Compounds of formula I are described, their production and use in pharmaceutical agents.
CONDENSED 2,3-BENZODIAZEPINE DERIVATIVES AND THEIR USE AS AMPA-RECEPTOR INHIBITORS

[0001] The invention relates to new 2,3-benzodiazepine derivatives, their production and use as pharmaceutical agents.

[0002] It is already known that selected 2,3-benzodiazepine derivatives have modulatory activity at quisqualate receptors and owing to this property are suitable as pharmaceutical agents for treating diseases of the central nervous system.

[0003] It has now been found that the 2,3-benzodiazepine derivatives according to the invention are also suitable for treating diseases of the central nervous system, whereby the compounds are distinguished by better properties compared to the above-mentioned prior art.

[0004] The invention relates to the compounds of formula I

\[
\begin{align*}
\text{R}^1 & \quad \text{X} & \quad \text{Y} \\
\text{R}^2 & \quad \text{R}^3 & \quad \text{NR} \quad \text{R}^9 & \quad \text{O} \quad \text{C}_{1-6} \quad \text{alkyl} & \quad \text{CF}_3 \quad \text{OH} & \quad \text{C}_{1-6} \quad \text{alkanoyloxy}, \\
\text{R}^5 & \quad \text{R}^6 & \quad \text{R}^7 & \quad \text{R}^8 & \quad \text{R}^9 & \quad \text{R}^{10} & \quad \text{R}^{11} & \quad \text{R}^{12} & \quad \text{R}^{13} & \quad \text{R}^{14}
\end{align*}
\]

[0005] in which

[0006] \( \text{R}^1 \) and \( \text{R}^2 \) are the same or different and mean hydrogen, \( \text{C}_{1-6} \) alkyl, nitro, halogen, cyano, the group \( \text{—NR}^9 \text{R}^9 \text{; } \text{—O} \text{—C}_{1-6} \text{—alkyl} \), \( \text{CF}_3 \), \( \text{OH} \) or \( \text{C}_{1-6} \) alkanoyloxy,

[0007] \( \text{R}^3 \) and \( \text{R}^4 \) are the same or different and mean hydrogen, halogen, \( \text{C}_1\text{-C}_6 \) alkoy, hydroxy, thiocyano, \( \text{C}_1\text{-C}_6 \) alkylthio, cyano, \( \text{COOR}^{12} \), \( \text{PO}_{3}{\text{R}^{13} \text{R}^{14}} \), \( \text{C}_{1-6} \) alkanoyl, \( \text{C}_{1-6} \) alkanoyloxy, \( \text{C}_{2-6} \) alkyl optionally substituted with \( \text{C}_{1-6} \) alkoy or phenyl, \( \text{C}_{2-6} \) alkoy optionally substituted with \( \text{C}_{1-6} \) alkoy or phenyl, \( \text{C}_{2-6} \) alky optionally substituted by halogen, hydroxy, \( \text{C}_1\text{-C}_6 \) alkoy, \( \text{C}_2\text{-C}_6 \) thiaoalkyl, \( \text{NR}^{10} \), \( \text{R}^{11} \), \( \text{C}_1\text{-C}_6 \) cycloalkyl, or an optionally substituted aryl or hetaryl radical,

[0008] \( \text{R}^9 \) and \( \text{R}^{10} \) are the same or different and mean hydrogen, \( \text{C}_1\text{-C}_6 \) alkoy or the group \( \text{—CO} \text{—C}_1\text{-C}_6 \) alkoy,

[0009] \( \text{R}^{10} \) and \( \text{R}^{11} \) are the same or different and mean hydrogen, \( \text{C}_1\text{-C}_6 \) alkoy or \( \text{C}_1\text{-C}_6 \) alkanoyl or together with the nitrogen atom form a 5- to 7-membered saturated heterocycle, which can contain another oxygen, sulfur or nitrogen atom and can be substituted,

[0010] \( \text{R}^{12} \), \( \text{R}^{13} \), \( \text{R}^{14} \) are the same or different and mean \( \text{H} \) or \( \text{C}_1\text{-C}_6 \) alkyl,

[0011] \( \text{X} \) means hydrogen or halogen,

[0012] \( \text{Y} \) means \( \text{C}_1\text{-C}_6 \) alkoy or \( \text{X} \) and \( \text{Y} \) together mean \( \text{—O} \text{—(CH}_2\text{)_n—O} \text{—} \),

[0013] \( \text{n} \) means 1, 2 or 3, and

[0014] A together with the nitrogen forms a saturated or unsaturated five-membered heterocycle, which can contain 1-3 nitrogen atoms and/or an oxygen atom and/or one or two carbonyl groups or their isomers or physiologically compatible salts.

[0015] Alkyl is defined in each case as a straight-chain or branched alkyl radical, such as, for example, methyl, ethyl, propyl, isopropyl, butyl, isobutyl, sec-butyl, pentyl, isopentyl or hexyl.

[0016] \( \text{R}^2 \) and \( \text{R}^4 \) in the meaning of \( \text{C}_{2-6} \) alkenyl contain at least one double bond such as, for example, vinyl, propenyl, buten-1-yl, isobutenyl, penten-1-yl, 2,2-dimethylbuten-1-yl, 3-methylbuten-1-yl, hexen-1-yl. If \( \text{R}^2 \) or \( \text{R}^4 \) means \( \text{C}_{2-6} \) alknoyl, at least 1 triple bond is present, such as, for example, ethynyl, propynyl, butyn-1-yl, butyn-2-yl, pentyn-1-yl, pentyn-2-yl, 3-methylbutyn-1-yl, hexyn-1-yl. The alknoyl and alkynyl radicals can be substituted, e.g., with \( \text{C}_1\text{-C}_6 \) alkoy or phenyl, which can be substituted with halogen. If a halogenated alkyl radical is present, the latter can be halogenated or perhalogenated in one or more places like \( \text{CF}_3 \).

[0017] Halogen is defined in each case as fluorine, chlorine, bromine and iodine.

[0018] The aryl and hetaryl radicals \( \text{R}^3 \) and \( \text{R}^4 \) can be substituted in one to three places in the same way or differently with halogen, \( \text{C}_1\text{-C}_6 \) alkoy or \( \text{C}_1\text{-C}_6 \) alkyl.

[0019] The aryl and hetaryl radicals can be present as monocyclic or bicyclic compounds and can contain 5-12 ring atoms, preferably 5-9 ring atoms, such as, for example, phenyl, biphenyl, napthyl, indenyl as an aryl radical, and thiophenyl, furanyl, pyrany, pyrrolyl, pyrazolyl, pyridyl, pyrimidinyl, pyridazinyl, oxazolyl, iso-oxazolyl, thiazolyl, isothiazolyl, \( 1,3\text{-oxadiazol-2-yl} \), \( 1,4\text{-oxadiazolyl-5-yl} \), \( 1,2\text{-oxadiazol-3-yl} \), quinolinyl, isoquinolinyl, benz[a]thienyl, benzo[4]thiophenyl as a hetaryl radical with up to 3 heteroatoms such as sulfur, oxygen and/or nitrogen, 2-Thienyl, 3-thienyl, pyridin-2-yl, pyridin-3-yl, pyridin-4-yl and phenyl can be mentioned as preferred.

[0020] Cycloalkyl is defined in each case as cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl and cycloheptyl, especially \( \text{C}_3\text{-C}_6 \) cycloalkyl.

[0021] As alkanyl radicals, straight-chain or branched aliphatic carboxylic acid radicals, such as formyl, acetyl, propionyl, butanoyl, isopropylcarbonyl, caproyl, valeroyl, trimethylacetyl, i.e., are suitable.

[0022] If \( \text{R}^{10} \) and \( \text{R}^{11} \) together with the nitrogen atom form a heterocycle, for example, piperidine, pyrrolidine, thiomorpholine, hexahydroxepine, morpholine, piperazine, imidazolidine, hexahydridiazepine is mentioned. If the heterocycle is substituted, the substituent \( \text{C}_1\text{-C}_6 \) alkyl or phenyl can be in one to two places, such as, for example, N-methylpiperazine, N-phenylpiperazine, 2,6-dimethylmorpholine.

[0023] If A together with the nitrogen atom forms a saturated heterocycle, the latter can be substituted at the carbon atom or at another nitrogen atom. In this case, \( \text{A} \) means, for example, \( \text{C}_3 \) alkylene, which can be substituted
with R³ and R⁴, and in which 1, 2 or 3 alkylene groups can be replaced by oxygen, carbonyl or —NR—, such as, for example, —(CH₂)₃—, CH₂—NR—CH₃, —CH₂—O—CO—, —CH₂—NR—CO—, —CO—NR—CO— or CH₂—O—CR³R⁴, whereby the carbonyl group is bonded to the nitrogen atom of the benzodiazepine, and R² and R²' preferably mean C₁₋₄ alkyl. These compounds of formula I contain a chiral center in the 4-position of the 2,3-benzodiazepine skeleton and can be present as a racemate or optical isomers.

[0024] If A together with the nitrogen atom forms an unsaturated 5-membered heterocycle, it thus is not a chiral carbon atom, but rather an exocyclic double bond that is present in the 4-position of the 2,3-benzodiazepine skeleton. The unsaturated 5-membered heterocycle can be present partially unsaturated or aromatic. Preferred are heteroaromatic compounds with 1-3 nitrogen atoms, in which A has, for example, the following meaning:

[0025] The physiologically compatible salts are derived from inorganic and organic acids. Suitable are inorganic acids, such as, for example, hydrohalic acids such as hydrochloric acid, hydrobromic acid, phosphoric acid, sulfuric acid, or organic acids such as, for example, aliphatic or aromatic mono- or dicarboxylic acids such as formic acid, acetic acid, maleic acid, fumaric acid, succinic acid, lactic acid, tartaric acid, citric acid, oxalic acid, glyoxylic acid or sulfonic acids, for example, C₃₋₄ alkanesulfonic acids such as methanesulfonic acid or benzensulfonic acids that are optionally substituted by halogen or C₁₋₄ alkyl, such as p-toluenesulfonic acid.

[0026] The compounds of formula I also comprise all possible stereoisomers and their mixtures, such as diastereomers, racemates and enantiomers.

[0027] Preferred are compounds of general formula I in which R² means hydrogen.

[0028] The compounds of general formula I as well as their physiologically compatible salts can be used as pharmaceutical agents owing to their non-competitive inhibition of the AMPA receptor. Owing to their profile of action, the compounds according to the invention are suitable for treating diseases that are caused by hyperactivity of excitatory amino acids, such as, for example, glutamate or aspartate. Since the new compounds act as non-competitive antagonists of excitatory amino acids, they are suitable especially for treating those diseases that are influenced by the receptors of excitatory amino acids, especially the AMPA receptor.

[0029] The pharmacological action of the compounds of formula I was determined by means of the tests described below:

[0030] Male NMRI mice weighing 18-22 g were kept under controlled conditions (0000-1800 hours light/dark cycle, with free access to food and water) and their assignment to groups was randomized. The groups consisted of 5-16 animals. The observation of the animals was performed between 0800 and 1300 hours.

[0031] AMPA was sprayed into the left ventricles of mice that were allowed to move freely. The applicator consisted of a cannula with a device made of stainless steel, which limits the depth of injection to 3.2 mm. The applicator was connected to an injection pump. The injection needle was inserted perpendicular to the surface of the skull according to the coordinates of Montemurro and Dukelow. The animals were observed up to 180 sec. until clonic or tonic seizures set in. The clonic movements, which last longer than 5 sec., were counted as seizures. The beginning of the clonic seizures was used as an endpoint for determining the seizure threshold. The dose that was necessary to raise or reduce the seizure threshold by 50% (THRD₅₀) was determined in 4-5 experiments. The THRD₅₀ and the confidence limit were determined in a regression analysis.

[0032] The results of these tests show that the compound of formula I and its acid addition salts influence functional disorders of the AMPA receptor. They are therefore suitable for the production of pharmaceutical agents for symptomatic and preventive treatment of diseases that are triggered by changing the function of the AMPA receptor complex.

[0033] The treatment with the compounds according to the invention prevents or delays the cell damage that occurs as a result of disease and functional disorders and reduces the concomitant symptoms.

[0034] According to the invention, the compounds can be used for treating neurological and psychiatric disorders that are triggered by overstimulation of the AMPA receptor. The neurological diseases, which can be treated functionally and preventively, include, for example, neurodegenerative disorders such as Parkinson’s disease, Alzheimer’s disease, Huntington’s chorea, amyotrophic lateral sclerosis, and olivopontocerebellar degeneration. According to the invention, the compounds can be used for the prevention of postischemic cellular degeneration, cellular degeneration after brain trauma, in the case of stroke, hypoxia, anoxia and hypoglycemia and for the treatment of senile dementia, AIDS dementia, neurological symptoms that are related to HIV infections, multifactor dementia as well as epilepsy and muscle spasms. The psychiatric diseases include anxiety conditions, schizophrenia, migraines, pain conditions as well as the treatment of sleep disorders and withdrawal symptoms after drug abuse such as in alcohol, cocaine, benzodiazepine or opiate withdrawal. In addition, the compounds can be used in the prevention of tolerance development during long-term treatment with sedative pharmaceutical agents, such as, for example, benzodiazepines, barbiturates and morphine. Moreover, the compounds can be used as anesthetics (anesthesia), analgesics or anti-emetics.

