(54) **Title:** REDUCING LOCATION-DEPENDENT INTERFERENCE IN DISTRIBUTED ANTENNA SYSTEMS OPERATING IN MULTIPLE-INPUT, MULTIPLE-OUTPUT (MIMO) CONFIGURATION, AND RELATED COMPONENTS, SYSTEMS, AND METHODS

FIG. 4A

(57) **Abstract:** Components, systems, and methods for reducing location- based interference in distributed antenna systems operating in multiple-input, multiple-output (MIMO) configuration are disclosed. Interference is defined as issues with received MIMO communications signals that can cause a MIMO algorithm to not be able to solve a channel matrix for MIMO communications signals received by MIMO receivers in client devices. These issues may be caused by lack of spatial (i.e., phase) separation in the received MIMO communications signals. Thus, to provide phase separation of received MIMO communication signals, multiple MIMO transmitters are each configured to employ multiple transmitter antennas, which are each configured to transmit in different polarization states. In certain embodiments, one of the MIMO communications signals is phase shifted in one of the polarization states to provide phase separation between received MIMO communication signals. In other embodiments, multiple transmitter antennas in a MIMO transmitter can be offset to provide phase separation.

**REDUCING LOCATION-DEPENDENT INTERFERENCE IN DISTRIBUTED
ANTENNA SYSTEMS OPERATING IN MULTIPLE-INPUT, MULTIPLE-OUTPUT
(MIMO) CONFIGURATION, AND RELATED COMPONENTS, SYSTEMS, AND
METHODS**

PRIORITY APPLICATION

[0001] This application claims priority under 35 U.S.C. § 119 to U.S. Provisional Patent Application No. 61/618,396 entitled “REDUCING LOCATION-DEPENDENT INTERFERENCE IN DISTRIBUTED ANTENNA SYSTEMS OPERATING IN MULTIPLE-INPUT, MULTIPLE OUTPUT (MIMO) CONFIGURATION, AND RELATED COMPONENTS, SYSTEMS, AND METHODS,” filed on March 30, 2012, the content of which is relied upon and incorporated herein by reference in its entirety.

RELATED APPLICATION

[0002] This application is related to U.S. Provisional Patent Application No. 61/541,566 entitled “AUTOMATIC ANTENNA SELECTION BASED ON ORIENTATION, AND RELATED APPARATUSES, ANTENNA UNITS, METHODS, AND DISTRIBUTED ANTENNA SYSTEMS,” filed on September 30, 2011, which is incorporated herein by reference in its entirety.

BACKGROUND

Field of the Disclosure

[0003] The technology of the disclosure relates to distribution of data (e.g., digital data services and radio-frequency communications services) in a distributed antenna system.

Technical Background

[0004] Wireless customers are demanding digital data services, such as streaming video signals. Concurrently, some wireless customers use their wireless devices in areas that are poorly served by conventional cellular networks, such as inside certain buildings or areas where there is little cellular coverage. One response to the intersection of these two concerns has been the use of distributed antenna systems. Distributed antenna systems can be particularly useful to be deployed inside buildings or other indoor environments where client devices may not otherwise be able to effectively receive radio-

frequency (RF) signals from a source. Distributed antenna systems include remote units (also referred to as “remote antenna units”) configured to receive and wirelessly transmit wireless communications signals to client devices in antenna range of the remote units. Such distributed antenna systems may use Wireless Fidelity (WiFi) or wireless local area networks (WLANs), as examples, to provide digital data services.

[0005] Distributed antenna systems may employ optical fiber to support distribution of high bandwidth data (e.g., video data) with low loss. Even so, WiFi and WLAN-based technology may not be able to provide sufficient bandwidth for expected demand, especially as high definition (HD) video becomes more prevalent. WiFi was initially limited in data rate transfer to 12.24 Mb/s and is provided at data transfer rates of up to 54 Mb/s using WLAN frequencies of 2.4 GHz and 5.8 GHz. While interesting for many applications, WiFi bandwidth may be too small to support real time downloading of uncompressed high definition (HD) television signals to wireless client devices.

[0006] Multiple-input, multiple-output (MIMO) technology can be employed in distributed antenna systems to increase the bandwidth up to twice the nominal bandwidth, as a non-limiting example. MIMO is the use of multiple antennas at both a transmitter and receiver to increase data throughput and link range without additional bandwidth or increased transmit power. However, even doubling bandwidth alone may not be enough to support high bandwidth data to wireless client devices, such as the example of real time downloading of uncompressed high definition (HD) television signals.

[0007] The frequency of wireless communications signals could also be increased in a MIMO distributed antenna system to provide larger channel bandwidth as a non-limiting example. For example, an extremely high frequency (EHF) in the range of approximately 30 GHz to approximately 300 GHz could be employed. For example, the sixty GHz (60 GHz) spectrum is an EHF that is an unlicensed spectrum by the Federal Communications Commission (FCC). EHF's could be employed to provide for larger channel bandwidths. However, higher frequency wireless signals are more easily attenuated and/or blocked from traveling through walls, building structures, or other obstacles where distributed antenna systems are commonly installed. Higher frequency wireless signals also provide narrow radiation patterns. Thus, remote units in distributed antenna systems may be arranged for line-of-sight (LOS) communications to allow for higher frequencies for higher bandwidth. However, if remote units are provided in a LOS configuration, and the

remote units are also configured to support MIMO, multiple data streams in the same frequency channel will be received by multiple receiver antennas in the remote units. This can lead to multiple data streams received in the same frequency channel leading to performance degradation and limited wireless coverage where the MIMO algorithm can fail to solve the channel matrix.

