proteins, but can optionally include proteins such as trypsin or other proteases that may be necessary for viral growth. The cells growing in such cultures naturally contain proteins themselves.

[00105] Known serum-free media include Iscove's medium, Ultra-CHO medium (BioWhittaker) or EX-CELL (JRH Bioscience). Ordinary serum-containing media include Eagle's Basal Medium (BME) or Minimum Essential Medium (MEM) (Eagle, Science, 130, 432 (1959)) or Dulbecco's Modified Eagle Medium (DMEM or EDM), which are ordinarily used with up to 10% fetal calf serum or similar additives. Optionally, Minimum Essential Medium (MEM) (Eagle, Science, 130, 432 (1959)) or Dulbecco's Modified Eagle Medium (DMEM or EDM) may be used without any serum containing supplement. Protein-free media like PF-CHO (JHR Bioscience), chemically-defined media like ProCHO 4CDM (BioWhittaker) or SMIF 7 (Gibco/BRL Life Technologies) and mitogenic peptides like Primactone, Pepticase or HyPep.TM. (ail from Quest International) or lactalbumin hydrolysate (Gibco and other manufacturers) are also adequately known in the prior art. The media additives based on plant hydrolysates have the special advantage that contamination with viruses, mycoplasma or unknown infectious agents can be ruled out.

[00106] Cell culture conditions (temperature, cell density, pH value, etc.) are variable over a very wide range owing to the suitability of the cell line employed according to the present disclosure and can be adapted to the requirements of particular viral strains.

[00107] The method for propagating virus in cultured cells generally includes the steps of inoculating the cultured cells with the strain to be cultured, cultivating the infected cells for a desired time period for virus propagation, such as for example as determined by virus titer or antigen expression (e.g. between 24 and 168 hours after inoculation) and collecting the propagated virus. In some embodiments, the virus is collected via plaque purification. The cultured cells are inoculated with a virus (measured by PFU or TCID₅₀) to cell ratio of 1:500 to 1:1, preferably 1:100 to 1:5. The virus is added to a suspension of the cells or is applied to a monolayer of the cells, and the virus is absorbed on the cells for at least 10 minutes, at least 20 minutes, at least 30 minutes, at least 40 minutes, at least 50 minutes, at least 60 minutes but usually less than 300 minutes at 25°C to 40°C, preferably 28°C to 38°C. The infected cell culture (e.g. monolayers) may be removed either by freeze-thawing or by enzymatic action to increase the viral content of the harvested culture supernatants. The harvested fluids are then either inactivated or stored frozen. Cultured cells may be infected at a multiplicity of infection ("MOI") of about 0.0001 to 10, preferably 0.002 to 5, more preferably to 0.001 to 2. Still more preferably, the cells are infected at an MOI of about 0.01. The supernatant of the infected cells may be harvested from 30 to 60 hours post infection, or 3 to 10 days post infection. In certain preferred embodiments, the supernatant of the infected cells is harvested 3 to 7 days post infection. More preferably, the supernatant of the infected cells is harvested 3 to 5 days post infection. In some embodiments, proteases (e.g., trypsin) may be added during cell culture to allow viral release, and the proteases may be added at any suitable stage during the culture. Alternatively, in certain embodiments, the supernatant of infected cell cultures may be harvested and the virus may be isolated or otherwise purified from the supernatant.

[00108] The viral inoculum and the viral culture are preferably free from (i.e. will have been tested for and given a negative result for contamination by) herpes simplex virus, respiratory syncytial virus, parainfluenza virus 3, SARS coronavirus, adenovirus, rhinovirus, reo viruses, polyomaviruses, biniaviruses, circoviruses, and/or parvoviruses [WO2006/027698].

[00109] Where virus has been grown on a cell line then it is standard practice to minimize the amount of residual cell line DNA in the final vaccine, in order to minimize any oncogenic activity of the host cell DNA. Contaminating DNA can be removed during vaccine preparation using standard purification procedures *e.g.* chromatography, *etc.* Removal of residual host cell DNA can be enhanced by nuclease treatment *e.g.* by using a DNase. A convenient method for reducing host cell DNA contamination disclosed in references (Lundblad (2001) *Biotechnology and Applied Biochemistry* 34: 195-197, *Guidance for Industry: Bioanalytical Method Validation*. U.S. Department of Health and Human Services Food and Drug Administration Center for Drug Evaluation and Research (CDER) Center for Veterinary Medicine (CVM). May 2001.) involves a two-step treatment, first using a DNase (*e.g.* Benzonase), which may be used during viral growth, and then a cationic detergent (*e.g.* CTAB), which may be used during virion disruption. Removal by β -propiolactone treatment can also be used. In one embodiment, the contaminating DNA is removed by benzonase treatment of the culture supernatant.

Production of Antigens

[00110] Antigens of the present disclosure for use in vaccines and/or immunogenic compositions including, without limitation, purified viruses, inactivated viruses, attenuated viruses, recombinant viruses, or purified and/or recombinant viral proteins for subunit vaccines to treat and/or prevent Zika virus infection and/or induce an immune response, such as a protective immune response, against Zika virus, may be produced and/or purified or otherwise isolated by any suitable method known in the art. Antigens of the present disclosure may include, without limitation, whole virus, attenuated virus, inactivated virus, proteins, polypeptides (including active proteins and individual polypeptide epitopes within proteins), glycopolypeptides, lipopolypeptides, peptides, polysaccharides, polysaccharide conjugates, peptide and non-peptide mimics of polysaccharides and other molecules, small molecules, lipids, glycolipids, and carbohydrates produced, derived, purified, and/or otherwise isolated from a Zika virus. For example, suitable antigens may include, without limitation, structural polypeptides such as C, prM, and/or E, and non-structural polypeptides, such as NS1, NS2A, NS2B, NS3, NS4A, NS4B, and/or NS5 from Zika virus. In one embodiment, the antigen of the present disclosure is a purified inactivated whole Zika virus.

[00111] Antigen of the present disclosure may be synthesized chemically or enzymatically, produced recombinantly, isolated from a natural source, or a combination of the foregoing. In certain embodiments, antigens of the present disclosure are produced, purified, isolated, and/or derived from at least one Zika virus of the present disclosure. Antigens of the present disclosure may be purified, partially purified, or a crude extract. In some embodiments, antigens of the present disclosure are viruses, such as inactivated viruses, produced as described in the above section entitled "Production of Vaccines and Immunogenic Compositions."

[00112] In certain embodiments, one or more antigens of the present disclosure may be produced by culturing a non-human cell. Cell lines suitable for production of the one or more antigens of the present disclosure may include insect cells (*e.g.*, any of the mosquito cells described herein). Cell lines suitable for production of the one or more antigens of the present disclosure may also be cells of mammalian origin, and

include, but are not limited to: VERO cells (from monkey kidneys), horse, cow (e.g. MDBK cells), sheep, dog (e.g. MDCK cells from dog kidneys, ATCC CCL34 MDCK (NBL2) or MDCK 330 16, deposit number DSM ACC 2219 as described in WO97/37001), cat, and rodent (e.g. hamster cells such as BHK2 1-F, HKCC cells, or Chinese hamster ovary cells (CHO cells)), and may be obtained from a wide variety of developmental stages, including for example, adult, neonatal, fetal, and embryo. In certain embodiments, the cells are immortalized (e.g. PERC6 cells, as described in WO01/38362 and WO02/40665, and as deposited under ECACC deposit number 96022940). In preferred embodiments, mammalian cells are utilized, and may be selected from and/or derived from one or more of the following non-limiting cell types: fibroblast cells (e.g. dermal, lung), endothelial cells (e.g. aortic, coronary, pulmonary, vascular, dermal microvascular, umbilical), hepatocytes, keratinocytes, immune cells (e.g. T cell, B cell, macrophage, NK, dendritic), mammary cells (e.g. epithelial), smooth muscle cells (e.g. vascular, aortic, coronary, arterial, uterine, bronchial, cervical, retinal pericytes), melanocytes, neural cells (e.g. astrocytes), prostate cells (e.g. epithelial, smooth muscle), renal cells (e.g. epithelial, mesangial, proximal tubule), skeletal cells (e.g. chondrocyte, osteoclast, osteoblast), muscle cells (e.g. myoblast, skeletal, smooth, bronchial), liver cells, retinoblasts, and stromal cells. WO97/37000 and WO97/37001 describe production of animal cells and cell lines that capable of growth in suspension and in serum free media and are useful in the production of viral antigens. In certain embodiments, the non-human cell is cultured in serum-free media.

[00113] Polypeptide antigens may be isolated from natural sources using standard methods of protein purification known in the art, including, but not limited to, liquid chromatography (e.g., high performance liquid chromatography, fast protein liquid chromatography, *etc.*), size exclusion chromatography, gel electrophoresis (including one-dimensional gel electrophoresis, two-dimensional gel electrophoresis), affinity chromatography, or other purification technique. In many embodiments, the antigen is a purified antigen, e.g., from about 50% to about 75% pure, from about 75% to about 85% pure, from about 85% to about 90% pure, from about 90% to about 95% pure, from about 95% to about 98% pure, from about 98% to about 99% pure, or greater than 99% pure.

[00114] One may employ solid phase peptide synthesis techniques, where such techniques are known to those of skill in the art. See Jones, *The Chemical Synthesis of Peptides* (Clarendon Press, Oxford) (1994). Generally, in such methods a peptide is produced through the sequential addition of activated monomelic units to a solid phase bound growing peptide chain.

[00115] Well-established recombinant DNA techniques can be employed for production of polypeptides, where, e.g., an expression construct comprising a nucleotide sequence encoding a polypeptide is introduced into an appropriate host cell (e.g., a eukaryotic host cell grown as a unicellular entity in *in vitro* cell culture, e.g., a yeast cell, an insect cell, a mammalian cell, *etc.*) or a prokaryotic cell (e.g., grown in *in vitro* cell culture), generating a genetically modified host cell; under appropriate culture conditions, the protein is produced by the genetically modified host cell.

[00116] Besides killed and attenuated virus immunogenic compositions, one can use a subunit immunogenic composition or other type of immunogenic composition which presents to the animal the

antigenic components of Zika virus. The antigenic component may be a protein, glycoprotein, lipid-conjugated protein or glycoprotein, a modified lipid moiety, or other viral component which, when injected into a human, stimulates an immune response in the human such that the human develops protective immunity against Zika virus. For a subunit immunogenic composition, the virus can be cultured on mammalian cells, as described above. The cell culture can be homogenized and an immunogenic composition can be isolated by passage of the cell culture homogenate over the appropriate column or through the appropriate pore size filter or via centrifugation of the cell culture homogenate.

[001 17] If the antigenic component is a protein, then one can isolate the nucleic acid which encodes that protein and generate an immunogenic composition that contains that isolated nucleic acid. The nucleic acid encoding the antigenic component can be placed on a plasmid downstream of a signal sequence of a eukaryotic promoter. That plasmid can contain one or more selectable markers and be transfected into an attenuated prokaryotic organism, such as *Salmonella* spp., *Shigella* spp., or other suitable bacteria. The bacteria can then be administered to the human so that the human can generate a protective immune response to the antigenic component. Alternatively, the nucleic acid encoding the antigenic component can be placed downstream of a prokaryotic promoter, have one or more selectable markers, and be transfected into an attenuated prokaryotic organism such as *Salmonella* spp., *Shigella* spp., or other suitable bacteria. The bacteria can then be administered to the eukaryotic subject for which immune response to the antigen of interest is desired. See, for example, U.S. Pat. No. 6,500,419.

[001 18] For a subunit immunogenic composition the nucleic acid encoding a proteinaceous antigenic component of a Zika virus can be cloned into a plasmid such as those described in International Patent Application Publication Number WO 00/32047 (Galen) and International Patent Application Publication Number WO 02/083890 (Galen). Then the plasmid can be transfected into bacteria and the bacteria can produce the desired antigenic protein. One can isolate and purify the desired antigenic protein by a variety of methods described in both patent applications.

Virus Inactivation

[001 19] Certain aspects of the present disclosure relate to Zika virus vaccines and immunogenic compositions containing one or more antigens from a Zika virus. Vaccines and/or immunogenic compositions of the present disclosure may include a purified virus, a whole virus, a recombinant virus, a live attenuated whole virus or, preferably, an inactivated whole virus, or subunits, polypeptides, and/or antigens from an inactivated virus. As such, certain embodiments of the present disclosure relate to Zika virus vaccines and/or immunogenic compositions containing one or more antigens from at least one inactivated Zika virus. Certain embodiments of the present disclosure relate to Zika virus vaccines and/or immunogenic compositions containing a purified inactivated Zika virus. The term "inactivated Zika virus" as used herein is intended to comprise a Zika virus which has been treated with an inactivating method such as treatment with an effective amount of formalin. In particular, the inactivated Zika virus is obtainable/obtained from a method wherein the Zika virus is treated with formaldehyde in an amount of about 0.02% w/v for 14 days at a temperature of 22°C. The inactivated Zika virus is no longer able to infect host cells which can be infected with a Zika virus.

which has not been inactivated. In one embodiment, the inactivated Zika virus is no longer able to infect VERO cells and exert a cytopathic effect on the VERO cells. The term "purified Zika virus" means that the Zika virus has been subjected to a purification process as described below. The purified Zika virus has a lower content of host cell proteins such as Vero cell proteins and host cell DNA such as Vero cell DNA than a non-purified Zika virus. The purity of the purified Zika virus can be determined by size exclusion chromatography. The main peak of the purified Zika virus in the size exclusion chromatography may be more than 85% of the total area under the curve in the size exclusion chromatography, or more than 90% of the total area under the curve in the size exclusion chromatography, or more than 95% of the total area under the curve in the size exclusion chromatography. Such results are considered as "purified" Zika virus. The term "purified inactivated whole Zika virus" thus refers to a Zika virus obtainable/obtained from a method wherein the Zika virus is treated with formalin in an amount that ranges from about 0.02% w/v for days at a temperature of 22°C and provides a main peak of at least 85% of the total area under the curve in the size exclusion chromatography. In certain embodiments the purified inactivated whole Zika virus is a clonal isolate obtained/obtainable by plaque purification.

[00120] Methods of inactivating or killing viruses to destroy their ability to infect mammalian cells, but do not destroy the secondary, tertiary or quaternary structure and immunogenic epitopes of the virus are known in the art. Such methods include both chemical and physical means. Suitable means for inactivating a virus include, without limitation, treatment with an effective amount of one or more agents selected from detergents, formalin (also referred to herein as "formaldehyde"), hydrogen peroxide, beta-propiolactone (BPL), binary ethylamine (BEI), acetyl ethyleneimine, heat, electromagnetic radiation, x-ray radiation, gamma radiation, ultraviolet radiation (LTV radiation), UV-A radiation, UV-B radiation, UV-C radiation, methylene blue, psoralen, carboxyfullerene (C60), hydrogen peroxide and any combination of any thereof.

[00121] In certain embodiments of the present disclosure the at least one virus is chemically inactivated. Agents for chemical inactivation and methods of chemical inactivation are well-known in the art and described herein. In some embodiments, the at least one virus is chemically inactivated with one or more of BPL, hydrogen peroxide, formalin, or BEI. In certain embodiments where the at least one virus is chemically inactivated with BPL, the virus may contain one or more modifications. In some embodiments, the one or more modifications may include a modified nucleic acid. In some embodiments, the modified nucleic acid is an alkylated nucleic acid. In other embodiments, the one or more modifications may include a modified polypeptide. In some embodiments, the modified polypeptide contains a modified amino acid residue including one or more of a modified cysteine, methionine, histidine, aspartic acid, glutamic acid, tyrosine, lysine, serine, and threonine.

[00122] In certain embodiments where the at least one virus is chemically inactivated with formalin, the inactivated virus may contain one or more modifications. In some embodiments, the one or more modifications may include a modified polypeptide. In some embodiments, the one or more modifications may include a cross-linked polypeptide. In some embodiments where the at least one virus is chemically inactivated with formalin, the vaccine or immunogenic composition further includes formalin. In certain embodiments where the at least one virus is chemically inactivated with BEI, the virus may contain one or

more modifications. In some embodiments, the one or more modifications may include a modified nucleic acid. In some embodiments, the modified nucleic acid is an alkylated nucleic acid.

[00123] In some embodiments where the at least one virus is chemically inactivated with formalin, any residual unreacted formalin may be neutralized with sodium metabisulfite, may be dialyzed out, and/or may be buffer exchanged to remove the residual unreacted formalin. In some embodiments, the sodium metabisulfite is added in excess. In some embodiments, the solutions may be mixed using a mixer, such as an in-line static mixer, and subsequently filtered or further purified (e.g., using a cross flow filtration system).

[00124] Certain embodiments of the present disclosure relate to a method for inactivating a Zika virus preparation. In some embodiments, the method involves (a) isolating the Zika virus preparation from one or more non-human cells that are used to produce the virus preparation and (b) treating the virus preparation with an effective amount of formalin. In certain embodiments, treating with an effective amount of formalin includes, without limitation, treating with formalin in an amount that ranges from about 0.001% v/v to about 3.0% v/v. For example, treating with an effective amount of formalin may include treating with formalin in an amount that ranges from about 0.001% to about 3.0% v/v, about 0.005% to about 2.0% v/v, or about 0.01% to about 1.0% v/v, or in an amount of about 0.001%, about 0.0025%, about 0.005%, about 0.0075%, about 0.01%, about 0.02%, about 0.03%, about 0.04%, about 0.05%, about 0.06%, about 0.07%, about 0.08%, about 0.09%, about 0.1%, about 0.2%, about 0.3%, about 0.4%, about 0.5%, about 0.6%, about 0.7%, about 0.8%, about 0.9%, about 1.0%, about 1.25%, about 1.5%, about 1.75%, about 2.0%, about 2.25%, about 2.5%, about 2.75%, or about 3.0% v/v.

[00125] In certain embodiments of the method, the Zika virus preparation is treated with formalin at a temperature that ranges from about 2°C to about 42°C. For example, the Zika virus preparation may be treated with formalin at a temperature that ranges from about 2°C to about 42°C, about 2°C to about 8°C, about 15°C to about 37°C, about 17°C to about 27°C, about 20°C to about 25°C, or at a temperature of about 2°C, about 4°C, about 8°C, about 10°C, about 15°C, about 17°C, about 18°C, about 19°C, about 20°C, about 21°C, about 22°C, about 23°C, about 24°C, about 25°C, about 26°C, about 27°C, about 28°C, about 29°C, about 30°C, about 37°C, or about 42°C. In some embodiments, the Zika virus preparation is treated with formalin at room temperature.

[00126] In some embodiments, the Zika virus preparation is treated with formalin for at least about 1 day. For example, the Zika virus preparation may be treated with formalin for at least about 1 day, at least about 2 days, at least about 3 days, at least about 4 days, at least about 5 days, at least about 6 days, at least about 7 days, at least about 8 days, at least about 9 days, at least about 10 days, at least about 11 days, at least about 12 days, at least about 13 days, at least about 14 days, at least about 15 days, at least about 16 days, at least about 17 days, at least about 18 days, at least about 19 days, at least about 20 days, at least about 21 days, at least about 22 days, at least about 23 days, at least about 24 days, at least about 25 days, at least about 26 days, at least about 27 days, at least about 28 days, at least about 29 days, at least about 30 days, or more. In some embodiments, the Zika virus preparation is treated with formalin for at least about 9 days. In some embodiments, the Zika virus preparation is treated with formalin for at least about 11 days. In some

embodiments, the Zika virus preparation is treated with formalin for at least about 14 days. In some embodiments, the Zika virus preparation is treated with formalin for at least about 20 days. In some embodiments, the Zika virus preparation is treated with formalin for at least about 30 days.

[00127] An inactivated whole Zika virus preparation is considered to be obtainable/obtained from a method wherein the Zika virus is treated with formaldehyde in an amount of about 0.02% w/v for 14 days at a temperature of 22°C.

[00128] In some embodiments, the method further involves neutralizing unreacted formalin with an effective amount of sodium metabisulfite. In some embodiments, the effective amount of sodium metabisulfite ranges from about 0.01 mM to about 100 mM. For example, the sodium metabisulfite may be added at an effective concentration of from about 0.01 mM to about 100 mM, from about 0.1 mM to about 50 mM, from about 0.5 mM to about 20mM, or from about 1 mM to about 10 mM, or at a concentration of about 0.01mM, about 0.05mM, about 0.1mM, about 0.25mM, about 0.5mM, about 0.75mM, about 1mM, about 2mM, about 3mM, about 4mM, about 5mM, about 6mM, about 7mM, about 8mM, about 9mM, about 10mM, about 20mM, about 30mM, about 40mM, about 50mM, about 75mM or about 100mM. In some embodiments, the formalin is neutralized with about 2mM sodium metabisulfite.

[00129] In some embodiments, the the Zika virus preparation is treated with hydrogen peroxide. In some embodiments, the the Zika virus preparation is treated with hydrogen peroxide at concentrations ranging from 0.1 to 3%, preferably 0.1 to 1% at any temperature from 20°C to 30°C for 5 to 120 minutes. In some embodiments, the the Zika virus preparation is treated with hydrogen peroxide at a final concentration of 0.01% for 60 minutes or less.

[00130] In some embodiments, the method involves (a) isolating the Zika virus preparation from one or more non-human cells that are used to produce the virus preparation; (b) treating the virus preparation with an effective amount of formalin; (c) neutralizing the virus preparation with an effective amount of sodium metabisulfite; and (d) purifying the neutralized virus preparation. Any method of purifying a virus preparation known in the art may be employed, including, without limitation, using cross flow filtration (CFF), multimodal chromatography, size exclusion chromatography, cation exchange chromatography, and/or anion exchange chromatography. In some embodiments, the neutralized virus preparation is purified by cross flow filtration (CFF). In some embodiments, the virus preparation is purified to a high degree in an amount that is about 70%, about 75%, about 80%, about 85%, about 90%, about 91%, about 92%, about 93%, about 94%, about 95%, about 96%, about 97%, about 98%, about 99%, or more.

[00131] The vaccines and/or immunogenic compositions of the present disclosure containing one or more antigens from at least one inactivated Zika virus may be useful for treating or preventing Zika virus infection in a subject in need thereof and/or inducing an immune response, such as a protective immune response, against Zika virus in a subject in need thereof.

Adjuvants

[00132] Other aspects of the present disclosure relate to Zika virus vaccines and/or immunogenic compositions containing one or more antigens from at least one Zika virus described herein in combination with one or more adjuvants. In some embodiments, the vaccines and/or immunogenic compositions contain a purified inactivated whole Zika virus such as a Zika virus with a mutation which is a tryptophan to glycine substitution at position 98 of SEQ ID NO: 1 or at a position corresponding to position 98 of SEQ ID NO: 1 as described herein in combination with one or more adjuvants. In some embodiments, the vaccine or immunogenic composition comprises a purified inactivated whole Zika virus comprising a Trp98Gly mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1, wherein the Zika virus is derived from strain PRVABC59 in combination with one or more adjuvants. In some embodiments, the vaccine or immunogenic composition comprises a purified inactivated whole Zika virus comprising a Trp98Gly mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1, wherein the Zika virus is derived from strain PRVABC59 comprising the genomic sequence according to SEQ ID NO: 2 in combination with one or more adjuvants. In one embodiment, the vaccines and immunogenic compositions contain a plaque purified clonal Zika virus isolate in combination with one or more adjuvants. Such adjuvanted vaccines and/or immunogenic compositions of the present disclosure may be useful for treating or preventing Zika virus infection in a subject in need thereof and/or inducing an immune response, such as a protective immune response, against Zika virus in a subject in need thereof.

[00133] Various methods of achieving an adjuvant effect for vaccines are known and may be used in conjunction with the Zika virus vaccines and/or immunogenic compositions disclosed herein. General principles and methods are detailed in "The Theory and Practical Application of Adjuvants", 1995, Duncan E. S. Stewart-Tull (ed.), John Wiley & Sons Ltd, ISBN 0-471-95 170-6, and also in "Vaccines: New Generation Immunological Adjuvants", 1995, Gregoriadis G et al. (eds.), Plenum Press, New York, ISBN 0-306-45283-9.

[00134] In some embodiments, a Zika virus vaccine or immunogenic composition includes the antigens and an adjuvant. Antigens may be in a mixture with at least one adjuvant, at a weight-based ratio of from about 10:1 to about 10¹⁰:1 antigen:adjuvant, e.g., from about 10:1 to about 100:1, from about 100:1 to about 10³:1, from about 10³:1 to about 10⁴:1, from about 10⁴:1 to about 10⁵:1, from about 10⁵:1 to about 10⁶:1, from about 10⁶:1 to about 10⁷:1, from about 10⁷:1 to about 10⁸:1, from about 10⁸:1 to about 10⁹:1, or from about 10⁹:1 to about 10¹⁰:1 antigen:adjuvant. One of skill in the art can readily determine the appropriate ratio through information regarding the adjuvant and routine experimentation to determine optimal ratios.