[0035] For use of the compounds according to the invention as pharmaceutical agents, the latter are brought into the form of a pharmaceutical preparation, which in addition to the active ingredient for enteral or parenteral administration contains suitable pharmaceutical, organic or inorganic inert media, such as, for example, water, gelatin, gum arabic, lactose, starch, magnesium stearate, talc, vegetable oils,
polyalkylene-glycols, etc. The pharmaceutical preparations can be present in solid form, for example, as tablets, coated tablets, suppositories, capsules or in liquid form, for example as solutions, suspensions or emulsions. Moreover, they optionally contain adjuvants such as preservatives, stabilizers, wetting agents or emulsifiers, salts for changing the osmotic pressure or buffers.

[0036] For parenteral use, especially injection solutions or suspensions, especially aqueous solutions of the active compounds in polyhydroxyethoxylated castor oil, are suitable.

[0037] As vehicle systems, surface-active adjuvants such as salts of bile acids or animal or vegetable phospholipids, but also mixtures of them as well as liposomes or their components, can also be used.

[0038] For oral use, especially tablets, coated tablets or capsules with t alc and/or hydrocarbon vehicles or binders, such as, for example, lactose, corn or potato starch, are suitable. The substance may also be administered in liquid form, such as, for example, as juice, to which optionally a sweetener is added.

[0039] The dosage of the active ingredients can vary depending on method of administration, age and weight of the patient, type and severity of the disease to be treated and similar factors. The daily dose is 0.5-1000 mg, preferably 50-200 mg, whereby the dose may be given as a single dose to be administered once or divided into two or more daily doses.

[0040] The production of the compounds according to the invention is carried out, for example, in that

[0041] a) a compound of formula II

\[
\text{II}
\]

in which

[0042] R', R₂, X and Y have the above meaning, is cyclized by reaction of

[0043] b) a compound of formula III or IV

\[
\text{III}
\]

[0044] c) Z=COOC₆H₅ alkyl with borane-trimethylamine complex and boron trifluoride etherate to compounds with A meaning --(CH₂)₃-- and --(CH₃)₂--CO--

[0045] d) Z=CH₂OH or --CH₂--NH₂ with phosgene to compounds with A meaning --CH₂--O--CO-- or --CH₂--NR₂--CO--

[0046] e) Z=CH₂OH with R³=CO-R⁴ to compounds with A meaning --CH₂—O--CR²R³ in which R³ and R⁴ have the above meaning.

[0047] in which R', R₂, X and Y have the above meaning, is cyclized by reaction of

[0048] a) Z=CH=CH—COOC₆H₅ alkyl with copper sulfate to compounds with A meaning --CH=CH--N=N--

[0049] b) Z=CH=CH—COOC₆H₅ alkyl with hydrazine hydrate and acid anhydrides or with acid hydrazides to compounds with A meaning --N=N--CR³--

[0050] c) Z=CH=CH—COOC₆H₅ alkyl with a-aminoacets to compounds with A meaning --N=CR³--CR³--

[0051] d) Z=CH=CH—COOC₆H₅ alkyl with hydrazine hydrate and acid anhydrides or with acid hydrazides to compounds with A meaning --N=N--CR³--

[0052] e) Z=CH=CH—COOC₆H₅ alkyl with a-aminoacets to compounds with A meaning --N=CR³--CR³--

[0053] f) Z=CH=CH—COOC₆H₅ alkyl with a-aminoacets to compounds with A meaning --N=CR³--CR³--

[0054] c) a compound of formula V,
in which $R^1$, $R^2$, $X$ and $Y$ have the meaning given above, is reacted with $\alpha$-aminonitriles, $\alpha$-aminoketals, $H\equiv N\equiv CH=CR^1$ or with ammonia and $\alpha$-haloketones, and then optionally nitro group $R^1$ and/or $R^2$ is reduced, the amino group is acetylated or alkylated or converted into halogen or hydroxyl or cyano or deaminated or X is dehalogenated simultaneously with the reduction of the nitro group or in succession or hydrogen is substituted by halogen or hydrogen is exchanged for another halogen, $-PO_2R^2R^3^14$, cyano, $C_{1-6}$ alkyl, $C_{1-6}$ alkoxy, hydroxyl, optionally substituted $C_{2-6}$ alkyl, optionally substituted $C_{1-6}$ alkyl, $C_{1-6}$ alkoxide, $CF_3$, $C_{1-6}$ thioalkyl, COOR, or $Y$ is re-etherified or the isomers are separated or the salts are formed.

[0056] It is advisable to carry out the fusing of the heterocycle on 2,3-benzodiazepines that are suitably substituted in the 4-position.

[0057] The reaction of the alkyl radical, in which $Z=COO=C_{1-6}$ alkyl, with $R^-N=O=C=O$ in aprotic solvents such as halogenated hydrocarbons at room temperature or at a higher temperature results in compounds of formula I with $A$ meaning $-CO-\equiv N-R^2=CO-$. Compounds of formula II in which $Z=CH_2OH$ or $CH_2\equiv NH$ are reacted with phenoxy in the presence of tertiary amines in inert solvents, such as optionally halogenated hydrocarbons, compounds of formula I with $A$ meaning $-CH_2O-\equiv CO-\equiv N-R^2=CO-$. Compounds of formula I in which $A$ meaning $-CH_2O-\equiv CR=CO-\equiv N-R^2=CO-$ are obtained.

[0058] If compounds of formula II, in which $Z=CH_2OH$, are reacted with carbonyl compounds in the presence of acids such as hydrochloric acid, compounds of formula I in which $A$ means $-CH_2O-\equiv CR^3=CO-$ are obtained as cyclization products.

[0059] If the 2,3-benzodiazepine in the 4-position contains a formyl group, the latter can be converted, e.g., with a Wittig reaction in the usual way into a compound of formula III, in which $Z=CH=CH=COO=C_{1-6}$ alkyl.

[0060] If an acylic acid ester that is obtained is treated with borane-trimethylamine complex and with boron trifluoride etherate in a halogenated hydrocarbon such as dichloromethane, compounds of formula I are obtained with $A=CH_2\equiv CO$ and $CH_2\equiv CO$, which are separated by column chromatography. If the 2,3-benzodiazepine that is formylated in 4-position is reacted with hydrzone hydrate, the corresponding hydrazone derivative, which is dissolved in polar solvents and mixed with a solution of copper sulfate in water, is obtained. Compounds of formula I in which $A$ means $\equiv CH=N=N$ are obtained as cyclization products.

[0061] If a compound of formula III or IV, in which $Z$ means $C_{1-6}$ alkyl-$S$ is reacted with acid hydrazides in the presence of an acid, e.g., sulfinic acid in an organic solvent, compounds of formula I, in which $A$ means $\equiv N=O-C(R)=O-$ are obtained. The reaction can also be performed such that the alkyldithio derivative in an organic solvent is heated with hydrazine hydrate, and then is reacted with an acid anhydride to the desired product.

[0062] If the methylthio-benzodiazepine derivative is heated with $\alpha$-aminonitriles $H\equiv N=CR^1=CH-(O-\equiv alkyl)\equiv N=CR^1=CH-(O-\equiv alkyl)$ or $H\equiv N=CR^1=CH-(O-\equiv alkyl)$, in the presence of an acid, such as p-toluensulfonic acid, compounds of formula I with $A$ meaning $N=CR^2=CH-\equiv N=CH=CR^4-$ or $N=CR^2=CH-\equiv N=CH=CR^4-$ are obtained.

[0063] The same compounds of formula I can be produced by a compound of formula V being reacted with the corresponding $\alpha$-aminonitrile $NH=CHR=CR'(OAOB)$, optionally in solvents such as Cellosolve$^{(8)}$ by introducing an inert gas, such as, e.g., argon or nitrogen to remove the hydrogen sulfide or in the presence of sulfur catchers, such as, e.g., mercury oxide. Radical (OAIK) is defined as either open or close or sometimes more advantageously—cyclic acetals or ketals. Compounds of formula I can also be produced by compounds of formula V being reacted with propargylic amines $H\equiv N=CH=CR=CR^2$ according to processes known in the literature (Eur J Med Chem 30, 429 (1995) or Ann Chem. 1987, (2), 103).

[0064] Compounds of formula I are obtained even if compounds of formula V with ammonia in solvents such as methanol or Cellosolve$^{(8)}$ optionally are converted under pressure or with the addition of a sulfur catalyst, such as, for example, silver triflate or mercury oxide, into the corresponding amine and then reacted with $\alpha$-haloketones.

[0065] If $Z'$ is a $CH_2OH$ group, the alcohol can be converted in a known way by reaction according to Mitsunobu into azide or into phthalimide. Azide can be converted into amine according to methods in literature by reducing agents or by triphenylphosphine. Phthalimide can also be converted into amine by treatment with hydrin. The acylation of this amine is possible with acid chlorides or acid anhydrides according to known processes. The subsequent cyclization with phosphorus oxychloride results in compounds of formula I with $A$ meaning $\equiv CH-N=CR^2=NO$. 

[0066] The reduction in the nitro group is performed in polar solvents at room temperature or a higher temperature. As catalysts for reduction, metals such as Raney nickel or noble metal catalysts such as palladium or platinum or else palladium hydroxide optionally on vehicles are suitable. Instead of hydrogen, for example, ammonium formate, cyclobutene or hydrazine can also be used in a known way. Reducing agents such as tin(II) chloride or titanium(III) chloride can also be used as complex metal hydroxides optionally in the presence of heavy metal salts. Iron can also be used as a reducing agent. The reaction is then performed in the presence of an acid such as, e.g., acetic acid or ammonium chloride, optionally with the addition of a solvent, such as, for example, water or methanol.

[0067] If alkylation of an amino group is desired, it can be performed according to commonly used methods—for example with alkyl halides—or according to the Mitsunobu variant by reaction with an alcohol in the presence of triphenylphosphine and azodicarboxylic acid ester, or the amine can be subjected to reductive amination with aldehydes or ketones optionally in succession with two different carbonyl compounds, whereby mixed derivatives are obtained [Bibliography, e.g., Verardo et al. Synthesis (1993), 121; Synthesis (1991), 447; Kawaguchi, Synthesis (1985), 701; Mikovic et al. Synthesis (1991), 1043].

[0068] The acylation of an amino group is carried out in the usual way, for example, with an acid halide or acid anhydride optionally in the presence of a base such as dimethylamino(pyridine in solvents such as methylene chloride, triethylphosphorane or pyridine, according to the Schotten-Baumann variant in aqueous solution at weakly alkaline pH or by reaction with an anhydride in glacial acetic acid.

[0069] The introduction of the halogens chlorine, bromine or iodine via the amino group can be carried out, for
example, also according to Sandmeyer, by the diazonium salts that are immediately formed with nitrates being reacted with copper(I) chloride or copper(I) bromide in the presence of the corresponding acid such as hydrochloric acid or hydrobromic acid or with potassium iodide. Instead of diazonium salts, the triazines optionally also can be used. If an organic nitrite is used, the halogen can be introduced into a solvent such as, for example, dimethylformamide, e.g., by addition of methylene iodide or tetrabromomethane. The removal of the amino group can be achieved either by reaction with an organic nitrite in tetrahydrofuran or by diazotization and reductive boiling-down of diazonium salt with, for example, phosphorous acid optionally with addition of copper(I) oxide.

[0070] The introduction of fluorine is possible by, for example, Balz Schiemann reaction of diazonium tetrafluoroborate or according to J. Fluor. Chem. 76, 1996, 59-62 by diazotization in the presence of HF or pyridine and subsequent boiling-down optionally in the presence of a fluoride ion source, such as, e.g., tetrabutylammonium fluoride.

[0071] The replacement of the amino group by the hydroxy group is carried out according to methods that are known in the literature, preferably by conversion into triazine and subsequent treatment with a strongly acidic ion exchanger (according to Tetrah. Letters 1990, 4409).

[0072] The introduction of halogens into the anelated ring is carried out according to processes known in the literature, e.g., by reaction with N-bromo- or N-iodosuccinimide in polar solvents, such as tetrahydrofuran, acetonitrile or dimethylformamide or else by reaction with iodic acid and iodine according to Lieb. Ann. Chem. 634, 84, (1960).

[0073] The exchange of a halogen in the anelated ring is carried out in a way known in the literature optionally under heavy metal catalysis, for example by palladium(II) or palladium(0) compounds by tin-organic or boron-organic compounds, C2-6 alkanes, C2-6 alkenes, di- or mon-alkylphosphite, cyanide in solvents such as toluene, tetrahydrofuran or dimethylformamide (M. Kosugi et al. Chem. Lett. 7, 1225, 1984). Optionally, a base, such as, e.g., triethylamine or sodium carbonate, and optionally a co-catalyst, such as, e.g., copper(I) iodide, must be added.

[0074] Halogens, such as bromine or iodine, can also be reacted with copper salts, such as copper(I) cyanide (introduction of a nitrile group), copper acetate (introduction of an alkynoxy group), sodium alcololate in the presence of copper(I) iodide (introduction of an alkoxy group) or a mixture of copper(I) iodide and sodium trifluoroacetate (introduction of a trifluoroethyl group).

[0075] The halogen can also be subjected to a halogen-metal exchange, e.g., by reaction with butyllithium at temperatures of 0°C to -78°C in solvents such as ether or tetrahydrofuran optionally with the addition of complexing agents such as tetramethylthielenediamine, and then the halogen can be recovered in a way that is known in the literature with electrophiles, such as, for example, dimethylformamide, alkyl halides such as iodides or chlorides, or aldehydes.

[0076] The isomer mixtures can be separated into enantiomers according to commonly used methods, such as, for example, crystallization, chromatography or salt formation.

[0077] The production of salts is carried out in the usual way by a solution of the compound of formula I being mixed with the equivalent amount of acid or excess acid, which optionally is in solution, and the precipitate being separated or the solution being worked up in the usual way.

[0078] In so far as the production of the starting compounds is not described, the latter are known or can be produced analogously to known compounds.