SUMMARY OF THE DETAILED DESCRIPTION

[0008] Components, systems, and methods for reducing location-based interference in distributed antenna systems operating in multiple-input, multiple-output (MIMO) configuration are disclosed. The distributed antenna systems include remote units employing MIMO transmitters configured to transmit multiple data streams in MIMO configuration to MIMO receivers in wireless client devices. Interference is defined as issues with received MIMO communications signals that can cause a MIMO algorithm to not be able to solve a channel matrix for MIMO communications signals received by MIMO receivers in client devices. These issues can occur due to lack of spatial (i.e., phase) separation in the received MIMO communications signals, especially with closely located MIMO transmitters configured for line-of-sight (LOS) communications. Thus, to provide phase separation of MIMO communication signals received by MIMO receivers in client devices, multiple MIMO transmitters in a remote unit are each configured to employ multiple transmitter antennas, which are each configured to transmit in different polarization states. In certain embodiments, one of the MIMO communications signals is phase shifted in one of the polarization states to provide phase separation between MIMO communication signals received by the MIMO receivers. In other embodiments, multiple transmitter antennas in a MIMO transmitter can be offset to provide phase separation.

[0009] The components, systems, and methods for location-based interference in a distributed antenna systems operating in MIMO configuration may significantly improve high-data rate wireless coverage without significant dependence on transmitter and/or receive placement. This may allow for LOS communications to be more easily achieved, especially for higher frequency communications where LOS communications may be employed to reduce the effect of obstacles. High antenna isolation is not required in the MIMO receivers. The increased coverage area can also allow for higher efficiency at higher frequencies typically inefficient for radio frequency (RF) amplifiers.

[0010] In this regard, in one embodiment, a MIMO remote unit configured to wirelessly distribute MIMO communications signals to wireless client devices in a distributed antenna system is provided. The MIMO remote unit comprises a first MIMO transmitter comprising a first MIMO transmitter antenna configured to transmit MIMO communications signals in a first polarization and a second MIMO transmitter antenna configured to transmit MIMO communications signals in a second polarization different from the first polarization. The MIMO remote unit also comprises a second MIMO transmitter comprising a third MIMO transmitter antenna configured to transmit MIMO communications signals in the first polarization and a fourth MIMO transmitter antenna configured to transmit MIMO communications signals in the second polarization. The first MIMO transmitter is configured to receive a first downlink MIMO communications signal in a first phase over a first downlink communications medium, and transmit the first downlink MIMO communications signal wirelessly as a first electrical downlink MIMO communications signal over the first MIMO transmitter antenna in the first polarization. The first MIMO transmitter is also configured to receive a second downlink MIMO communications signal in the first phase over a second downlink communications medium, and transmit the second downlink MIMO communications signal wirelessly as a second electrical downlink MIMO communications signal over the second MIMO transmitter antenna in the second polarization. The second MIMO transmitter is configured to receive a third downlink MIMO communications signal in the first phase over a third downlink communications medium, and transmit the third downlink MIMO communications signal wirelessly as a third electrical downlink MIMO communications signal over the third MIMO transmitter antenna in the first polarization. The second MIMO transmitter is also configured to receive a fourth downlink MIMO communications signal over a fourth downlink communications medium, and transmit the fourth downlink MIMO communications signal in a second phase shifted from the first phase, wirelessly as a fourth electrical downlink MIMO communications signal over the fourth MIMO transmitter antenna in the second polarization.

[0011] In another embodiment, a method of transmitting MIMO communications signals to wireless client devices in a distributed antenna system is provided. The method includes receiving a first downlink MIMO communications signal in a first phase over a first downlink communications medium. The method also includes transmitting the first

downlink MIMO communications signal wirelessly as a first electrical downlink MIMO communications signal over a first MIMO transmitter antenna in a first polarization. The method also includes receiving a second downlink MIMO communications signal in the first phase over a second downlink communications medium. The method also includes transmitting the second downlink MIMO communications signal wirelessly as a second electrical downlink MIMO communications signal over a second MIMO transmitter antenna in a second polarization. The method also includes receiving a third downlink MIMO communications signal in the first phase over a third downlink communications medium. The method also includes transmitting the third downlink MIMO communications signal wirelessly as a third electrical downlink MIMO communications signal over the third MIMO transmitter antenna in the first polarization. The method also includes receiving a fourth downlink MIMO communications signal over a fourth downlink communications medium. The method also includes transmitting the fourth downlink MIMO communications signal in a second phase shifted from the first phase, wirelessly as a fourth electrical downlink MIMO communications signal over the fourth MIMO transmitter antenna in the second polarization.

[0012] In another embodiment, a distributed antenna system for distributing MIMO communications signals to wireless client devices is provided. The distributed antenna system comprises a central unit. The central unit comprises a central unit transmitter configured to receive a downlink communications signal. The central unit transmitter is also configured to transmit the received downlink communications signal as a first MIMO downlink communications signal over a first downlink communications medium, a second MIMO downlink communications signal over a second downlink communications medium, a third MIMO downlink communications signal over a third downlink communications medium, and a fourth MIMO downlink communications signal over a fourth downlink communications medium.