[00135] Exemplary adjuvants may include, but are not limited to, aluminum salts, calcium phosphate, toll-like receptor (TLR) agonists, monophosphoryl lipid A (MLA), MLA derivatives, synthetic lipid A, lipid A mimetics or analogs, cytokines, saponins, muramyl dipeptide (MDP) derivatives, CpG oligos, lipopolysaccharide (LPS) of grain-negative bacteria, polyphosphazenes, emulsions (oil emulsions), chitosan, vitamin D, stearyl or ociadecyl tyrosine, virosomes, cochleates, poly(lactide-co-glycolides) (PLG) microparticles, poloxamer particles, microparticles, liposomes, Complete Freund's Adjuvant (CPA), and Incomplete Freund's Adjuvant (IFA). In some embodiments, the adjuvant is an aluminum salt.

[00136] In some embodiments, the adjuvant includes at least one of alum, aluminum phosphate, aluminum hydroxide, potassium aluminum sulfate, and Alhydrogel 85. In some embodiments, aluminum salt adjuvants of the present disclosure have been found to increase **adsorption** of the antigens of the Zika virus vaccines **and/or** immunogenic compositions of the present disclosure. Accordingly, in some embodiments, at least about 75%, at least about 80%, at least about 85%, at least about 90%, at least about 91%, at least about 92%, at least about 93%, at least about 94%, at least about 95%, at least about 96%, at least about 97%, at least about 98%, at least about 99%, or about 100% of the antigen is adsorbed to the aluminum salt adjuvant.

[00137] In some embodiments, the vaccine or immunogenic composition includes an aluminum salt adjuvant (e.g., alum) from about 1 μg to about 500 μg, about 5 μg to about 500 μg, about 10 μg to about 500 μg, about 15 μg to about 500 μg, about 25 μg to about 500 μg, about 50 μg to about 500 μg, about 75 μg to about 500 μg, about 100 μg to about 500 μg, about 125 μg to about 500 μg, about 150 μg to about 500 μg, about 175 μg to about 500 μg, about 200 μg to about 500 μg, about 225 μg to about 500 μg, about 250 μg to about 500 μg, about 275 μg to about 500 μg, about 300 μg to about 500 μg, about 325 μg to about 500 μg, about 350 μg to about 500 μg, about 375 μg to about 500 μg, about 400 μg to about 500 μg, about 425 μg to about 500 μg, about 450 μg to about 500 μg, about 475 μg to about 500 μg, about 1 μg to about 475 μg, about 5 μg to about 475 μg, about 10 μg to about 475 μg, about 15 μg to about 475 μg, about 25 μg to about 475 μg, about 50 μg to about 475 μg, about 75 μg to about 475 μg, about 100 μg to about 475 μg, about 125 μg to about 475 μg, about 150 μg to about 475 μg, about 175 μg to about 475 μg, about 200 μg to about 475 μg, about 225 μg to about 475 μg, about 250 μg to about 475 μg, about 275 μg to about 475 μg, about 300 μg to about 475 μg, about 325 μg to about 475 μg, about 350 μg to about 475 μg, about 375 μg to about 475 μg, about 400 μg to about 475 μg, about 425 μg to about 475 μg, about 450 μg to about 475 μg, about 1 μg to about 450 μg, about 5 μg to about 450 μg, about 10 μg to about 450 μg, about 15 μg to about 450 μg, about 25 μg to about 450 μg, about 50 μg to about 450 μg, about 75 μg to about 450 μg, about 100 μg to about 450 μg, about 125 μg to about 450 μg, about 150 μg to about 450 μg, about 175 μg to about 450 μg, about 200 μg to about 450 μg, about 225 μg to about 450 μg, about 250 μg to about 450 μg, about 275 μg to about 450 μg, about 300 μg to about 450 μg, about 325 μg to about 450 μg, about 350 μg to about 450 μg, about 375 μg to about 450 μg, about 400 μg to about 450 μg, about 425 μg to about 450 μg, about 1 μg to about 425 μg, about 5 μg to about 425 μg, about 10 μg to about 425 μg, about 15 μg to about 425 μg, about 25 μg to about 425 μg, about 50 μg to about 425 μg, about 75 μg to about 425 μg, about 100 μg to about 425 μg, about 125 μg to about 425 μg, about 150 μg to about 425 μg, about 175 μg to about 425 μg, about 200 μg to about 425 μg, about 225 μg to about 425 μg, about 250 μg to about 425 μg, about 275 μg to about 425 μg, about 300 μg to about 425 μg, about 325 μg to about 425 μg, about 350 μg to about 425 μg, about 375 μg to about 425 μg, about 400 μg to about 425 μg, about 1 μg to about 400 μg, about 5 μg to about 400 μg, about 10 μg to about 400 μg, about 15 μg to about 400 μg, about 25 μg to about 400 μg, about 50 μg to about 400 μg, about 75 μg to about 400 μg, about 100 μg to about 400 μg, about 125 μg to about 400 μg, about 150 μg to about 400 μg, about 175 μg to about 400 μg, about 200 μg to about 400 μg, about 225 μg to about 400 μg, about 250 μg to about 400 μg, about 275 μg to about 400 μg, about 300 μg to about 400 μg, about 325 μg to about 400 μg, about 350 μg to about 400 μg, about 375 μg to about 400 μg, about 1 μg to about 375 μg, about 5 μg to about 375 μg, about 10 μg to about 375 μg, about 15 μg to about 375 μg, about 25 μg to about 375 μg, about 50 μg to about 375 μg, about 75 μg to about 375 μg, about 100 μg to about 375 μg, about 125 μg to about 375 μg, about 150 μg to about 375 μg, about 175 μg to about 375 μg, about 200 μg to about 375 μg, about 225 μg to about 375 μg, about 250 μg to about 375 μg, about 275 μg to about 375 μg, about 300 μg to about 375 μg, about 325 μg to about 375 μg, about 350 μg to about 375 μg, about 375 μg to about 375 μg.

about 1 µg to about 75 µg, about 5 µg to about 75 µg, about 10 µg to about 75 µg, about 15 µg to about 75 µg, about 25 µg to about 75 µg, about 50 µg to about 75 µg, about 1 µg to about 50 µg, about 5 µg to about 50 µg, about 10 µg to about 50 µg, about 15 µg to about 50 µg, about 25 µg to about 50 µg, about 1 µg to about 25 µg, about 5 µg to about 25 µg, about 10 µg to about 25 µg, about 15 µg to about 25 µg, about 1 µg to about 15 µg, about 5 µg to about 15 µg, about 10 µg to about 15 µg, about 1 µg to about 30 µg, about 5 µg to about 10 µg, or about 1 µg to about 5 µg per dose. In some embodiments, the vaccine or immunogenic composition includes an aluminum salt adjuvant (e.g., alum) at about 1 µg, about 5 µg, about 10 µg, about 15 µg, about 25 µg, about 50 µg, about 75 µg, about 100 µg, about 125 µg, about 150 µg, about 175 µg, about 200 µg, about 225 µg, about 250 µg, about 275 µg, about 300 µg, about 325 µg, about 350 µg, about 375 µg, about 400 µg, about 425 µg, about 450 µg, about 475 µg, or about 500 µg per dose.

[00138] Certain embodiments of the present disclosure include a method for preparing an adjuvanted Zika virus vaccine or immunogenic composition, which involves (a) mixing the vaccine or immunogenic composition with an aluminum salt adjuvant, with the vaccine or immunogenic composition including one or more antigens from at least one Zika virus described herein and (b) incubating the mixture under suitable conditions for a period of time that ranges from about 1 hour to about 24 hours (e.g., about 16 hours to about 24 hours), with at least about 75%, at least about 80%, at least about 85%, at least about 90%, at least about 91%, at least about 92%, at least about 93%, at least about 94%, at least about 95%, at least about 96%, at least about 97%, at least about 98%, at least about 99%, or about 100% of the antigen adsorbed to the aluminum salt adjuvant. In certain embodiments of the method, the at least one Zika virus is a Zika virus comprising a non-human cell adaptation mutation (e.g., a non-human cell adaptation mutation in protein NS1 such as a Trp98Gly mutation). In some embodiments, the at least one Zika virus is a purified inactivated whole Zika virus comprising a Trp98Gly mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1, wherein the Zika virus is derived from strain PRVABC59. In some embodiments, the Zika virus is a purified inactivated whole Zika virus comprising a Trp98Gly mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1, wherein the Zika virus is derived from strain PRVABC59 comprising the genomic sequence according to SEQ ID NO:2.

[00139] In some embodiments of the method, the mixture is incubated at a temperature that ranges from about 2°C to about 8°C. In some embodiments of the method, the mixture is incubated under constant mixing using any suitable mixer known in the art. In some embodiments of the method, the mixture is incubated at pH that ranges in value from about 6.5 to about 8.5, from about 6.5 to about 8, from about 6.8 to about 7.8, from about 6.9 to about 7.6, from about 7 to about 7.5, from about 6.8 to about 8.5, from about 6.9 to about 8.5, or from about 7 to about 8.5. In certain preferred embodiments, the mixture is incubated at a neutral pH. In some embodiments of the method, the aluminum salt adjuvant is selected from alum, aluminum phosphate, aluminum hydroxide, potassium aluminum sulfate, and Alhydrogel 85.

[00140] Monophosphoryl Lipid A (MLA), a non-toxic derivative of lipid A from Salmonella, is a potent TLR-4 agonist that has been developed as a vaccine adjuvant (Evans et al. (2003) Expert Rev. Vaccines 2(2): 219-229). In preclinical murine studies intranasal MLA has been shown to enhance secretory, as well as systemic, humoral responses (Baldrige et al. (2000) Vaccine 18(22): 2416-2425; Yang et al. (2002) Infect.

Immun. 70(7): 3557-3565). It has also been proven to be safe and effective as a vaccine adjuvant in clinical studies of greater than 120,000 patients (Baldrick et al. (2002) Regul. Toxicol. Pharmacol. 35(3): 398-413; Baldrick et al. (2004) J. Appl. Toxicol. 24(4): 261-268). MLA stimulates the induction of innate immunity through the TLR-4 receptor and is thus capable of eliciting nonspecific immune responses against a wide range of infectious pathogens, including both gram negative and gram positive bacteria, viruses, and parasites (Baldrick et al. (2004) J. Appl. Toxicol. 24(4): 261-268; Persing et al. (2002) Trends Microbiol. 10(10 Suppl): S32-37). Inclusion of MLA in intranasal formulations should provide rapid induction of innate responses, eliciting nonspecific immune responses from viral challenge while enhancing the specific responses generated by the antigenic components of the vaccine.

[00141] Accordingly, in one embodiment, the present disclosure provides a composition comprising monophosphoryl lipid A (MLA), 3 De-O-acylated monophosphoryl lipid A (3D-MLA), or a derivative thereof as an enhancer of adaptive and innate immunity. Chemically 3D-MLA is a mixture of 3 De-O-acylated monophosphoryl lipid A with 4, 5 or 6 acylated chains. A preferred form of 3 De-O-acylated monophosphoryl lipid A is disclosed in European Patent 0 689 454 B1 (SmithKline Beecham Biologicals SA). In another embodiment, the present disclosure provides a composition comprising synthetic lipid A, lipid A mimetics or analogs, such as BioMira's PET Lipid A, or synthetic derivatives designed to function like TLR-4 agonists.

[00142] Additional exemplar}' adjuvants include, without limitation, polypeptide adjuvants that may be readily added to the antigens described herein by co-expression with the polypeptide components or fusion with the polypeptide components to produce chimeric polypeptides. Bacterial flagellin, the major protein constituent of flagella, is an adjuvant which has received increasing attention as an adjuvant protein because of its recognition by the innate immune system by the toll-like receptor TLR5. Flagellin signaling through TLR5 has effects on both innate and adaptive immune functions by inducing DC maturation and migration as well as activation of macrophages, neutrophils, and intestinal epithelial cells resulting in production of pro-inflammatory mediators.

[00143] TLR5 recognizes a conserved structure within flagellin monomers that is unique to this protein and is required for flagellar function, precluding its mutation in response to immunological pressure. The receptor is sensitive to a 100 fM concentration but does not recognize intact filaments. Flagellar disassembly into monomers is required for binding and stimulation.

[00144] As an adjuvant, flagellin has potent activity for induction of protective responses for heterologous antigens administered either parenterally or intranasally and adjuvant effects for DNA vaccines have also been reported. A Th2 bias is observed when flagellin is employed which would be appropriate for a respiratory}' virus such as influenza but no evidence for IgE induction in mice or monkeys has been observed. In addition, no local or systemic inflammatory responses have been reported following intranasal or systemic administration in monkeys. The Th2 character of responses elicited following use of flagellin is somewhat surprising since flagellin signals through TLR5 in a MyD88-dependent manner and all other MyD88-dependent signals through TLRs have been shown to result in a Th1 bias. Importantly, pre-existing antibodies to flagellin have no appreciable effect on adjuvant efficacy making it attractive as a multi-use adjuvant.

[00145] A common theme in many recent intranasal vaccine trials is the use of adjuvants and/or delivery systems to improve vaccine efficacy. In one such study an influenza H3 vaccine containing a genetically detoxified *E. coli* heat-labile enterotoxin adjuvant (LT R192G) resulted in heterosubtypic protection against H5 challenge but only following intranasal delivery. Protection was based on the induction of cross neutralizing antibodies and demonstrated important implications for the intranasal route in development of new vaccines.

[00146] Cytokines, colony-stimulating factors (e.g., GM-CSF, CSF, and the like); tumor necrosis factor; interleukin-2, -7, -12, interferons and other like growth factors, may also be used as adjuvants as they may be readily included in the Zika virus vaccines or immunogenic compositions by admixing or fusion with the polypeptide component.

[00147] In some embodiments, the Zika virus vaccine and/or immunogenic compositions disclosed herein may include other adjuvants that act through a Toll-like receptor such as a nucleic acid TLR9 ligand comprising a 5'-TCG-3' sequence; an imidazoquinoline TLR7 ligand; a substituted guanine TLR7/8 ligand; other TLR7 ligands such as Loxoribine, 7-deazadeoxyguanosine, 7-thia-8-oxodeoxyguanosine, Imiquimod (R-837), and Resiquimod (R-848).

[00148] Certain adjuvants facilitate uptake of the vaccine molecules by APCs, such as dendritic cells, and activate these. Non-limiting examples are selected from the group consisting of an immune targeting adjuvant; an immune modulating adjuvant such as a toxin, a cytokine, and a mycobacterial derivative; an oil formulation; a polymer; a micelle forming adjuvant; a saponin; an immunostimulating complex matrix (ISCOM matrix); a particle; DDA; aluminum adjuvants; DNA adjuvants; MLA; and an encapsulating adjuvant.

[00149] Additional examples of adjuvants include agents such as aluminum salts such as hydroxide or phosphate (alum), commonly used as 0.05 to 0.1 percent solution in buffered saline (see, e.g., Nicklas (1992) Res. Immunol. 143:489-493). admixture with synthetic polymers of sugars (e.g. Carbopol®) used as 0.25 percent solution, aggregation of the protein in the vaccine by heat treatment with temperatures ranging between 70° to 101°C for 30 second to 2 minute periods respectively and also aggregation by means of cross-linking agents are possible. Aggregation by reactivation with pepsin treated antibodies (Fab fragments) to albumin, mixture with bacterial cells such as *C. parvum* or endotoxins or lipopoly saccharide components of gram-negative bacteria, emulsion in physiologically acceptable oil vehicles such as mannide mono-oleate (Aracel A) or emulsion with 20 percent solution of a perfluorocarbon (Fluosol-DA) used as a block substitute may also be employed. Admixture with oils such as squalene and IFA may also be used.

[00150] DDA (dimethyldioctadecylammonium bromide) is an interesting candidate for an adjuvant, but also Freund's complete and incomplete adjuvants as well as quillaja saponins such as QuilA and QS21 are interesting. Further possibilities include poly [di(carboxylatophenoxy)phosphazene (PCPP) derivatives of lipopoly saccharides such as monophosphoryl lipid A (MLA), muramyl dipeptide (MDP) and threonyl muramyl dipeptide (tMDP). The lipopoly saccharide based adjuvants may also be used for producing a

predominantly T_H1-type response including, for example, a combination of monophosphoryl lipid A, such as 3-de-O-acylated monophosphoryl lipid A, together with an aluminum salt.

[00151] Liposome formulations are also known to confer adjuvant effects, and therefore liposome adjuvants may be used in conjunction with the Zika virus vaccines and/or immunogenic compositions.

[00152] Immunostimulating complex matrix type (ISCOM® matrix) adjuvants may also be used with the Zika virus vaccine antigens and immunogenic compositions, especially since it has been shown that this type of adjuvants are capable of up-regulating MHC Class II expression by APCs. An ISCOM matrix consists of (optionally fractionated) saponins (triterpenoids) from *Quillaja saponaria*, cholesterol, and phospholipid. When admixed with the immunogenic protein such as the Zika virus vaccine or immunogenic composition antigens, the resulting particulate formulation is what is known as an ISCOM particle where the saponin may constitute 60-70% w/w, the cholesterol and phospholipid 10-15% w/w, and the protein 10-15% w/w. Details relating to composition and use of immunostimulating complexes can for example be found in the above-mentioned text-books dealing with adjuvants, but also Morein B et al. (1995) *Clin. Immunother.* 3: 461-475 as well as Barr I G and Mitchell G F (1996) *Immunol. and Cell Biol.* 74: 8-25 provide useful instructions for the preparation of complete immunostimulating complexes.

[00153] The saponins, whether or not in the form of iscoms, that may be used in the adjuvant combinations with the Zika virus vaccines and immunogenic compositions disclosed herein include those derived from the bark of *Quillaja Saponaria* Molina, termed Qui! A, and fractions thereof, described in U.S. Pat. No. 5,057,540 and "Saponins as vaccine adjuvants", Kensil, C. R. (1996) *Crit Rev Ther Drug Carrier Syst* 12 (1-2): 1-55; and EP 0 362 279 B1. Exemplary fractions of Quil A are QS21, QS7, and QS17.

[00154] β -Escin is another hemolytic saponin for use in the adjuvant compositions of the Zika virus vaccines and/or immunogenic compositions. Escin is described in the Merck index (12th ed: entry 3737) as a mixture of saponins occurring in the seed of the horse chestnut tree, Lat: *Aesculus hippocastanum*. Its isolation is described by chromatography and purification (Fiedler, *Arzneimittel-Forsch.* 4, 213 (1953)), and by ion-exchange resins (Erbring et al., U.S. Pat. No. 3,238,190). Fractions of escin have been purified and shown to be biologically active (Yoshikawa M, et al. (*Chem Pharm Bull (Tokyo)* 3996 August; 44(8): 1454-1464)). β -escin is also known as aescin.

[00155] Another hemolytic saponin for use in the Zika virus vaccines and/or immunogenic compositions is Digitonin. Digitonin is described in the Merck index (12th Edition, entry 3204) as a saponin, being derived from the seeds of *Digitalis purpurea* and purified according to the procedure described Gisvold et al. (1934) *J. AraPharin. Assoc.* 23: 664; and Ruhenstroth-Bauer (1955) *Physiol. Chem.*, 301, 621. Its use is described as being a clinical reagent for cholesterol determination.

[00156] Another interesting possibility of achieving adjuvant effect is to employ the technique described in Gosselin et al., 1992. In brief, the presentation of a relevant antigen such as an antigen in a Zika virus vaccine and/or immunogenic composition of the present disclosure can be enhanced by conjugating the

antigen to antibodies (or antigen binding antibody fragments) against the FC receptors on monocytes/macrophages. Especially conjugates between antigen and anti-FCRI have been demonstrated to enhance immunogenicity for the purposes of vaccination. The antibody may be conjugated to the Zika virus vaccine or immunogenic composition antigens after generation or as a part of the generation including by-expressing as a fusion to any one of the polypeptide components of the Zika virus vaccine and/or immunogenic composition antigens. Other possibilities involve the use of the targeting and immune modulating substances (e.g., cytokines). In addition, synthetic inducers of cytokines such as poly I:C may also be used.

[00157] Suitable mycobacterial derivatives may be selected from the group consisting of muramyl dipeptide, complete Freund's adjuvant, RIBI, (Ribi immunoChem Research Inc., Hamilton, Mont.) and a diester of trehalose such as TDM and TDE.

[00158] Examples of suitable immune targeting adjuvants include CD40 ligand and CD40 antibodies or specifically binding fragments thereof (cf. the discussion above), mannose, a Fab fragment, and CTLA-4.

[00159] Examples of suitable polymer adjuvants include a carbohydrate such as dextran, PEG, starch, mannan, and mannose; a plastic polymer; and latex such as latex beads.

[00160] Yet another interesting way of modulating an immune response is to include the immunogen (optionally together with adjuvants and pharmaceutically acceptable carriers and vehicles) in a "virtual lymph node" (VLN) (a proprietary medical device developed by ImmunoTherapy, Inc., 360 Lexington Avenue, New-York, N.Y. 10017-6501). The VLN (a thin tubular device) mimics the structure and function of a lymph node. Insertion of a VLN under the skin creates a site of sterile inflammation with an upsurge of cytokines and chemokines. T- and B-cells as well as APCs rapidly respond to the danger signals, home to the inflamed site and accumulate inside the porous matrix of the VLN. It has been shown that the necessary- antigen dose required to mount an immune response to an antigen is reduced when using the VLN, and that immune protection conferred by vaccination using a VLN surpassed conventional immunization using Ribi as an adjuvant. The technology is described briefly in Gelber C et al., 1998, "Elicitation of Robust Cellular and Humoral Immune Responses to Small Amounts of Immunogens Using a Novel Medical Device Designated the Virtual Lymph Node", in: "From the Laboratory to the Clinic. Book of Abstracts, Oct. 12-15, 1998, Seascape Resort, Aptos, Calif. "

[00161] Oligonucleotides may be used as adjuvants in conjunction with the Zika virus vaccine and/or immunogenic composition antigens and may contain two or more dinucleotide CpG motifs separated by at least three or more or even at least six or more nucleotides. CpG-containing oligonucleotides (in which the CpG dinucleotide is unmethylated) induce a predominantly Th1 response. Such oligonucleotides are well known and are described, for example, in WO 96/02555, WO 99/33488 and U.S. Pat. Nos. 6,008,200 and 5,856,462.

[00162] Such oligonucleotide adjuvants may be deoxynucleotides. In certain embodiments, the nucleotide backbone in the oligonucleotide is phosphorodithioate, or a phosphorothioate bond, although phosphodiester and other nucleotide backbones such as PNA including oligonucleotides with mixed backbone linkages may also be used. Methods for producing phosphorothioate oligonucleotides or phosphorodithioate are described in U.S. Pat. No. 5,666,153, U.S. Pat. No. 5,278,302 and WO 95/26204.

[00163] Exemplary oligonucleotides have the following sequences. The sequences may contain phosphorothioate modified nucleotide backbones:

[00164] (SEQ ID NO: 3) OLIGO 1: TCC ATG ACG TTC CTG ACG TT (CpG 1826);

[00165] (SEQ ID NO: 4) OLIGO 2: TCT CCC AGC GTG CGC CAT (CpG 1758);

[00166] (SEQ ID NO: 5) OLIGO 3: ACC GAT GAC GTC GCC GGT GAC GGC ACC ACG;

[00167] (SEQ ID NO: 6) OLIGO 4: TCG TCG TTT TGT CGT TTT GTC GTT (CpG 2006); and

[00168] (SEQ ID NO: 7) OLIGO 5: TCC ATG ACG TTC CTG ATG CT (CpG 1668)

[00169] Alternative CpG oligonucleotides include the above sequences with inconsequential deletions or additions thereto. The CpG oligonucleotides as adjuvants may be synthesized by any method known in the art (e.g., EP 468520). For example, such oligonucleotides may be synthesized utilizing an automated synthesizer. Such oligonucleotide adjuvants may be between 10-50 bases in length. Another adjuvant system involves the combination of a CpG-containing oligonucleotide and a saponin derivative particularly the combination of CpG and QS21 is disclosed in WO 00/09159.