[0079] The invention also comprises the compounds of formulas IIa and IIIa, their isomers and salts

\[
\begin{align*}
\text{IIa} & : Z \quad X \quad N \quad Y \\
\text{IIIa} & : Z' \quad X' \quad N \quad Y \
\end{align*}
\]

[0080] in which

[0081] R1, R2, X and Y have the above-indicated meaning and

[0082] Z' means \(-\text{CH}_2\text{OH}, -\text{CHO}, -\text{COO}-\text{C}_2\text{H}_5\) or \(-\text{NHR}_3\), COO–C1–alkyl, CH3NHR3, COO–C1–alkyl

[0083] and R3 has the above-mentioned meaning, which represent valuable intermediate products for the production of pharmacologically active compounds. The conversion of the intermediate products into active substances is carried out according to the processes described above.

[0084] The production of the intermediate products is carried out according to known methods or methods that are described here. If the 2,3-benzodiazepine in the 4-position contains a methyl group, the latter can be oxidized to formyl with, for example, SeO2. Optionally, the formyl group can be reduced to \(-\text{CH}_2\text{OH}\) or oxidized to the carboxyl group, which can then be esterified or the formyl group can be converted into \(-\text{CH}_3\text{NHR}_3\) or subjected to a Wittig reaction.

[0085] The following examples are to explain the process according to the invention:
Production of the Starting Compounds

I.) 8-Hydroxymethyl-7-methylcarbamoyl-5-(4-nitrophenyl)-8,9-dihydro-7H-1,3-dioxolo[4,5-h][2,3]benzodiazepine

A. 8-Formyl-5-(4-nitrophenyl)-9H-1,3-dioxolo[4,5-h][2,3]benzodiazepine

**[0086]** 1.0 g (3.1 mmol) of 8-methyl-5-(4-nitrophenyl)-9H-1,3-dioxolo[4,5-h][2,3]benzodiazepine (French Patent No. 2566774) is dissolved at 90°C in 15 ml of DMF. 0.38 g (3.4 mmol) of SeO2 is added, and it is stirred for 40 minutes at 90°C. After the solid is filtered off, the product is precipitated with 100 ml of water, the crude product is filtered off, and it is washed with water and dried. 1.04 g of the compound is obtained. After purification by column chromatography (silica gel, eluant benzene/ethyl acetate 1:1) and subsequent separation of the crystalline compound in ethanol, 0.52 g (50%) of product is obtained. Melting point 228-230°C. (decomposition).

B. 8-Hydroxymethyl-5-(4-nitrophenyl)-8,9-dihydro-7H-1,3-dioxolo[4,5-h][2,3]benzodiazepine

**[0087]** A suspension of 7.0 g (20.7 ml) of the aldehyde that is obtained after reaction step A is cooled to 20°C in 420 ml of ethanol while being stirred and mixed little by little with 7.84 g (0.21 mol) of NaBH4. The reaction mixture is heated to boiling for 1 hour, then mixed with activated carbon and hot-filtered. The solvent is removed, the residue is taken up in dichloromethane, worked up, and 6.37 g (90%) of crude product, which is purified by column chromatography on silica gel with a 1:1 mixture of benzene/ethyl acetate as an eluant, is obtained. 5.46 g (77%) of pure product with melting point 132-134°C. is obtained.

C. 8-Hydroxymethyl-7-methylcarbamoyl-5-(4-nitrophenyl)-8,9-dihydro-7H-1,3-dioxolo[4,5-h][2,3]benzodiazepine

**[0088]** 1.0 g (2.9 mmol) of the alcohol that is obtained after reaction step B is dissolved in 40 ml of dichloromethane and mixed with 0.5 ml (8.8 mmol) of methyl isocyanate. The solution is allowed to stand at room temperature for 3 days and then concentrated by evaporation. The crystalline residue is suspended in 10 ml of ethanol and heated to boiling. 1.02 g (87%) of yellow product with a melting point of 242-243°C. (decomposition) is obtained.

II.) 5-(4-Aminophenyl)-8-hydroxymethyl-7-methylcarbamoyl-8,9-dihydro-7H-1,3-dioxolo[4,5-h][2,3]benzodiazepine

**[0089]** A suspension of 1.02 g (2.56 mmol) of 8-hydroxymethyl-7-methylcarbamoyl-5-(4-nitrophenyl)-8,9-dihydro-7H-1,3-dioxolo[4,5-h][2,3]benzodiazepine (stage C) in 40 ml of ethanol is mixed with 0.45 ml (9 mmol) of 98% hydrazine hydrate and Raney nickel catalyst while being stirred. After 30 minutes, the catalyst is filtered off, and the solution is concentrated by evaporation. The residue is recrystallized in ethanol, and 0.83 g (88%) of product with a melting point of 136-138°C. is obtained.

III.) 8-Hydroxymethyl-5-(4-nitrophenyl)-9H-1,3-dioxolo[4,5-h][2,3]benzodiazepine

**[0090]** 2.5 g (7.41 mmol) of 8-formyl-5-(4-nitrophenyl)-9H-1,3-dioxolo[4,5-h][2,3]benzodiazepine (I, stage A) is suspended in THF:water=1:1 and mixed with 0.14 g (3.7 mmol) of sodium borate while being stirred and cooled to 20°C. After 45 minutes of stirring, it is filtered and the crude product is precipitated from the filtrate with 130 ml of water. 2.35 g, which is recrystallized from a mixture of 6.3 ml of dimethylformamide and 1.3 ml of water, is obtained. 1.97 g (78%) of the title compound with a melting point of 175°C. (decomposition) is obtained.

**EXAMPLE 1**

9-Methyl-5-(4-nitrophenyl)-11H-1,3-dioxolo[4,5-h]imidazo[3,4-e][2,3]benzodiazepine-8,10(9H,10aH)-dione

**[0091]**

**A. 5-(4-Nitrophenyl)-9H-[1,3]-dioxolo[4,5-h][2,3]-benzodiazepine-8-carboxylic acid**

**[0092]** 42 ml of a 4% NaOH solution is added to a solution of 3.0 g of AgNO3 in water (50 ml). The solution of 3.0 g of 8-formyl-5-(4-nitrophenyl)-9H-1,3-dioxolo[4,5-h][2,3]benzodiazepine in 120 ml of dioxane is slowly added to the heterogeneous mixture, and the reaction mixture is stirred for 30 minutes at 25°C. After activated carbon is added, it is filtered, the filtrate is concentrated by evaporation in a vacuum at 50-60°C., the suspension that is produced is diluted with 30 ml of water and cooled. After standing overnight, it is filtered off, the precipitate is washed with 2x10 ml of ice water, and 1.94 g of sodium salt, which is dissolved in 60 ml of hot water, and, after cooling, acidified with 1 ml of acetic acid, is obtained. After filtration and washing with water, 1.66 g (53%) of product with a melting point of 196-198°C. (decomposition) is obtained.

B. 8-(Methoxycarbonyl)-5-(4-nitrophenyl)-9H-1,3-dioxolo[4,5-h][2,3]benzodiazepine

**[0093]** 8.0 g (22.0 mmol) of the compound that is obtained after reaction step A is suspended in 390 ml of methanol and, after 4.2 ml (34.4 mmol) of boron trifluoride etherate is added, the mixture is refluxed for 3 hours. The solvent is drawn off; the residue is taken up in dichloromethane and 100 ml of a 10% Na2CO3 solution, and it is stirred for 30 minutes. The crude product that is obtained after working-up1 is purified by column chromatography (silica gel, eluant: benzene/ethyl acetate 20:1), and 3.86 g (46%) of the title-
compound with a melting point of 235-238°C. (decomposition) is obtained.

Here and in the other examples, working up is defined as: The organic phase is washed with water, dried, filtered and concentrated by evaporation.

C. 8-(Methoxycarbonyl)-5-(4-nitrophenoxy)-8,9-dihydro-7H-1,3-dioxolo[4,5-b][2,3]benzodiazepine

A suspension of 2.94 g (8.0 mmol) of the compound that is obtained after reaction step B in 30 ml of dichloromethane is mixed with 15 ml of trifluoroacetic acid while being stirred. 6.3 ml (40 mmol) of triethylsilane is added and stirred for 24 hours at room temperature. Then, it is mixed with 30 ml of dichloromethane, and a solution of 12.3 g of Na2CO3 in 60 ml of water is added while being stirred and cooled with ice water. The residue that is obtained after working-up is treated with 20 ml of methanol, and 2.85 g (96%) of the title compound with a melting point of 161-164°C. is obtained.

D. 9-Methyl-5-(4-nitrophenoxy)-11H-1,3-dioxolo[4,5-h][3,4-c][2,3]benzodiazepine-8,10(9H, 10aH)-dione

0.85 g (2.3 mmol) of the compound that is obtained after reaction step C is dissolved in 30 ml of dichloromethane, and it is allowed to react for 3 weeks at room temperature with 1.0 ml (17.5 mmol) of methyl isocyanate. The solvent is drawn off, and the residue is purified by boiling with methanol. After suctioning-off, 0.77 g (84%) of the product with a melting point of 242-244°C. (decomposition) is obtained.

EXAMPLE 2

5-(4-Aminophenyl)-9-methyl-11H-1,3-dioxolo[4,5-h][3,4-c][2,3]benzodiazepine-8,10(9H, 10aH)-dione

A. 8-[(Methyleneiminomethyl]-5-(4-nitrophenoxy)-9H-1,3-dioxolo[4,5-h][2,3]benzodiazepine

2.0 g (5.9 mmol) of 8-formyl-5-(4-nitrophenoxy)-9H-1,3-dioxolo[4,5-h][2,3]benzodiazepine is dissolved in 100 ml of a 1:1 mixture of dichloromethylene-methanol, mixed with 40 ml of a 33% solution of methyamine in ethanol and allowed to stand for 24 hours at room temperature. Then, the solvent is drawn off, and the residue is boiled with 25 ml of ethanol. After filtration, 1.95 g (93%) of the title compound with a melting point of 245-247°C. (decomposition) is obtained.

B.

5.5 g (15.7 mmol) of the imine that is obtained after reaction step A is suspended in 800 ml of ethanol and mixed in portions with 26 ml of concentrated HCl while being stirred. 13.6 g (0.36 mmol) of NaBH4 is added to the solution that is obtained for 1 hour in small portions. It is stirred for 30 more minutes, filtered, the filtrate is concentrated by evaporation and the residue is purified by column chromatography with methanol as eluant. 3.67 g (66%) of 8-[(methyleneiminomethyl]-5-(4-nitrophenoxy)-9H-1,3-dioxolo[4,5-h][2,3]benzodiazepine with a melting point of 110-112°C. is obtained.

C. 9-Methyl-5-(4-nitrophenoxy)-9,10,10a,11-tetrahydro-8H-1,3-dioxolo[4,5-h][3,4-c][2,3]benzodiazepine-8-one

2.26 ml (3.6 mmol) of a 15.6% phosphogene solution in toluene is added drop by drop to a cooled and stirred solution of 1.05 g (3.0 mmol) of the methylaminomethyl compound after reaction step B and 0.99 ml (7.2 mmol) of triethylamine in 15 ml of dichloromethane. The mixture is stirred for 2 hours and evaporated to the dry state. The residue is treated with water, and 1.08 g of crude product, which is purified by boiling in 10 ml of ethanol, is obtained. After suctioning-off, 0.96 g (84%) of the title compound with a melting point of 252-255°C. is obtained.
EXAMPLE 4

5-(4-Aminophenyl)-9-methyl-9,10,10a,11-tetrahydro-8H-1,3-dioxolo[4,5-h]imidazo[3,4-c][2,3]benzodiazepin-8-one

[0103]

![Chemical structure](image)

[0104] 0.38 g (1.0 mmol) of the nitro compound of Example 3 is reduced in 20 ml of methanol with RaNi and hydrazine hydrate analogously to Example 2. After boiling with ethanol, 0.25 g (71%) of the title compound of ethanol with a melting point of 280-289°C (decomposition) is obtained.

EXAMPLE 5

5-(4-Nitrophenyl)-9,10,10a,11-tetrahydro-8H-1,3-dioxolo[4,5-h]pyrrolo[2-c][2,3]benzodiazepine

[0105]

![Chemical structure](image)

A. Methyl-3-[5-(4-nitrophenyl)-9H-1,3-dioxolo[4,5-h][2,3]benzodiazepin-8-yl]-propenolate

[0106] 1.9 ml (13.6 mmol) of triethylamine and 5.64 g (13.6 mmol) of methoxycarbonylmethyl-triphenylphosphonium bromide are added in succession to a solution of 4.0 g (11.8 mmol) of 8-formyl-5-(4-nitrophenyl)-9H-1,3-dioxolo[4,5-h][2,3]benzodiazepine in 200 ml of a 1:1 mixture of dichloromethane and methanol while being stirred. After 2 hours at room temperature, the solvent is drawn off from the suspension, the residue is suspended in 70 ml of ethanol and filtered. After washing three times each with 10 ml of ethanol and 50 ml of water and subsequent drying of the suctioned-off solid, 4.44 g (95%) of methyl-3-[5-(4-nitro-

EXAMPLE 6

5-(4-Nitrophenyl)-9,10,10a,11-tetrahydro-8H-1,3-dioxolo[4,5-h]pyrrolo[2-c][2,3]benzodiazepin[4,5-h] 8-one

[0108]

![Chemical structure](image)

[0109] If the crude product that is obtained according to Example 5 is chromatographed on silica gel with the more polar mixture of ethyl acetate:benzene=4:1 as an eluant, 1.26 g (15%) of the title compound with a melting point of 251-253°C (decomposition) is obtained.