[0013] This distributed antenna system also comprises a remote unit. The remote unit comprises a first MIMO transmitter comprising a first MIMO transmitter antenna configured to transmit MIMO communications signals in a first polarization and a second MIMO transmitter antenna configured to transmit MIMO communications signals in a second polarization different from the first polarization. The remote unit also comprises a second MIMO transmitter comprising a third MIMO transmitter antenna configured to

transmit MIMO communications signals in the first polarization and a fourth MIMO transmitter antenna configured to transmit MIMO communications signals in the second polarization. The first MIMO transmitter is configured to receive a first downlink MIMO communications signal in a first phase over a first downlink communications medium, and transmit the first downlink MIMO communications signal wirelessly as a first electrical downlink MIMO communications signal over the first MIMO transmitter antenna in the first polarization. The first MIMO transmitter is also configured to receive a second downlink MIMO communications signal in the first phase over a second downlink communications medium, and transmit the second downlink MIMO communications signal wirelessly as a second electrical downlink MIMO communications signal over the second MIMO transmitter antenna in the second polarization. The second MIMO transmitter is configured to receive a third downlink MIMO communications signal in the first phase over a third downlink communications medium, and transmit the third downlink MIMO communications signal wirelessly as a third electrical downlink MIMO communications signal over the third MIMO transmitter antenna in the first polarization. The second MIMO transmitter is also configured to receive a fourth downlink MIMO communications signal over a fourth downlink communications medium, and transmit the fourth downlink MIMO communications signal in a second phase shifted from the first phase, wirelessly as a fourth electrical downlink MIMO communications signal over the fourth MIMO transmitter antenna in the second polarization. The remote unit also comprises at least one phase shifter configured to phase shift the fourth downlink MIMO communications signal to the second phase.

[0014] The distributed antenna systems disclosed herein can be configured to support one or more radio-frequency (RF)-based services and/or distribution of one or more digital data services. The remote units in the distributed antenna systems may be configured to transmit and receive wireless communication signal at one or more frequencies, including but not limited to extremely high frequencies (EHF) (i.e., approximately 30 GHz – approximately 300 GHz). The distributed antenna systems may include, without limitation, wireless local area networks (WLANs). Further, as a non-limiting example, the distributed antenna systems may be an optical fiber-based distributed antenna system, but such is not required. An optical fiber-based distributed antenna system may employ Radio-over-Fiber (RoF) communications. The embodiments disclosed herein are also

applicable to other remote antenna clusters and distributed antenna systems, including those that include other forms of communications media for distribution of communications signals, including electrical conductors and wireless transmission. For example, the distributed antenna systems may include electrical and/or wireless communications mediums between a central unit and remote units in addition or in lieu of optical fiber communications medium. The embodiments disclosed herein may also be applicable to remote antenna clusters and distributed antenna systems and may also include more than one communications media for distribution of communications signals (e.g., digital data services, RF communications services). The communications signals in the distributed antenna system may or may not be frequency shifted.

[0015] It is to be understood that both the foregoing general description and the following detailed description present embodiments, and are intended to provide an overview or framework for understanding the nature and character of the disclosure. The drawings illustrate various embodiments, and together with the description serve to explain the principles and operation of the concepts disclosed.

BRIEF DESCRIPTION OF THE FIGURES

[0016] FIG. 1 is a schematic of an exemplary distributed antenna system;

[0017] FIG. 2 is a schematic diagram of an exemplary multiple-in, multiple-out (MIMO) optical fiber-based distributed antenna system;

[0018] FIG. 3A is a top view diagram of a room having an exemplary MIMO antenna system comprising two (2) MIMO transmitter antennas in line-of-sight (LOS) with two (2) MIMO receiver antennas to illustrate interference in MIMO communication signals received in the same frequency channel by the MIMO receiver antennas that can cause a MIMO algorithm to fail to solve the channel matrix;

[0019] FIG. 3B is a graph illustrating exemplary measured performance degradation for a given placement distance between the MIMO transmitter antennas in the MIMO antenna system in FIG. 3A;

[0020] FIG. 3C is a graph illustrating an exemplary effective antenna coverage area in proximity to the MIMO transmitter antennas in FIG. 3A;

[0021] FIG. 4A is a schematic diagram of an exemplary MIMO optical fiber-based distributed antenna system employing a central unit employing a MIMO transmitter

configured to electrically phase shift at least one transmitted MIMO electrical downlink communications signal received and transmitted by a remote unit employing multiple MIMO transmitters each configured with multiple MIMO transmitter antennas configured to transmit in different polarization states;

[0022] FIG. 4B is a schematic diagram of an exemplary MIMO optical fiber-based distributed antenna system employing an optical phase shifter in an optical downlink communications medium configured to optically phase shift at least one transmitted MIMO electrical downlink communications signal received and transmitted by a remote unit employing multiple MIMO transmitters each configured with multiple MIMO transmitter antennas configured to transmit in different polarization states;