[00170] Many single or multiphase emulsion systems have been described. One of skill in the art may readily adapt such emulsion systems for use with a Zika virus vaccine and/or immunogenic composition antigens so that the emulsion does not disrupt the antigen's structure. Oil in water emulsion adjuvants per se have been suggested to be useful as adjuvant compositions (EP 399843B), also combinations of oil in water emulsions and other active agents have been described as adjuvants for vaccines (WO 95/17210; WO 98/56414; WO 99/12565; WO 99/11241). Other oil emulsion adjuvants have been described, such as water in oil emulsions (U.S. Pat. No. 5,422,109; EP 0480982 B2) and water in oil in water emulsions (U.S. Pat. No. 5,424,067; EP 0480981 B).

[00171] The oil emulsion adjuvants for use with the Zika virus vaccines and/or immunogenic compositions described herein may be natural or synthetic, and may be mineral or organic. Examples of mineral and organic oils will be readily apparent to one skilled in the art.

[00172] In order for any oil in water composition to be suitable for human administration, the oil phase of the emulsion system may include a metabolizable oil. The meaning of the term metabolizable oil is well known in the art. Metabolizable can be defined as "being capable of being transformed by metabolism"

(Dorland's Illustrated Medical Dictionary, W.B. Sanders Company, 25th edition (1974)). The oil may be any vegetable oil, fish oil, animal oil or synthetic oil, which is not toxic to the recipient and is capable of being transformed by metabolism. Nuts (such as peanut oil), seeds, and grains are common sources of vegetable oils. Synthetic oils may also be used and can include commercially available oils such as NEOBEE® and others. Squalene (2,6,10,15, 19,23-Hexamethyl-2,6,10,14,18,22-tetracosahexaene) is an unsaturated oil which is found in large quantities in shark-liver oil, and in lower quantities in olive oil, wheat germ oil, rice bran oil, and yeast, and may be used with the Zika virus vaccine and/or immunogenic compositions. Squalene is a metabolizable oil virtue of the fact that it is an intermediate in the biosynthesis of cholesterol (Merck index, 10th Edition, entry no.8619).

[00173] Exemplary oil emulsions are oil in water emulsions, and in particular squalene in water emulsions.

[00174] In addition, the oil emulsion adjuvants for use with the Zika virus vaccine and/or immunogenic compositions may include an antioxidant, such as the oil α -tocopherol (vitamin E, EP 0 382 271 B1).

[00175] WO 95/17210 and WO 99/11241 disclose emulsion adjuvants based on squalene, α -tocopherol, and TWEEN 80 (TM), optionally formulated with the immunostimulants QS21 and/or 3D-MLA. WO 99/12565 discloses an improvement to these squalene emulsions with the addition of a sterol into the oil phase. Additionally, a triglyceride, such as tricaprylin (C₂₇H₅₀O₆), may be added to the oil phase in order to stabilize the emulsion (WO 98/56414).

[00176] The size of the oil droplets found within the stable oil in water emulsion may be less than 1 micron, may be in the range of substantially 30-600 nm, substantially around 30-500 nm in diameter, or substantially 150-500 nm in diameter, and in particular about 150 nm in diameter as measured by photon correlation spectroscopy. In this regard, 80% of the oil droplets by number may be within these ranges, more than 90% or more than 95% of the oil droplets by number are within the defined size ranges. The amounts of the components present in oil emulsions are conventionally in the range of from 2 to 10% oil, such as squalene; and when present, from 2 to 10% α tocopherol; and from 0.3 to 3% surfactant, such as polyoxyethylene sorbitan monooleate. The ratio of oil: α tocopherol may be equal or less than 1 as this provides a more stable emulsion. SPAN 85 (TM) may also be present at a level of about 1%. In some cases it may be advantageous that the Zika virus vaccines and/or immunogenic compositions disclosed herein will further contain a stabilizer.

[00177] The method of producing oil in water emulsions is well known to one skilled in the art. Commonly, the method includes the step of mixing the oil phase with a surfactant such as a PBS/TWEEN80® solution, followed by homogenization using a homogenizer, it would be clear to one skilled in the art that a method comprising passing the mixture twice through a syringe needle would be suitable for homogenizing small volumes of liquid. Equally, the emulsification process in microfluidizer (MHOS microfluidics machine, maximum of 50 passes, for a period of 2 minutes at maximum pressure input of 6 bar (output pressure of about 850 bar)) could be adapted by one skilled in the art to produce smaller or larger volumes of emulsion.

This adaptation could be achieved by routine experimentation comprising the measurement of the resultant emulsion until a preparation was achieved with oil droplets of the required diameter.

[00178] Alternatively the Zika virus vaccines and/or immunogenic compositions may be combined with vaccine vehicles composed of chitosan (as described above) or other polycationic polymers, polylactide and poly(lactide-co-glycolide) particles, poly-N-acetyl glucosamine-based polymer matrix, particles composed of polysaccharides or chemically modified polysaccharides, liposomes and lipid-based particles, particles composed of glycerol monoesters, etc. The saponins may also be formulated in the presence of cholesterol to form particulate structures such as liposomes or ISCOMs. Furthermore, the saponins may be formulated together with a polyoxyethylene ether or ester, in either a non-particulate solution or suspension, or in a particulate structure such as a paucilamellar liposome or ISCOM.

[00179] Additional illustrative adjuvants for use in the Zika virus vaccines and/or immunogenic compositions as described herein include SAF (Chiron, Calif., United States), MF-59 (Chiron, see, e.g., Granoff et al. (1997) *Infect Immun* 65 (5): 1710-1715), the SBAS series of adjuvants (e.g., SB-AS2 (an oil-in-water emulsion containing MLA and QS21); SBAS-4 (adjuvant system containing alum and MLA), available from SmithKline Beecham, Rixensart, Belgium), Detox (Enhanzyn®) (GlaxoSmithKline), RC-512, RC-522, RC-527, RC-529, RC-544, and RC-560 (GlaxoSmithKline) and other aminoalkyl glucosaminide 4-phosphates (AGPs), such as those described in pending U.S. patent application Ser. Nos. 08/853,826 and 09/074,720.

[00180] Other examples of adjuvants include, but are not limited to, Hunter's TiterMax® adjuvants (CytRx Corp., Norcross, Ga.); Gerbu adjuvants (Gerbu Biotechnik GmbH, Gaiberg, Germany); nitrocellulose (Nilsson and Larsson (1992) *Res. Immunol.* 143:553-557); alum (e.g., aluminum hydroxide, aluminum phosphate) emulsion based formulations including mineral oil, non-mineral oil, water-in-oil or oil-in-water emulsions, such as the Seppic ISA series of Montamide adjuvants (e.g., ISA-51, ISA-57, ISA-720, ISA-151, etc.; Seppic, Paris, France); and PROVAX® (IDEC Pharmaceuticals); OM-174 (a glucosamine disaccharide related to lipid A); Leishmania elongation factor; non-ionic block copolymers that form micelles such as CRL 1005; and Syntex Adjuvant Formulation. See, e.g., O'Hagan et al. (2001) *Biomol Eng.* 18(3):69-85; and "Vaccine Adjuvants: Preparation Methods and Research Protocols" D. O'Hagan, ed. (2000) Humana Press.

[00181] Oilier exemplary adjuvants include adjuvant molecules of the general formula:

where, n is 1-50, A is a bond or ~C(O)~, R is C1-50 alkyl or Phenyl C1-50 alkyl.

[00182] One embodiment consists of a vaccine formulation comprising a polyoxyethylene ether of general formula (I), where n is between 1 and 50, 4-24, or 9; the R component is C1-50, C4-C20 alkyl, or C12 alkyl, and A is a bond. The concentration of the polyoxyethylene ethers should be in the range 0.1-20%, from 0.1-10%, or in the range 0.1-1%. Exemplary polyoxyethylene ethers are selected from the following group: polyoxyethylene-9-lauryl ether, polyoxyethylene-9-stearyl ether, polyoxyethylene-8-stearyl ether, polyoxyethylene-4-lauryl ether, polyoxyethylene-35-lauryl ether, and polyoxyethylene-23-lauryl ether.

Polyoxyethylene ethers such as polyoxyethylene lauryl ether are described in the Merck index (12th edition: entry 7717). These adjuvant molecules are described in WO 99/52549.

[00183] The polyoxyethylene ether according to the general formula (I) above may, if desired, be combined with another adjuvant. For example, an adjuvant combination may include the CpG as described above.

[00184] Further examples of suitable pharmaceutically acceptable excipients for use with the Zika virus vaccines and/or immunogenic compositions disclosed herein include water, phosphate buffered saline, isotonic buffer solutions.

[00185] Virus purification

[00186] Further aspects of the present disclosure relate to methods of purifying Zika virus. In some embodiments, the method includes inoculating a plurality of cells with an inoculum containing a population of Zika viruses, and obtaining from one or more of the inoculated cells a Zika virus clonal isolate by plaque purification. In some embodiments, the cells are non-human cells (e.g., insect cells, mammalian cells, etc.). In some embodiments, the cells are insect cells (such as any of the mosquito cell/line lines described herein). In some embodiments, the cells are mammalian cells (such as any of the mammalian cell/line lines described herein). In some embodiments, the mammalian cells are monkey cells.

[00187] In some embodiments, the population of Zika virus is heterogeneous (e.g., comprising two or more genotypes). In some embodiments, the population of Zika viruses comprises a Zika virus clinical isolate (e.g., from strain PRVABC59) and/or one or more Zika viruses that have been previously passaged in cell culture. In some embodiments, plaque purification (e.g., as described herein) allows for the substantial and/or complete separation of a (genetically homogeneous) clonal isolate from a heterogeneous viral population. In some embodiments, the monkey cells are from a VERO cell line (e.g., VERO 10-87 cells). In some embodiments, the inoculum comprises human serum. In some embodiments, the inoculum comprises one or more adventitious agents (e.g., one or more contamination viruses). In some embodiments, plaque purification (e.g., as described herein) allows for the substantial and/or complete purification of a (genetically homogeneous) clonal isolate away from one or more adventitious agents.

[00188] In some embodiments, the methods described for isolating and/or purifying a Zika virus clonal isolate includes one or more (e.g., one or more, two or more, three or more, four or more, five or more, etc.) additional plaque purifications of the Zika virus clonal isolate. In some embodiments, the methods described for isolating and/or purifying a Zika virus clonal isolate includes passaging the Zika virus clonal isolate one or more (e.g., one or more, two or more, three or more, four or more, five or more, etc.) times in cell culture (e.g., in insect cells such as a mosquito cell line and/or in mammalian cells such as a VERO cell line).

[00189] Further aspects of the present disclosure relate to methods of purifying Zika virus for the preparation of a vaccine or immunogenic composition. In some embodiments, the methods include one or more (e.g., one or more, two or more, three or more, four or more, five or more, or six) steps of (in any order,

including the following order): performing depth filtration of a sample or preparation containing a Zika virus; buffer exchanging and/or diluting a sample containing a Zika virus (e.g., by cross flow filtration (CFF)) to produce a retentate; binding a sample comprising a Zika virus to an ion exchange membrane (e.g., an anion exchange membrane, a cation exchange membrane) to produce a bound fraction, where the bound fraction comprises the Zika virus, and eluting the bound fraction from the ion exchange membrane; treating a sample containing a Zika virus with an effective amount of any of the chemical inactivators described herein; neutralizing a sample containing a chemically inactivated Zika virus with sodium metabisulfite; and/or purifying a neutralized sample comprising a chemically inactivated Zika virus (e.g., by cross flow filtration (CFF)). In some embodiments, the method includes the steps of (a) passing a sample containing a Zika virus through a first depth filter to produce a first eluate, where the first eluate contains the Zika virus; (b) buffer exchanging and/or diluting the first eluate by cross flow filtration (CFF) to produce a first retentate, where the first retentate contains the Zika virus; (c) binding the first retentate to an ion exchange membrane to produce a first bound fraction, where the first bound fraction contains the Zika virus, and eluting the first bound fraction from the ion exchange membrane to produce a second eluate, where the second eluate contains the Zika virus; (d) passing the second eluate through a second depth filter to produce a second retentate, wherein the second retentate contains the Zika virus; (e) treating the second retentate with an effective amount of a chemical inactivator; (f) neutralizing the treated second retentate with sodium metabisulfite; and (g) purifying the neutralized second retentate by cross flow filtration (CFF).

[00190] Depth filters may be applied in a cartridge or capsule format, such as with the SUPRACAP™ series of depth filter capsules (Pall Corporation) using a Bio 20 SEITZ® depth filter sheet. Other suitable depth filtration techniques and apparatuses are known in the art and include Saitorius PP3 filters. In some embodiments, the depth filter has a pore size of between about 0.2 μm and about 3 μm. In some embodiments, the pore size of the depth filter is less than about any of the following pore sizes (in μm): 3, 2.8, 2.6, 2.4, 2.2, 2.0, 1.8, 1.6, 1.4, 1.2, 1.0, 0.8, 0.6, and 0.4. In some embodiments, the pore size of the depth filter is greater than about any of the following pore sizes (in μm): 0.2, 0.4, 0.6, 0.8, 1.0, 1.2, 1.4, 1.6, 1.8, 2.0, 2.2, 2.4, 2.6, or 2.8. That is, the pore size of the depth filter can be any of a range of pore sizes (in μm) having an upper limit of 3, 2.8, 2.6, 2.4, 2.2, 2.0, 1.8, 1.6, 1.4, 1.2, 1.0, 0.8, 0.6, and 0.4 and an independently selected lower limit of 0.2, 0.4, 0.6, 0.8, 1.0, 1.2, 1.4, 1.6, 1.8, 2.0, 2.2, 2.4, 2.6, or 2.8; wherein the lower limit is less than the upper limit.

[00191] As described herein, cation exchange and anion exchange chromatography may be used in the methods of the present disclosure to purify a Zika virus harvested from a cell supernatant of the present disclosure. For example, clarified viral harvest may be basified, loaded onto an anion exchange membrane, eluted by salt or pH, filtered, and inactivated. This is only an exemplar scheme, and one of skill in the art may readily contemplate variants thereof with substituted, deleted, inserted, or reordered steps.

[00192] Anion and cation exchange chromatography both rely on the attraction of charged macromolecules of interest (e.g., a virus) in a mobile phase to a substrate having an opposite charge. In cation exchange chromatography, the negatively charged substrate or membrane attracts positively charged macromolecules. In anion exchange chromatography, the positively charged substrate or membrane attracts

negatively charged macromolecules. Once macromolecules are bound or loaded onto the substrate, they may be eluted in linear or step-wise fashion from the substrate in a manner dependent on their characteristics, thereby enacting a separation of differently charged molecules. This principle may be used to purify viruses from other macromolecules. Elution may be effected by varying pH or salt content of the mobile phase buffer. Elution may be gradient or step-wise. As described herein, elution may be effected using a change in pH of the mobile phase or by using a change in ionic strength of the mobile phase (e.g., through addition of a salt). A variety of salts are used for elution, including without limitation sodium chloride, potassium chloride, sodium sulphate, potassium sulphate, ammonium sulphate, sodium acetate, potassium phosphate, calcium chloride, and magnesium chloride. In certain embodiments, the salt is NaCl. A variety of suitable buffers are known in the art and described herein. Viral purification methods using ion exchange chromatography are also generally known; see, e.g., purification of influenza virus available online at www.pall.com/pdfs/Biopharmaceuticals/MustangQXT_AcroPrep_USD2916.pdf.

[00193] A variety of devices known in the art are suitable for cation exchange chromatography (optionally including filtration), such as the Mustang® S system (Pall Corporation), which uses a cation exchange membrane with a 0.65 µm pore size. A variety of functional groups are used for cation exchange membranes, including without limitation pendant sulfonic functional groups in a cross-linked, polymeric coating. A variety of buffers may be used to bind an eluate containing a Zika virus of the present disclosure to a cation exchange membrane. Exemplary buffers include, without limitation, citrate and phosphate buffers (additional buffers are described infra). In some embodiments, a buffer used in cation exchange chromatography (e.g., in loading and/or elution) contains polysorbate (e.g., TWEEN®-80 at 0.05%, 0.1%, 0.25%, or 0.5%).

[00194] A variety of devices known in the art are suitable for anion exchange chromatography (optionally including filtration), such as the Mustang® Q system (Pall Corporation), which uses an anion exchange membrane with a 0.8 µm pore size. Another suitable anion exchange membrane is SartobindQ IEXNano. A variety of functional groups are used for anion exchange membranes, including without limitation pendant quaternary amine functional groups in a cross-linked, polymeric coating. A variety of buffers may be used to bind an eluate containing a Zika virus of the present disclosure to an anion exchange membrane. Exemplary buffers include, without limitation, phosphate buffer (additional buffers are described infra). In some embodiments, a buffer used in anion exchange chromatography (e.g., in loading and/or elution) contains polysorbate (e.g., TWEEN®-80 at 0.05%, 0.1%, 0.25%, or 0.5%). In some embodiments, the virus is eluted by step elution, e.g. using 250 mM NaCl, 500 mM NaCl and 750 mM NaCl.

[00195] Formulations of Vaccines and/or immunogenic compositions

[00196] Further aspects of the present disclosure relate to formulations of vaccines and/or immunogenic compositions of the present disclosure containing one or more antigens from a Zika virus described herein. In some embodiments, the Zika virus is a purified inactivated whole Zika virus. In some embodiments, the purified inactivated whole Zika virus comprises a mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1. In some embodiments, the purified inactivated whole Zika

vims comprises a Trp98Gly mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO:1. In some embodiments, the purified inactivated whole Zika virus comprises a Trp98Gly mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO:1, wherein the Zika vims is derived from strain PRVABC59. In some embodiments, the purified inactivated whole Zika vims comprises a Trp98Gly mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1, wherein the Zika virus is derived from strain PRVABC59 comprising the genomic sequence according to SEQ ID NO:2.

[00197] Such vaccines and/or immunogenic compositions of the present disclosure containing one or more antigens from a Zika vims described herein may be useful for treating or preventing Zika virus infection in a subject in need thereof and/or inducing an immune response, such as a protective immune response, against Zika virus in a subject in need thereof.

[00198] Typically, vaccines and/or immunogenic compositions of the present disclosure are prepared as injectable* either as liquid solutions or suspensions; solid forms suitable for solution in, or suspension in, liquid prior to injection may also be prepared. Such preparations may also be emulsified or produced as a dry powder. The active immunogenic ingredient is often mixed with excipients which are pharmaceutically acceptable and compatible with the active ingredient. Suitable excipients are, for example, water, saline, dextrose, sucrose, glycerol, ethanol, or the like, and combinations thereof. In addition, if desired, the vaccine or immunogenic composition may contain auxiliary substances such as wetting or emulsifying agents, pH buffering agents, or adjuvants which enhance the effectiveness of the vaccine or immunogenic composition.

[00199] Vaccines or immunogenic compositions may be conventionally administered parenterally, by injection, for example, either subcutaneously, transcutaneously, intradermally, subdermally or intramuscularly. Additional formulations which are suitable for other modes of administration include suppositories and, in some cases, oral, peroral, intranasal, buccal, sublingual, intraperitoneal, intravaginal, anal and intracranial formulations. For suppositories, traditional binders and carriers may include, for example, polyalkylene glycols or triglycerides; such suppositories may be formed from mixtures containing the active ingredient in the range of 0.5% to 10%, or even 1-2%. In certain embodiments, a low melting wax, such as a mixture of fatty acid glycerides or cocoa butter is first melted and the Zika virus vaccine and/or immunogenic composition described herein is dispersed homogeneously, for example, by stirring. The molten homogeneous mixture is then poured into conveniently sized molds and allowed to cool and to solidify.

[00200] Formulations suitable for intranasal delivery include liquids (e.g., aqueous solution for administration as an aerosol or nasal drops) and dry powders (e.g. for rapid deposition within the nasal passage). Formulations include such normally employed excipients as, for example, pharmaceutical grades of mannitol, lactose, sucrose, trehalose, xylitol, and chitosan. Mucosadhesive agents such as chitosan can be used in either liquid or powder formulations to delay mucociliary clearance of intranasally-administered formulations. Sugars such as mannitol, sorbitol, trehalose, and/or sucrose can be used as stability agents in liquid formulations and as stability, bulking, or powder flow and size agents in dry powder formulations. In

addition, adjuvants such as monophosphoryl lipid A (MLA), or derivatives thereof, or CpG oligonucleotides can be used in both liquid and dry powder formulations as an immunostimulatory adjuvant.

[00201] Formulations suitable for oral delivery include liquids, solids, semi-solids, gels, tablets, capsules, lozenges, and the like. Formulations suitable for oral delivery include tablets, lozenges, capsules, gels, liquids, food products, beverages, nutraceuticals, and the like. Formulations include such normally employed excipients as, for example, pharmaceutical grades of mannitol, sorbitol, trehalose, sucrose, lactose, starch, magnesium stearate, sodium saccharine, cellulose, magnesium carbonate, and the like. Other Zika virus vaccines and immunogenic compositions may take the form of solutions, suspensions, pills, sustained release formulations or powders and contain 10-95% of active ingredient, or 25-70%. For oral formulations, cholera toxin is an interesting formulation partner (and also a possible conjugation partner).

[00202] The Zika virus vaccines and/or immunogenic compositions when formulated for vaginal administration may be in the form of pessaries, tampons, creams, gels, pastes, foams or sprays. Any of the foregoing formulations may contain agents in addition to Zika virus vaccine and/or immunogenic compositions, such as carriers, known in the art to be appropriate.

[00203] In some embodiments, the Zika virus vaccines and/or immunogenic compositions of the present disclosure may be formulated for systemic or localized delivery. Such formulations are well known in the art. Parenteral vehicles include sodium chloride solution, Ringer's dextrose, dextrose and sodium chloride, lactated Ringer's or fixed oils. Intravenous vehicles include fluid and nutrient replenishes, electrolyte replenishes (such as those based on Ringer's dextrose), and the like. Systemic and localized routes of administration include, e.g., intradermal, topical application, intravenous, intramuscular, etc.