EXAMPLE 7

5-(4-Aminophenyl)-9,10,10a,11-tetrahydro-8H-1,3-dioxolo[4,5-h]pyrrolo[2-c][2,3]benzodiazepine

[0110]

![Chemical structure](image)
0.68 g (1.94 mmol) of the nitro compound according to Example 5 is reduced in methanol with RaNi/hydrazine hydrate analogously to Example 2. After recrystallization from a mixture of 50% ethanol/water, 0.48 g (77%) of the title compound with a melting point of 153-155° C. is obtained.

**EXAMPLE 8**

5-(4-Nitrophenyl)-9,10,11-tetrahydro-8H-1,3-dioxolo[4,5-h]pyrrolo[1,2-c][2,3]benzodiazepinone

The compound that is obtained according to Example 6 is reduced in 1:1 dichloromethane/methanol RaNi/hydrazine hydrate analogously to Example 2. After recrystallization from ethanol, 0.8 g (80%) of the title compound with a melting point of 291-292° C. (decomposition) is obtained.

**EXAMPLE 9**

5-(4-Nitrophenyl)-11H-1,3-dioxolo[4,5-i][1,2,3]triazolo[4,3-c][2,3]benzodiazepine

1.17 g (3.35 mmol) of the nitro compound of Example 9 is reduced in 100 ml of a 1:1 mixture of dichloromethane/methanol with RaNi/hydrazine hydrate analogously to Example 2. After recrystallization from DMF-water (10:1), 0.8 g (74%) of the title compound with a melting point >260° C. (decomposition) is obtained.

**EXAMPLE 10**

5-(4-Aminophenyl)-11H-1,3-dioxolo[4,5-i][1,2,3]triazolo[4,3-c][2,3]benzodiazepine

10a,11-Dihydro-8,8-dimethyl-5-(4-nitrophenyl)-10H-1,3-dioxolo[4,5-h]oxazolo[3,4-c][2,3]benzodiazepine

3.0 g (8.9 mmol) of 8-formyl-5-(4-nitrophenyl)-9H-1,3-dioxolo[4,5-h][2,3]benzodiazepine-hydrazone is suspended in 18 ml of DMF and mixed with 1.3 ml (26.7 mmol) of 98% hydrazine hydrate and heated for 1 hour to 110-120° C. After cooling to room temperature, it is added to water, suctioned off, and the residue is washed with water and dried. This crude product is 80% recrystallized from DMF-water. 2.5 g (80%) of the title compound with a melting point of 221-223° C. (decomposition) is obtained.

B. 5-(4-Nitrophenyl)-11H-1,3-dioxolo[4,5-i][1,2,3]triazolo[4,3-c][2,3]benzodiazepine
[0120] 1.87 g (5.48 mmol) of 8-hydroxymethyl-5-(4-nitrophenyl)-8,9-dihydro-7H-1,3-dioxolo[4,5-h][2,3]benzodiazepine is dissolved in 25 ml of acetonitrile and mixed with 0.54 ml (6.67 mmol) of 37% HCl. After 30 minutes, the reaction mixture is cooled, and the hydrochloride is filtered off. The dichloromethane suspension of this salt is shaken with 20 ml of 8% NaHCO₃ solution until the salt is dissolved. The organic phase is separated, washed with water, dried and concentrated by evaporation. After recrystallization, 1.7 g (81%) of the title compound, melting point 171-173°C, is obtained.

**EXAMPLE 12**

5-(4-Aminophenyl)-10a,11-dihydro-10H-1,3-dioxolo[4,5-h]oxazolo[3,4-c][2,3]benzodiazepine

[0121]

\[
\begin{array}{c}
\text{N} \\
\text{O}
\end{array}
\]

\[
\begin{array}{c}
\text{NH}_2 \\
\text{O}
\end{array}
\]

[0122] Analogously to Example 2, 1.2 g (76%) of the title compound with a melting point of 133-135°C (ethanol:water=1:1) is obtained from 1.7 g (4.46 mmol) of the compound of Example 11 with RanNi/hydrazine hydrate in methanol.

**EXAMPLE 13**

10a,11-Dihydro-5-(4-nitrophenyl)-10H-1,3-dioxolo[4,5-h]oxazolo[3,4-c][2,3]benzodiazepin-8-one

[0123]

[0124] A solution of 1.0 g (2.93 mmol) of 8-hydroxymethyl-5-(4-nitrophenyl)-8,9-dihydro-7H-1,3-dioxolo[4,5-h][2,3]benzodiazepine is mixed in succession with 0.98 ml (7.03 mmol) of triethylamine and 2.23 ml (3.52 mmol) of a 15.6% phosgene solution in toluene while being stirred and cooled. Then, the reaction mixture is heated for 3 hours to 25°C. The precipitate of the crude product is separated, the filtrate is concentrated by evaporation and the residue is treated with water. The combined residues are boiled with ethanol, and after suctioning-off, 0.72 g (67%) of the title compound with a melting point >250°C (decomposition) is obtained.

**EXAMPLE 14**

5-(4-Aminophenyl)-10a,11-dihydro-10H-1,3-dioxolo[4,5-h]oxazolo[3,4-c][2,3]benzodiazepin-8-one

[0125]

[0126] 0.5 g (1.36 mmol) of the nitro compound that is obtained according to Example 13 is reduced in DMF with RanNi/hydrazine hydrate analogously to Example 2. The crude product is purified in 4.5 ml of hot ethanol, and 0.49 g (85%) of the title compound with a melting point of 173-175°C is obtained.

**EXAMPLE 15**

5-(4-Nitrophenyl)-8-methyl-11H-1,3-dioxolo[4,5-h][1,2,4]triazolo[4,3-c][2,3]benzodiazepine

[0127]

[0128] A solution of 0.2 g (0.21 mmol) of 2-(1,3-benzodioxol-5-yl)cinnamaldehyde in ethylacetate is heated with an equivalent amount of 4-nitrobenzaldehyde analogously to C.A. 105, 1986, 226357, and 50.7 g (81%) of the title compound, melting point 149-150°C (ethanol), is obtained.
B.

4.5-Methylenedioxy-2-(4-nitrobenzoyl)-phenylacetic acid

[0129] 10.0 g (33.4 mmol) of the isochroman that is obtained after reaction step A is oxidized to the title compound according to Jones (F. Gatta et al. II Farmaco 40, 1985, 942-955), yield 46%, melting point 257-259° C. (Methyl Cellosolve[80]).

C. 5-(4-Nitrophenyl)-7H-1,3-dioxolo[4,5-h][2,3]benzodiazepin-8(9H)-one

[0130] 5.0 g (15.2 mmol) of the compound that is obtained after reaction step B is reacted in Methyl Cellosolve[60] (50 ml) at 110° C. with 5.0 ml of 98% hydrazine hydrate for 2.5 hours. The solvent is drawn off in a vacuum, and the residue is dissolved in dichloromethane (200 ml) and 40% acetic acid (20 ml). The organic phase is separated, washed with water and dried. 4.0 g (19.4 mmol) of 1,3-dicyclohexylcarbodiimide is added and allowed to stand overnight at room temperature. The precipitate is filtered off, and the filtrate is concentrated by evaporation. Both solids are heated with 60 ml of ethanol and then suctioned off. 1.95 g (39%) of the title compound, melting point 292-294° C., is obtained.

D. 5-(4-Nitrophenyl)-7H-1,3-dioxolo[4,5-h][2,3]benzodiazepin-8(9H)-thione

[0131] 6.5 g (20.0 mmol) of the compound that is obtained after reaction step C and 7.6 g (30.0 mmol) of phosphorus pentasulfide are heated in 100 ml of pyridine at 80° C. After 1.5 hours, the reaction mixture is poured into 400 ml of water, and the pH of the solution is set at 6.5 with acetic acid. The precipitate is filtered off, washed and dried. 4.36 g (64%) of product, melting point 257-258° C. (acetone), is obtained.

[0132] Produced analogously via stages A-D are:

[0133] 5-(4-Chlorophenyl)-7H-1,3-dioxolo[4,5-h][2,3]benzodiazepine-8(9H)-thione

[0134] 5-(4-Fluorophenyl)-7H-1,3-dioxolo[4,5-h][2,3]benzodiazepine-8(9H)-thione

[0135] 5-(2-Fluorophenyl)-7H-1,3-dioxolo[4,5-h][2,3]benzodiazepine-8(9H)-thione

[0136] 5-(3-Chlorophenyl)-7H-1,3-dioxolo[4,5-h][2,3]benzodiazepine-8(9H)-thione

[0137] 5-(2-Chlorophenyl)-7H-1,3-dioxolo[4,5-h][2,3]benzodiazepine-8(9H)-thione

[0138] 5-phenyl-7H-1,3-dioxolo[4,5-h][2,3]benzodiazepine-8(9H)-thione

E. 8-(Methylthio)-5-(4-nitrophenyl)-9H-1,3-dioxolo-[4,5-h][2,3]benzodiazepine

[0139] 2.2 g (6.45 mmol) of the compound that is obtained after reaction step D is dissolved in 500 ml of acetone and mixed with 2.22 g of K₂CO₃ and 2 ml (32 mmol) of methyl iodide. It is stirred for about 2 days, poured into water, the precipitate is separated, and it is washed with water. After drying, 2.0 g (87%) of product, melting point 280-281° C., is obtained.

[0140] Produced analogously are:

[0141] 5-(2-Fluorophenyl)-8-(methylthio)-9H-1,3-dioxolo-[4,5-h][2,3]benzodiazepine
[0149] Analogously to Example 15, the product is obtained with propionic acid hydrazide after process step F. Yield 71%, melting point 234-235° C.

[0150] Produced in a basically similar way are:

[0151] 5-(4-Nitrophenyl)-8-propyl-11H-1,3-dioxolo[4,5-h]1,2,4]triazolo[4,3-c][2,3]benzodiazepine (melting point 124-126° C.)

[0152] 5-(4-nitrophenyl)-8-cyclopropyl-11H-1,3-dioxolo[4,5-h]1,2,4]triazolo[4,3-c][2,3]benzodiazepine (melting point 154-156° C.)

[0153] 5-(4-nitrophenyl)-8-n-butyl-11H-1,3-dioxolo[4,5-h]1,2,4]triazolo[4,3-c][2,3]benzodiazepine (melting point 124-125° C.)

[0154] 5-(4-nitrophenyl)-8-methoxymethyl-11H-1,3-dioxolo[4,5-h]1,2,4]triazolo[4,3-c][2,3]benzodiazepine (melting point 142-143° C.)

[0155] 5-(2-chlorophenyl)-8-methyl-11H-1,3-dioxolo[4,5-h]1,2,4]triazolo[4,3-c][2,3]benzodiazepine

[0156] 5-(3-chlorophenyl)-8-(methyl)-11H-1,3-dioxolo[4,5-h]1,2,4]triazolo[4,3-c][2,3]benzodiazepine

[0157] 5-(2-fluorophenyl)-8-(methyl)-11H-1,3-dioxolo[4,5-h]1,2,4]triazolo[4,3-c][2,3]benzodiazepine

[0158] 8-methyl-5-phenyl-11H-1,3-dioxolo[4,5-h]1,2,4]triazolo[4,3-c][2,3]benzodiazepine

[0159] 8-ethyl-5-phenyl-11H-1,3-dioxolo[4,5-h]1,2,4]triazolo[4,3-c][2,3]benzodiazepine

[0160] 8-cyclopropyl-5-phenyl-11H-1,3-dioxolo[4,5-h]1,2,4]triazolo[4,3-c][2,3]benzodiazepine

[0161] 8-(4-nitrophenyl)-5-phenyl-11H-1,3-dioxolo[4,5-h]1,2,4]triazolo[4,3-c][2,3]benzodiazepine

EXAMPLE 18

5-(4-Aminophenyl)-8-ethyl-11H-1,3-dioxolo[4,5-h]1,2,4]triazolo[4,3-c][2,3]benzodiazepine

[0162] The nitro compound that is obtained according to Example 17 is reduced analogously to Example 16. Yield 84%, melting point 265-266° C. (ethanol).

[0164] Produced analogously are:

[0165] 5-(4-Aminophenyl)-8-propyl-11H-1,3-dioxolo[4,5-h]1,2,4]triazolo[4,3-c][2,3]benzodiazepine (melting point 202-203° C., ethyl acetate)

[0166] 5-(4-aminophenyl)-8-cyclopropyl-11H-1,3-dioxolo[4,5-h]1,2,4]triazolo[4,3-c][2,3]benzodiazepine (melting point 191-192° C., ethyl acetate/diethyl ether)

[0167] 5-(4-aminophenyl)-8-n-butyl-11H-1,3-dioxolo[4,5-h]1,2,4]triazolo[4,3-c][2,3]benzodiazepine (melting point 186-187° C., ethyl acetate)

[0168] 5-(4-aminophenyl)-8-methoxymethyl-11H-1,3-dioxolo[4,5-h]1,2,4]triazolo[4,3-c][2,3]benzodiazepine (melting point 261-263° C., ethanol)

[0169] 8-(4-aminophenyl)-5-phenyl-11H-1,3-dioxolo[4,5-h]1,2,4]triazolo[4,3-c][2,3]benzodiazepine

EXAMPLE 19

5-(4-Nitrophenyl)-8-(4-pyridyl)-11H-1,3-dioxolo[4,5-h]1,2,4]triazolo[4,3-c][2,3]benzodiazepine

[0170] [O171] The methylthio derivative that is described in Example 15E is reacted analogously to Example 15F with isonicotinic acid hydrazide in DMF and concentrated hydrochloric acid as a catalyst. Yield 76%, melting point 305-308° C. (decomposition).