[0023] FIG. 4C is a schematic diagram of an exemplary MIMO optical fiber-based distributed antenna system employing remote units employing multiple MIMO transmitters each employing multiple MIMO transmitter antennas configured to transmit in different polarization states, wherein one of the MIMO electrical downlink communications signals transmitted by one of the MIMO transmitters in a polarization state is electrically phase shifted;

[0024] FIG. 5A is a graph illustrating exemplary measured performance degradation for a given placement distance between MIMO transmitter antennas in a MIMO transmitter in a remote unit in the distributed antenna systems in FIGS. 4A-4C, when employing and not employing phase shifting of at least one transmitted downlink communications signals;

[0025] FIG. 5B is a graph illustrating an exemplary effective antenna coverage area in proximity to the MIMO transmitter antennas of a remote unit in the distributed antenna systems in FIGS. 4A-4C;

[0026] FIG. 5C is a graph illustrating an exemplary effective antenna coverage versus placement distance between MIMO transmitter antennas in a MIMO transmitter in a remote unit in the distributed antenna systems in FIGS. 4A-4C, for a given first placement distance between MIMO receiver antennas, when employing and not employing phase shifting of at least one transmitted downlink communications signals;

[0027] FIG. 5D is a graph illustrating an exemplary effective antenna coverage versus placement distance between MIMO transmitter antennas in a MIMO transmitter in a remote unit in the distributed antenna systems in FIGS. 4A-4C, for a given second

placement distance between MIMO receiver antennas, when employing and not employing phase shifting of at least one transmitted downlink communications signal;

[0028] FIG. 6 is a schematic diagram of an exemplary remote unit in a MIMO distributed antenna system, wherein the remote unit employs multiple MIMO transmitters, and wherein at least one of the MIMO transmitters provides an offset between its multiple MIMO transmitters antennas configured to transmit in different polarization states;

[0029] FIG. 7A is a graph illustrating an exemplary effective antenna coverage versus placement distance between MIMO transmitter antennas in a MIMO transmitter of the remote unit in FIG. 6, for a given first placement distance between MIMO receiver antennas, when employing and not employing placement offset between the MIMO transmitter antennas;

[0030] FIG. 7B is a graph illustrating an exemplary effective antenna coverage versus placement distance between MIMO transmitter antennas in a MIMO transmitter of the remote unit in FIG. 6, for a given second placement distance between MIMO receiver antennas, when employing and not employing placement offset between MIMO transmitter antennas;

[0031] FIG. 7C is a graph illustrating an exemplary effective antenna coverage for a given placement distance between MIMO transmitter antennas, in a MIMO transmitter of the remote unit in FIG. 6, for a given placement distance between MIMO receiver antennas, when employing and not employing placement offset between MIMO transmitter antennas; and

[0032] FIG. 8 is a schematic diagram of a generalized representation of an exemplary controller that can be included in any central unit, remote units, wireless client devices, and/or any other components of distributed antenna systems to reduce or eliminate issues with a MIMO algorithm solving the channel matrix for transmitted MIMO electrical downlink communications signals.

DETAILED DESCRIPTION

[0033] Reference will now be made in detail to the embodiments, examples of which are illustrated in the accompanying drawings, in which some, but not all embodiments are shown. Indeed, the concepts may be embodied in many different forms and should not be construed as limiting herein; rather these embodiments are provided so that this disclosure

will satisfy applicable legal requirements. Whenever possible, like reference numbers will be used to refer to like components or parts.

[0034] Components, systems, and methods for reducing location-based interference in distributed antenna systems operating in multiple-input, multiple-output (MIMO) configuration are disclosed. The distributed antenna systems include remote units employing MIMO transmitters configured to transmit multiple data streams in MIMO configuration to MIMO receivers in wireless client devices. Interference is defined as issues with received MIMO communications signals that can cause a MIMO algorithm to not be able to solve a channel matrix for MIMO communications signals received by MIMO receivers in client devices. These issues can occur due to lack of spatial (i.e., phase) separation in the received MIMO communications signals, especially with closely located MIMO transmitters configured for line-of-sight (LOS) communications. Thus, to provide phase separation of MIMO communication signals received by MIMO receivers in client devices, multiple MIMO transmitters in a remote unit are each configured to employ multiple transmitter antennas, that are each configured to transmit in different polarization states. In certain embodiments, one of the MIMO communications signals is phase shifted in one of the polarization states to provide phase separation between MIMO communication signals received by the MIMO receivers. In other embodiments, multiple transmitter antennas in a MIMO transmitter can be offset to provide phase separation.