[00204] The vaccines and/or immunogenic compositions of the present disclosure may be administered in a manner compatible with the dosage formulation, and in such amount as will be therapeutically effective and immunogenic. The vaccine may comprise a purified inactivated whole Zika virus, in the form of a clonal isolate obtained/obtainable from plaque purification, such as a Zika virus with a mutation which is a thryptophan to glycine substitution at position 98 of SEQ ID NO: 1 or at a position corresponding to position 98 of SEQ ID NO: 1 as described herein. In some embodiments, the vaccine or immunogenic composition comprises a purified inactivated whole Zika virus comprising a Trp98Gly mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1, wherein the Zika virus is derived from strain PRVABC59. In some embodiments, the vaccine or immunogenic composition comprises a purified inactivated whole Zika virus comprising a Trp98Gly mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1, wherein the Zika virus is derived from strain PRVABC59 comprising the genomic sequence according to SEQ ID NO:2. The quantity to be administered depends on the subject to be treated, including, e.g., the capacity of the individual's immune system to mount an immune response, and the degree of protection desired. Suitable dosage ranges may include, for example, from about 0.1 μg to about 100 μg , about 1 μg to about 100 μg , about 2 μg to about 100 μg , about 5 μg to about 100 μg , about 10 μg to about 100 μg , about 15 μg to about 100 μg , about 20 μg to about 100 μg , about 25 μg to about 100 μg , about 30 μg to about 100 μg , about 35 μg to about 100 μg , about 40 μg to about 100

10 µg to about 55 µg, about 15 µg to about 55 µg, about 20 µg to about 55 µg, about 25 µg to about 55 µg, about 30 µg to about 55 µg, about 35 µg to about 55 µg, about 40 µg to about 55 µg, about 45 µg to about 55 µg, about 50 µg to about 55 µg, about 0.1 µg to about 50 µg, about 1 µg to about 50 µg, about 2 µg to about 50 µg, about 5 µg to about 50 µg, about 10 µg to about 50 µg, about 15 µg to about 50 µg, about 20 µg to about 50 µg, about 25 µg to about 50 µg, about 30 µg to about 50 µg, about 35 µg to about 50 µg, about 40 µg to about 50 µg, about 45 µg to about 50 µg, about 0.1 µg to about 45 µg, about 1 µg to about 45 µg, about 2 µg to about 45 µg, about 5 µg to about 45 µg, about 10 µg to about 45 µg, about 15 µg to about 45 µg, about 20 µg to about 45 µg, about 25 µg to about 45 µg, about 30 µg to about 45 µg, about 35 µg to about 45 µg, about 40 µg to about 45 µg, about 0.1 µg to about 40 µg, about 1 µg to about 40 µg, about 2 µg to about 40 µg, about 5 µg to about 40 µg, about 10 µg to about 40 µg, about 15 µg to about 40 µg, about 20 µg to about 40 µg, about 25 µg to about 40 µg, about 30 µg to about 40 µg, about 35 µg to about 40 µg, about 0.1 µg to about 35 µg, about 1 µg to about 35 µg, about 2 µg to about 35 µg, about 5 µg to about 35 µg, about 10 µg to about 35 µg, about 15 µg to about 35 µg, about 20 µg to about 35 µg, about 25 µg to about 35 µg, about 30 µg to about 35 µg, about 0.1 µg to about 30 µg, about 1 µg to about 30 µg, about 2 µg to about 30 µg, about 5 µg to about 30 µg, about 10 µg to about 30 µg, about 15 µg to about 30 µg, about 20 µg to about 30 µg, about 25 µg to about 30 µg, about 0.1 µg to about 25 µg, about 1 µg to about 25 µg, about 2 µg to about 25 µg, about 5 µg to about 25 µg, about 10 µg to about 25 µg, about 15 µg to about 25 µg, about 20 µg to about 25 µg, about 0.1 µg to about 20 µg, about 1 µg to about 20 µg, about 2 µg to about 20 µg, about 5 µg to about 20 µg, about 10 µg to about 20 µg, about 15 µg to about 20 µg, about 0.1 µg to about 15 µg, about 1 µg to about 15 µg, about 2 µg to about 15 µg, about 5 µg to about 15 µg, about 10 µg to about 15 µg, about 0.1 µg to about 10 µg, about 1 µg to about 10 µg, about 2 µg to about 10 µg, about 5 µg to about 10 µg, about 0.1 µg to about 5 µg, about 1 µg to about 5 µg, about 2 µg to about 5 µg, about 0.1 µg to about 2 µg, about 1 µg to about 2 µg, or about 0.1 µg to about 1 µg per dose. In certain embodiments, the dosage can be about 0.1 µg, about 0.2 µg, about 0.3 µg, about 0.4 µg, about 0.5 µg, about 0.6 µg, about 0.7 µg, about 0.8 µg, about 0.9 µg, about 1 µg, about 1.1 µg, about 1.2 µg, about 1.3 µg, about 1.4 µg, about 1.5 µg, about 1.6 µg, about 1.7 µg, about 1.8 µg, about 1.9 µg, about 2 µg, about 2.1 µg, about 2.2 µg, about 2.3 µg, about 2.4 µg, about 2.5 µg, about 2.6 µg, about 2.7 µg, about 2.8 µg, about 2.9 µg, about 3 µg, about 4 µg, about 5 µg, about 6 µg, about 7 µg, about 8 µg, about 9 µg, about 10 µg, about 11 µg, about 12 µg, about 13 µg, about 14 µg, about 15 µg, about 16 µg, about 17 µg, about 18 µg, about 19 µg, about 20 µg, about 21 µg, about 22 µg, about 23 µg, about 24 µg, about 25 µg, about 26 µg, about 27 µg, about 28 µg, about 29 µg, about 30 µg, about 31 µg, about 32 µg, about 33 µg, about 34 µg, about 35 µg, about 36 µg, about 37 µg, about 38 µg, about 39 µg, about 40 µg, about 41 µg, about 42 µg, about 43 µg, about 44 µg, about 45 µg, about 46 µg, about 47 µg, about 48 µg, about 49 µg, about 50 µg, about 51 µg, about 52 µg, about 53 µg, about 54 µg, about 55 µg, about 56 µg, about 57 µg, about 58 µg, about 59 µg, about 60 µg, about 61 µg, about 62 µg, about 63 µg, about 64 µg, about 65 µg, about 66 µg, about 67 µg, about 68 µg, about 69 µg, about 70 µg, about 71 µg, about 72 µg, about 73 µg, about 74 µg, about 75 µg, about 76 µg, about 77 µg, about 78 µg, about 79 µg, about 80 µg, about 81 µg, about 82 µg, about 83 µg, about 84 µg, about 85 µg, about 86 µg, about 87 µg, about 88 µg, about 89 µg, about 90 µg, about 91 µg, about 92 µg, about 93 µg, about 94 µg, about 95 µg, about 96 µg, about 97 µg, about 98 µg, about 99 µg, or about 100 µg per dose. The amount of the purified inactivated Zika virus can be determined by a Bradford assay (Bradford et al. (1976) Anal. Biochem. 72: 248-

254) using defined amounts of recombinant Zika envelope protein to establish the standard **curve**. Thus the dosage of **the** antigen may thus also be referred to as micrograms (fig) of Zika Envelope protein E (μg Env). μg Antigen as mentioned above in this paragraph and μg Env as mentioned in the **paragraph** below **thus** mean the same within the meaning of this disclosure.

[00205] In some embodiments, the dosage may be measured in micrograms (μg) of Zika Envelope protein E (Env). Accordingly, in some embodiments, the dosage ranges may include, for example, from about 0.1 μg Env to about 100 μg Env, about 1 μg Env to about 100 μg Env, about 2 μg Env to about 100 μg Env, about 5 μg Env to about 100 μg Env, about 10 μg Env to about 100 μg Env, about 15 μg Env to about 100 μg Env, about 20 μg Env to about 100 μg Env, about 25 μg Env to about 100 μg Env, about 30 μg Env to about 100 μg Env, about 35 μg Env to about 100 μg Env, about 40 μg Env to about 100 μg Env, about 45 μg Env to about 100 μg Env, about 50 μg Env to about 100 μg Env, about 55 μg Env to about 100 μg Env, about 60 μg Env to about 100 μg Env, about 65 μg Env to about 100 μg Env, about 70 μg Env to about 100 μg Env, about 75 μg Env to about 100 μg Env, about 80 μg Env to about 100 μg Env, about 85 μg Env to about 100 μg Env, about 90 μg Env to about 100 μg Env, about 95 μg Env to about 100 μg Env, about 0.1 μg Env to about 95 μg Env, about 1 μg Env to about 95 μg Env, about 2 μg Env to about 95 μg Env, about 5 μg Env to about 95 μg Env, about 10 μg Env to about 95 μg Env, about 15 μg Env to about 95 μg Env, about 20 μg Env to about 95 μg Env, about 25 μg Env to about 95 μg Env, about 30 μg Env to about 95 μg Env, about 35 μg Env to about 95 μg Env, about 40 μg Env to about 95 μg Env, about 45 μg Env to about 95 μg Env, about 50 μg Env to about 95 μg Env, about 55 μg Env to about 95 μg Env, about 60 μg Env to about 95 μg Env, about 65 μg Env to about 95 μg Env, about 70 μg Env to about 95 μg Env, about 75 μg Env to about 95 μg Env, about 80 μg Env to about 95 μg Env, about 85 μg Env to about 95 μg Env, about 90 μg Env to about 95 μg Env, about 0.1 μg Env to about 90 μg Env, about 1 μg Env to about 90 μg Env, about 2 μg Env to about 90 μg Env, about 5 μg Env to about 90 μg Env, about 10 μg Env to about 90 μg Env, about 15 μg Env to about 90 μg Env, about 20 μg Env to about 90 μg Env, about 25 μg Env to about 90 μg Env, about 30 μg Env to about 90 μg Env, about 35 μg Env to about 90 μg Env, about 40 μg Env to about 90 μg Env, about 45 μg Env to about 90 μg Env, about 50 μg Env to about 90 μg Env, about 55 μg Env to about 90 μg Env, about 60 μg Env to about 90 μg Env, about 65 μg Env to about 90 μg Env, about 70 μg Env to about 90 μg Env, about 75 μg Env to about 90 μg Env, about 80 μg Env to about 90 μg Env, about 85 μg Env to about 90 μg Env, about 0.1 μg Env to about 85 μg Env, about 1 μg Env to about 85 μg Env, about 2 μg Env to about 85 μg Env, about 5 μg Env to about 85 μg Env, about 10 μg Env to about 85 μg Env, about 15 μg Env to about 85 μg Env, about 20 μg Env to about 85 μg Env, about 25 μg Env to about 85 μg Env, about 30 μg Env to about 85 μg Env, about 35 μg Env to about 85 μg Env, about 40 μg Env to about 85 μg Env, about 45 μg Env to about 85 μg Env, about 50 μg Env to about 85 μg Env, about 55 μg Env to about 85 μg Env, about 60 μg Env to about 85 μg Env, about 65 μg Env to about 85 μg Env, about 70 μg Env to about 85 μg Env, about 75 μg Env to about 85 μg Env, about 80 μg Env to about 85 μg Env, about 0.1 μg Env to about 80 μg Env, about 1 μg Env to about 80 μg Env, about 2 μg Env to about 80 μg Env, about 5 μg Env to about 80 μg Env, about 10 μg Env to about 80 μg Env, about 15 μg Env to about 80 μg Env, about 20 μg Env to about 80 μg Env, about 25 μg Env to about 80 μg Env, about 30 μg Env to about 80 μg Env, about 35 μg Env to about 80 μg Env, about 40 μg Env to about 80 μg Env, about 45 μg Env to about 80 μg Env, about 50 μg Env to about 80 μg Env, about 55 μg Env to about 80 μg Env,

μg Env to about 35 μg Env, about 15 μg Env to about 35 μg Env, about 20 μg Env to about 35 μg Env, about 25 μg Env to about 35 μg Env, about 30 μg Env to about 35 μg Env, about 0.1 μg Env to about 30 μg Env, about 1 μg Env to about 30 μg Env, about 2 μg Env to about 30 μg Env, about 5 μg Env to about 30 μg Env, about 10 μg Env to about 30 μg Env, about 15 μg Env to about 30 μg Env, about 20 μg Env to about 30 μg Env, about 25 μg Env to about 30 μg Env, about 0.1 μg Env to about 25 μg Env, about 1 μg Env to about 25 μg Env, about 2 μg Env to about 25 μg Env, about 5 μg Env to about 25 μg Env, about 10 μg Env to about 25 μg Env, about 15 μg Env to about 25 μg Env, about 20 μg Env to about 25 μg Env, about 0.1 μg Env to about 20 μg Env, about 1 μg Env to about 20 μg Env, about 2 μg Env to about 20 μg Env, about 5 μg Env to about 20 μg Env, about 10 μg Env to about 20 μg Env, about 15 μg Env to about 20 μg Env, about 0.1 μg Env to about 15 μg Env, about 1 μg Env to about 15 μg Env, about 2 μg Env to about 15 μg Env, about 5 μg Env to about 15 μg Env, about 10 μg Env to about 15 μg Env, about 0.1 μg Env to about 10 μg Env, about 1 μg Env to about 10 μg Env, about 2 μg Env to about 10 μg Env, about 5 μg Env to about 10 μg Env, about 0.1 μg Env to about 5 μg Env, about 1 μg Env to about 5 μg Env, about 2 μg Env to about 5 μg Env, about 0.1 μg Env to about 2 μg Env, about 1 μg Env to about 2 μg Env, or about 0.1 μg Env to about 1 μg Env per dose. In certain embodiments, the dosage can be about 0.1 μg Env, about 0.2 μg Env, about 0.3 μg Env, about 0.4 μg Env, about 0.5 μg Env, about 0.6 μg Env, about 0.7 μg Env, about 0.8 μg Env, about 0.9 μg Env, about 1 μg Env, about 1.1 μg Env, about 1.2 μg Env, about 1.3 μg Env, about 1.4 μg Env, about 1.5 μg Env, about 1.6 μg Env, about 1.7 μg Env, about 1.8 μg Env, about 1.9 μg Env, about 2 μg Env, about 2.1 μg Env, about 2.2 μg Env, about 2.3 μg Env, about 2.4 μg Env, about 2.5 μg Env, about 2.6 μg Env, about 2.7 μg Env, about 2.8 μg Env, about 2.9 μg Env, about 3 μg Env, about 4 μg Env, about 5 μg Env, about 6 μg Env, about 7 μg Env, about 8 μg Env, about 9 μg Env, about 10 μg Env, about 11 μg Env, about 12 μg Env, about 13 μg Env, about 14 μg Env, about 15 μg Env, about 16 μg Env, about 17 μg Env, about 18 μg Env, about 19 μg Env, about 20 μg Env, about 21 μg Env, about 22 μg Env, about 23 μg Env, about 24 μg Env, about 25 μg Env, about 26 μg Env, about 27 μg Env, about 28 μg Env, about 29 μg Env, about 30 μg Env, about 31 μg Env, about 32 μg Env, about 33 μg Env, about 34 μg Env, about 35 μg Env, about 36 μg Env, about 37 μg Env, about 38 μg Env, about 39 μg Env, about 40 μg Env, about 41 μg Env, about 42 μg Env, about 43 μg Env, about 44 μg Env, about 45 μg Env, about 46 μg Env, about 47 μg Env, about 48 μg Env, about 49 μg Env, about 50 μg Env, about 51 μg Env, about 52 μg Env, about 53 μg Env, about 54 μg Env, about 55 μg Env, about 56 μg Env, about 57 μg Env, about 58 μg Env, about 59 μg Env, about 60 μg Env, about 61 μg Env, about 62 μg Env, about 63 μg Env, about 64 μg Env, about 65 μg Env, about 66 μg Env, about 67 μg Env, about 68 μg Env, about 69 μg Env, about 70 μg Env, about 71 μg Env, about 72 μg Env, about 73 μg Env, about 74 μg Env, about 75 μg Env, about 76 μg Env, about 77 μg Env, about 78 μg Env, about 79 μg Env, about 80 μg Env, about 81 μg Env, about 82 μg Env, about 83 μg Env, about 84 μg Env, about 85 μg Env, about 86 μg Env, about 87 μg Env, about 88 μg Env, about 89 μg Env, about 90 μg Env, about 91 μg Env, about 92 μg Env, about 93 μg Env, about 94 μg Env, about 95 μg Env, about 96 μg Env, about 97 μg Env, about 98 μg Env, about 99 μg Env, or about 100 μg Env per dose.

[00206] Suitable regimens for initial administration and booster shots are also variable but are typified by an initial administration followed by subsequent inoculations or other administrations. The manner of application may be varied widely. Any of the conventional methods for administration of a vaccine or

immunogenic composition are applicable. These include oral application on a solid physiologically acceptable base or in a physiologically acceptable dispersion, parenterally, by injection or the like. The dosage of the vaccine or immunogenic composition will depend on the route of administration and may vary according to the age of the person to be vaccinated and the formulation of the antigen. The vaccine or immunogenic composition can have a unit dosage volume of more than 0.5mL, of 0.5mL or of less than 0.5mL, as described herein. For instance, it can be administered at a volume of 0.25mL.

[00207] Delivery agents that improve mucoadhesion can also be used to improve delivery and immunogenicity especially for intranasal, oral or lung based delivery formulations. One such compound, chitosan, the N-deacetylated form of chitin, is used in many pharmaceutical formulations. It is an attractive mucoadhesive agent for intranasal vaccine delivery due to its ability to delay mucociliary clearance and allow more time for mucosal antigen uptake and processing. In addition, it can transiently open tight junctions which may enhance transepithelial transport of antigen to the NALT. In a recent human trial, a trivalent inactivated influenza vaccine administered intranasally with chitosan but without any additional adjuvant yielded seroconversion and HI titers that were only marginally lower than those obtained following intramuscular inoculation.

[00208] Chitosan can also be formulated with adjuvants that function well intranasally such as the genetically detoxified E. coli heat-labile enterotoxin mutant LTK63. This adds an immunostimulatory effect on top of the delivery and adhesion benefits imparted by chitosan resulting in enhanced mucosal and systemic responses.

[00209] Finally, it should be noted that chitosan formulations can also be prepared in a dry powder format that has been shown to improve vaccine stability and result in a further delay in mucociliary clearance over liquid formulations. This was seen in a recent human clinical trial involving an intranasal dry powder diphtheria toxoid vaccine formulated with chitosan in which the intranasal route was as effective as the traditional intramuscular route with the added benefit of secretory IgA responses. The vaccine was also very well tolerated. Intranasal dry powdered vaccines for anthrax containing chitosan and MLA, or derivatives thereof induce stronger responses in rabbits than intramuscular inoculation and are also protective against aerosol spore challenge.

[00210] Intranasal vaccines represent an exemplary formulation as they can affect the upper and lower respiratory tracts in contrast to parenterally administered vaccines which are better at affecting the lower respiratory tract. This can be beneficial for inducing tolerance to allergen-based vaccines and inducing immunity for pathogen-based vaccines.

[00211] In addition to providing protection in both the upper and lower respiratory tracts, intranasal vaccines avoid the complications of needle inoculations and provide a means of inducing both mucosal and systemic humoral and cellular responses via interaction of particulate and/or soluble antigens with nasopharyngeal-associated lymphoid tissues (NALT).

[00212] Vaccines and/or immunogenic compositions of the present disclosure are pharmaceutically acceptable. They may include components in addition to the antigen and adjuvant, e.g. they will typically include one or more pharmaceutical carrier(s) and/or excipient(s). A thorough discussion of such components is available in Gennaro (2000) Remington: The Science and Practice of Pharmacy. 20th edition, ISBN: 0683306472.

[00213] To control tonicity, it is preferred to include a physiological salt, such as a sodium salt. Sodium chloride (NaCl) is preferred, which may be present at between 1 and 20 nig/ml. Other salts that may be present include potassium chloride, potassium dihydrogen phosphate, disodium phosphate dehydrate, magnesium chloride, calcium chloride, etc.

[00214] Vaccines and/or immunogenic compositions of the present disclosure may include one or more buffers. Typical buffers include: a phosphate buffer; a Tris buffer; a borate buffer; a succinate buffer; a histidine buffer (particularly with an aluminum hydroxide adjuvant); or a citrate buffer. Buffers will typically be included in the 5-20mM range

[00215] The pH of a vaccine or immunogenic composition will generally be between 5.0 and 8.5 or 5.0 and 8.1, and more typically between 6.0 and 8.5 e.g. between 6.0 and 8.0, between 6.5 and 8.0, between 6.5 and 7.5, between 7.0 and 8.5, between 7.0 and 8.0, or between 7.0 and 7.8. A manufacturing process of the present disclosure may therefore include a step of adjusting the pH of the bulk vaccine prior to packaging.

[00216] The vaccine or immunogenic composition is preferably sterile. It is preferably non pyrogenic, e.g. containing < 1 EU (endotoxin unit, a standard measure) per dose, and preferably <0.1 EU per dose. It is preferably gluten free.

[00217] In certain embodiments, the vaccines and/or immunogenic compositions of the present disclosure may include a detergent in an effective concentration. In some embodiments, an effective amount of detergent may include without limitation, about 0.00005% v/v to about 5% v/v or about 0.0001 % v/v to about 1% v/v. In certain embodiments, an effective amount of detergent is about 0.001% v/v, about 0.002% v/v, about 0.003% v/v, about 0.004% v/v, about 0.005% v/v, about 0.006% v/v, about 0.007% v/v, about 0.008% v/v, about 0.009% v/v, or about 0.01% v/v. Without wishing to be bound by theory, detergents help maintain the vaccines and/or immunogenic compositions of the present disclosure in solution and help to prevent the vaccines and/or immunogenic compositions from aggregating.

[00218] Suitable detergents include, for example, polyoxyethylene sorbitan ester surfactant (known as 'Tweens'), octoxynol (such as octoxynol-9 (Triton X 100) or t-octylphenoxypolyethoxyethanol), cetyl trimethyl ammonium bromide ('CTAB'), and sodium deoxycholate, particularly for a split or surface antigen vaccine. The detergent may be present only at trace amounts. Other residual components in trace amounts could be antibiotics (e.g. neomycin, kanamycin, polymyxin B). In some embodiments, the detergent contains polysorbate. In some embodiments, the effective concentration of detergent includes ranges from about 0.00005% v/v to about 5% v/v.

[0021 9] The vaccines **and/or** immunogenic compositions are preferably stored **at** between 2°C and 8°C. They should ideally be kept out of direct light. The antigen and emulsion will typically be in admixture, although **they** may initially be presented in **the form of** a kit of separate components for extemporaneous admixing. Vaccines and/or immunogenic compositions will generally be in aqueous form when administered to a subject.

Methods of the Present Disclosure

[00220] Further aspects **of** the present disclosure relate to methods **for** using vaccines and/or or immunogenic compositions described herein containing one or more antigens from at least one Zika virus (e.g., a clonal Zika vims isolate, a Zika virus comprising a non-human cell adaptation mutation such as a non-human cell adaptation mutation in protein NS1 such as a purified inactivated whole Zika virus, **in the form of** a clonal isolate obtained/obtainable from plaque purification, such as a Zika virus **with** a mutation which is a **tryptophan to** glycine substitution at position 98 of SEQ **ID NO:1** or at a position corresponding **to** position 98 of SEQ **ID NO: 1** as described herein) to treat or prevent Zika virus in **a** subject in need thereof and/or **to** induce an immune response to Zika **virus** in a subject in need thereof. Further aspects of the present disclosure relate to methods for using vaccines and/or or immunogenic compositions described herein containing a purified inactivated whole Zika **virus** with a mutation which is a **tryptophan to** glycine substitution **at** position 98 of SEQ **ID NO: 3** or at a position corresponding **to** position 98 of SEQ **ID NO: i** **to** treat or prevent Zika **virus** in a subject in need thereof and/or **to** induce an immune response to Zika virus in a subject in need thereof. Further aspects of the present disclosure relate to methods for using vaccines and/or or immunogenic compositions described herein containing a purified inactivated whole Zika virus with a mutation which is a **tryptophan to** glycine substitution at position 98 of SEQ **ID NO: 1** or at a position **corresponding** to position 98 of SEQ **ID NO: 1**, wherein the Zika virus is derived from strain PRVABC59, to treat or prevent Zika viras in a subject in need thereof and/or to induce an immune response **to** Zika vims in **a** subject in need thereof. Further aspects of the present disclosure relate to methods for using vaccines and/or or immunogenic compositions described herein containing a purified inactivated whole Zika vims with a mutation which is a **tryptophan to** glycine substitution at position 98 of SEQ **ID NO: 1** or at **a** position corresponding **to** position 98 of SEQ **ID NO: 1**, wherein the **Zika** viras is derived from strain PRVABC59 comprising **the genomic** sequence according **to** SEQ **ID NO:2** to treat or prevent **Zika virus** in a subject **in need thereof** and/or to induce **an immune** response to **Zika** viras **in** a subject **in need thereof**.

[00221.] **In** some **embodiments**, the present disclosure relates **to** methods for treating or preventing Zika **virus** infection **in** a subject **in need thereof** by **administering** to the subject a **therapeutically** effective amount of a vaccine and/or immunogenic composition of the present disclosure containing one or more antigens from **at least one** Zika virus (e.g., a clonal Zika virus isolate, a Zika viras comprising a non-human cell adaptation mutation such as a non-human cell adaptation mutation in protein NS1, such as a purified inactivated whole Zika viras, **in the form of** a clonal isolate **obtained/obtainable** from plaque purification, such as a Zika vims with a mutation which is a **tryptophan to** glycine substitution **at** position 98 of SEQ **ID NO: 1** or at a position **corresponding-** to position 98 of SEQ **ID NO: 1** as described herein).

[00222] In some embodiments, the present disclosure relates to methods for treating or preventing Zika virus infection in a subject in need thereof by administering to the subject a therapeutically effective amount of a vaccine and/or immunogenic composition of the present disclosure containing a purified inactivated whole Zika virus with a mutation which is a tryptophan to glycine substitution at position 98 of SEQ ID NO: 1 or at a position corresponding to position 98 of SEQ ID NO: 1. In some embodiments, the present disclosure relates to methods for treating or preventing Zika virus infection in a subject in need thereof by administering to the subject a therapeutically effective amount of a vaccine and/or immunogenic composition of the present disclosure containing a purified inactivated whole Zika virus with a mutation which is a tryptophan to glycine substitution at position 98 of SEQ ID NO: 1 or at a position corresponding to position 98 of SEQ ID NO: 1, wherein the Zika virus is derived from strain PRVABC59. In some embodiments, the present disclosure relates to methods for treating or preventing Zika virus infection in a subject in need thereof by administering to the subject a therapeutically effective amount of a vaccine and/or immunogenic composition of the present disclosure containing a purified inactivated whole Zika virus with a mutation which is a tryptophan to glycine substitution at position 98 of SEQ ID NO: 1 or at a position corresponding to position 98 of SEQ ID NO: 1, wherein the Zika virus is derived from strain PRVABC59 comprising the genomic sequence according to SEQ ID NO:2.