[0172] Produced analogously is:

[0173] 5-Phenyl-8-(4-pyridyl)-11H-1,3-dioxolo[4,5-h]1,2,4]triazolo[4,3-c][2,3]benzodiazepine
EXAMPLE 20

5-(4-Aminophenyl)-8-(4-pyridyl)-11H-1,3-dioxolo[4,5-h][1,2,4]triazolo[4,3-c][2,3]benzodiazepine

[0174]

EXAMPLE 21

5-(4-Nitrophenyl)-11H-1,3-dioxolo[4,5-h][1,2,4]triazolo[4,3-c][2,3]benzodiazepine

[0175] The nitro compound of Example 19 is reduced analogously to Example 2. Yield 46%, melting point 301-302°C. (decomposition).

EXAMPLE 22

5-(4-Aminophenyl)-11H-1,3-dioxolo[4,5-h][1,2,4]triazolo[4,3-c][2,3]benzodiazepine

[0176]

EXAMPLE 23

5-(4-Nitrophenyl)-8-(trifluoromethyl)-11H-1,3-dioxolo[4,5-h][2,4]triazolo[4,3-c][2,3]benzodiazepine

[0177] 0.53 g of the methylthio compound that is obtained according to Example 15E is reacted analogously to Example 15F with 0.18 g of formic acid hydrizide in DMF with concentrated HCl as a catalyst. After chromatography on silica gel with chloroform:methanol=95:5 as an eluant, 0.34 g (71%) of product is obtained. Melting point 182-183°C.

[0178] Produced analogously is:

[0179] 5-Phenyl-11H-1,3-dioxolo[4,5-h][1,2,4]triazolo[4,3-c][2,3]benzodiazepine

[0180] The nitro compound that is obtained according to Example 21 is reduced analogously to Example 2. Yield 70%. Melting point 280-281°C. (ethanol).

EXAMPLE 24

5-(4-Nitrophenyl)-8-(tri fluoromethyl)-11H-1,3-dioxolo[4,5-h][1,2,4]triazolo[4,3-c][2,3]benzodiazepine

[0181] 0.53 g (1.50 mmol) of the methylthio compound that is obtained in Example 15E is heated to boiling with 1.5 ml of hydrazine hydrate in 25 ml of Methyl Celllosolve. After 1 hour, the solvent is drawn off, the residue is taken up in water and the precipitate is filtered off. After drying, the compound is dissolved in dichloromethane, and it is mixed drop by drop with 0.40 ml of trifluoroacetic acid anhydride while being stirred and cooled with ice water. The reaction mixture is then heated to boiling for 1 hour and then evaporated to the dry state. The residue is taken up in toluene, heated for 20 minutes, and the solvent is then removed. After chromatography on silica gel with chloroform:methanol=95:5 as an eluant, 0.27 g (43%) of product is obtained. Melting point 244-246°C. (methanol).

[0184] Produced analogously is:

[0185] 5-Phenyl-8-(trifluoromethyl)-11H-1,3-dioxolo[4,5-h][1,2,4]triazolo[4,3-c][2,3]benzodiazepine
EXAMPLE 24

5-(4-Aminophenyl)-8-(trifluoromethyl)-11H-1,3-dioxolo[4,5-h][1,2,4]triazolo[4,3-c]2,3-benzodiazepine

[0186]

EXAMPLE 25

5-(4-Nitrophenyl)-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c]2,3-benzodiazepine

[0188]

EXAMPLE 26

5-(4-Aminophenyl)-11H-13-dioxolo[4,5-h]imidazo[1,2-c]2,3-benzodiazepine

[0192]

EXAMPLE 27

5-(4-Aminophenyl)-8-methoxy-3-propyl-11H-1,2,4-triazolo[4,3-c]2,3-benzodiazepine

[0194]

[0187] The nitro compound that is obtained according to Example 23 is reduced analogously to Example 2. Yield 68%, melting point 206-208° C. (methanol).

EXAMPLE 25

5-(4-Nitrophenyl)-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c]2,3-benzodiazepine

[0188]

0.53 g (1.50 mmol) of the methylthio derivative that is obtained in Example 15E is heated to 120° C. with 0.10 g of p-toluenesulfonic acid and 0.32 g (3.00 mmol) of aminoacetate aldehyde dimethylacetal. After 10 hours, the reaction mixture is poured into water, and the precipitated intermediate compound is filtered off. This compound is dissolved in 20 ml of a 1:1 mixture of concentrated HCl and ethanol and heated to boiling for 4 hours. After cooling, the hydrochloride of the title compound is obtained by filtration. Yield 0.32 g (55%), melting point 237-239° C.

EXAMPLE 26

5-(4-Nitrophenyl)-11H-13-dioxolo[4,5-h]imidazo[1,2-c]2,3-benzodiazepine

[0192]

[0193] The nitro compound that is produced in Example 25 is reduced analogously to Example 2. Yield 0.2 g (76%), melting point 264-265° C. (ethanol).

EXAMPLE 27

6-(4-Aminophenyl)-8-methoxy-3-propyl-11H-[1,2,4]triazolo[4,3-c]2,3-benzodiazepine

[0194]

A.

3.90 g (10.0 mmol) of 7-bromo-8-methoxy-1-(4-nitropheryl)-4,5-dihydro-3H-2,3-benzodiazepin-4-one is dissolved in anhydrous pyridine and mixed with 5.70 g (25.6 mmol) of phosphorus pentasulfide. After 2 hours at 80° C., the mixture is poured onto 450 g of ice and stirred for 1 hour. The precipitated crystals are filtered and washed with water. After recrystallization from acetonitrile, 2.88 g (71%) of 7-bromo-8-methoxy-1-(4-nitropheryl)-4,5-dihydro-3H-2,3-benzodiazepin-4-thione with a melting point of 245-247° C. is obtained.

B.

2.84 g (7.0 mmol) of the compound of step A is dissolved in 10 ml of anhydrous DMF and 100 ml of acetone, and after 1.93 g (14.0 mmol) of potassium carbonate and 1.75 ml (28.0 mmol) of methyl iodide are added, the mixture is stirred for 20 hours at room temperature. The acetone is then drawn off, and the residue is taken up in 80
ml of water. The precipitated crystals are suctioned off and washed with water. The crude product is recrystallized twice from acetonitrile. 1.68 g (57%) of 7-bromo-8-methoxy-4-methylthio-1H-[4(nitrophenyl)-5H]-2,3-benzodiazepine with a melting point of 225-227°C is obtained.

[0199] C.

[0200] 1.17 g (2.78 mmol) of the compound of step B is dissolved in 40 ml of anhydrous DMF and mixed with 0.73 g (8.4 mmol) of butyric acid hydrazide as well as 3 drops of concentrated HCl. The mixture is stirred for 5 hours at 110-115°C. Then, the mixture is poured onto ice (160 g) and stirred for 1 more hour. The precipitated crystals are suctioned off and washed with water. 1.05 g (83%) of 9-bromo-6-(4-nitrophenyl)-8-methoxy-3-propyl-11H-[1,2,4]triazolo[4,3-c]2,3-benzodiazepine with a melting point of 238-240°C is obtained.

[0201] 8-Methoxy-3-methyl-6-(4-nitrophenyl)-11H-[1,2,4]triazolo[4,3-c]2,3-benzodiazepine

[0202] 3-ethyl-8-methoxy-6-(4-nitrophenyl)-11H-[1,2,4]triazolo[4,3-c]2,3-benzodiazepine

[0203] 3-cyclopropyl-8-methoxy-6-(4-nitrophenyl)-11H-[1,2,4]triazolo[4,3-c]2,3-benzodiazepine

D.

[0205] 1.0 g (2.2 mmol) of the compound of step C is dissolved in a mixture of 80 ml of methanol and 3 ml of water, and after 0.8 g of 10% Pd/C catalyst and 0.30 g (2.2 mmol) of potassium carbonate are added, it is hydrogenated for about 15 hours. Then, catalyst is suctioned out, and the filtrate is concentrated by evaporation. The crude product is recrystallized from ethyl acetate (3 ml), and 0.44 g (58%) of 6-(4-aaminophenyl)-8-methoxy-3-propyl-11H-[1,2,4]triazolo[4,3-c]2,3-benzodiazepine with a melting point of 192-194°C is obtained.

[0206] Produced in a basically similar way are:

[0207] 6-(4-Aminophenyl)-8-methoxy-3-methyl-11H-[1,2,4]triazolo[4,3-c]2,3-benzodiazepine

[0208] 6-(4-Aminophenyl)-8-methoxy-3-ethyl-11H-[1,2,4]triazolo[4,3-c]2,3-benzodiazepine

[0209] 6-(4-Aminophenyl)-8-methoxy-3-cyclopropyl-11H-[1,2,4]triazolo[4,3-c]2,3-benzodiazepine

EXAMPLE 28

6-(4-Aminophenyl)-8-methoxy-3-methyl-11H-imidazol[1,2-c]2,3-benzodiazepine

[0210] From 9-bromo-8-methoxy-3-methyl-6-(4-nitrophenyl)-11H-imidazol[1,2-c]2,3-benzodiazepine analogously to Example 27D Melting point 190-193°C (ethyl acetate).

[0211] Produced in a basically similar way are:

[0212] 6-(4-Aminophenyl)-8-methoxy-2-methyl-11H-imidazol[1,2-c]2,3-benzodiazepine, melting point 255-260°C (ethanol), (starting material from Example 39).

[0213] 6-(4-Aminophenyl)-8-methoxy-3-n-propyl-11H-imidazol[1,2-c]2,3-benzodiazepine, melting point 183-185°C C., (starting material from Example 41).

EXAMPLE 29

9-Methyl-5-(4-nitrophenyl)-11H-1,3-dioxolo[4,5-h]imidazol[1,2-c]2,3-benzodiazepine

[0215] 1.70 g (4.99 mmol) of 5-(4-nitrophenyl)-8,9-dihydro-7H-1,3-dioxolo[4,5-h]2,3-benzodiazepine-8-thione (Example 15D) and 1.17 g (10.0 mmol) of 2-(1-aminoethyl)-1,3-dioxolane (Shinzo Kano i.a.: Heterocycles 26, 1987, 2805) are stirred with 1.08 g of red mercury oxide in Methyl Cellosolve® (50 ml) and heated for 36 hours to 120°C. The mixture is then filtered and concentrated by evaporation to a volume of 5 ml. The intermediate product that precipitates during cooling is suctioned off and dissolved in a 1:1 mixture of concentrated hydrochloric acid and ethanol (25 ml) and heated to boiling for 1.5 hours. After cooling, the hydrochloride of the title compound is isolated.

[0216] Yield: 0.70 g (35%), melting point 252-254°C.

EXAMPLE 30

5-(4-Aminophenyl)-9-methyl-11H-1,3-dioxolo[4,5-h]imidazol[1,2-c]2,3-benzodiazepine
The reduction of the compound of Example 29 is performed according to Example 2.

Yield: 0.37 g (62%), melting point 165-166° C. (ethanol).

EXAMPLE 31
8-Cyclopropyl-5-(4-nitrophenyl)-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c]2,3-benzodiazepine

A suspension of 0.50 g (1.47 mmol) of 5-(4-nitrophenyl)-8,9-dihydro-7H-1,3-dioxolo[4,5-h]2,3-benzodiazepine-8-thione (Example 15D) and 0.42 g (2.94 mmol) of 2-aminomethyl-2-cyclopropyl-1,3-dioxolane in 12 ml of Methyl Cellosolve® with 0.32 g (1.47 mmol) of red mercury oxide is stirred for 12 hours at 110° C. After filtration, the mixture is concentrated by evaporation to a volume of 5 ml and poured into water. The precipitate is suctioned off and dissolved in 10 ml of a 1:1 mixture of concentrated hydrochloric acid and glacial acetic acid and heated to boiling for 1.5 hours. During cooling, the hydrochloride salt of the title compound precipitates.

Yield: 0.35 g (56%), melting point 223-225° C.

EXAMPLE 32
5-(4-Aminophenyl)-8-cyclopropyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c]2,3-benzodiazepine

The nitro compound that is produced according to Example 31 is reduced analogously to Example 2. The crude product is purified by column chromatography (silica gel, eluant chloroform: methanol=95:5).

Yield: 0.25 g (85%), melting point 227-229° C. (ethanol).

EXAMPLE 33
8-Methyl-5-(4-nitrophenyl)-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c]2,3-benzodiazepine

The reaction is performed analogously to Example 31 from 2.0 g (5.86 mmol) of the thione compound of Example 15D and 1.37 g (11.71 mmol) of 2-aminomethyl-2-methyl-1,3-dioxolane (Jiro Adachi and Nobuhiro Sato: J. Org. Chem. 37, 1972, 221) with 1.27 g (5.86 mmol) of red mercury oxide. The rings of the isolated intermediate compound are closed by boiling in 50 ml of glacial acetic acid for 5 hours. Then, it is evaporated to the dry state, and the residue is dissolved in 10% sodium carbonate solution and ethyl acetate. After the organic phase is concentrated by evaporation, the crude product is purified by column chromatography (silica gel, eluant chloroform:methanol=95:5).

Yield: 0.80 g (38%), melting point 220-222° C.

EXAMPLE 34
5-(4-Aminophenyl)-8-methyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c]2,3-benzodiazepine

The nitro compound that is produced according to Example 34 is reduced analogously to Example 2.
Yield: 0.51 g (68%), melting point 283-285 °C (ethanol).