[0035] Before discussing examples of components, systems, and methods for reducing location-based interference in distributed antenna systems operating in MIMO configuration starting at **FIG. 4A**, an exemplary distributed antenna system is described in regard to **FIGS. 1-3C**. In this regard, **FIG. 1** is a schematic diagram of a conventional distributed antenna system **10**. The distributed antenna system **10** is an optical fiber-based distributed antenna system. The distributed antenna system **10** is configured to create one or more antenna coverage areas for establishing communications with wireless client devices located in the radio frequency (RF) range of the antenna coverage areas. In an exemplary embodiment, the distributed antenna system **10** may provide RF communication services (e.g., cellular services). As illustrated, the distributed antenna system **10** includes a central unit **12**, one or more remote units **14**, and an optical fiber **16** that optically couples the central unit **12** to the remote unit **14**. The central unit **12** may also be referred to as a head-end unit. The remote unit **14** is a type of remote

communications unit, and may also be referred to as a “remote antenna unit.” In general, a remote communications unit can support wireless communications or wired communications, or both. The central unit **12** is configured to receive communications over downlink electrical RF signals **18D** from a source or sources, such as a network or carrier as examples, and provide such communications to the remote unit **14**. The central unit **12** is also configured to return communications received from the remote unit **14**, via uplink electrical RF signals **18U**, back to the source or sources. In this regard, in this embodiment, the optical fiber **16** includes at least one downlink optical fiber **16D** to carry signals communicated from the central unit **12** to the remote unit **14** and at least one uplink optical fiber **16U** to carry signals communicated from the remote unit **14** back to the central unit **12**.

[0036] One downlink optical fiber **16D** and one uplink optical fiber **16U** could be provided to support multiple full-duplex channels each using wave-division multiplexing (WDM), as discussed in U.S. Patent Application No. 12/892,424, entitled “Providing Digital Data Services in Optical Fiber-based Distributed Radio Frequency (RF) Communications Systems, And Related Components and Methods,” incorporated herein by reference in its entirety. Other options for WDM and frequency-division multiplexing (FDM) are also disclosed in U.S. Patent Application No. 12/892,424, any of which can be employed in any of the embodiments disclosed herein. Further, U.S. Patent Application No. 12/892,424 also discloses distributed digital data communications signals in a distributed antenna system which may also be distributed in the distributed antenna system **10** either in conjunction with the RF communications signals or not.

[0037] The distributed antenna system **10** has an antenna coverage area **20** that can be disposed about the remote unit **14**. The antenna coverage area **20** of the remote unit **14** forms an RF coverage area **21**. The central unit **12** is adapted to perform or to facilitate any one of a number of Radio-over-Fiber (RoF) applications, such as RF identification (RFID), wireless local-area network (WLAN) communication, or cellular phone service. Shown within the antenna coverage area **20** is a client device **24** in the form of a mobile device, which may be a cellular telephone as an example. The client device **24** can be any device that is capable of receiving RF communications signals. The client device **24** includes an antenna **26** (e.g., a wireless card) adapted to receive and/or send electromagnetic RF signals.

[0038] With continuing reference to **FIG. 1**, to communicate the electrical RF signals over the downlink optical fiber **16D** to the remote unit **14**, to in turn be communicated to the client device **24** in the antenna coverage area **20** formed by the remote unit **14**, the central unit **12** includes a radio interface in the form of an electrical-to-optical (E/O) converter **28**. The E/O converter **28** converts the downlink electrical RF signals **18D** to downlink optical RF signals **22D** to be communicated over the downlink optical fiber **16D**. The remote unit **14** includes an optical-to-electrical (O/E) converter **30** to convert the received downlink optical RF signals **22D** back to electrical RF signals to be communicated wirelessly through an antenna **32** of the remote unit **14** to the client device **24** located in the antenna coverage area **20**.

[0039] Similarly, the antenna **32** is also configured to receive wireless RF communications from the client device **24** in the antenna coverage area **20**. In this regard, the antenna **32** receives wireless RF communications from the client device **24** and communicates electrical RF signals representing the wireless RF communications to an E/O converter **34** in the remote unit **14**. The E/O converter **34** converts the electrical RF signals into uplink optical RF signals **22U** to be communicated over the uplink optical fiber **16U**. An O/E converter **36** provided in the central unit **12** converts the uplink optical RF signals **22U** into uplink electrical RF signals, which can then be communicated as uplink electrical RF signals **18U** back to a network or other source.

[0040] As noted, one or more of the network or other sources can be a cellular system, which may include a base station or base transceiver station (BTS). The BTS may be provided by a second party such as a cellular service provider, and can be co-located or located remotely from the central unit **12**.

[0041] In a typical cellular system, for example, a plurality of BTSs is deployed at a plurality of remote locations to provide wireless telephone coverage. Each BTS serves a corresponding cell and when a mobile client device enters the cell, the BTS communicates with the mobile client device. Each BTS can include at least one radio transceiver for enabling communication with one or more subscriber units operating within the associated cell. As another example, wireless repeaters or bi-directional amplifiers could also be used to serve a corresponding cell in lieu of a BTS. Alternatively, radio input could be provided by a repeater, picocell, or femtocell, as other examples. In a particular

exemplary embodiment, cellular signal distribution in the frequency range from 400 MHz to 2.7 GHz is supported by the distributed antenna system **10**.

[0042] Although the distributed antenna system **10** in **FIG. 1** allows for distribution of radio frequency (RF) communications signals; the distributed antenna system **10** is not limited to distribution of RF communications signals. Data communications signals, including digital data signals, for distributing data services could also be distributed in the distributed antenna system **10** in lieu of or in addition to RF communications signals. Also note that while the distributed antenna system **10** in **FIG. 1** discussed below includes distribution of communications signals over optical fiber, the distributed antenna system **10** is not limited to distribution of communications signals over optical fiber. Distribution media could also include, but are not limited to, coaxial cable, twisted-pair conductors, wireless transmission and reception, and any combination thereof. Also, any combination can be employed that also involves optical fiber for portions of the distributed system.