[00223] In some embodiments, the present disclosure relates to methods for inducing an immune response to Zika virus in a subject in need thereof by administering to the subject a therapeutically effective amount of a vaccine and/or immunogenic composition of the present disclosure containing one or more antigens from at least one Zika (e.g., a clonal Zika virus isolate, a Zika virus comprising a non-human cell adaptation mutation such as a non-human cell adaptation mutation in protein NS1, such as a purified inactivated whole Zika virus, in the form of a clonal isolate obtained/obtainable from plaque purification, such as a Zika virus with a mutation which is a tryptophan to glycine substitution at position 98 of SEQ ID NO: 1 or at a position corresponding to position 98 of SEQ ID NO: 1 as described herein). In some embodiments, the present disclosure relates to methods for inducing an immune response to Zika virus in a subject in need thereof by administering to the subject a therapeutically effective amount of a vaccine and/or immunogenic composition of the present disclosure containing a purified inactivated whole Zika virus with a mutation which is a tryptophan to glycine substitution at position 98 of SEQ ID NO: 1 or at a position corresponding to position 98 of SEQ ID NO: 1, wherein the Zika virus is derived from strain PRVABC59. In some embodiments, the present disclosure relates to methods for inducing an immune response to Zika virus in a subject in need thereof by administering to the subject a therapeutically effective amount of a vaccine and/or immunogenic composition of the present disclosure containing a purified inactivated whole Zika virus with a mutation which is a tryptophan to glycine substitution at position 98 of SEQ ID NO: 1 or at a position corresponding to position 98 of SEQ ID NO: 1, wherein the Zika virus is derived from strain PRVABC59 comprising the genomic sequence according to SEQ ID NO:2.

[00224] In some embodiments, the administering step induces a protective immune response against Zika virus in the subject. In some embodiments, the subject is a human. In some embodiments, the subject is pregnant or intends to become pregnant.

[00225] The Zika virus vaccines and/or immunogenic compositions disclosed herein may be used to protect or treat a subject (e.g., a mammal such as a human) susceptible to, or suffering from a viral infection, by means of administering the vaccine by intranasal, peroral, oral, buccal, sublingual, intramuscular, intraperitoneal, intradermal, transdermal, subdermal, intravaginal, anal, intracranial, intravenous, transcutaneous, or subcutaneous administration. Methods of systemic administration of the vaccines and/or immunogenic compositions of the present disclosure may include conventional syringes and needles, or devices designed for ballistic delivery of solid vaccines (WO 99/27961), or needleless pressure liquid jet device (U.S. Pat. No. 4,596,556; U.S. Pat. No. 5,993,412), or transdermal patches (WO 97/48440; WO 98/28037). The Zika virus vaccines and/or immunogenic compositions of the present disclosure may also be applied to the skin (transdermal or transcutaneous delivery WO 98/20734; WO 98/28037). The Zika-virus vaccines and/or immunogenic compositions of the present disclosure therefore may include a delivery device for systemic administration, pre-filled with the Zika virus vaccine or immunogenic compositions. Accordingly there is provided methods for treating or preventing Zika virus infection and/or for inducing an immune response in a subject (e.g., a mammal such as a human), including the step of administering a vaccine or immunogenic composition of the present disclosure and optionally including an adjuvant and/or a carrier, to the subject, where the vaccine or immunogenic composition is administered via the parenteral or systemic route.

[00226] The vaccines and/or immunogenic compositions of the present disclosure may be used to protect or treat a subject (e.g., a mammal such as a human) susceptible to, or suffering from a viral infection, by means of administering the vaccine or immunogenic composition via a mucosal route, such as the oral/alimentary or nasal route. Alternative mucosal routes are intravaginal and intra-rectal. The mucosal route of administration may be via the nasal route, termed intranasal vaccination. Methods of intranasal vaccination are well known in the art, including the administration of a droplet, spray, or dry powdered form of the vaccine into the nasopharynx of the individual to be immunized. Nebulized or aerosolized vaccine formulations are potential forms of the Zika virus vaccines and/or immunogenic compositions disclosed herein. Enteric formulations such as gastro resistant capsules and granules for oral administration, suppositories for rectal or vaginal administration are also formulations of the vaccines and/or immunogenic compositions of the present disclosure.

[00227] The Zika virus vaccines and/or immunogenic compositions of the present disclosure may also be administered via the oral route. In such cases the pharmaceutically acceptable excipient may also include alkaline buffers, or enteric capsules or microgranules. The Zika virus vaccines and/or immunogenic compositions of the present disclosure may also be administered by the vaginal route. In such cases, the pharmaceutically acceptable excipients may also include emulsifiers, polymers such as CARBOPOL®, and other known stabilizers of vaginal creams and suppositories. The Zika virus vaccines and/or immunogenic compositions may also be administered by the rectal route. In such cases the excipients may also include waxes and polymers known in the art for forming rectal suppositories.

[00228] In some embodiments, the administering step includes one or more administrations. Administration can be by a single dose schedule or a multiple dose (prime-boost) schedule. In a multiple dose

schedule the various doses may be given by the same or different routes e.g. a parenteral prime and mucosal boost, a mucosal prime and parenteral boost, etc. Typically they will be given by the same route. Multiple doses will typically be administered at least 1 week apart (e.g. about 2 weeks, about 3 weeks, about 4 weeks, about 5 weeks, about 6 weeks, about 7 weeks, about 8 weeks, about 9 weeks, about 10 weeks, about 11 weeks, about 12 weeks, about 16 weeks, etc.). Giving two doses separated by from 25-30 days (e.g. 28 days) is particularly useful.

[00229] The methods of the present disclosure include administration of a therapeutically effective amount or an immunogenic amount of the Zika virus vaccines and/or immunogenic compositions of the present disclosure. A therapeutically effective amount or an immunogenic amount may be an amount of the vaccines and/or immunogenic compositions of the present disclosure that will induce a protective immunological response in the uninfected, infected or unexposed subject to which it is administered. Such a response will generally result in the development in the subject of a secretory, cellular and/or antibody-mediated immune response to the vaccine. Usually, such a response includes, but is not limited to one or more of the following effects; the production of antibodies from any of the immunological classes, such as immunoglobulins A, D, E, G or M; the proliferation of B and T lymphocytes; the provision of activation, growth and differentiation signals to immunological cells; expansion of helper T cell, suppressor T cell, and/or cytotoxic T cell.

[00230] In some embodiments, the protective immunological response induced in the subject after administration of a vaccine and/or immunogenic composition containing a non-human cell adapted Zika virus of the present disclosure is greater than the immunological response induced in a corresponding subject administered a vaccine and/or immunogenic composition containing a Zika virus that is not adapted for non-human cell growth and/or comprises a different non-human cell adaptation mutation. In some embodiments, the protective immunological response induced in the subject after administration of the vaccine and/or immunogenic composition containing a non-human cell adapted Zika virus of the present disclosure is at least about 5%, at least about 10%, at least about 15%, at least about 20%, at least about 25%, at least about 30%, at least about 35%, at least about 40%, at least about 45%, at least about 50%, at least about 55%, at least about 60%, at least about 65%, at least about 70%, at least about 75%, at least about 80%, at least about 85%, at least about 90%, at least about 95%, or at least about 99% greater than the immunological response induced in a corresponding subject administered a vaccine and/or immunogenic composition containing a Zika virus that is not adapted for non-human cell growth and/or comprises a different non-human cell adaptation mutation. Methods of measuring protective immunological responses are generally known to one of ordinary skill in the art.

[00231] In some embodiments, administration of a vaccine and/or immunogenic composition containing a non-human cell adapted Zika virus of the present disclosure induces generation of neutralizing antibodies to Zika virus in the subject. In some embodiments, administration of a vaccine and/or immunogenic composition containing a non-human cell adapted Zika virus of the present disclosure induces generation of neutralizing antibodies to Zika virus in the subject in an amount that is greater than the amount of neutralizing antibodies induced in a corresponding subject administered a vaccine and/or immunogenic composition containing a

Zika virus that is not adapted for non-human cell growth and/or comprises a different non-human cell adaptation mutation. In some embodiments, administration of a vaccine and/or immunogenic composition containing a non-human cell adapted Zika virus of the present disclosure induces generation of neutralizing antibodies to Zika virus in the subject in an amount that is at least about 5%, at least about 10%, at least about 15%, at least about 20%, at least about 25%, at least about 30%, at least about 35%, at least about 40%, at least about 45%, at least about 50%, at least about 55%, at least about 60%, at least about 65%, at least about 70%, at least about 75%, at least about 80%, at least about 85%, at least about 90%, at least about 95%, or at least about 99% greater than the amount of neutralizing antibodies induced in a corresponding subject administered a vaccine and/or immunogenic composition containing a Zika virus that is not adapted for non-human cell growth and/or comprises a different non-human cell adaptation mutation. In some embodiments, administration of a vaccine and/or immunogenic composition containing a non-human cell adapted Zika virus of the present disclosure induces generation of neutralizing antibodies to Zika virus in the subject in an amount that is at least about 1-fold, at least about 2-fold, at least about 3-fold, at least about 4-fold, at least about 5-fold, at least about 6-fold, at least about 7-fold, at least about 8-fold, at least about 9-fold, at least about 10-fold, at least about 100-fold, or at least about 1000-fold greater than the amount of neutralizing antibodies induced in a corresponding subject administered a vaccine and/or immunogenic composition containing a Zika virus that is not adapted for non-human cell growth and/or comprises a different non-human cell adaptation mutation. Methods of measuring neutralizing antibodies in a subject are generally known to one of ordinary skill in the art.

[00232] Preferably, the therapeutically effective amount or immunogenic amount is sufficient to bring about treatment or prevention of disease symptoms. The exact amount necessary will vary depending on the subject being treated; the age and general condition of the subject to be treated; the capacity of the subject's immune system to synthesize antibodies; the degree of protection desired; the severity of the condition being treated; the particular Zika virus antigen selected and its mode of administration, among other factors. An appropriate therapeutically effective amount or immunogenic amount can be readily determined by one of skill in the art. A therapeutically effective amount or immunogenic amount will fall in a relatively broad range that can be determined through routine trials.

[00233] The present disclosure will be more fully understood by reference to the following Examples. They should not, however, be construed as limiting any aspect or scope of the present disclosure in any way.

EXAMPLES

Example 1: Clonal Zika Virus Strain Generation

[00234] This example describes the production of Zika virus (ZIKAV) strains with a known research history.

Materials and Methods

Vero Cell Maintenance

[00235] One vial of WHO Vero 10-87 cells was rapidly thawed in a water bath and directly inoculated into 19mL pre-warmed DMEM (Dulbecco's modified minimal essential medium) containing penicillin-streptomycin, L-glutamine 40mM, and 10% FBS in a T-75cm² flask at 36°C±2°C, at 5% CO₂. Cells were allowed to grow to confluency and subcultured using Tryple. This flask was expanded to two T-185cm² flasks, grown to confluency and subcultured to 31 x T-185cm² flasks and grown until the cells reached 100% confluency. Cells were harvested by trypsinization centrifuged at 800 x g for 10 minutes, and resuspended in DMEM containing 10% FBS and 10% DMSO at a concentration of 1.9x10⁷ cells/mL. One vial of the Vero cells was rapidly thawed and resuscitated as described above into a T-75cm² flask. These were subcultured twice to produce a cell bank in 13 x T-185cm² flasks. After trypsinization, the cells were centrifuged at 800 x g and resuspended in freezing media (DMEM containing 10% FBS, and 10% DMSO) at a concentration of 4.68x10⁵ cells/mL. This cell bank was aliquoted into cryovials.

[00236] The Vero cells were grown and maintained in DMEM containing penicillin-streptomycin, L-glutamine and 10% FBS (cDMEM-10%-FBS). TrypleExpress was used to maintain and trypsinize cells. Two days before viral adsorption, 6-well plates were seeded with 4-5 x 10⁵ cells/well in 3 mL of cDMEM-10%-FBS or 7 x 10⁵ cells in T-25cm² flasks in 5 mL cDMEM-10%-FBS, or 1 x 10⁴ cells/well in 96-well plates in 0.1mL cDMEM-10%-FBS. Incubators were monitored daily to maintain indicated temperatures. The Vero cell lines were stored in liquid nitrogen.

Plaque Assay

[00237] Viral titers were determined by plaque titration in freshly confluent monolayers of Vero cells grown in 6-well plates. Frozen aliquots were thawed and ten-fold dilution series of the aliquots were made in cDMEM-0%-FBS in 96-well plates. The diluted viruses were maintained on ice prior to inoculation of the Vero cell monolayers. At the time of assay, the growth medium was aspirated from the 6-well plate, and 100 µL of each virus dilution was added to the wells. Virus was adsorbed for 60 min at 36°C±2°C, at 5% CO₂, with frequent (every 10 min) rocking of the plates to prevent drying of the cell sheets. Following viral adsorption, 4 mL of a first agarose overlay (1X cDMEM-2%-FBS + 0.8% agarose) maintained at 40-41°C was added to each well. The agarose was allowed to solidify for 30 min at room temperature, and the plates were then incubated upside down for 4-6 days at 36°C±2°C, at 5% CO₂. Two mL of a second agarose overlay containing 160 µg/mL of neutral red vital dye was added on day 4. Plaques were visualized on days 5 and 6.

Virus Quantification by TCID₅₀ Assay

[00238] Viral titers were also determined by titration in freshly confluent monolayers of Vero cells grown in 96-well plates. Frozen aliquots were thawed and ten-fold dilution series of the aliquots were made in cDMEM-2%-FBS diluent in 96-well plates. The diluted viruses were maintained on ice prior to inoculation of

the Vero cell monolayers. At the time of assay, the growth medium was aspirated from the 96-well plate, and 100 µL of each virus dilution was added to the wells. The plates were incubated for 5 days at 36°C±2°C, at 5% CO₂. The 50% Tissue Culture Infective Dose (TCID₅₀) titer was calculated using the Reed/Muench calculator.

Test Articles

[00239] Zika virus strain PRVABC59 (one 0.5 mL vial on dry ice) was received from the Centers for Disease Control and Prevention (CDC) Zika virus identification was confirmed through RT-PCR. The strain tested negative for Alphavirus and mycoplasma contamination by PGR. This information is summarized in Table 1.

Table 1: PRVABC59 strain information

Strain	Isolation Information	Patient information	Prep info	Analyses	PFU
PRVABC59 (Asian)	Human serum; travel to Puerto Rico in 2015	None provided	Passage: Vero(2)C6/36(1) Prep: 29Jan2016 Host: C6/36	<ul style="list-style-type: none"> ▪ Sequencing by ion torrent: gene accession #KU501215 ▪ PFU by plaque assay ▪ Identity by RT-PCR ▪ (-) For alphaviruses by PCR ▪ (-) for mycoplasma by ATCC and ABM PCR 	6.7 log pfu/mL

Sequencing

[00240] A QIAampViral RNA Mini Spin kit was used to extract RNA from stabilized virus harvests of each isolate according to manufacturer protocols. Extracted RNA from each isolate was used to create and amplify 6 cDNA fragments encompassing the entire Zika viral genome. Amplified cDNA fragments were analyzed for size and purity on a 1% Agarose/TBE gel and subsequently gel purified using a Qiagen Quick Gel Extraction Kit. An ABI 3130XL Genetic Analyzer sequencer was used to conduct automatic sequencing reactions. Lasergene SeqMan software was used to analyze sequencing data.

Results

[00241] A ZIKAV strain with a known research history that was relevant to the current ZIKAV outbreak in the Americas was sought. For this reason, ZIKAV strain PRVABC59 was chosen. To generate a well-characterized virus adapted for growth in Vero cells, the ZIKAV PRVABC59 was first amplified in Vero cells (PI).

[00242] Flasks of Vera cells (T-175cm²), 100% confluent, were infected at an MOI of 0.01 in 4mL of cDMEM-0%-FBS. Vims was adsorbed to the monolayer for 60 minutes at 36°C±2°C, at 5% CO₂, then 20 mL of cDMEM-0%-FBS was applied for viral amplification at 36°C±2°C, at 5% CO₂. The cell layer was monitored daily for cytopathic effect (CPE) following inoculation (FIG. 1). The supernatant was harvested after 96 hours by collecting the media and clarifying by centrifugation (600 x g, 4°C, 10 min). The harvest was stabilized by adding treMose to a final concentration of 18% w/v. The bulk was aliquoted into 0.5mL cryovials and stored at -80 °C.

[00243] The stabilized P1 harvest was analyzed for the presence of infectious vims on Vera cell monolayers by a TCID₅₀ assay. Growth kinetics were monitored by taking daily aliquots beginning on hour 0. Peak titer was reached by hour 72 (FIG. 2).

[00244] P3 material was plaque-purified by titrating the harvest from day 3 on 6-well monolayers of Vero cells. Plaques were visualized on day 6, and 10 plaques to be isolated were identified by drawing a circle around a distinct and separate plaque on the bottom of the plastic plate. Plaques were picked by extracting the plug of agarose using a sterile wide bore pipette while scraping the bottom of the well and rinsing with cDMEM-10%-FBS. The agarose plug was added to 0.5 mL of cDMEM-10%-FBS, vortexed, labeled as PRVABC59 P2a-j and placed in an incubator overnight at 36°C±2°C, at 5% CO₂.

[00245] Three plaques (PRVABC59 P2a-c) were carried forward for additional purification. Each isolate was plated neat in duplicate onto a fresh 6-well monolayer of Vero cells. This P2/P3 transition was plaque purified, and labeled PRVABC59 P3a-j.

[00246] Six plaques (PRVABC59 P3a-f) were carried forward for a final round of purification. Each isolate was plated neat in duplicate onto a fresh 6-well monolayer of Vero cells. This P3/P4 transition was plaque purified, and labeled PRVABC59 P4a-j.

[00247] Six plaques (PRVABC59 P4a-f) from the P4 plaque purification were blind passaged on monolayers of Vero cells in T-25 cm² flasks. Each plaque pick was diluted in 2 ml, cDMEM-0%-FBS - 1 mL was adsorbed for 1 hour at 36°C±2°C, at 5% CO₂; the other 1 ml. was stabilized with trehalose (18% v/v final) and stored at <-60°C. Following vims adsorption cDMEM-0%-FBS was added to each flask and allowed to grow at 36°C±2°C, at 5% CO₂ for 4 days. Virus supernatants were harvested, clarified by centrifugation (600 x g, 4°C, 10 min), stabilized in 18% trehalose and aliquoted and stored at <-60°C. This P5 seed was tested by TCID₅₀ for Zika virus potency (FIG. 3).

[00248] Confluent monolayers of T-175cm² flasks of Vero cells were infected with each of the six clones of PRVABC59 (P5a-f) at an MOI of 0.01 in 4mL cDMEM-0%-FBS. The virus was allowed to adsorb for 60 minutes at 36°C±2°C, at 5% CO₂, after which 20 ml, of cDMEM-0%-FBS was added to each flask and allowed to grow at 36°C±2°C, at 5% CO₂. Vero cell monolayer health and CPE was monitored daily. Virus was harvested on days 3 and 5 as indicated (FIG. 4). The P6 strain harvests from days 3 and 5 were pooled, stabilized with 18% trehalose, aliquoted and stored <-60°C.

[00249] Each of the six clones of PRVABC59 (P6a-f) were tested for Zika virus in vitro potency (FIG. 5). The potency was determined by two different methods, TCID50 and plaque titration. The TCID50 was calculated by visual inspection of CPE (microscope) and by measuring the difference in absorbance (A560-A420) of the wells displaying CPE (yellow in color) compared with red (no CPE). The plates were read on a plate reader, and applied to the same calculator as the microscopically read-plates (absorbance). The values in TCID50 between the two scoring techniques are quite similar, while the values obtained by plaque titration are lower.

A summary of the generation of the P6 virus and characterization is shown in Table 2 below.

Table 2: Summary of virus passage and characterization for the generation of clonal ZIKAV strains

Passage	Seed production/purification	Characterization
P1	Virus amplification in Vero	TCID50 titer
P2	Amplify P1 by plaque titration; Plaque purification of P1	plaque purification
P3	Pick and passage plaques from P2 plaque assay; plaque purification of P2	plaque purification
P4	Pick and passage plaques from P3 plaque assay; plaque purification of P3	plaque purification
P5	Amplify P4 plaques (a-f) in Vero cells	TCID50 titer
P6	Amplify P5 (a-f) virus in Vero cells	TCID50 titer, plaque phenotype, genotype, full genome sequencing, growth kinetics

[00250] An isolated Zika virus clone that closely resembled the envelope glycoprotein sequence of the original isolate was sought, since the envelope protein of flaviviruses is the dominant immunogenic portion of the virus. PRVABC59 clones P6a, P6c, P6d and P6f contained a G→T mutation at nucleotide 990 in the envelope region (G990T), resulting in an amino acid mutation of Val→Leu at envelope residue 330, whereas the envelope gene of PRVABC59 clones P6b and P6e were identical relative to the reference strain (GenBank ref KU501215. 1) (Table 3 and FIG. 6).

Table 3: Sequencing of PRVABC59 P6 clones

Envelope sequencing (reference gene from PRVABC59; accession #KU501215)				
Strain	Nucleotide	Amino Acid	Mutation	Comments
PRVABC59 P6a	Env-990: G→T	Env-330: Val330→Leu	Val/Leu	Mutation in 3 of 4 reads.
PRVABC59 P6b	Env-1404: T→G silent	Wild type	Wild type	Wild type relative to reference.
PRVABC59 P6c	Env-990: G→T	Env-330: Val330→Leu	Val/Leu	Mutation in 3 of 4 reads.
PRVABC59 P6d	Env-990: G→T	Env-330: Val330→Leu	Val/Leu	Mutation in 2 of 2 reads.
PRVABC59 P6e	Wild type	Wild type	Wild type	Wild type relative to reference.
PRVABC59 P6f	Env-990: G→T	Env-330: Val330→Leu	Val/Leu	Mutation in 2 of 2 reads. 190 bp not sequenced (aa 421 – 484).

Full genome sequencing (reference gene from PRVABC59; accession #KU501215)				
Strain	Nucleotide	Amino Acid	Mutation	Comments
PRVABC59 P6b	Env-1404 T→G	Wild-type	Silent	Mutation in 2 of 2 reads
	NS1-292 T→G	NS1-98 Trp98→Gly	Trp/Gly	Mutation in 2 of 2 reads
PRVABC59 P6e	NS1-292 T→G	NS1-98 Trp98→Gly	Trp/Gly	Mutation in 2 of 2 reads

[00251] The two clones lacking mutations in the Zika envelope sequence were then subjected to full genome sequencing. Sequencing results are summarized in Table 3 above. Sequence analysis revealed a T→G substitution at nucleotide 292 in the NS1 region for both clones, resulting in a Trp→Gly mutation at NS1 residue 98. This mutation was also later confirmed through deep sequencing. The NS1 W98G mutation is located in the intertwined loop of the wing domain of ZIKAV NS1, which has been implicated in membrane association, interaction with envelope protein and potentially hexameric NS1 formation. While other tryptophan residues (W115, W118), are highly conserved across flaviviruses, W98 is not (FIG. 7). Interestingly, however, 100% conservation of the W98 residue is observed across 11 different ZIKAV strains, including those from the African and Asian lineages. The identified mutations in each strain are summarized in Table 4.

Table 4: Summary of mutations identified in PRVABC59 P6 clones

Mutations identified in envelope		
Clone	Nucleotide	Amino Acid
P6a	G990T	V330L
P6b	T1404G	(silent)
P6c	G990T	V330L
P6d	G990T	V330L
P6e	none	none
P6f	G990T	V330L
Additional mutations identified in genome		
Clone	Nucleotide	Amino Acid
P6b	NS1-T292G	NS1-W98G
P6e	NS1-T292G	NS1-W98G
Ref sequence: KU501215.1 (PRVABC59)		

[00252] Phenotypic analysis of the ZIKAV PRVABC59 P6 stocks was conducted to characterize the ZIKAV clones. As illustrated in FIG. 8 and quantified in FIG. 9, each clonal isolate consisted of a relatively homogeneous population of large-sized plaques as compared to the P1 vims which had a mixed population of large and small plaques. These data suggest the successful isolation of single ZIKAV clones.

[00253] Next, growth kinetics analyses in Vero cells of the ZIKAV PRVABC59 P6 clones were analyzed. Vero cells were infected with 0.01 TCID₅₀/cell of each ZIKAV P6 clones in serum free growth medium. Viral supernatant samples were taken daily and simultaneously assayed for infectious titer by TCID₅₀ assay. For all P6 clones, peak titer occurred between day 3 and 4 (-9.0 log₁₀TCID₅₀/mL). There was no significant difference in growth kinetics of the various P6 clones (FIG. 10).