EXAMPLE 35
8-Methyl-5-(4-nitrophenyl)-11H-1,3-dioxolo[4,5-h]
imidazo[3,4-c][2,3]benzodiazepine

A. 5-(4-Nitrophenyl)-8-(phthalimidomethyl)-9H-1,3-dioxolo[4,5-h][2,3]benzodiazepine

A solution of 1.25 ml (8.05 mmol) of diethyl azodicarboxylate in 7 ml of THF is added in drops to a stirred solution of 2.60 g (7.66 mmol) of 8-hydroxynitro-5-(4-nitrophenyl)-9H-1,3-dioxolo[4,5-h][2,3]-benzodiazepine (starting compound III), 2.11 g (8.05 mmol) of triphenylphosphine and 1.18 g (8.05 mmol) of phthalimide in 130 ml of dry THF at room temperature. The mixture is stirred for 24 hours at this temperature. Then, the precipitated product is suctioned off and washed with ethanol. 2.87 g (80%) of the title compound, which can be further processed without further purification, is obtained.

B. 8-Aminomethyl-5-(4-nitrophenyl)-9H-1,3-dioxolo[4,5-h][2,3]benzodiazepine

0.60 ml (11.7 mmol) of 98% hydrazine hydrate is added to a suspension of 1.10 g (2.35 mmol) of the phthalimido compound from reaction step A in 75 ml of methanol, and the mixture is heated to boiling for 3 hours. After concentration by evaporation, the residue is pulverized with 30 ml of methylene chloride and filtered off. The filtrate is concentrated by evaporation in a vacuum, and the residue is brought to crystallization with water. After suctioning-off, 0.72 g (90%) of the product with a melting point of 143-146 °C, which is suitable for the next step without further purification, is obtained.

C. 8-Acetaminomethyl-5-(4-nitrophenyl)-9H-1,3-dioxolo[4,5-h][2,3]benzodiazepine

0.72 g (2.13 mmol) of the aminomethyl compound from step B is dissolved in 6 ml of acetic anhydride at 25 °C and allowed to stand for 1 hour. The solution is diluted with ice water (50 ml) and stirred for 2 hours. The precipitated substance is filtered and, after drying by column chromatography, purified (silica gel, eluant ethyl acetate:benzene=4:1). After the fractions are concentrated by evaporation, 0.65 g of crystalline substance is obtained, which after washing with ethanol yields 0.56 g (70%) of pure title compound with a melting point of 205 °C (decomposition).

D. 8-Methyl-5-(4-nitrophenyl)-11H-1,3-dioxolo[4,5-h]imidazo[3,4-c][2,3]benzodiazepine

0.40 g (1.05 mmol) of the acetamido compound of step C is suspended in 20 ml of methylene chloride and mixed with 0.48 ml (5.3 mmol) of phosphorus oxychloride. Then, the mixture is heated to boiling for 3 hours. After concentration by evaporation, the residue is taken up in methylene chloride (30 ml) and washed with sodium bicarbonate solution and water, dried, filtered and concentrated by evaporation. 0.38 g of solid substance, which is purified by column chromatography, is obtained (silica gel, eluant chloroform:methanol=95:5). 0.32 g (84%) of pure title compound with a melting point of 305-310 °C (decomposition) is obtained.

EXAMPLE 36
5-(4-Aminophenyl)-8-methyl-11H-1,3-dioxolo[4,5-h]imidazo[3,4-c][2,3]benzodiazepine

Produced analogously via corresponding stages C-D, whereby the method used for acylation is placed in parentheses, are:

[0239] 5-(4-Nitrophenyl)-11H-1,3-dioxolo[4,5-h]imidazo[3,4-c][2,3]benzodiazepine (formic acid, DCC)

[0240] 5-phenyl-11H-1,3-dioxolo[4,5-h]imidazo[3,4-c][2,3]benzodiazepine (formic acid, DCC)

[0241] 8-cyclopropyl-5-(4-nitrophenyl)-11H-1,3-dioxolo[4,5-h]imidazo[3,4-c][2,3]benzodiazepine (acid chloride)

[0242] 5-(4-nitrophenyl)-8-n-propyl-11H-1,3-dioxolo[4,5-h]imidazo[3,4-c][2,3]benzodiazepine (acid chloride)

EXAMPLE 36
5-(4-Aminophenyl)-8-methyl-11H-1,3-dioxolo[4,5-h]imidazo[3,4-c][2,3]benzodiazepine

Produced analogously are:

[0243] 5-(4-Aminophenyl)-8-methyl-11H-1,3-dioxolo[4,5-h]imidazo[3,4-c][2,3]benzodiazepine

[0244] The nitro compound (0.30 g, 0.83 mmol) that is produced according to Example 35 is reduced analogously to Example 2. 0.22 g (81%) of the title compound with a melting point of 282-284 °C (decomposition) is obtained.

[0245] Produced analogously are:

[0246] 5-(4-Aminophenyl)-11H-1,3-dioxolo[4,5-h]imidazo[3,4-c][2,3]benzodiazepine
A. 8-Azidomethyl-5-(4-nitrophenyl)-9H-1,3-dioxolo[4,5-h][2,3]benzodiazepine

A solution of 3.06 g (9.0 mmol) of 8-hydroxymethyl-5-(4-nitrophenyl)-9H-1,3-dioxolo[4,5-h][2,3]-benzodiazepine (starting compound III) and 2.58 g (9.9 mmol) of triphenylphosphine in 100 ml of dry tetrahydrofuran is mixed with 13.5 ml of a 1.2N hydrozoic acid solution in toluene, then a solution of 1.74 ml (9.9 mmol) of azodicarboxylic acid-diethyl ester is added, and the mixture is stirred for another 2 hours. The precipitated product is suctioned off and washed with tetrahydrofuran and n-hexane. 2.23 g (68%) of the title compound with a melting point of 198-200°C is obtained.

B. 8-Ethyl-5-(4-nitrophenyl)-11H-1,3-dioxolo[4,5-h][2,3]benzodiazepine

1.98 g (5.4 mmol) of the compound from step A is dissolved in 100 ml of dry THF and mixed with 1.56 g (5.94 mmol) of triphenylphosphine and stirred for 4 hours. Then, the solution is cooled to ~50°C, and a solution of 0.78 ml (6.0 mmol) of propionic acid anhydride in 3 ml of THF is added. After 1 hour at ~50°C, the mixture is stirred overnight at room temperature. The reaction mixture is then diluted with diethyl ether and washed with 10% sodium bicarbonate solution and water, dried and concentrated by evaporation. The residue is purified by column chromatography on silica gel. (Gradient elution: beginning with n-hexane: ethyl acetate=1:1, then with a constantly increasing proportion of ethyl acetate).

1.0 g of a product which, after being boiled up in 5 ml of ethyl acetate, yields 0.75 g of a mixture of substances, which consists of the title compound and the intermediate compound 8-propionylaminomethyl-5-(4-nitrophenyl)-9H-1,3-dioxolo[4,5-h][2,3]-benzodiazepine, is obtained.

[0253] To complete the closure of the rings, the above mixture is dissolved in anhydrous dichloroethane and, after 0.20 ml (2.15 mmol) of phosphorus oxychloride is added, heated to boiling for 2 hours. The cooled reaction mixture is then washed with sodium bicarbonate solution and evaporated to the dry state.

[0254] 0.65 g (33%) of the title compound with a melting point of 243-245°C is obtained.

EXAMPLE 38

5-(4-Aminophenyl)-8-ethyl-11H-1,3-dioxolo[4,5-h]imidazo[3,4-c][2,3]benzodiazepine

[0255] 0.38 g (1.0 mmol) of the nitro compound that is produced according to Example 37 is reduced in 10 ml of a 1:1 mixture of methylene chloride and methanol according to Example 2. The crude product is purified by column chromatography (silica gel, eluant: chloroform:methanol=95:5).

[0257] 0.28 g (81%) of the title compound with a melting point of 135-138°C is obtained.

EXAMPLE 39

9-Ethyl-5-(4-nitrophenyl)-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine

[0258] After a catalytic amount of p-toluene sulfonic acid is added, a mixture of 1.0 g (2.82 mmol) of 8-methylthio-5-(4-nitrophenyl)-9H-1,3-dioxolo[4,5-h][2,3]-benzodiazepine was dissolved in anhydrous dichloroethane and, after 0.20 ml (2.15 mmol) of phosphorus oxychloride is added, heated to boiling for 2 hours. The cooled reaction mixture is then washed with sodium bicarbonate solution and evaporated to the dry state.

[0259] 0.65 g (33%) of the title compound with a melting point of 243-245°C is obtained.

EXAMPLE 37

8-Ethyl-5-(4-nitrophenyl)-11H-1,3-dioxolo[4,5-h]imidazo[3,4-c][2,3]benzodiazepine

[0248] 5-(4-aminophenyl)-8-n-propyl-11H-1,3-dioxolo[4,5-h]imidazo[3,4-c][2,3]benzodiazepine

[0247] 8-cyclopropyl-5-(4-aminophenyl)-11H-1,3-dioxolo[4,5-h]imidazo[3,4-c][2,3]benzodiazepine
epine (Example 15, step E) and 0.74 g (5.64 mmol) of 2-(1-aminopropyl)-1,3-dioxolane (J. Org. Chem. 21, 1956, 115) in 60 ml of Methyl Cellosolve is stirred for 48 hours at 120°C. After cooling, the unchanged methylthio compound is filtered out, and the filtrate is concentrated by evaporation to a volume of 10 ml. After 50 ml of water is added, the intermediate compound of the condensation step precipitates and is suctioned off. The filter residue is dissolved in 10 ml of ethanol:concentrated hydrochloric acid=1:1 and heated to boiling for 1.5 hours. Then, the solution is concentrated by evaporation, and the residue is taken up in 50 ml of water. It is neutralized with sodium carbonate and extracted with ethyl acetate, dried, filtered and concentrated by evaporation. The residue is purified by column chromatography (silica gel, eluant: chloroform:methanol=95:5). 0.38 g (36%) of the title compound with a melting point of 188-190°C is obtained.

[0260] Produced analogously are:

[0261] 9-Bromo-8-methoxy-3-methyl-6-(4-nitrophenyl)-11H-imidazo[1,2-c][2,3]benzodiazepine, melting point: 196-200°C.

[0263] (Starting material is in each case the compound of Example 27B).

EXAMPLE 40

5-(4-Aminophenyl)-9-ethyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine

[0264]

[0265] The nitro compound of Example 39 is reduced in methylene chloride:methanol=1:1 analogously to Example 2. After recrystallization from ethyl acetate, 0.14 g (41%) of the title compound with a melting point of 192-194°C is obtained.

EXAMPLE 41

5-(4-Nitrophenyl)-8-propyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine hydrochloride [0266]

Produced from 0.68 g (2.0 mmol) of the thione compound (Example 15, step D) and 0.58 g (4.0 mmol) of 2-aminomethyl-2-propyl-1,3-dioxolane (produced analogously to J. Org. Chem., 37, 1972, 221) and 0.43 g (2.0 mmol) of red mercury oxide according to Example 29. After 10 hours at 110°C., the intermediate compound of the condensation step is purified by chromatography (silica gel, eluant: chloroform-methanol=95:5). Ring-closure reaction is implemented by heating the intermediate product in a 1:1 mixture of acetic acid and concentrated hydrochloric acid.

[0267] Produced from 0.68 g (2.0 mmol) of the thione compound (Example 15, step D) and 0.58 g (4.0 mmol) of 2-aminomethyl-2-propyl-1,3-dioxolane (produced analogously to J. Org. Chem., 37, 1972, 221) and 0.43 g (2.0 mmol) of red mercury oxide according to Example 29. After 10 hours at 110°C., the intermediate compound of the condensation step is purified by chromatography (silica gel, eluant: chloroform-methanol=95:5). Ring-closure reaction is implemented by heating the intermediate product in a 1:1 mixture of acetic acid and concentrated hydrochloric acid.

[0268] After the concentration by evaporation, 0.36 g of the title compound is obtained as hydrochloride salt.

[0269] Yield 42%, melting point 200-201°C.

[0270] Produced analogously is:

[0271] 9-Bromo-8-methoxy-6-(4-nitrophenyl)-3-n-propyl-11H-imidazo[1,2-c][2,3]benzodiazepine, melting point 150-162°C.

EXAMPLE 42

5-(4-Aminophenyl)-8-propyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine [0272]

[0273]
The nitro compound of Example 41 is reduced analogously to Example 2. After recrystallization from ethanol, 0.27 g (89%) of the title compound with a melting point of 175-176°C (from ethanol) is obtained.

**EXAMPLE 43**

8-Ethyl-5-(4-nitrophenyl)-11H-1,3-dioxolo[4,5-h]imidazol[1,2-c][2,3]benzodiazepine hydrochloride

Produced analogously to Example 41 from 0.68 g (2.0 mmol) of the thione compound (Example 15, step D) and 0.53 g (4.0 mmol) of 2-aminomethyl-2-ethyl-1,3-dioxolane (production analogous to J. Org. Chem., 37, 1972, 221). The title compound is isolated as hydrochloride (0.32 g).

Yield: 39%, melting point 217-218°C.

**EXAMPLE 44**

5-(4-Aminophenyl)-8-ethyl-11H-1,3-dioxolo[4,5-h]imidazol[1,2-c][2,3]benzodiazepine

Produced from the nitro compound of Example 43 according to Example 2. 0.18 g of the title compound is obtained. Yield: 67%, melting point 258-260°C (ethanol).

The title compound is produced analogously to Example 29 from 2.0 g (5.86 mmol) of the thio compound of Example 15, step D and 1.54 g (11.72 mmol) of 2-(1-aminomethyl)-2-methyl-1,3-dioxolane (J. Org. Chem., 37, 1972, 221) with 1.279 (5.86 mmol) of red mercury oxide. The condensation step takes about 30 hours at 110°C. The intermediate product is purified by chromatography as in Example 41 and then the rings are closed by boiling in 10 ml of a mixture that consists of ethanol-concentrated hydrochloric acid. The title compound is isolated as hydrochloride: 0.52 g (22%), melting point 240-243°C.