[0043] A distributed antenna system, including the distributed antenna system **10** in **FIG. 1**, can be configured in MIMO configuration for MIMO operation. In this regard, **FIG. 2** illustrates a schematic diagram of an exemplary MIMO optical fiber-based distributed antenna system **40** (hereinafter referred to as “MIMO distributed antenna system **40**”). The MIMO distributed antenna system **40** is configured to operate in MIMO configuration. MIMO technology involves the use of multiple antennas at both a transmitter and receiver to improve communication performance. In this regard, a central unit **42** is provided that is configured to distribute downlink communications signals to one or more remote units **44**. **FIG. 2** only illustrates one remote unit **44**, but note that a plurality of remote units **44** is typically provided. The remote units **44** are configured to wirelessly communicate the downlink communication signals to one or more client devices **46** that are in communication range of the remote unit **44**. The remote units **44** may also be referred to as “remote antenna units **44**” because of their wireless transmission over antenna functionality. The remote unit **44** is also configured to receive uplink communication signals from the client devices **46** to be distributed to the central unit **42**. In this embodiment, an optical fiber communications medium **47** comprising at least one downlink optical fiber **48D** and at least one uplink optical fiber **48U** is provided to commutatively couple the central unit **42** to the remote units **44**. The central unit **42** is also configured to receive uplink communication signals from the remote units **44** via the

optical fiber communications medium **47**, although more specifically over the at least one uplink optical fiber **48U**. The client device **46** in communication with the remote unit **44** can provide uplink communication signals to the remote unit **44** which are then distributed over the optical fiber communications medium **47** to the remote unit **44** to be provided to a network or other source, such as a base station for example.

[0044] With continuing reference to **FIG. 2**, more detail will be discussed regarding the components of the central unit **42**, the remote unit **44**, and the client device **46** and the distribution of downlink communications signals. The central unit **42** is configured to receive electrical downlink MIMO communication signals **50D** from outside the MIMO distributed antenna system **40** in a signal processor **52** and provide electrical uplink communications signals **50U** received from client devices **46**, to other systems. The signal processor **52** is configured to provide the electrical downlink communication signals **50D** to a mixer **60**, which may be an IQ signal mixer in this example. The mixer **60** in this embodiment is configured to convert the electrical downlink MIMO communication signals **50D** to IQ signals. The mixer **60** is driven by a frequency signal **56** that is provided by a local oscillator **58**. Frequency conversion is optional. In this embodiment, it is desired to up-convert the frequency of the electrical downlink MIMO communication signals **50D** to a higher frequency to provide electrical downlink MIMO communication signals **66D** to provide for a greater bandwidth capability before distributing the electrical downlink MIMO communications signals **66D** to the remote units **44**. For example, the up-conversion carrier frequency may be provided as an extremely high frequency (e.g. approximately 30 GHz to 300GHz).

[0045] With continuing reference to **FIG. 2**, because the communication medium between the central unit **42** and the remote unit **44** is the optical fiber communications medium **47**, the electrical downlink MIMO communication signals **66D** are converted to optical signals by an electro-optical converter **67**. The electro-optical converter **67** includes components to receive a light wave **68** from a light source **70**, such as a laser. The light wave **68** is modulated by the frequency oscillations in the electrical downlink MIMO communication signals **66D** to provide optical downlink MIMO communication signals **72D** to be communicated over the downlink optical fiber **48D** to the remote unit **44**. The electro-optical converter **67** may be provided so that the electrical downlink

MIMO communication signals **66D** are provided as radio-over-fiber (RoF) communications signals over the downlink optical fiber **48D**.

[0046] With continuing reference to **FIG. 2**, the optical downlink MIMO communication signals **72D** are received by an optical bi-directional amplifier **74**, which is then provided to a MIMO splitter **76** in the remote unit **44**. The MIMO splitter **76** is provided so that the optical downlink MIMO communication signals **72D** can be split among two separate communication paths **77(1)**, **77(2)** to be radiated over two separate MIMO transmitter antennas **78(1)**, **78(2)** provided in two separate MIMO transmitters **79(1)**, **79(2)** configured in MIMO configuration. The MIMO splitter **76** in the remote unit **44** is an optical splitter since the received optical downlink MIMO communication signals **72D** are optical signals. In each communication path **77(1)**, **77(2)**, optical-to-electrical converters **80(1)**, **80(2)** are provided to convert the optical downlink MIMO communication signals **72D** to electrical downlink MIMO communication signals **82D(1)**, **82D(2)**. In this embodiment, as will be discussed in more detail below, a delay element **84** is provided in one of the transmission paths **77(1)**, **77(2)** to phase shift one of the optical downlink MIMO communication signals **72D(1)**, **72D(2)** transmitted over one of the MIMO transmitter antennas **78(1)**, **78(2)** to reduce or eliminate issues with a MIMO algorithm solving the channel matrix for received electrical downlink MIMO communication signals **82D** by the client device **46**.