[00254] Taken together, the results indicate that a Zika virus seed was successfully generated. This seed selection required understanding of growth history, kinetics, yield, genotype, and phenotype of the vims. Importantly, clonal isolation of the Zika vims strains allowed for the successful purification of the vims away from contaminating agents (e.g., adventitious agents that may be in the parental human isolate). Interestingly, three sequential plaque purifications succeeded in quickly selecting Vero-cell adapted vims (strains P6a-f), where these strains were able to replicate well in serum-free Vero cell cultures, with strain P6a, c, d, and f harboring a mutation in the viral envelope protein, while strains p6b and p6e obtained a mutation in the viral NS1 protein (with no modification to the viral envelope). Additionally, the Vero-adapted strains enabled efficient and reproducible growth and manufacture of subsequent viral passages propagated from these strains. Without wishing to be bound by theory, the Env-V330L mutation observed in strains P6a, c, d, and f may potentially be a result of in vitro adaptation, as a mutation at Env 330 was also observed upon passaging in Vero cells (Weger-Lucarelli et al. 2017. Journal of Virology). Because the envelope protein is the dominant immunogenic epitope of Zika vims, strains containing a Vero adaptive mutation in Env may negatively

impact vaccine immunogenicity. Without wishing to be bound by theory, the adaptation mutation in protein NS1 appears not only to enhance viral replication, but may also reduce or otherwise inhibit the occurrence of undesirable mutations, such as in the envelope protein E (Env) of the Zika virus. In addition, NS1 may be known to bind to the Envelope protein during the life cycle of the virus. This mutation (NS1 W98G) may be implicated in changing the ability of the NS1 to associate, and possibly co-purify, with the virus during downstream processing. NS1 is also known to be immunogenic, and could be implicated in the immune response to the vaccine.

Example 2: Preclinical immunogenicity and efficacy of a purified inactivated Zika virus vaccine (PIZV) derived from the P6b and P6e strains

[00255] The following example describes the preclinical immunogenicity and efficacy in CD1 and AG129 mice of an inactivated Zika virus vaccine (PIZV) derived from the P6b and P6e strains. As described in Example 1, six clones were generated from the epidemically relevant PRVABC59 strain, and two (P6b and P6e) were chosen for further preclinical immunogenicity and efficacy studies.

Materials and Methods

Purification, inactivation and formulation of a Zika virus vaccine

[00256] A lot of inactivated ZIKAV vaccine, suitable for use in preclinical immunogenicity and efficacy studies, was generated and characterized. Virus was amplified from the P6b and P6e strains by infecting flasks of confluent Vero cells at a MOI of 0.01. Virus was adsorbed for 1 hour at $36^{\circ}\text{C} \pm 2^{\circ}\text{C}$ / 5% CO₂. Following adsorption, 20 mL of cDMEM-0%-FBS was added to each flask, and incubated at $36^{\circ}\text{C} \pm 2^{\circ}\text{C}$ / 5% CO₂ for five days. Cell supernatants were harvested on day 3 and 5 post-infection, and cell debris was clarified by centrifugation.

[00257] For each isolate, clarified supernatants were pooled, stabilized in DMEM containing 18% trehalose and stored at $<-60^{\circ}\text{C}$. Pooled, clarified virus supernatants were thawed in a 37°C water bath and treated with benzonase overnight at 4°C . Following benzonase treatment, each sample was applied to a Sartorius PP3 depth filter. Following depth filtration, each sample was applied to a Centricon Plus-70 tangential flow filtration (TFF) device. Retentate was buffer exchanged, diluted, and applied to a Sartorius SartobindQ IEXNano. Each sample was applied to a second Sartorius SartobindQ IEXNano and eluted using a 3 step-elution process with 250 mM, 500 mM, and 750 mM NaCl. Following MonoQ chromatography and dilution, each 250 mM eluate was applied to a Centricon Plus-70 cross flow filtration (CFF) device for buffer exchange, diluted to 35 mL with PBS, and stored at $2-8^{\circ}\text{C}$.

[00258] For formalin inactivation, freshly prepared 1% formaldehyde was added dropwise to each purified sample with gentle swirling to obtain a final formaldehyde concentration of 0.02%. Samples were incubated at room temperature ($\sim 22^{\circ}\text{C}$) for 14 days with daily inversion. Formaldehyde was neutralized with sodium metabisulfite for 15' at room temperature before being applied to a Centricon Plus-70 tangential flow filtration (TFF) device. Buffer exchange was performed four times by the addition of 50 mL Drug Substance

Buffer (10 mM NaH₂P₀₄ , 50 mM NaCl, 6% sucrose, pH 7.4) . Each sample was then diluted to 15 mL with Drug Substance Buffer, sterilized using a 0.2m syringe filter, aliquoted into sterile stoppered glass vials (0.5 mL per vial) and frozen at <-60°C.

[00259] Virus inactivation was confirmed by TCID₅₀ assay and double infectivity assay. Briefly drug substance sample was applied to C6/36 cells and allowed to amplify for 6 days. Supernatant from C6/36 cells was applied to Vero cells and CPE was monitored for 8 days. For drug product formulation, vials of PTZV drug substance were thawed, pooled according to sample type, and diluted to 1 ug/mL or 10 µg/mL in PBS with or without Alhydrogel (Brenntag ; 0.5 mg/mL final, 0.050 mg/dose) and incubated overnight at 2-8°C with gentle agitation. The resulting drug product lots were then aliquoted into sterile stoppered glass vials and stored at 2-8°C until use. FIG. 11 provides a summary of the steps used to prepare drug product.

Mouse immunization and challenge

[00260] For the immunogenicity study, six-week old male and female Swiss-ICR (CD-1) mice were divided into 6 groups (n = 10/group). On Day 0, mice in groups 1-5 were inoculated with 0.1 mL of vaccine by the intramuscular (i.m.) route (2 x 0.05 mL injections). Mice in group 6 were inoculated with PBS as a placebo control. Mice were boosted on day 28 and 56 using the same dosage and vaccine type as day 0. Blood samples were collected on day -1 (pre-immune), day 27 (prime), day 42 (boost 1) and day 70 (boost 2).

[00261] For the immunogenicity and efficacy study, four-week old male and female AG129 mice were divided into 7 groups (n = 5/group). On Day 0, mice in groups 1-6 were inoculated with 0.1 mL of vaccine by the intramuscular (i.m.) route (2 x 0.05 mL injections). Mice in group 7 were inoculated with PBS as a placebo control. Mice were boosted on day 28 using the same dosage and vaccine type as on day 0. Blood samples were collected from the tail vein on day -1 (pre-immune), day 27 (prime) and day 55 (boost). At the time of euthanization, mice were bled via cardiac puncture under deep anesthesia with isoflurane (terminal). On day 56, mice were intraperitoneally challenged with 104 plaque forming units (PFU) of ZIKAV PRVABC59.

Serum transfer

[00262] Serum was collected from PIZV-vaccinated and challenged AG129 mice, and were frozen after pooling (groups 1, 2, 4, and 5 of Table 6). The serum pool was thawed, and the test articles were generated by three-fold dilutions of the serum pool in PBS. A placebo was generated using 3-fold dilutions of AG129 normal mouse serum in PBS.

[00263] The test articles were administered as 0.1 mL intraperitoneal injections into AG129 mice (an equivalent volume of the placebo article was administered to control mice). Animals were then challenged intraperitoneally with 104 plaque forming units of Zika virus strain PRVABC59 in 100µL.

[00264] Allowable blood volume by weight was collected as whole blood by tail bleeding from ten mice on day -1 (pre-immunization). Whole blood was collected from each mouse on day 1 (primary, circulating

Nab) and day 4 (viremia) by tail bleeding. Terminal bleeding after lethal challenge was performed by heart puncture under deep anesthesia for larger volume before euthanization by cervical dislocation. Blood samples were collected in microtainer SST serum separation gel tubes and allowed to clot for at least 30 min before separation of serum by centrifugation (10,000 x g for 2 min) and frozen at -80°C.

Plaque reduction neutralization test

[00265] Neutralizing antibody titers were determined by a plaque reduction neutralization test (PRNT) as described previously (See e.g., Osorio et al. Lancet Infect Dis. 2014 Sep;14(9):830-8).

Reporter virus particle (RVP) neutralization assay

[00266] Neutralizing antibody titers were analyzed by titration of serum samples with a constant amount of Zika RWs in Vero cells grown in 96-well plates. RWs contained the prME proteins of Zika (strain SPH2012) and a Dengue-based Renilla luciferase reporter. Briefly, sera were heat inactivated at 56°C for 30 min, diluted, and then incubated at 37°C with RWs. The serum/RVP mixture was then mixed with Vero cells and incubated for 72 hours at 37°C ± 2°C/ 5% CO2 before detection with luciferase substrate. Data was analyzed using JMP1 non-linear 4 parameter analysis, normalized to a positive tracking control and effective dose 50% (EC50) was reported.

[00267] Unless indicated to the contrary, all additional experimental methods were carried out as described in Example 1 above.

Results

[00268] To assess the immunogenicity of the PIZV candidates in 6 week old male and female CD-1 mice, groups of CD-1 mice (N=10/group) were immunized by the i.m. route with either a 0.1 µg (+ alum), 1.0 µg (+ alum) dose of a vaccine derived from either ZIKAV PRVABC69 P6b or P6e virus strains. To assess the need for adjuvant, a group of animals was vaccinated with 0.1 µg of vaccine derived from P6e and lacking alum adjuvant. Vaccinations occurred on days 0, 28, and 56, with group 6 receiving PBS as a placebo control (FIG. 12A and Table 5).

Table 5: PIZV **formulations** and challenges in CD-1 mice

Group	Strain	Dose (µg)	Alum (µg)	N
1	P6b	0.1	0.50	10
2	P6b	1.0	0.50	10
3	P6e	0.1	0.50	10
4	P6e	1.0	0.50	10
5	P6e	0.1	-	10
6	Placebo (PBS)	-	-	10

[00269] Following vaccination, serum samples collected after primary (day 27), secondary (day 40) and tertiary (day 70) immunizations were tested for ZIKAV-specific neutralizing antibodies by RVP neutralization assay (FIG. 12B). Twenty-seven days after receiving the first dose, a slight neutralizing antibody response was observed in mice vaccinated with PIZV derived from either clone containing alum, as compared to the PBS placebo control group. Importantly, this response increased significantly upon a second immunization (day 40), but was not additionally enhanced upon immunization with a third dose (day 70). No neutralizing antibody response was observed in mice vaccinated with non-adjuvanted vaccine (FIG. 12B).

[00270] To assess the immunogenicity and protective efficacy of the PIZV candidates, groups of 4 week old AG129 mice (n=5/group) were immunized by the i.m. route with either a 0.1 µg dose (+ alum), 1.0 µg dose (+ alum) or 0.1 µg dose (- alum) of a vaccine derived from either the ZIKAV PRVABC59 P6b or P6e stocks on days 1 and 28 (FIG. 13A and Table 6).

Table 6: PIZV formulations and challenges in AG129 mice

Group	Sex	Strain	Dose (µg)	Alum (µg)	N
1	F	P6b	0.1	0.50	5
2	F	P6b	1.0	0.50	5
3	F	P6b	0.1	-	5
4	M	P6e	0.1	0.50	5
5	M	P6e	1.0	0.50	5
6	M	P6e	0.1	-	5
7	M	Placebo (PBS)	-	-	5

[00271] Following vaccination, vaccinated and control mice were intraperitoneally challenged at day 56 with 104 PFU of ZIKAV PRVABC59 (low passage). Serum samples collected after primary (D27) and secondary (D55) immunizations were tested for ZIKAV-specific neutralizing antibody response (FIG. 13B and Table 7). Only groups receiving the high dose of alum-adjuvanted vaccine (groups 2 and 5) elicited a neutralizing antibody response after a single immunization, which increased dramatically after boosting. In contrast, groups receiving either the low or high dose of alum-adjuvanted vaccine produced a high neutralizing antibody response after a second dose. Upon receiving two doses of vaccine, there was no statistical difference between groups of mice receiving alum-adjuvanted vaccine, regardless of the dosage or the derivation from the P6 clone.

Table 7: ZIKAV-specific neutralizing antibody response

Group	Formulation	Serum neutralizing antibody titers			
		D27 (prime)		D55 (boost)	
		GMT	% sc	GMT	% sc
1	P6b 0.1 µg + alum	<20	40	1280	100
2	P6b 1.0 µg + alum	135	80	2229	100
3	P6b 0.1 µg - alum	<20	0	<20	0
4	P6e 0.1 µg + alum	<20	20	640	100
5	P6e 1.0 µg + alum	30	100	905	100
6	P6e 0.1 µg - alum	<20	0	<20	20
7	PBS	<20	0	<20	0

[00272] All groups were also monitored for mortality, morbidity and weight loss for 21 days post challenge. Viremia following challenge was detected and quantitated by plaque titration. Mice vaccinated with a low or high dose of PIZV candidates formulated with alum (groups 1, 2, 4 and 5) were fully protected from lethal ZIKAV challenge, as assessed by the plaque reduction neutralization test (PRNT) assay, as well as a comparable secondary neutralization assay (Table 8). No weight loss or clinical signs of illness were observed in vaccinated mice, none had detectable infectious viremia three days post challenge, and all mice vaccinated with either low or high dose antigen + alum adjuvant survived to 21 days post-challenge (FIGS. 14-16). In contrast, challenge of all naive mice resulted in high viremia on day 2 post challenge and morbidity/mortality between day 10 and 18 post challenge (median survival = D13). Additionally, challenge of mice vaccinated with a non-alum-adjuvanted low dose vaccine derived from strain P6b resulted in high viremia on day 2 post challenge and a median survival day similar to the placebo control group, while mice vaccinated with a non-alum-adjuvanted low dose derived from clone e remained partially protected with a median survival of 19 days. These results indicate immunization is more effective with alum, secondary immunization may be a requirement, and that low dose was as effective as high dose.

Table 8: Serum neutralizing antibody titers

Pool	Serum neutralizing antibody titers	
	Terminal (post challenge)	
	PRNT ₅₀	Secondary assay
Alum (1,2,4,5)	10240	20480
No alum (3,6)	2560	2560
PBS (7)	1280	1280

[00273] Additionally, the presence of NSI in the vaccine drug substance (DS) produced from whole inactivated P7b and P7e virus (one additional passage from the P6b and P6e strains, respectively) was tested. A sandwich ELISA was performed using plates pre-coated with a monoclonal antibody reactive to both Asian and African lineages of Zika virus NSI, but non-cross-reactive to Dengue NSI. Duplicate 2-, 4-, 8-, 16-, and 32-fold dilutions of DS were prepared, and were compared to a standard curve using recombinant purified NSI in duplicate at a concentration of 0-8 ng/mL. Duplicate dilutions of DS buffer alone were prepared as negative controls. Bound NSI was detected with anti-NSI HRP-conjugate, and absorbance (A450-A630) of the wells with DS buffer alone was subtracted from the absorbance measured in the wells containing the matching DS samples. Results of the sandwich ELISA are shown in Table 9 below. Interestingly, NSI was observed to co-purify with the vaccine drug substance preparations, suggesting that viral NSI may be an immunogenic component of the whole inactivated vims vaccine.

Table 9: NSI ELISA

Strain in vaccine preparation	Sample OD	Predicted log ng/mL	Std Error	Lower 95%	Upper 95%	Dilution Factor	Predicted concentration (ng/mL)
P7b	3.61	0.951	0.018	0.915	0.986	32	~285
P7e	3.79	0.980	0.023	0.935	1.024	32	~306

[00274] The threshold of neutralizing antibody (Nab) needed to confer protection from wild-type Zika virus challenge after passive transfer of antibodies was next tested. (Tables 10A and B).

Table 10A: design of passive transfer study in AG129 mice

Group	Test Article	Serum dilution	Predicted Nab titer before IP
1	100 µL	1/3	6827 / 3.83
2	100 µL	1/9	2276 / 3.36
3	100 µL	1/27	759 / 2.88
4	100 µL	1/81	253 / 2.40
5	100 µL	1/243	84 / 1.93
6	100 µL	1/729	28 / 1.45
7	100 µL	1/2187	9 / 0.97
8	100 µL	PBS	-

Table 10B: Timing of passive transfer study in AG129 mice

Description	Study Day
Passive transfer	Day 0
Primary Bleed (AM)	Day 1
Challenge (PM)	Day 1
Viremia Bleed	Day 4
Terminal Bleed	Day 29 for survivors

[00275] Pooled serum from vaccinated and challenged AG129 mice was serially diluted 3-fold in PBS and intraperitoneally injected into 7 groups (N=5/group) of 5-6 week old AG129 mice. Pre-immune AG129 mouse serum was used as placebo control (group 8). Following passive transfer (-16-19 hours later), whole blood was collected and serum was separated by centrifugation from each mouse prior to virus challenge for determination of circulating neutralizing antibody titer (FIG. 17). Just prior to virus challenge, groups of mice (designated groups 1, 2, 3, 4, 5, 6, 7, 8) had meanlog₁₀ neutralizing antibody titers of 2.69, 2.26, 1.72, 1.30, <1.30, <1.30, <1.30, <1.30, respectively.

[00276] Twenty four hours following passive transfer of ZIKV nAbs, mice were intraperitoneally challenged with 104 pfu of ZIKV PRVABC59. Following challenge, animals were weighed daily and monitored 1-3 times a day for 28 days for signs of illness. A clinical score was given to each animal based on the symptoms (Table 11). Animals that were moribund and/or showed clear neurological signs (clinical score >2) were humanely euthanized and counted as non-survivors.

Table 11: Description of clinical scores given while monitoring for morbidity and mortality

Score	Description
0	Normal appearance and behavior
1	Slightly ruffled fur and/or general loss of condition
2	Increases in above behavior/appearance, breathing changes, twitching, anti-social behavior
3	First signs of neuropathy – Severely hunched posture, partial paralysis (immobility, unsteady gait, flaccid hind legs, severe twitching), or full paralysis
4	Found dead without showing signs of score of 2 or 3 first

[00277] Signs of disease began appearing nine days after challenge in the control group (group 8) and groups 5-7, with a corresponding loss in weight (FIG. 18). Whole blood was collected and serum was separated by centrifugation from each animal three days post challenge. Serum samples were analyzed for the presence of infectious ZIKV using a plaque titration assay (FIG. 19). The mean infectious titer (log₁₀ pfu/mL) for mice in groups 1-8 were: 1.66, 2.74, 4.70, 4.92, 7.24, 7.54, 7.54 and 7.46, respectively. Importantly, mice in groups 1-4 with detectable levels of ZIKV neutralizing antibodies (>1.30 log₁₀) had statistically significant lower levels (102.5- to 106.0- fold lower titers) of viremia (p = 0.0001, 0.0003, 0.0007 and 0.0374) than control mice. These results suggested that detectable levels of ZIKV neutralizing antibodies (>1.30 log₁₀) reduced viremia in a dose-dependent manner.

[00278] The median survival day of mice in groups 1-8 were: not determined, day 17, day 17, day 13, day 11, day 11, day 11, and day 10, respectively (FIG. 20). Importantly, the survival curves for groups of mice with detectable ZIKV neutralizing antibody titers (groups 1-4) were statistically different compared to the control group (group 8) (p = 0.0019, 0.0019, 0.0019, 0.0153, respectively). These results suggested that detectable levels (>1.30 log₁₀) of ZIKV neutralizing antibodies delayed onset of disease in a dose-dependent manner.

[00279] Finally, the ZIKV neutralizing antibody titer of each animal was graphed against its corresponding viremia titer and linear regression analysis was performed. A highly inversely correlated relationship between ZIKV neutralizing antibody titers and viremia levels at day 3 post-challenge was observed (FIG. 21). A summary of the results from the passive transfer studies is shown in Table 12 below.

Table 12: Summary of passive transfer results

Group	Serum dilution	Circulating ZIKV nAb GMT	Viremia (D3) log ₁₀ pfu/mL	% survival (D28)	Median survival day
1	1/3	2.69 ± 0.17	1.66 ± 0.62	20	24
2	1/9	2.26 ± 0.13	2.73 ± 0.68	0	17
3	1/27	1.72 ± 0.16	4.69 ± 0.77	0	17
4	1/81	1.30 ± 0.16	4.94 ± 1.29	0	13
5	1/243	<1.30	7.25 ± 0.10	0	11
6	1/729	<1.30	7.54 ± 0.31	0	11
7	1/2187	<1.30	7.52 ± 0.39	0	11
8	PBS	<1.30	7.47 ± 0.37	0	10

[00280] While no groups of mice receiving ZIKAV neutralizing antibodies were fully protected from lethal ZIKAV challenge in this experiment, reduced viremia levels and delayed onset of disease in a dose-dependent manner among the groups of mice with detectable levels of circulating ZIKAV neutralizing antibody titers was demonstrated.

[00281] Taken together, preclinical data from both CD-I and AG129 mouse studies indicate that a PIZV derived from separate and well-characterized viral clones are immunogenic and able to provide protection against challenge with wild-type ZIKAV. Importantly, a low and high vaccine dose elicited a similar neutralizing antibody response after two doses, and provided similar levels of protection against lethal ZIKAV challenge. Interestingly, mice vaccinated with an unadjuvanted PIZV candidate also showed partial protection from ZIKAV challenge. Vaccine antisera significantly diminished viremia in passively immunized AG129 mice, and prolonged survival against lethal ZIKAV challenge. These results also demonstrate that the well-characterized PIZV candidates were highly efficacious against ZIKAV infection in the highly ZIKAV-susceptible AG129 mouse model.

[00282] Additionally, it was found that the sequence of a PRVABC59 (from PRVABC59 P6e) at passage 7 was genetically identical to that of passage 6. This was surprising given that flaviviruses are generally regarded as genetically labile. PRVABC59 P6e was selected as the pre-master virus seed due in part to its genetic stability over 7 passages. Without wishing to be bound by theory, it is believed that this enhanced genetic stability may be due to the single amino acid substitution (W98G) in the wing domain of NS1, as this was the only mutation observed in the Vero cell-adapted PRVABC59 P6 genome. Additionally, genetic

stability and homogeneity is advantageous in that it reduces variability and increases reproducible production of subsequent strains that may be used for vaccine formulation.

Example 3: Preclinical **assessment** of the **phenotype** of the P6a and **P6e** strains

Materials and Methods

[00283] AG129 mice (lacking interferon α/β and γ receptors) are susceptible to ZIKV infection and disease, including severe pathologies in the brain. 14-week-old AG129 mice were intraperitoneally infected with 104 and 103 pfu of the ZIKV passage 6 clones a (P6a) and e (P6e).

[00284] Mice were weighed and monitored daily (up to 28 days) for clinical signs of illness (weight loss, ruffled fur, hunched posture, lethargy, limb weakness, partial/full paralysis). Additionally, analysis of viremia was performed by plaque titration of serum samples collected three days post-challenge as described in Example 1.

Results

[00285] Infection with P6e resulted in 100% mortality (median survival time = 12.5 days), while infection with P6a resulted in only 33% mortality (median survival time = undetermined) (Figure 22). In agreement with this, preMVS P6e infected mice showed greater weight loss as compared to PRVABC59 P6a infected mice (3). No statistical difference was found in mean group viremia levels between groups of mice infected with PRVABC59 P6a or P6e (Figure 24). These data suggest that growth kinetics alone may not be a key determinant (since both strains produced similar viremia, and similar peak titers in vitro) and that a characteristic of the Envelope protein could be important for virulence (of a wildtype strain) and immunogenicity (of an inactivated candidate).

Example 4: Clinical immunogenicity and efficacy of a **purified** inactivated **Zika** virus vaccine (**PIZV**) derived from **P6e** strains

[00286] The following example describes a clinical immunogenicity and efficacy study of a purified inactivated Zika virus vaccine (PIZV) in Flavivirus naive patients.

[00287] A lot of purified inactivated Zika virus vaccine (PIZV), suitable for use in clinical immunogenicity and efficacy studies, was generated and characterized.

[00288] The inactivated Zika -virus active agent is no longer able to infect host cells, which can be infected with a Zika virus which has not been inactivated. For example, the inactivated Zika virus is no longer able to infect Vero cells and exert a cytopathic effect on the Vero cells.

[00289] The amount of the purified inactivated Zika virus can be determined by a Bradford assay (Bradford et al. (1976) *Anal. Biochem.* 72: 248-254) using defined amounts of recombinant Zika envelope protein to establish the standard curve.

[00290] The purity of the purified Zika virus can be determined by size exclusion chromatography. In the current example, the main peak of the purified Zika virus in the size exclusion chromatography was more than 85% of the total area under the curve in the size exclusion chromatography.

