ACHILLE DE FALCO
INVENTOR

BY Victor J. Evans & Co.
ATTORNEY

WITNESS:

Patented Dec. 6, 1932

1,890,370

UNITED STATES PATENT OFFICE

ACHILLE DE FALCO, OF NORTH ADAMS, MASSACHUSETTS

HANGER

Application filed January 12, 1932. Serial No. 586,207.

This invention relates to hangers and it has for one of its objects the provision of a hanger particularly adapted to function as a clothes hanger.

Another object of the invention is the provision of a simple, economical and efficient hanger of the type mentioned.

Other objects will be appreciated from a reading of the following specification.

The invention will be fully and comprehensively understood from a consideration of the following detailed description when read in connection with the accompanying drawing which forms part of the application with the understanding, however, that the improvement is capable of extended application and is not confined to the exact showing of the drawing nor to the precise construction described and, therefore, such changes and modifications may be made therefrom as do not affect the spirit of the invention nor exceed the scope thereof as expressed in the appended claim.

In the drawing:

Fig. 1 is a front elevation of the hanger constructed in accordance with my invention, this view showing fragmentarily a trousers held by the hanger.

Fig. 2 is an end view of Fig. 1.

Fig. 3 is a fragmentary plan view of the lower part of the hanger with a trousers held thereby; and

Fig. 4 is a section taken on the line 4—4 of Fig. 3, looking in the direction of the arrows.

Referring to the drawing for a more detailed description thereof, the embodiment of my invention, as illustrated, comprises a hanger 5 which includes a hook 6 and a loop 7, both the hook and the loop being formed of one continuous piece of wire which is doubled at the free end 8 of the hook and continuous from the bottom of the hook to form the loop 7, the end of the doubled wire being wound around the lower portion of the hook, as indicated by the numeral 9. From the foregoing it will readily be understood that the hook and the loop which together comprise the complete hanger, are formed of a single piece of doubled wire or other suitable material, such material being preferably resilient, as is the wire.

The loop 7 comprises inclined portions 8′ and a horizontal portion 10, the former as well as the latter consisting of parallel portions of the doubled single piece of material of which the hanger is formed. The horizontal portion 10 of the loop 7 comprises parts 11 and 12, which are embraced by rings 15, the latter being spaced apart and being adapted to exert pressure on the members 11 and 12 when the trousers 16 is held between the mentioned members when the rings are sufficiently moved towards each other, the rings pressing the latter members toward each other to effectively hold the article of clothing between them. The members 11 and 12 are corrugated on their outer sides at the points where the rings 15 operate.

What is claimed as new and useful is:

A hanger comprising a hook and a loop, the lower portion of which loop comprises a pair of horizontal members, and a pair of rings embracing and slidable on said members and adapted to press the same together when the hanger is holding one or more articles, said hook and loop being formed from a single piece of material doubled at the free end of the hook.

In testimony whereof I hereby affix my signature.

ACHILLE DE FALCO.