[0047] With continuing reference to **FIG. 2**, the client device **46** includes two MIMO receivers **85(1)**, **85(2)** that include MIMO receiver antennas **86(1)**, **86(2)** also configured in MIMO configuration. The MIMO receiver antennas **86(1)**, **86(2)** are configured to receive the electrical downlink MIMO communication signals **82D(1)**, **82D(2)** wirelessly from the remote unit **44**. Mixers **88(1)**, **88(2)** are provided and coupled to the MIMO receiver antennas **86(1)**, **86(2)** in the client device **46** to provide frequency conversion of the electrical downlink MIMO communication signals **82D(1)**, **82D(2)**. In this regard, a local oscillator **90** is provided that is configured to provide oscillation signals **92(1)**, **92(2)** to the mixers **88(1)**, **88(2)**, respectively, for frequency conversion. In this embodiment, the electrical downlink MIMO communications signals **82D(1)**, **82D(2)** are down converted back to their native frequency as received by the central unit **42**. The down converted electrical downlink MIMO communication signals **82D(1)**, **82D(2)** are then provided to a signal analyzer **92** in the client device **46** for any processing desired.

[0048] FIG. 3A illustrates a top view of a room 100 employing the exemplary MIMO distributed antenna system 40 in FIG. 2 to discuss performance of MIMO communications as affected by antenna placement. As illustrated in FIG. 3A, the two MIMO transmitter antennas 78(1), 78(2) of the remote unit 44 are shown as being located in the room 100. Similarly, a client device 46 is shown with its two MIMO receiver antennas 86(1), 86(2) configured to receive the electrical downlink MIMO communication signals 82D(1), 82D(2) from the two MIMO transmitter 81(1), 81(2) (FIG. 2) in MIMO configuration. The MIMO transmitter antennas 78(1), 78(2) in the MIMO transmitter 81(1), 81(2) in the remote unit 44 are separated by a distance D_1 . The MIMO receiver antennas 86(1), 86(2) in the client device 46 are separated by a distance D_2 . Issues can arise with MIMO algorithm being able to solve the channel matrix for received electrical downlink MIMO communication signals 82D(1), 82D(2) at the client device 46 as a function of the distance between the MIMO transmitter antennas 78(1), 78(2) in the remote unit 44, the distance between MIMO receiver antennas 86(1), 86(2) in the client device 46, and the distance D_3 between remote unit 44 and the client device 46. These issues are also referred to herein as interference issues.

[0049] A MIMO algorithm not being able to solve a channel matrix for the received electrical downlink MIMO communication signals 82D(1), 82D(2) can negatively affect communications performance. These issues with electrical downlink MIMO communication signals 82D(1), 82D(2) received by the MIMO receiver antennas 86(1), 86(2) can occur due to lack of spatial (i.e., phase) separation in the received electrical downlink MIMO communication signals 82D(1), 82D(2), especially in line-of-sight (LOS) communications. To illustrate the effect of these issues, FIG. 3B illustrates a graph 102 illustrating the exemplary measured performance degradation for a given placement distance between the MIMO transmitter antennas 78(1), 78(2) in FIG. 3A. The graph 102 in FIG. 3B illustrates the capacity on the y-axis in Gigabits per second (Gbs/s) versus the MIMO transmitter antennas 78(1), 78(2) separation distance D_1 in centimeters. As illustrated in the graph 102, at separation distances D_1 of approximately 42 centimeters (cm) and 85 cm, the communications capacity illustrated by a capacity curve 104 is severely degraded for the received electrical downlink MIMO communication signals 82D(1), 82D(2) by the MIMO receiver antennas 86(1), 86(2). Even at other distances, the capacity is severely degraded, as illustrated in the capacity curve 104. A degradation

curve **106** in **FIG. 3B** illustrates the effect of a MIMO algorithm not being able to solve a channel matrix, which is complementary to the capacity curve **104**.

[0050] **FIG. 3C** illustrates a graph **108** representing an exemplary effective communication coverage area provided by the distributed antenna system **40** in **FIG. 2** according to the MIMO transmitter antennas **78(1)**, **78(2)**, separation distance D_1 , the MIMO receiver antennas **86(1)**, **86(2)**, separation distance D_2 in **FIG. 3A**, and distance therebetween D_3 . As illustrated in **FIG. 3C**, a desired antenna coverage area **109** is shown as being provided by the area formed inside a boundary line **110**. However, an actual communication coverage area **113** for the remote unit **44** is provided inside the boundary line **112**, illustrating the effect in reduction communication range of the remote unit **44**.

[0051] To address these issues, **FIGS. 4A-7C** are provided to illustrate exemplary distributed antenna systems configured to reduce location-based interference in distributed antenna systems operating in multiple-input, multiple-output (MIMO) configuration. In these embodiments, to provide phase separation of MIMO communication signals received by MIMO receivers in client devices, multiple MIMO transmitters in a remote unit are each configured to employ multiple transmitter antennas. The multiple transmitter antennas are each configured to transmit communications signals in different polarization states. In certain embodiments, one of the MIMO communications signals is phase shifted in one of the polarization states to provide phase separation between MIMO communication signals received by the MIMO receivers.