[00291] The investigational vaccine (PIZV) refers to Zika purified formalin-inactivated virus formulated with 200 µg aluminum hydroxide, Al(OH)₃, as adjuvant, in phosphate buffered saline solution (PBS). The final liquid formulated product is filled into single-use vials and sealed with tamper-evident seals. The investigational vaccine is administered IM (intramuscularly) as a 2-dose regimen of 0.5 mL at 2, 5, or 10 µg antigen per dose, 28 days apart.

[00292] Sodium chloride (NaCl) 0.9% solution for injection is being used as placebo. It is supplied in single-use vials. It is a sterile, clear, colorless liquid solution of sodium chloride without preservative designed for parenteral use only. The placebo is administered IM as a 2-dose regimen of 0.5 mL per dose, 28 days apart.

Test methods

[00293] PRNT assay: Neutralizing antibody titers were determined by a plaque reduction neutralization test (PRNT) as described previously (See Protection of Rhesus monkeys against dengue virus challenge after tetra-valent live attenuated dengue virus vaccination. *J. Infect. Dis.* 193, 1658-1665 (2006). Muthumani K, Griffin BD, Agarwal S, et al. In vivo protection against ZIKV infection and pathogenesis through passive antibody transfer and active immunisation with a prMEnv DNA vaccine. *NPJ Vaccines* 2016; 1: 16021). The Zika strain used for PRNT assay development was PRVABC59.

Immuno Outcome Measures:

Definitions:

[00294] Sero-positivity (PRNT): titers of >LOD (Limit of detection)

[00295] Sero-negativity (PRNT): titers of <LOD (Limit of detection)

[00296] Seroconversion (PRNT): Post vaccination titers of >LOD in initially seronegative subjects

[00297] LOD (PRNT) = 10

[00298] Assigned value for below LOD = 5

[00299] LLoQ (Lower Limit of Qualification, PRNT) = 26

[00300] Assigned value for below LLoQ (Lower Limit of Qualification) = 13

[00301] Reporter virus particle (RVP) neutralization assay: Neutralizing antibody titers were analyzed by titration of serum samples with a constant amount of Zika RVPs in Vera cells grown in 96-well plates. RVPs contained the prME proteins of Zika (strain SPH2012) and a Dengue-based Renilla luciferase reporter. Briefly, sera were heat inactivated at 56°C for 30 min, diluted, and then incubated at 37°C with RVPs. The serum/RVP mixture was then mixed with Vera cells and incubated for 72 hours at 37°C ± 2°C/ 5% CO₂ before detection with luciferase substrate. Data was analyzed using JMP11 non-linear 4 parameter analysis, normalized to a positive tracking control and effective dose 50% (EC50) was reported.

Study description

[00302] A Phase I, Randomized, Observer-Blind, Placebo-Controlled, Safety, Immunogenicity, and Dose Ranging Study of Purified Inactivated Zika Virus Vaccine (PIZV) in Flavivirus Naive and Primed Healthy Adults Aged 18 to 49 Years

[00303] The study design is shown in Figure 25. This study was designed to sequentially enroll flavivirus-naive and flavivirus-primed healthy adults between the ages of 18 and 49 years. The two sequential cohorts are each comprised of 120 subjects (planned) randomly allocated to one of 4 groups of 30 subjects, to receive either one of three dosages of the PIZV vaccine or saline placebo. The vaccination regimen consists of 2 doses administered 28 days apart. The data in this example only relates to the Flavivirus naive subjects (n=124), further data with Flavivirus primed subjects are to be expected. This example provides data from a first interim analysis following Day 57 (28 days post-dose 2) for the "flavivirus-naive cohort". Data from the flavivirus-primed cohort are not part of this interim analysis, as recruitment for this group was still ongoing at the time first interim analysis.

[00304] In summary, subjects were randomized into four study groups, who received two doses of either placebo (saline) or purified inactivated Zika vaccine (PIZV) with a concentration of 2 µg, 5 µg and 10 µg. The study involved intramuscular injection of the vaccine (or placebo) at day 1 and day 29, with blood samples being taken on day -15, 1, 8, 29, 36, 57, 211, 393, 767 of the study. Blood samples on day -15 were used to determine Flavivirus serostatus screening and eligibility screening. Samples on day 1, 29, 57 were for immunogenicity assessment. Safety lab testing was carried out on days 8 and 36. Persistence of immunity will be assessed on day 211, 393 and 767.

[00305] Based on the data from 28 days post dose 2, the purified inactivated Zika virus vaccine (PIZV) was safe and immunogenic in Flavivirus-naive adults aged between 18-49 yrs.

Primary Objectives

[00306] The primary objective of the study was to describe the safety of two doses of PIZV given 28 days apart and to select a dose level from three different antigen concentrations (2, 5 or 10 µg) for use in

subsequent clinical studies. The primary endpoints were: the percentages of subjects experiencing solicited local and systemic adverse events (AEs) during the 7-day period after administration of each dose of PIZV or placebo, and the percentages of subjects experiencing non-serious unsolicited AEs and serious adverse events (SAEs) during the 28-day period after vaccination.

Secondary Objectives

[00307] The secondary objectives were to describe the immune response to the purified inactivated Zika virus vaccine (PIZV) at 28 days post dose 1 and 28 days post dose 2 in flavivirus naïve adults. The secondary endpoints related to these objectives are geometric mean titers (GMTs) of neutralizing anti-ZIKV antibodies, seropositivity rates (SPR) and seroconversion rates (SCR) at the considered timepoints.

[00308] Analysis of the data was performed by a separate set of unblinded statisticians and programmers, who had access to the individual treatment assignments. All personnel involved in the conduct of the trial were blinded to the individual subject treatment assignments. The study team had access to the group level unblinded results only.

Study population:

[00309] A total of 124 subjects were enrolled in the flavivirus-naïve cohort and included in the Safety-Set (SS), comprised of all randomized subjects who have received at least one dose of PIZV or placebo. Among those, 118 (95.2% of the SS) were included in the Full Analysis Set (FAS) of randomized subjects who had received at least one dose of the investigational vaccine (PIZV)/placebo, provided valid serology results at baseline and at least once post-vaccination. One hundred and thirteen (113) subjects (91.1% of the SS) were included in the Per Protocol Set (PPS) of subjects in the FAS who had no major protocol violations relevant for the immunogenicity analysis. The analysis sets are presented in Table 14.

Table 14: Analysis sets

	Number of Subjects (%)				
	Placebo (N=30)	2µg PIZV (N=31)	5µg PIZV (N=31)	10µg PIZV (N=32)	Total (N=124)
Safety Set (SS)	30 (100%)	31 (100%)	31 (100%)	32 (100%)	124 (100%)
Full Analysis Set (FAS)	29 (96.7%)	28 (90.3%)	31 (100%)	30 (93.8%)	118 (95.2%)
Per-Protocol Set (PPS)	28 (93.3%)	26 (83.9%)	29 (93.5%)	30 (93.8%)	113 (91.1%)

Safety Set = all randomized subjects who received at least one (1) dose of PIZV or placebo

Full Analysis Set = all randomized subjects who received at least one dose of PIZV/placebo and provided valid baseline and at least one post-vaccination serology result

Per Protocol Set = all subjects in the FAS who had no major protocol violations

[00310] Subjects in the SS were 35.3 ± 8.91 years of age (mean ± standard deviation), and were distributed as 28.2% in the 18-29 years age-range and 71.8% in the 30-49 years age-range. Women

represented 54.8% of the cohort. Study participants were White (81.5%), Black (14.5%), and "Non-Hispanic" (93.5%) regarding race and ethnicity. The mean BMI in the SS was 27.5 ± 4.05 (mean \pm standard deviation). Demographic characteristics (age, sex, height, weight, BMI and ethnicity) were overall similar across the four study groups. Women were more represented in the placebo group, where they constituted 66% of the study participants, than in the other groups, where gender distribution was more balanced. The demographics and baseline characteristics are presented in Table 15.

[00311] Safety laboratory parameters and vital signs were checked at study entry as part of inclusion criteria. These specified that vital signs had to be within normal limits (i.e., below Grade 1 as indicated in the FDA Toxicity Grading Scale) and that safety laboratory tests had to be within normal limits or not be above Grade 1 as defined in the FDA Toxicity Grading Scale.

Safety/reactogenicity

[00312] The overall reporting incidence of solicited local adverse events (AEs) was higher in the groups that received the vaccine (PIZV) than in the placebo group. Pain was the most frequently reported solicited AE at the injection site. After dose 1, pain was experienced by 30.0% to 38.7% of subjects in the PIZV groups compared to 13.8% in the placebo group. After dose 2, incidences of pain were similar to those following dose 1: 29.6% to 40% in the PIZV groups, and 14.3% in the placebo group. Intensity of pain was reported as mild after dose 1 and mild to moderate after dose 2, with 2 subjects in the 5µg PIZV group (6.7%) and one subject in the 10µg PIZV group (3.3%) reporting moderate pain. Other solicited local AEs (erythema, swelling and induration) were reported by not more than 9.7% of the subjects.

[00313] The onset of pain occurred on day 1 for 90% of the subjects or day 2 (for 3 subjects). Pain was not reported beyond day 5 by any subject in the placebo or PIZV groups.

[00314] Solicited systemic AEs of any nature were reported by 30% to **48.4%** of the subjects across the PIZV groups and by 41.4% in the Placebo group after dose 1. After dose 2, incidences were 10% to 33.3% across the PIZV groups and 27.6% in the Placebo group. Overall 81.3% (dose 1) and 75% (dose 2) of the solicited systemic AEs were judged as related to study vaccination. After both doses, the most reported systemic events were headache, fatigue and myalgia.

[00315] Most systemic AEs were reported as mild, i.e. not interfering with daily activity. A few occurrences were moderate in intensity:

after dose 1, for 6.7-12.9% of subjects in the PIZV groups and 17.2% of placebo recipients;

after dose 2, for 0 - 3.3% of subjects across the PIZV groups and 10.3% in the placebo group.

[00316] There was a single report of a severe AE: one subject in the placebo group experienced fever. This study participant presented a temperature of 39.4°C, measured orally, 4 days after receiving the second study vaccination. This fever was not judged as study-related by the investigator.

[00317] Solicited systemic AEs were variably reported throughout the 7-day period in the four groups. The onset of events for fever, fatigue, arthralgia and myalgia was mainly during the 2 days following vaccination and was variable for headache and malaise. Fever was reported during the 2 days following vaccination, except for the subject reporting severe fever in the placebo group on day 4.

[00318] The incidence of solicited local and systemic adverse events 7 days after vaccination are shown in Table 16.

Table 16: Incidence of solicited local and systemic adverse events 7 days after vaccination (Safety set)

Malaise	4 (13.8)	2 (6.7)	2 (6.5)	4 (12.9)	2 (6.9)	0	0	3 (10.0)

N= number of subjects with information available; n (%) -number (percentage) of subjects reporting a specific AE,

[00319] In total 30.6% of the subjects reported unsolicited AEs (not including prolonged solicited AEs) in the 28 days following any dose: 21.9-38.7% in the PIZV groups and 36.7% in the placebo group. These AEs were mainly infections, infestations (13.7%) and nervous system disorders (3.2% : headache, migraine, dizziness). All were mild to moderate in intensity.

[00320] Unsolicited AEs were considered as related to the study vaccination for three subjects (2.4%). The events reported were:

at post dose 1, dizziness for one subject in the 5µg PIZV group and flushing for one subject in the 2µg PIZV group;

at post dose 2, eye pruritus and lacrimation increased for one subject in the 10µg PIZV group.

[00321] These were mild to moderate in intensity, started on day 1 or 2 after vaccination, had a duration of 1 to 3 days and were all resolved.

[00322] One subject discontinued with the study vaccination due to a headache after dose 1. This subject received PIZV and experienced the headache 1 day after vaccination. The headache was resolved 36 days after its onset. No serious adverse event (SAE) was reported during the period from dose 1 up to 28 days post dose 2.

[00323] The few changes from the baseline observed for blood safety laboratory parameters in the 7 days following vaccination, e.g. from normal to mild or from mild to moderate AEs, occurred in comparable

percentages of subjects across the four groups. Urinalysis parameters were either normal at all time-points or the grading category was similar across groups and visits.

Immunogenicity

[00324] Table 17 presents the geometric antibody titers of Zika virus neutralizing antibodies (EC50) as measured by PRNT as well as seropositivity rates and seroconversion rates after each vaccine dose.

[00325] The PIZV vaccine was immunogenic in flavivirus-naïve adults. All subjects were seronegative at baseline. Vaccination of subjects initially seronegative for antibodies against Zika virus elicited seropositivity in all subjects after two doses of PIZV vaccine of any dosage: seroconversion rates ranged from 69.23% to 96.43% post-dose 1 and were 100% post-dose 2. All subjects in the placebo group remained seronegative throughout the period considered.

[00326] A dose-ranging effect was observed on seropositivity rates post-dose 1 and on GMTs after each dose. After the first dose, almost all subjects (96.4%) who had received the 10⁶ pfu PIZV dose had mounted neutralizing antibodies against the Zika virus. The second dose led to a more than 10-fold increase in GMT from dose 1, in the three PIZV groups.

Table 17: Seropositivity, seroconversion rates and GMTs of Zika virus neutralizing antibodies (EC₅₀) (PRNT) before and 28 days after administration of each dose of PIZV (Per Protocol Set)

		Placebo (N=28)	2µg PIZV (N=26)	5µg PIZV (N=29)	10µg PIZV (N=30)
Sero-positivity rate (95%CI)	Pre-dose 1	0	0	0	0
	Post-dose 1	0	69.23 (48.21, 85.67)	82.14 (63.11, 93.94)	96.43 (81.65, 99.91)
	Post-dose 2	0	100 (85.75, 100.00)	100 (87.66, 100.00)	100 (87.66, 100.00)
Sero-conversion rate (95%CI)	Post-dose 1	0	69.23 (48.21, 85.67)	82.14 (63.11, 93.94)	96.43 (81.65, 99.91)
	Post-dose 2	0	100 (85.75, 100.00)	100 (87.66, 100.00)	100 (87.66, 100.00)
GMTs (95% CI)	Pre-dose 1	5.00	5.00	5.00	5.00
	Post-dose 1	5.00	38.06 (17.53, 82.66)	93.76 (44.34, 198.30)	291.41 (161.74, 525.06)
	Post-dose 2	5.00	1100.75 (741.07, 1635.00)	1992.33 (1401.28, 2832.70)	3689.89 (2676.75, 5086.49)

N= number of subjects in the PPS with PRNT data available;

Seropositivity is defined as titer ≥ 10 ; Seroconversion is defined as: seronegative subjects at baseline (titer < 10) have titer ≥ 10 post-vaccination; Results < 10 are assigned a titer of 5; Titers ≥ 10 (limit of detection) and < 26 (lower limit of quantification) are assigned a value of 13.

[00327] The Geometric mean titers determined using PRNT, according to table 17, are shown graphically in Figure 26. The percentage of subjects achieving seroconversion determined using PRNT according to table 17, are shown graphically in Figure 27.

[00328] The distribution of neutralization titers, after dose 1 and after dose 2, are shown in reverse cumulative distribution curves in Figures 28 and 29 respectively.

[00329] In addition to measuring immune response with the PRNT assay, the samples were also tested with the RVP neutralization assay. Table 18 presents the geometric antibody titers of Zika virus neutralizing antibodies (EC₅₀) as measured by the RVT assay. The RW assay results show a similar dose-ranging effect of the PRNT data, with gradually higher GMTs with increasing PIZV doses.

Table 18: GMTs of Zika virus neutralizing antibodies (EC₅₀) (RVP) before and 28 days after vaccination (Per Protocol Set)

Group		Placebo	2 µg PIZV	5 µg PIZV	10 µg PIZV
		(N=27)	(N=26)	(N=28)	(N=30)
GMTs (95%CI)	Pre-dose 1	34 (27, 43)	34 (26, 44)	32 (27, 39)	46 (39, 53)
	Post-dose 1	28 (22, 36)	360 (242, 536)	656 (442, 972)	1310 (875, 1961)
	Post-dose 2	31 (25, 40)	3148 (1988, 4986)	6212 (4126, 9354)	13604 (9560, 19359)

N= number of subjects in the PPS with RW data available.

Conclusion

[00330] The PZV vaccine was **well** tolerated and safe for all antigen doses evaluated in the **flavivirus-naïve** cohort. Solicited **systemic** AEs were reported in all groups with no apparent increase with increasing dose **strength** and intensity was **mild** to moderate. Local solicited AEs reported were also mild to moderate in intensity across the groups. Unsolicited symptoms were reported with similar frequencies in the four study groups. Overall, the vaccine was **immunogenic in flavivirus-naïve** subjects and a positive dose-ranging response was observed.

CLAIMS

What is claimed is:

1. A vaccine or immunogenic composition comprising one or more antigens from a Zika virus, wherein the Zika virus comprises at least one non-human cell adaptation mutation.
2. The vaccine or immunogenic composition of claim 1, wherein the at least one non-human cell adaptation mutation is in Zika virus Non-structural protein 1 (NS1).
3. The vaccine or immunogenic composition of claim 2, wherein the at least one adaptation mutation occurs at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1.
4. The vaccine or immunogenic composition of claim 3, wherein the at least one adaptation mutation is a Trp98Gly mutation.
5. The vaccine or immunogenic composition of any one of claims 1-4, wherein the at least one adaptation mutation enhances genetic stability as compared to a Zika virus lacking the at least one adaptation mutation.
6. The vaccine or immunogenic composition of any one of claims 1-5, wherein the at least one adaptation mutation enhances viral replication as compared to a Zika virus lacking the at least one adaptation mutation.
7. The vaccine or immunogenic composition of any one of claims 1-6, wherein the Zika virus does not comprise a mutation in Envelope protein E (Env).
8. The vaccine or immunogenic composition of any one of claims 1-7, wherein the non-human cell is a mammalian cell.
9. The vaccine or immunogenic composition of any one of claims 1-8, wherein the non-human cell is a monkey cell.
10. The vaccine or immunogenic composition of claim 9, wherein the monkey cell is from a Vero cell line.
11. The vaccine or immunogenic composition of claim 10, wherein the Vero cell line is a WHO Vero 10-87 cell line.
12. The vaccine or immunogenic composition of any one of claims 1-11, wherein the Zika virus is an African lineage virus or an Asian lineage virus.
13. The vaccine or immunogenic composition of any one of claims 1-11, wherein the Zika virus is an Asian lineage virus.
14. The vaccine or immunogenic composition of claim 13, wherein the Zika virus is from strain PRVABC59.

15. The vaccine or immunogenic composition of any one of claims 1-14, wherein the vaccine or immunogenic composition is a purified antigen vaccine or immunogenic composition, a subunit vaccine or immunogenic composition, an inactivated whole virus vaccine or immunogenic composition, or an attenuated virus vaccine or immunogenic composition.
16. The vaccine or immunogenic composition of any one of claims 1-15, wherein the vaccine or immunogenic composition is an inactivated whole virus vaccine or immunogenic composition.
17. The vaccine or immunogenic composition of any one of claims 1-16, wherein the virus was chemically inactivated.
18. The vaccine or immunogenic composition of claim 17, wherein the virus was chemically inactivated with one or more of a detergent, formalin, hydrogen peroxide, beta-propiolactone (BPL), binary ethylamine (BEi), acetyl ethyleneimine, methylene blue, and psoralen.
19. The vaccine or immunogenic composition of claim 17, wherein the virus was chemically inactivated with formalin.
20. The vaccine or immunogenic composition of any one of claims 1-19, further comprising an adjuvant.
21. The vaccine or immunogenic composition of claim 20, wherein the adjuvant is selected from the group consisting of aluminum salts, toll-like receptor (TLR) agonists, monophosphoryl lipid A (MLA), synthetic lipid A, lipid A mimetics or analogs, MLA derivatives, cytokines, saponins, muramyl dipeptide (MDP) derivatives, CpG oligos, lipopolysaccharide (LPS) of gram-negative bacteria, polyphosphazenes, emulsions, virosomes, cochleates, poly(lactide-co-glycolides) (PLG) microparticles, poloxamer particles, microparticles, liposomes, Complete Freund's Adjuvant (CFA), and Incomplete Freund's Adjuvant (IFA).
22. The vaccine or immunogenic composition of claim 20 or 21, wherein the adjuvant is an aluminum salt.
23. The vaccine or immunogenic composition of claim 22, wherein the adjuvant is selected from the group consisting of alum, aluminum phosphate, aluminum hydroxide, potassium aluminum sulfate, and Alhydrogel 85.
24. The vaccine or immunogenic composition of any one of claims 20-23, wherein at least 75%, at least 85%, at least 90%, at least 95%, at least 96%, at least 97%, at least 98%, at least 99%, or 100% of the one or more antigens are adsorbed to the adjuvant.
25. The vaccine or immunogenic composition of any one of claims 1-24, comprising from about 0.1 µg Zika virus or Env to about 100 µg Zika virus or Env.
26. The vaccine or immunogenic composition of claim 25, wherein the vaccine or immunogenic composition is unadjuvanted.
27. The vaccine or immunogenic composition of any one of claims 1-26, wherein the Zika virus is a clonal isolate.

28. The vaccine or immunogenic composition of claim 27, wherein the clonal isolate is substantially free of one or more adventitious agents.
29. A vaccine comprising a Zika virus having a mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1.
30. The vaccine of claim 29, wherein the mutation is a Trp98Gly mutation in SEQ ID NO: 1.
31. The vaccine of claim 29 or 30, wherein the Zika virus does not comprise a mutation in the envelope protein (Env).
32. The vaccine of claim 31, wherein the sequence encoding the envelope protein is the same as the corresponding sequence in SEQ ID No. 2.
33. The vaccine of any one of claims 29 to 32, wherein the Zika virus is derived from strain PRVABC59.
34. The vaccine of claim 33, wherein strain PRVABC59 comprises the genomic sequence according to SEQ ID NO: 2.
35. The vaccine of any one of claims 29 to 34, wherein the Zika virus is inactivated.
36. The vaccine of any one of claims 29 to 35, further comprising an adjuvant.
37. The vaccine of claim 36, wherein the adjuvant is selected from the group consisting of aluminum salts, toll-like receptor (TLR) agonists, monophosphoryl lipid A (MLA), synthetic lipid A, lipid A mimetics or analogs, MLA derivatives, cytokines, saponins, muramyl dipeptide (MDP) derivatives, CpG oligos, lipopolysaccharide (LPS) of gram-negative bacteria, polyphosphazenes, emulsions, virosomes, cochleates, poly(lactide-co-glycolides) (PLG) microparticles, poloxamer particles, microparticles, liposomes, Complete Freund's Adjuvant (CPA), and Incomplete Freund's Adjuvant (IFA).
38. The vaccine of claim 36 or 37, wherein the adjuvant is an aluminum salt.
39. The vaccine of any one of claims 36 to 38, wherein the adjuvant is selected from the group consisting of alum, aluminum phosphate, aluminum hydroxide, potassium aluminum sulfate, and Alhydrogel 85.
40. A vaccine or immunogenic composition comprising: a) an aluminum salt adjuvant; and b) a whole inactivated Zika virus, wherein the Zika virus comprises a non-human cell adaptation mutation, and wherein the non-human cell adaptation mutation is a Trp98Gly mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1.
41. A method of treating or preventing Zika virus infection in a subject in need thereof, comprising administering to the subject a therapeutically effective amount of the vaccine or immunogenic composition of any one of claims 1-40,

42. A method for inducing an immune response in a subject in need thereof, comprising administering to the subject an immunogenic amount of the vaccine or immunogenic composition of any one of claims 1-40,.
43. The method of claim 41 or claim 42, wherein the subject is a human.
44. The method of any one of claims 41-43, wherein the subject is pregnant or intends to become pregnant.
45. The method of any one of claims 41-44, wherein administration of the vaccine or immunogenic composition induces a protective immune response in the subject.
46. The method of claim 45, wherein the protective immune response induced in the subject is greater than a protective immune response induced in a corresponding subject administered a vaccine or immunogenic composition comprising one or more antigens from a Zika virus lacking the at least one non-human cell adaptation mutation
47. The method of any one of claims 41-46, wherein administration of the vaccine or immunogenic composition induces the generation of neutralizing antibodies to Zika virus in the subject.
48. The method of claim 47, wherein the concentration of neutralizing antibodies generated in the subject is higher than a concentration of neutralizing antibodies generated in a corresponding subject administered a vaccine or immunogenic composition comprising one or more antigens from a Zika virus lacking the at least one non-human cell adaptation mutation.
49. The method of any one of claims 41-48, wherein the vaccine or immunogenic composition is administered by a route selected from the group consisting subcutaneous administration, transcutaneous administration, intradermal administration, subdermal administration, intramuscular administration, peroral administration, intranasal administration, buccal administration, intraperitoneal administration, intravaginal administration, anal administration and intracranial administration
50. The method of claim 41-49, wherein the vaccine or immunogenic composition is administered as a first (prime) and a second (boost) administration.
51. The method of claim 50, wherein the second (boost) administration is administered 28 days after the first (prime) administration.
52. The vaccine or immunogenic composition of any one of claims 1-40 for use in treating or preventing Zika virus infection in a subject in need thereof.
53. The vaccine or immunogenic composition of any one of claims 1-40 for use in inducing an immune response in a subject in need thereof.
54. The vaccine or immunogenic composition for the use of claims 52 or 53, wherein the subject is a human.