**EXAMPLE 46**

5-(4-Aminophenyl)-8,9-dimethyl-11H-1,3-dioxolo[4,5-h]imidazol[1,2-c][2,3]benzodiazepine

Produced analogously to Example 2:

9-Bromo-2,3-dimethyl-8-methoxy-6-(4-nitrophenyl)11H-imidazol[1,2-c][2,3]benzodiazepine, melting point: 190-193°C.

**EXAMPLE 47**

8,9-Dimethyl-5-(4-nitrophenyl)-11H-1,3-dioxolo[4,5-h]imidazol[1,2-c][2,3]benzodiazepine hydrochloride

Produced analogously to Example 2. 0.33 g (75%) of the title compound with a melting point of 226-227°C (ethanol) is obtained.
EXAMPLE 47

A. 4-Nitrobenzoylhydrazone of 2-hydroxy-4-methoxybenzaldehyde

[0285] 63.4 g of 4-nitrobenzhydrazide is introduced into 2.5 l of 1-propanol and mixed with 53.3 g of 2-hydroxy-4-methoxybenzaldehyde and refluxed for 1 hour. After cooling in an ice bath, it is suctioned off. 104 g of the 4-nitrobenzoylhydrazone of 2-hydroxy-4-methoxybenzaldehyde is obtained.

[0286] Produced analogously are:

[0287] Benzoylhydrazone of 2-hydroxy-4-methoxybenzaldehyde

[0288] 4-bromobenzoylhydrazone of 2-hydroxy-4-methoxybenzaldehyde

B. 2-(4-Nitrobenzoyl)-4-methoxybenzaldehyde

[0289] 50 g of 4-nitrobenzoylhydrazone of 2-hydroxy-4-methoxybenzaldehyde is introduced into 1.5 l of tetrahydrofuran (dried on a molecular sieve) at 8° C. and mixed in portions with 99.4 g of lead(IV) acetate (85%). After addition is completed, it is stirred for 30 more minutes, suctioned off, and the filtrate is concentrated by evaporation. The residue is taken up ethyl acetate, washed in succession with water and common salt solution, dried, filtered and concentrated by evaporation. After recrystallization from ethyl acetate/hexane, 6.3 g of 2-(4-methoxy-2-(4-nitrobenzoyl)phenyl)acetic acid is obtained.

[0289] Produced analogously are:

[0290] 2-Benzyloxy-methoxybenzaldehyde

C. 1-Methoxy-2-(4-methoxy-2-(4-nitrobenzoyl)phenyl)ethyline

[0293] 10 g of 2-(4-nitrobenzoyl)-4-methoxybenzaldehyde is introduced together with 18 g of (methoxymethyl) triphenylphosphonium chloride in 400 ml of toluene and mixed in portions with 5.9 g of potassium-tetra-butyrate while being cooled with ice. After 1 hour of stirring while being cooled with ice and a subsequent 3.5 hours of stirring at room temperature, it is mixed with 200 ml of water, weakly acidified with 1N hydrochloric acid and extracted three times with ethyl acetate. The ethyl acetate phases are washed with saturated common salt solution, dried, filtered and concentrated by evaporation. The residue is chromatographed on silica gel with hexane:ethyl acetate:1:1 as an eluant. 6.9 g of 1-methoxy-2-(4-methoxy-2-(4-nitrobenzoyl)phenyl)ethyline as a mixture of the E- and Z-forms is obtained.

[0294] Produced analogously are:

[0296] 1-Methoxy-2-(4-methoxy-2-(4-bromobenzoyl)phenyl)ethyline.

D. 2-(4-Methoxy-2-(4-nitrobenzoyl)phenyl)acetic acid

[0297] 6.9 g of 1-methoxy-2-(4-methoxy-2-(4-nitrobenzoyl)ethyline as a mixture of the E- and Z-forms is intro-duced into 310 ml of tetrahydrofuran and mixed with 100 ml of 1N hydrochloric acid. After stirring overnight at room temperature, it is diluted with 300 ml of water, and the tetrahydrofuran is distilled off at a bath temperature of 50° C. The aqueous phase is extracted three times with ethyl acetate. The collected organic phase is washed with water, dried, filtered and concentrated by evaporation. It is taken up in 300 ml of acetone and mixed drop by drop with 11.8 ml of 8N Jones reagent at 40° C. After the addition is completed, it is stirred for 2 more hours at this temperature, mixed with 6 ml of isopropanol and stirred for another 15 minutes. It is then diluted with 200 ml of water, and the acetone is drawn off in a rotary evaporator. The aqueous phase is extracted three times with ethyl acetate, and the collected organic phase is washed with water, dried, filtered and concentrated by evaporation. After recrystallization from ethyl acetate/hexane, 6.3 g of 2-(4-methoxy-2-(4-nitrobenzoyl)phenyl)acetic acid is obtained.

[0298] Produced analogously are:

[0299] 2-(4-Methoxy-2-benzoylphenyl) acetic acid

[0300] 2-(4-methoxy-2-(4-bromobenzoyl)phenyl) acetic acid

E. 8-Methoxy-1-(4-nitrophenyl)-4,5-dihydro-3H-2,3-benzodiazepin-4-one

[0301] 7.8 g of 2-(4-methoxy-2-(4-nitrobenzoyl)phenyl)acetic acid is mixed in 200 ml of tetrahydrofuran with 2.3 ml of 80% hydrazine hydrate and stirred for 6 hours at room temperature. After standing overnight, it is mixed with 50 ml of water, and the tetrahydrofuran is drawn off in a rotary evaporator. The precipitated 2-(4-methoxy-2-(4-nitrobenzoyl)phenyl)acetic acid hydrazide (4.9 g) is suctioned off and stirred in 37 ml of glacial acetic acid at room temperature for 2 hours. It is diluted with 37 ml of water and suctioned off. 4.37 g of 8-methoxy-1-(4-nitrophenyl)-4,5-dihydro-3H-2,3-benzodiazepin-4-one with a melting point of 282° C. is obtained.

[0302] Produced in a basically similar way but with the mixed acid anhydride with isobutyl chloroformate are:

[0303] 8-Methoxy-1-phenyl-4,5-dihydro-3H-2,3-benzodiazepin-4-one

[0304] 8-methoxy-1-(4-bromophenyl)-4,5-dihydro-3H-2,3-benzodiazepin-4-one

F. 8-Methoxy-1-(4-nitrophenyl)-4,5-dihydro-3H-2,3-benzodiazepine-4-thione

[0305] 4.3 g of 8-methoxy-1-(4-nitrophenyl)-4,5-dihydro-3H-2,3-benzodiazepin-4-one is mixed in 48 ml of pyridine with 2.46 g of diphosphorus pentasulfide and stirred under argon and with exclusion of moisture for 2 hours at a bath temperature of 100° C. It is diluted with water, and the precipitated product is suctioned off. After chromatography on silica gel first with ethyl acetate/hexane:1:1 and later with ethyl acetate, a total of 3.13 g of 8-methoxy-1-(4-nitrophenyl)-4,5-dihydro-3H-2,3-benzodiazepine-4-thione is obtained.

[0306] Produced analogously are:

[0307] 8-Methoxy-1-phenyl-4,5-dihydro-3H-2,3-benzodiazepine-4-thione

[0308] 8-methoxy-1-(4-bromophenyl)-4,5-dihydro-3H-2,3-benzodiazepine-4-thione
500 mg of 8-methoxy-1-(4-nitrophenyl)-4, 5-dihydro-3H-2,3-benzodiazepine-4-thione is stirred in 1.5 ml of ethylene glycol monomethyl ether (Cellosolve®) and 548 mg of 2-aminomethyl-2-methyl-1,3-dioxolane while argon is passing through it for 10 hours at 60° C. After filtration and washing with cold ethanol and disopropyl ether, 550 mg of imino compound, which is dissolved in 10 ml of ethanol, mixed with 10 ml of concentrated hydrochloric acid and refluxed for 3 hours, is obtained. It is added to water, set at pH 11 and extracted with ethyl acetate. The ethyl acetate phase is washed with water, dried, filtered and concentrated by evaporation. After recrystallization from ethyl acetate/disopropyl ether, 240 mg of 8-methoxy-3-methyl-6-phenyl-11H-imidazo[1,2-c]2,3-benzodiazepine with a melting point of 140° C is obtained.

Produced analogously from the corresponding thiones are:

8-methoxy-2-methyl-6-phenyl-11H-imidazo[1,2-c][2,3]benzodiazepine
8-methoxy-3-methyl-6-phenyl-11H-imidazo[1,2-c][2,3]benzodiazepine
8-methoxy-3-ethyl-2-methyl-6-phenyl-11H-imidazo[1,2-c][2,3]benzodiazepine
8-methoxy-6-phenyl-3-(4-pyridyl)-11H-imidazo[1,2-c][2,3]benzodiazepine
8-methoxy-6-phenyl-3-(2-pyridyl)-11H-imidazo[1,2-c][2,3]benzodiazepine
8-methoxy-6-phenyl-3-(3-pyridyl)-11H-imidazo[1,2-c][2,3]benzodiazepine

2.3 g of 8-methoxy-1-(4-nitrophenyl)-4, 5-dihydro-3H-2,3-benzodiazepine-4-thione is stirred with 3 ml of 2-amino-3,3,3-dimethoxbutane (produced by reductiveamination according to J. Org. Chem. 52, (12), 2616 from 3,3-dimethoxybutan-2-one) while argon is passing through it for 4 hours at a bath temperature of 110° C. The preparation is mixed with 50 ml of 1N hydrochloric acid, diluted with water to 100 ml and extracted three times with 150 ml of ethyl acetate each. The aqueous phase is made alkaline with 1N sodium hydroxide solution and extracted three times with ethyl acetate. The collected organic phases are dried, filtered and concentrated by evaporation, and the residue is chromatographed on silica gel with methylene chloride:ethanol=10:1 as an eluant. 1.5 g of 2,3-dimethyl-8-methoxy-6-(4-nitrophenyl)-11H-imidazo[1,2-c]benzodiazepine is obtained.

Produced analogously are:

6-(4-Bromophenyl)-2,3-dimethyl-8-methoxy-11H-imidazo[1,2-c][2,3]benzodiazepine
2,3-dimethyl-8-methoxy-6-phenyl-11H-imidazo[1,2-c][2,3]benzodiazepine
8,9-dimethyl-5-(4-fluorophenyl)-11H-1,3-dioxol[4,5-h]imidazo[1,2-c][2,3]benzodiazepine
EXAMPLE 49
A. 6-(4-Aminophenyl)-2,3-dimethyl-8-methoxy-11H-imidazo[1,2-c][2,3]benzodiazepine

[0332]

834 mg of 2,3-dimethyl-8-methoxy-6-(4-nitrophenyl)-11H-imidazo[1,2-c][2,3]benzodiazepine in 33 ml of glacial acetic acid together with 2.25 g of iron powder are heated for 20 minutes in an oil bath that is preheated to 90°C. It is suctioned off hot and rewarshed with glacial acetic acid. The filtrate is concentrated by evaporation, and the residue is dispersed in ethyl acetate and 1N sodium hydroxide solution. The aqueous phase is shaken out twice with ethyl acetate, and the collected organic phase is washed with water, dried, filtered and concentrated by evaporation. This residue is chromatographed on silica gel with methylene chloride:ethanol=10:1 as an eluant. After the corresponding fractions that are concentrated by evaporation are absorbedly precipitated with ethyl acetate-hexane, 331 mg of 6-(4-aminophenyl)-2,3-dimethyl-8-methoxy-11H-imidazo[1,2-c][2,3]benzodiazepine with a melting point of 280°C is obtained.

EXAMPLE 50
8-Methyl-5-phenyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine

[0344]

[0340] 527 mg of 8-ethyl-9-methyl-5-(4-nitrophenyl)-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine is mixed in 11 ml of ethanol with 5.4 ml of cyclohexene and 106 mg of palladium hydroxide on carbon (Pearlmans catalyst), and it is stirred for 3 hours at a bath temperature of 110°C. After catalyst is filtered out, it is concentrated by evaporation, and the residue is chromatographed on silica gel with ethyl acetate as an eluant. After combining the corresponding fractions and recrystallization from ethanol, 348 mg of 5-(4-aminophenyl)-8-ethyl-9-methyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine with a melting point of 227-228°C is obtained.

Produced analogously are:

[0342] 5-(4-Aminophenyl)-8-(4-pyridyl)-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine

[0343] 5-(4-aminophenyl)-9-ethyl-8-methyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine

EXAMPLE 51
5-(4-Chlorophenyl)-8-methyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine

[0345] 200 mg of 5-(4-aminophenyl)-8-methyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine is mixed in 30 ml of tetrahydrofuran with 1.32 ml of pentyl nitrite and refluxed under argon for 2 hours. After concentration by evaporation, it is chromatographed on silica gel with methylene chloride:ethanol=10:1. 136 mg of 8-methyl-5-phenyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine is obtained.

EXAMPLE 51
5-(4-Chlorophenyl)-8-methyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine

[0346]
EXAMPLE 52

5-(4-Fluorophenyl)-8-methyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine

EXAMPLE 53

9-Bromo-8-methyl-5-(4-nitrophenyl)-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine

EXAMPLE 54

2-Acetyl-3-(3-pyridyl)-8-methoxy-6-phenyl-11H-imidazo[1,2-c][2,3]benzodiazepine

EXAMPLE 55

900 mg of 8-methyl-5-(4-nitrophenyl)-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine is mixed in 10 ml of dimethylformamide with 441 mg of N-bromosuccinimide and stirred for 1.5 hours at room temperature. After dilution with 40 ml of water, the precipitated product is suctioned off, and 900 mg of 9-bromo-8-methyl-5-(4-nitrophenyl)-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine is obtained.