55. The vaccine or immunogenic composition for the use of any one of **claims 52-54**, wherein the subject is pregnant or intends to become pregnant.
56. The vaccine or immunogenic composition for the use of any one of **claims 52-55**, wherein administration of the vaccine or immunogenic composition induces a protective immune response **in** the subject.
57. The vaccine or immunogenic composition for the use of claim 56, wherein the protective immune response induced in the subject is greater **than** a protective immune response induced in a corresponding subject **administered** a vaccine or immunogenic composition comprising one or more antigens from a Zika **virus** lacking **the** at least one non-human cell adaptation mutation.
58. The vaccine or immunogenic composition for the use of any one of claims 52-57, wherein administration of the vaccine or immunogenic composition induces the generation of neutralizing antibodies to Zika virus **in the** subject.
59. The vaccine **or** immunogenic composition for the use of claim 58, wherein the concentration of neutralizing antibodies generated **in the** subject is higher **than** a concentration of neutralizing antibodies generated **in** a corresponding subject administered a vaccine or **immunogenic** composition comprising one or more antigens from a Zika virus lacking **the** at least one non-human cell adaptation mutation.
60. The vaccine or immunogenic composition for the use **of** any one of claims 52-59, wherein the vaccine or immunogenic composition is administered by a route selected from the group consisting subcutaneous administration, transcutaneous administration, intradermal administration, **subdermal** administration, intramuscular **administration**, peroral administration, intranasal **administration**, buccal administration, intraperitoneal **adnmstration**, intravaginal administration, anal administration and intracranial **administration** administration.
61. The vaccine or immunogenic composition for the use **of** any one of claims 52-60, wherein the vaccine or immunogenic composition is administered as a first (prime) and a second (boost) administration.
62. The vaccine or immunogenic composition for the use of claim 61, wherein the second (boost) administration is administered 28 days after the first (prime) administration.
63. Use of the vaccine or immunogenic composition of any one of claims 1-40 in the **manufacture** of a medicament for treating or preventing Zika **virus** infection in a subject **in** need thereof.
64. Use of the vaccine **or immunogenic** composition of any one **of** claims 1-40 in the manufacture of a medicament for inducing **an** immune response **in** a subject in need thereof.
65. The use **of** claims 63 **or** 64, wherein the subject is a **human**.
66. The use of any one of claims 63-65, wherein the subject is pregnant or intends to become pregnant.

67. The use of any one of claims 63-66, wherein administration of the vaccine or immunogenic composition induces a protective immune response in the subject.
68. The use of claim 67, wherein the protective immune response induced in the subject is greater than a protective immune response induced in a corresponding subject administered a vaccine or immunogenic composition comprising one or more antigens from a Zika virus lacking the at least one non-human cell adaptation mutation.
69. The use of any one of claims 63-66, wherein administration of the vaccine or immunogenic composition induces the generation of neutralizing antibodies to Zika virus in the subject.
70. The use of claim 69, wherein the concentration of neutralizing antibodies generated in the subject is higher than a concentration of neutralizing antibodies generated in a corresponding subject administered a vaccine or immunogenic composition comprising one or more antigens from a Zika virus lacking the at least one non-human cell adaptation mutation.
71. The use of any one of claims 63-70, wherein the vaccine or immunogenic composition is administered by a route selected from the group consisting subcutaneous administration, transcutaneous administration, intradermal administration, subdermal administration, intramuscular administration, peroral administration, intranasal administration, buccal administration, intraperitoneal administration, intravaginal administration, anal administration and intracranial administration.
72. The use of any one of claims 63-71, wherein the vaccine or immunogenic composition is administered as a first (prime) and a second (boost) administration.
73. The use of claim 72, wherein the second (boost) administration is administered 28 days after the first (prime) administration.
74. A method for inactivating a Zika virus preparation comprising:
- (a) isolating the Zika virus preparation from one or more non-human cells, wherein the cells are used to produce the virus preparation, and wherein the Zika virus comprises at least one non-human cell adaptation mutation; and
 - (b) treating the virus preparation with an effective amount of formalin.
75. The method of claim 74, further comprising (c) neutralizing the formalin-treated virus preparation with sodium metabisulfite.
76. The method of claim 75, wherein the virus preparation is neutralized at least five, at least seven, at least nine, at least 11, or at least 14 days after formalin treatment.
77. The method of any one of claims 74-76, further comprising (d) purifying the neutralized virus preparation.

78. The method of claim 77, wherein the neutralized virus preparation is purified by process selected from the group consisting of cross flow filtration (CFF), multimodal chromatography, size exclusion chromatography, cation exchange chromatography, and anion exchange chromatography.
79. The method of any one of claims 74-78, wherein the virus preparation is mixed with an adjuvant.
80. The method of claim 79, wherein the adjuvant is selected from the group consisting of aluminum salts, toll-like receptor (TLR) agonists, monophosphoryl lipid A (MLA), synthetic lipid A, lipid A mimetics or analogs, MLA derivatives, cytokines, saponins, muramyl dipeptide (MDP) derivatives, CpG oligos, lipopolysaccharide (LPS) of gram-negative bacteria, polyphosphazenes, emulsions, virosomes, cocMeates, poly(lactide-co-glycolides) (PLG) microparticles, poloxamer particles, microparticles, liposomes, Complete Freund's Adjuvant (CFA), and Incomplete Freund's Adjuvant (IFA).
81. The method of claim 79 and 80, wherein the adjuvant is an aluminum salt.
82. The method of claim 81, wherein the adjuvant is selected from the group consisting of alum, aluminum phosphate, aluminum hydroxide, potassium aluminum sulfate, and Alhydrogel 85.
83. The method of any one of claims 79-82, wherein at least 75%, at least 85%, at least 90%, at least 95%, at least 96%, at least 97%, at least 98%, at least 99%, or 100% of one or more antigens in the vims preparation are adsorbed to the adjuvant.
84. The method of any one of claims 74-83, wherein the at least one non-human cell adaptation mutation is in Zika virus NS1.
85. The method of claim 84, wherein the at least one adaptation mutation occurs at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1.
86. The method of claim 85, wherein the at least one adaptation mutation is a Trp98Gly mutation.
87. The method of any one of claims 74-86, wherein the at least one adaptation mutation enhances genetic stability as compared to a Zika virus lacking the at least one adaptation mutation.
88. The method of any one of claims 74-86, wherein the at least one adaptation mutation enhances viral replication as compared to a Zika vims lacking the at least one adaptation mutation.
89. The method of any one of claims 74-88, wherein the Zika virus does not comprise a mutation in Envelope protein E (Env).
90. A method for inactivating a Zika vims preparation comprising:
- (a) isolating the Zika virus preparation from one or more non-human cells, wherein the cells are used to produce the vims preparation, and wherein the Zika virus comprises a mutation at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1; and
 - (b) treating the vims preparation with an effective amount of formalin.

91. The method of claim 90, wherein the mutation is a Trp98Gly mutation in SEQ ID NO: 1.
92. The method of claim 90 or 91, wherein the Zika virus does not comprise a mutation in the envelope protein (E).
93. The method of claim 92, wherein the sequence encoding the envelope protein is the same as the corresponding sequence in SEQ ID No. 2.
94. The method of any one of claims claim 90-93, further comprising (c) neutralizing the formalin-treated virus preparation with sodium metabisulfite.
95. The method of claim 94, wherein the virus preparation is neutralized at least five, at least seven, at least nine, at least 11, or at least 14 days after formalin treatment.
96. The method of any one of claims 90-95, further comprising (d) purifying the neutralized virus preparation.
97. The method of claim 96, wherein the neutralized virus preparation is purified by process selected from the group consisting of cross flow filtration (CFF), multimodal chromatography, size exclusion chromatography, cation exchange chromatography, and anion exchange chromatography.
98. The method of any one of claims 90-97, wherein the virus preparation is mixed with an adjuvant.
99. The method of claim 98, wherein the adjuvant is selected from the group consisting of aluminum salts, toll-like receptor (TLR) agonists, monophosphoryl lipid A (MLA), synthetic lipid A, lipid A mimetics or analogs, MLA derivatives, cytokines, saponins, muramyl dipeptide (MDP) derivatives, CpG oligos, lipopolysaccharide (LPS) of gram-negative bacteria, polyphosphazenes, emulsions, virosomes, Complete Freund's Adjuvant (CPA), and Incomplete Freund's Adjuvant (IFA).
100. The method of claim 99, wherein the adjuvant is an aluminum salt.
101. The method of claim 100, wherein the adjuvant is selected from the group consisting of alum, aluminum phosphate, aluminum hydroxide, potassium aluminum sulfate, and Alhydrogel 85.
102. The method of any one of claims 98-101, wherein at least 75%, at least 85%, at least 90%, at least 95%, at least 96%, at least 97%, at least 98%, at least 99%, or 100% of one or more antigens in the virus preparation are adsorbed to the adjuvant.
103. A method of purifying Zika virus comprising:
- (a) inoculating a plurality of cells with an inoculum comprising a population of Zika viruses; and
 - (b) obtaining a Zika virus clonal isolate by plaque purification from one or more of the inoculated cells.

104. The method of claim 103, wherein the cells are non-human cells.
105. The method of claim 103 or claim 104, wherein the cells are insect cells.
106. The method of claim 105, wherein the insect cells are mosquito cells.
107. The method of claim 103 or claim 104, wherein the cells are mammalian cells
108. The method of claim 107, wherein the mammalian cells are monkey cells.
109. The method of claim 108, wherein the monkey cells are from a Vera cell line.
110. The method of claim 109, wherein the Vera cell line is a WHO Vero 10-87 cell line.
111. The method of any one of claims 103-110, wherein the population of Zika viruses is heterogeneous.
112. The method of any one of claims 103-111, wherein the population of Zika viruses comprises a Zika virus clinical isolate.
113. The method of claim 112, wherein the Zika virus clinical isolate is from strain PRVABC59.
114. The method of any one of claims 103-113, wherein the population of Zika viruses comprises a Zika virus that has been previously passaged one or more times in cell culture.
115. The method of any one of claims 103-114, wherein the inoculum comprises human serum.
116. The method of any one of claims 103-115, wherein the inoculum comprises one or more adventitious agents.
117. The method of claim 116, wherein the Zika virus clonal isolate is substantially free of the one or more adventitious agents.
118. The method of any one of claims 103-117, further comprising one or more additional plaque purifications of the Zika virus clonal isolate.
119. The method of claim 118, wherein the Zika virus clonal isolate is further plaque purified two or more times.
120. The method of any one of claims 103-119, further comprising passaging the Zika virus clonal isolate one or more times in cell culture.
121. The method of claim 120, wherein the Zika virus clonal isolate is passaged two or more times.
122. The method of any one of claims 103-121, further comprising formulating a vaccine or immunogenic composition comprising one or more antigens from the Zika virus clonal isolate.

123. The method of claim 122, wherein the vaccine or immunogenic composition is a purified antigen vaccine or immunogenic composition, a **subunit** vaccine or immunogenic composition, an inactivated whole virus vaccine or immunogenic composition, or an attenuated virus vaccine or immunogenic composition.
124. The method of claim 122, wherein the vaccine or immunogenic composition is an inactivated whole virus vaccine or immunogenic composition.
125. The method of any one of claims 103-124, wherein the Zika **virus** clonal isolate was chemically inactivated.
126. The method of claim 125, wherein the Zika **virus** clonal isolate was chemically inactivated with one or more of a detergent, formalin, hydrogen peroxide, beta-propiolactone (BPL), binary **ethylamine (BET)**, **acetyl ethyleneimine**, methylene blue, and psoralen.
127. The method of claim 125, wherein the Zika **virus** clonal isolate was chemically inactivated with formalin.
128. The method of any one of claims 122-127, **further** comprising admixing the vaccine or immunogenic composition with an adjuvant.
129. The method of claim 128, wherein the adjuvant is selected from the group consisting of **aluminum** salts, toll-like receptor (TLR) agonists, **monophosphoryl** lipid A (**MLA**), synthetic lipid A, lipid A **mimetics** or analogs, MLA derivatives, cytokines, saponins, **muramyl** dipeptide (**MDP**) derivatives, CpG oligos, lipopolysaccharide (LPS) of gram-negative bacteria, polyphosphazenes, emulsions, virosomes, cochleates, **poly(lactide-co-glycolides)** (PLG) **microparticles**, poloxamer particles, microparticles, liposomes, Complete **Freund's** Adjuvant (CFA), and Incomplete Freund's Adjuvant (**TFA**).
130. The method of claim 128, wherein the adjuvant is an aluminum salt.
131. The method of claim 128, wherein the adjuvant is selected from the group consisting of **alum**, aluminum phosphate, aluminum hydroxide, potassium aluminum sulfate, and Alhydrogel 85.
132. The method of any one of claims 128-131, wherein at least 75%, at least 85%, at least 90%, at least 95%, at least 96%, at least 97%, at least 98%, at least 99%, or 100% of the one or more antigens are adsorbed to the adjuvant.
133. The method of any one of claims 122-128, wherein the vaccine or immunogenic composition comprises from about 0.1 µg Zika virus or Env to about 100 µg Zika virus or **Env**.
134. The method of claim 133, wherein the vaccine or immunogenic composition is **adjuvanted**.
135. The method of any one of claims 103-134, wherein the Zika **virus** clonal isolate is a homogenous genetic population.

136. The method of any one of claims 103-135, wherein the Zika virus clonal isolate does not comprise a mutation in Envelope protein E (Env).
137. The method of any one of claims 103-135, wherein the Zika virus clonal isolate comprises at least one mutation.
138. The method of claim 137, wherein the at least one mutation is in Zika virus Non-structural protein 1 (NS1).
139. The method of claim 137, wherein the at least one mutation occurs at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1.
140. The method of claim 139, wherein the at least one mutation is a Trp98Gly mutation.
141. The method of any one of claims 137-140, wherein the at least one mutation is not in Envelope protein E (Env).
142. The method of any one of claims 137-141, wherein the at least one mutation enhances genetic stability as compared to a Zika virus lacking the at least one mutation.
143. The method of any one of claims 137-142, wherein the at least one mutation enhances viral replication as compared to a Zika virus lacking the at least one mutation.
144. A method of purifying Zika virus for the preparation of a vaccine or immunogenic composition, the method comprising one or more steps selected from the group of:
- (a) passing a sample comprising a Zika virus through a depth filter to produce an eluate, wherein the eluate comprises the Zika virus;
 - (b) buffer exchanging and/or diluting a sample comprising a Zika virus by cross flow filtration (CFF) to produce a retentate, wherein the retentate comprises the Zika virus;
 - (c) binding a sample comprising a Zika virus to an ion exchange membrane to produce a bound fraction, wherein the bound fraction comprises the Zika virus, and eluting the bound fraction from the ion exchange membrane;
 - (d) treating a sample comprising a Zika virus with an effective amount of a chemical inactivator;
 - (e) neutralizing a sample comprising a chemically inactivated Zika virus with sodium metabisulfite; and
 - (f) purifying a naturalized sample comprising a chemically inactivated Zika virus by cross flow filtration (CFF).
145. The method of claim 144, comprising the steps of:
- (a) passing a sample comprising a Zika virus through a depth filter to produce an eluate, wherein the eluate comprises the Zika virus;
 - (b) buffer exchanging and/or diluting a sample comprising a Zika virus by cross flow filtration (CFF) to produce a retentate, wherein the retentate comprises the Zika virus;

- (c) binding a sample comprising a Zika virus to an ion exchange membrane to produce a bound fraction, wherein the bound fraction comprises the Zika virus, and eluting the bound fraction from the ion exchange membrane;
- (d) treating a sample comprising a Zika virus with an effective amount of a chemical inactivator;
- (e) neutralizing a sample comprising a chemically inactivated Zika virus with sodium metabisulfite; and
- (f) purifying a naturalized sample comprising a chemically inactivated Zika virus by cross flow filtration (CFF).

346. The method of claim 144 or claim 145, comprising the steps of:

- (a) passing a sample comprising a Zika virus through a first depth filter to produce a first eluate, wherein the first eluate comprises the Zika virus;
- (b) buffer exchanging and/or diluting the first eluate by cross flow filtration (CFF) to produce a first retentate, wherein the first retentate comprises the Zika virus;
- (c) binding the first retentate to an ion exchange membrane to produce a first bound fraction, wherein the first bound fraction comprises the Zika virus, and eluting the first bound fraction from the ion exchange membrane to produce a second eluate, wherein the second eluate comprises the Zika virus;
- (d) passing the second eluate through a second depth filter to produce a second retentate, wherein the second retentate comprises the Zika virus;
- (e) treating the second retentate with an effective amount of a chemical inactivator;
- (f) neutralizing the treated second retentate with sodium metabisulfite; and
- (g) purifying the neutralized second retentate by cross flow filtration (CFF).

147. The method of any one of claims 145-146, wherein the ion exchange membrane is an anion exchange membrane.

148. The method of claim 147, wherein the anion exchange membrane comprises quaternary ammonium ligands.

149. The method of any one of claims 145-148, wherein the bound fraction of step (c) is eluted in multiple steps, wherein each step comprises an increasing salt concentration.

150. The method of claim 149, wherein the salt is sodium chloride.

151. The method of claim 150, wherein the salt concentration increases from 250 mM to 750 mM.

152. The method of any one of claims 145-151, wherein the chemical inactivator is one or more of a detergent, formalin, hydrogen peroxide, beta-propiolactone (BPL), binary ethylamine (BEI), acetyl ethyleneimine, methylene blue, and psoralen.

153. The method of any one of claims 145-151, wherein the chemical inactivator is formalin.

154. The method of any one of claims 145-153, wherein the neutralization occurs for at least five, at least seven, at least nine, at least 11, or at least 14 days.

155. The method of any one of claims 145-154, wherein the Zika virus is a Zika virus clonal isolate produced by any one of claims 103-143.
156. A vaccine or immunogenic composition comprising one or more antigens from a plaque purified clonal Zika virus isolate.
157. The vaccine or immunogenic composition of claim 156, wherein the plaque purified clonal Zika virus isolate was plaque purified from cells contacted with an inoculum comprising a population of Zika viruses.
158. The vaccine or immunogenic composition of claim 157, wherein the cells are non-human cells.
159. The vaccine or immunogenic composition of claim 157 or claim 158, wherein the cells are insect cells.
160. The vaccine or immunogenic composition of claim 159, wherein the insect cells are mosquito cells.
161. The vaccine or immunogenic composition of claim 157 or claim 158, wherein the cells are mammalian cells.
162. The vaccine or immunogenic composition of claim 161, wherein the mammalian cells are monkey cells.
163. The vaccine or immunogenic composition of claim 162, wherein the monkey cells are from a Vero cell line.
164. The vaccine or immunogenic composition of claim 163, wherein the Vero cell line is a WHO Vero 10-87 cell line.
365. The vaccine or immunogenic composition of any one of claims 157-164, wherein the population of Zika viruses was heterogeneous.
166. The vaccine or immunogenic composition of any one of claims 157-165, wherein the population of Zika viruses comprised a Zika virus clinical isolate.
167. The vaccine or immunogenic composition of claim 166, wherein the Zika virus clinical isolate is from strain PRVABC59.
168. The vaccine or immunogenic composition of any one of claims 157-165, wherein the population of Zika viruses comprised a Zika virus that had been previously passaged one or more times in cell culture.
169. The vaccine or immunogenic composition of any one of claims 157-168, wherein the inoculum comprised human serum.
370. The vaccine or immunogenic composition of any one of claims 157-169, wherein the inoculum comprised one or more adventitious agents.

171. The vaccine or immunogenic composition of claim 170, wherein the plaque purified clonal Zika virus isolate is substantially free of the one or more adventitious agents.
172. The vaccine or immunogenic composition of any one of claims 157-171, wherein the plaque purified clonal Zika virus isolate is modified as compared to a wild-type Zika virus.
173. The vaccine or immunogenic composition of any one of claims 157-172, wherein the plaque purified clonal Zika virus isolate is a homogenous genetic population.
174. The vaccine or immunogenic composition of any one of claims 157-173, wherein the plaque purified clonal Zika virus isolate does not comprise a mutation in Envelope protein E (Env)
175. The vaccine or immunogenic composition of any one of claims 157-173, wherein the plaque purified clonal Zika virus isolate comprises at least one mutation.
176. The vaccine or immunogenic composition of claim 175, wherein the at least one mutation is in Zika virus Non-structural protein 1 (NS1).
177. The vaccine or immunogenic composition of claim 176, wherein the at least one mutation occurs at position 98 of SEQ ID NO: 1, or at a position corresponding to position 98 of SEQ ID NO: 1.
178. The vaccine or immunogenic composition of claim 177, wherein the at least one mutation is a Trp98Gly mutation.
179. The vaccine or immunogenic composition of any one of claims 175-178, wherein the at least one mutation is not in Zika virus Envelope protein E (Env).
180. The vaccine or immunogenic composition of any one of claims 174-178, wherein the at least one mutation enhances genetic stability as compared to a Zika virus lacking the at least one mutation.
181. The vaccine or immunogenic composition of any one of claims 174-180, wherein the at least one mutation enhances viral replication as compared to a Zika virus lacking the at least one mutation.
182. The vaccine or immunogenic composition of any one of claims 157-181, wherein the plaque purified clonal Zika virus isolate is an African lineage virus or an Asian lineage virus.
183. The vaccine or immunogenic composition of any one of claims 157-182, wherein the plaque purified clonal Zika virus isolate is an Asian lineage virus.
184. The vaccine or immunogenic composition of any one of claims 157-183, wherein the vaccine or immunogenic composition is a purified antigen vaccine or immunogenic composition, a subunit vaccine or immunogenic composition, an inactivated whole virus vaccine or immunogenic composition or an attenuated virus vaccine or immunogenic composition.

185. The vaccine or immunogenic composition of any one of claims 157-183, wherein the vaccine or immunogenic composition is an inactivated whole virus vaccine or immunogenic composition.
186. The vaccine or immunogenic composition of any one of claims 157-185, wherein the plaque purified clonal Zika virus isolate was chemically inactivated.
187. The vaccine or immunogenic composition of claim 186, wherein the plaque purified Zika virus was chemically inactivated with one or more of a detergent, formalin, hydrogen peroxide, beta-propiolactone (BPL), binary ethylamine (BE1), acetyl ethyleneimine, methylene blue, and psoralen.
188. The vaccine or immunogenic composition of claim 186, wherein the plaque purified clonal Zika virus isolate was chemically inactivated with formalin.
189. The vaccine or immunogenic composition of any one of claims 157-188, further comprising an adjuvant.
190. The vaccine or immunogenic composition of claim 189, wherein the adjuvant is selected from the group consisting of aluminum salts, toll-like receptor (TLR) agonists, monophosphoryl lipid A (MLA), synthetic lipid A, lipid A mimetics or analogs, MLA derivatives, cytokines, saponins, muramyl dipeptide (MDP) derivatives, CpG oligos, lipopolysaccharide (LPS) of gram-negative bacteria, polyphosphazenes, emulsions, virosomes, cochleates, poly(lactide-co-glycolides) (PLG) microparticles, poloxamer particles, microparticles, liposomes, Complete Freund's Adjuvant (CFA), and incomplete Freund's Adjuvant (IFA).
191. The vaccine or immunogenic composition of claim 189, wherein the adjuvant is an aluminum salt.
192. The vaccine or immunogenic composition of claim 189, wherein the adjuvant is selected from the group consisting of alum, aluminum phosphate, aluminum hydroxide, potassium aluminum sulfate, and Alhydrogel 85.
193. The vaccine or immunogenic composition of any one of claims 189-192, wherein at least 75%, at least 85%, at least 90%, at least 95%, at least 96%, at least 97%, at least 98%, at least 99%, or 100% of the one or more antigens are adsorbed to the adjuvant.
194. The vaccine or immunogenic composition of any one of claims 157-188, comprising from about 0.1 µg Zika virus or Env to about 100 µg Zika virus or Env.
195. The vaccine or immunogenic composition of claim 194, wherein the vaccine or immunogenic composition is unadjuvanted.