EXAMPLE 56

EXAMPLE 59

2-Acetyl-3-(3-pyridyl)-8-methoxy-6-phenyl-11H-imidazo[1,2-c][2,3]benzodiazepine
US 2002/0052364 A1
May 2, 2002

[0360] 82 mg of 2-bromo-3-(3-pyridyl)-8-methoxy-6-phenyl-11H-imidazo[1,2-c][2,3]benzodiazepine is mixed in 3 ml of toluene and 0.5 ml of dimethylformamide with 650 mg of (1-ethoxyvinyl)tributylstannane and 10 mg of palladium(O)tetraakistriphenylphosphine, and it is heated for 4 hours to a bath temperature of 120°C. Then, (1-ethoxyvinyl)tributylstannane and 10 mg of palladium(O)tetraakistriphenylphosphine are added again, and it is heated for 10 hours to a bath temperature of 120°C. After cooling, it is mixed with 2 ml of 1N hydrochloric acid, stirred for 10 minutes, made alkaline with ammonia and shaken out with ethyl acetate. The ethyl acetate phase is washed with water and saturated common salt solution, dried, filtered and concentrated by evaporation. After chromatography of the residue on silica gel with ethyl acetate as an eluant, 20 mg of 2-acetyl-3-(3-pyridyl)-8-methoxy-6-phenyl-11H-imidazo[1,2-c][2,3]benzodiazepine is obtained.

[0361] Obtained analogously are: 2-Vinyl-3-(3-pyridyl)-8-methoxy-6-phenyl-11H-imidazo[1,2-c][2,3]benzodiazepine,
9-propynyl-5-phenyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine with the addition of a Cu(I) co-catalyst.

[0362] 9-(3-Pyridyl)-5-phenyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine is provided, dissolved in 4 ml of toluene and 1.5 ml of ethanol. 54 mg of diethyl-3-pyridyl-borane, 20 mg of tetraakis(triphenylphosphine)-palladium (0) and 0.8 ml of a 2 M Na₂CO₃ solution are added, and it is stirred for 3 hours at 110°C. After water is added, it is extracted using ethyl acetate, and the organic phase is concentrated by evaporation. This residue is chromatographed on silica gel with dichloromethane:ethanol=95:5 as an eluant. 13 mg of 8-methyl-5-phenyl-9-(3-pyridyl)-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c]benzodiazepine is obtained.

[0363] Produced analogously from 9-iodo-5-phenyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine is:

[0364] 120 mg of 9-bromo-8-methyl-5-phenyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine is mixed in 15 ml of tetrahydrofuran at −78°C with 0.36 ml of butyllithium (hexane, 1 mol) and stirred for 15 minutes. It is then mixed at this temperature with 0.6 ml of dimethylformamide and stirred for 15 minutes. After stirring to room temperature, it is mixed with water, the tetrahydrofuran is distilled off and extracted with ethyl acetate. After the solvent is distilled off, it is chromatographed on silica gel with dichloromethane:ethanol=95:5 as an eluant. 46 mg of 9-formyl-8-methyl-5-phenyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine is obtained.

[0365] Produced in a basically similar way are:
9-(1-Hydroxyprop-1-yl)-8-methyl-5-phenyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine
9-ethyl-8-methyl-5-phenyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine
9-methoxymethyl-8-methyl-5-phenyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine

[0366] EXAMPLE 55
EXAMPLE 56
[0367] 100 mg of 9-iodo-8-methyl-5-phenyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine is provided, dissolved in 4 ml of toluene and 1.5 ml of ethanol. 54 mg of diethyl-3-pyridyl-borane, 20 mg of tetraakis(triphenylphosphine)-palladium (0) and 0.8 ml of a 2 M Na₂CO₃ solution are added, and it is stirred for 3 hours at 110°C. After water is added, it is extracted using ethyl acetate, and the organic phase is concentrated by evaporation. This residue is chromatographed on silica gel with dichloromethane:ethanol=95:5 as an eluant. 13 mg of 8-methyl-5-phenyl-9-(3-pyridyl)-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c]benzodiazepine is obtained.

EXAMPLE 56
[0368] 90 mg of 9-bromo-8-methyl-5-phenyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine is provided, dissolved in 4 ml of toluene and 1.5 ml of ethanol. 54 mg of diethyl-3-pyridyl-borane, 20 mg of tetraakis(triphenylphosphine)-palladium (0) and 0.8 ml of a 2 M Na₂CO₃ solution are added, and it is stirred for 3 hours at 110°C. After water is added, it is extracted using ethyl acetate, and the organic phase is concentrated by evaporation. This residue is chromatographed on silica gel with dichloromethane:ethanol=95:5 as an eluant. 13 mg of 8-methyl-5-phenyl-9-(3-pyridyl)-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c]benzodiazepine is obtained.

EXAMPLE 57
[0369] 100 mg of 9-iodo-8-methyl-5-phenyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine is provided, dissolved in 4 ml of toluene and 1.5 ml of ethanol. 54 mg of diethyl-3-pyridyl-borane, 20 mg of tetraakis(triphenylphosphine)-palladium (0) and 0.8 ml of a 2 M Na₂CO₃ solution are added, and it is stirred for 3 hours at 110°C. After water is added, it is extracted using ethyl acetate, and the organic phase is concentrated by evaporation. This residue is chromatographed on silica gel with dichloromethane:ethanol=95:5 as an eluant. 13 mg of 8-methyl-5-phenyl-9-(3-pyridyl)-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c]benzodiazepine is obtained.

EXAMPLE 58

1. Compounds of formula I

in which R¹ and R² are the same or different and mean hydrogen, C₁-C₆ alkyl, nitro, halogen, cyano, the group —NR²R³, —CF₃, OH or C₁-C₆ alkanoyloxy,

R³ and R⁴ are the same or different and mean hydrogen, halogen, C₁-C₆ alkox, hydroxy, thiocyanato, C₁-C₆ alkylthio, cyano, COOR², PO,R³OR⁴, C₁-C₆ alkanoyl, C₁-C₆ alkanoxy, C₁-C₆ alkyl optionally substituted with C₁-C₆ alkox or phenyl, C₁-C₆ alkyn optionally substituted with C₁-C₆ alkox or phenyl; C₁-C₆ alkyl optionally substituted by halogen, hydroxy, C₁-C₆ alkox, C₁-C₆ thioalkyl, NR¹R², C₆-C₁₀ cyclalkyl, or an optionally substituted aryl or hetaryl radical,
R⁰ and R⁹ are the same or different and mean hydrogen, C₁-C₆ alkyl or the group —CO—C₁-C₆ alkyl,
R₁⁰ and R₁¹ are the same or different and mean hydrogen, C₁-C₆ alkyl or C₁-C₆ alkanoyl or together with the nitrogen atom form a 5- to 7-membered saturated heterocycle, which can contain another oxygen, sulfur or nitrogen atom and can be substituted,
R₁², R₁³, R₁⁴ are the same or different and mean H or C₁-C₆ alkyl.
X means hydrogen or halogen,
Y means C₁-C₆ alkoxy or X and Y together mean —O—(CH₂)₆—O—,
n means 1, 2 or 3, and
A together with the nitrogen forms a saturated or unsaturated five-membered heterocycle, which can contain 1-3 nitrogen atoms and/or an oxygen atom and/or one or two carbonyl groups or their isomers or physiologically compatible salts.

2. 5-(4-Aminophenyl)-8-methyl-11H-1,3-dioxolo[4,5-h] [1,2,4]triazolo[4,3-c][2,3]benzodiazepine
5-(4-Aminophenyl)-8-cyclopropyl-11H-1,3-dioxolo[4,5-h][1,2,4]triazolo[4,3-c][2,3]benzodiazepine

6-(4-Aminophenyl)-8-methoxy-3-ethyl-11H-[1,2,4]triazolo[4,3-c][2,3]benzodiazepine
6-(4-Aminophenyl)-8-methoxy-3-cyclopropyl-11H-[1,2,4]triazolo[4,3-c][2,3]benzodiazepine
5-(4-Aminophenyl)-9-methyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine
5-(4-Aminophenyl)-8-cyclopropyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine
5-(4-Aminophenyl)-8-methyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine
8-cyclopropyl-5-(4-Aminophenyl)-11H-1,3-dioxolo[4,5-h]imidazo[3,4-c][2,3]benzodiazepine
5-(4-Aminophenyl)-9-ethyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine
5-(4-Aminophenyl)-8,9-dimethyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine
8-methoxy-3-methyl-6-phenyl-11H-imidazo[1,2-c][2,3]benzodiazepine
8-methoxy-2-methyl-6-phenyl-11H-imidazo[1,2-c][2,3]benzodiazepine
8-methoxy-3-methyl-6-phenyl-11H-imidazo[1,2-c][2,3]benzodiazepine
8-methoxy-6-phenyl-3-(4-pyridyl)-11H-imidazo[1,2-c][2,3]benzodiazepine
8-methoxy-6-phenyl-3-(2-pyridyl)-11H-imidazo[1,2-c][2,3]benzodiazepine
8-methoxy-6-phenyl-3-(3-pyridyl)-11H-imidazo[1,2-c][2,3]benzodiazepine

2,3-dimethyl-8-methoxy-6-phenyl-11H-imidazo[1,2-c][2,3]benzodiazepine
6-(4-Aminophenyl)-2,3-dimethyl-8-methoxy-11H-imidazo[1,2-c][2,3]benzodiazepine
6-(4-Aminophenyl)-8-methoxy-3-(2-pyridyl)-11H-imidazo[1,2-c][2,3]benzodiazepine
6-(4-Aminophenyl)-8-methoxy-3-(4-pyridyl)-11H-imidazo[1,2-c][2,3]benzodiazepine
5-(4-Aminophenyl)-8-(4-pyridyl)-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine
5-(4-Aminophenyl)-9-ethyl-8-methyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine
8-methyl-5-phenyl-11H-1,3-dioxolo[4,5-h]imidazo[1,2-c][2,3]benzodiazepine according to claim 1.

3. Pharmaceutical agent that contains a compound of formula I according to claim 1.

4. Process for the production of the compound of formula I according to claim 1, in that
a) a compound of general formula II

\[
\text{in which R⁰, R⁹, X and Y have the above meaning, is cyclized by reaction of}
\begin{align*}
\alpha) Z=\text{COO}-C₁₆ & \text{alkyl with R²—N=C=O to compounds with A meaning —CO—NR³—CO—} \\
\beta) Z=\text{CH}_₂\text{OH} & \text{or } —\text{CH}_₂—\text{NHR}³ \text{ with phosgene to compounds with A meaning } —\text{CH}_₂—\text{O—CO—} \text{ or } —\text{CH}_₂—\text{NR}³—\text{CO—} \\
\gamma) Z=—\text{CH}_₂\text{OH} & \text{with R³—CO—R⁴ to compounds with A meaning } —\text{CH}_₂—\text{O—CR³R⁴, in which R³ and R⁴ have the above meaning, }
\end{align*}

b) a compound of formula III or IV
in which \( R', R \times \text{and } Y \) have the above meaning, is cyclized by reaction of

\[
\alpha) Z = CH=CH-COOC_{1-6} \text{ alkyl with borane-trimethylamine complex and boron trifluoride etherate to compounds with } A \text{ meaning } -(CH_2)_n \text{ and } -(CH_2)_m-\text{CO-}
\]

\[
\beta) Z = \text{CH}=\text{N}-
\]

\[
\gamma) Z = \text{S} - C_{1-4} \text{ alkyl with hydrazine hydrate and acid anhydrides or with acid hydrazides to compounds with } A \text{ meaning } \text{N} = \text{N} = \text{CR}^3
\]

\[
\delta) Z = \text{S} - C_{1-4} \text{ alkyl with } \alpha\text{-aminoacetals to compounds with } A \text{ meaning } \text{N} = \text{N} = \text{CR}^3
\]

\[
\epsilon) Z = \text{CH}_2\text{OH is converted into CH}_2\text{NH}_2, \text{the latter is acylated and cyclized to compounds with } A \text{ meaning } \text{CH}-\text{N} = \text{CR}^3
\]

c) a compound of formula \( V \),

\[
\text{IV CH}_2-C\equiv C-R^3 \text{ or with ammonia and } \alpha\text{-haloketones, and then optionally nitro group } R' \text{ and/or } R^2 \text{ is reduced, the amino group is acylated or alkylated or converted into halogen or hydroxy or cyano or deaminated or } X \text{ is dehalogenated simultaneously with the reduction of the nitro group or in succession or hydrogen is substituted by halogen or halogen is exchanged for another halogen, } -\text{PO}_2\text{R}_{12}R_{14}, \text{cyano, } C_{1-6} \text{ alkanoyl, } C_{1-6} \text{ alkanoyloxy, hydroxy, optionally substituted } C_{2-5} \text{ alkynyl, optionally substituted } C_{2-6} \text{ alkynyl, optionally substituted } C_{1-6} \text{ alkyll, } C_{1-6} \text{ thioalkyl, } \text{COOR}_{12}^3, \text{or } Y \text{ is } \text{C-etherified or the isomers are separated or the salts are formed.} \]

5. Compounds of formulas IIa and IIIa, their isomers and salts

\[
\text{IIa}
\]

\[
\text{IIIa}
\]

\[
\text{V}
\]

in which \( R', R^2, X \text{ and } Y \) have the above meaning given above, is reacted with \( \alpha\text{-aminoacetals, } \alpha\text{-aminoketals, } H\text{N-}

\[\ast \ast \ast \ast \ast\]