[0052] In this regard, **FIG. 4A** illustrates an alternative MIMO distributed antenna system **40(1)** similar to the MIMO distributed antenna system **40** in **FIG. 2**. The MIMO distributed antenna system **40(1)** in **FIG. 4A** is configured to reduce or eliminate the inability of a MIMO algorithm not being able to solve a channel matrix of received downlink communication signals at a MIMO receiver in a client device based on the separation distance between MIMO transmitter antennas in a MIMO transmitter of a remote unit to reduce or eliminate performance degradation such as shown in **FIGS. 3B** and **3C** above. The MIMO distributed antenna system **40(1)** may include the same components in the MIMO distributed antenna system **40** in **FIG. 2** unless otherwise noted in **FIG. 4A**.

[0053] With continuing reference to **FIG. 4A**, a central unit **42(1)** is configured to receive the electrical downlink MIMO communications signals **50D** as discussed in regard

to FIG. 2. However, a signal processor **52(1)** is configured to split the electrical downlink MIMO communications signals **50D** into four (4) electrical downlink MIMO communications signals **50D(1)-50D(4)** over four separate channels. A delay element **122** is provided in the central unit **42(1)** to phase shift at least one of the electrical downlink MIMO communications signals **50D**. Note that although the electrical downlink MIMO communications signal **50D(4)** in this example, any other(s) downlink MIMO communications signal(s) **50D(1)-50D(3)** could be phase shifted. The delay element **122** may be a tunable delay element that can be programmed or controlled to control the amount of phase shift, if desired. As will be discussed in more detail below, the phase shifting of one of the electrical downlink MIMO communications signals **50D** will allow one of the polarization states provided by one of MIMO transmitters in a remote unit **44(1)** to include phase separation between first through fourth electrical downlink MIMO communication signals **82D(1)-82D(4)** that are received by the MIMO receivers to reduce or eliminate the inability of a MIMO algorithm to solve a channel matrix. Turning back to the central unit **42(1)**, electro-optical converters **67(1)-67(4)** are provided to convert the electrical downlink MIMO communications signals **50D(1)-50D(4)** into optical downlink MIMO communications signals **72D(1)-72D(4)** provided over optical fiber communications medium **47(1)**.

[0054] With continuing reference to FIG. 4A, the remote unit **44(1)** includes two MIMO transmitters **124(1), 124(2)** in MIMO configuration. However, the MIMO transmitters **124(1), 124(2)** each include two MIMO transmitter antennas **126(1)(1), 126(1)(2), and 126(2)(1), 126(2)(2)**. The first MIMO transmitter **124(1)** includes the first MIMO transmitter antenna **126(1)(1)** configured to radiate the first electrical downlink MIMO communications signals **82D(1)** (after conversion from optical to electrical signals) in a first polarization **128(1)**, as indicated in FIG. 4A. The first MIMO transmitter **124(1)** also includes the second MIMO transmitter antenna **126(1)(2)** configured to radiate the second electrical downlink MIMO communications signal **82D(2)** in a second polarization **128(2)** different from the first polarization **128(1)**. In this manner, the first and second electrical downlink MIMO communications signals **82D(1), 82D(2)** can be received by two different MIMO receiver antennas **130(1), 130(2)** in MIMO receivers **132(1), 132(2)**, respectively, each configured to receive signals in different polarizations **128(1), 128(2)** among the first and second polarizations **128(1), 128(2)** without the MIMO algorithm

being unable to solve the channel matrix. Thus, the MIMO receivers **132(1)**, **132(2)** can receive the first and second electrical downlink MIMO communications signal **82D(1)**, **82D(2)** in different polarizations **128(1)**, **128(2)**, respectively, from the first MIMO transmitter **124(1)** so that a MIMO algorithm can solve the channel matrix for the first and second electrical downlink MIMO communications signal **82D(1)**, **82D(2)**. In this embodiment, the first polarization **128(1)** is configured to be orthogonal to the second polarization **128(2)** to maximize avoidance of the MIMO receivers **132(1)**, **132(2)** receiving the incorrect electrical downlink MIMO communications signal **82D(1)**, **82D(2)**, but this configuration is not required.

[0055] With continuing reference to **FIG. 4A**, the second MIMO transmitter **124(2)** in the remote unit **44(1)** includes a third MIMO transmitter antenna **126(2)(1)** configured to radiate the third electrical downlink MIMO communications signals **82D(3)** (after conversion from optical to electrical signals) in the first polarization **128(1)**, as indicated in **FIG. 4A**. The second MIMO transmitter **124(2)** also includes the fourth MIMO transmitter antenna **126(2)(2)** configured to radiate the fourth electrical downlink MIMO communications signal **82D(4)** in the second polarization **128(2)** different from the first polarization **128(1)**. In this manner, the third and fourth electrical downlink MIMO communications signals **82D(3)**, **82D(4)** can also be received by the two different MIMO receiver antennas **130(1)**, **130(2)** in MIMO receivers **132(1)**, **132(2)**, respectively, each configured to receive signals in different polarizations **128(1)**, **128(2)** among the first and second polarizations **128(1)**, **128(2)**. Thus, the MIMO receivers **132(1)**, **132(2)** can receive the third and fourth electrical downlink MIMO communications signal **82D(3)**, **82D(4)** in different polarizations, respectively, from the second MIMO transmitter **124(2)** between the third and fourth electrical downlink MIMO communications signal **82D(3)**, **82D(4)**. The electrical downlink MIMO communications signals **82D(1)**-**82D(4)** are received by the MIMO receivers **132(1)**, **132(2)** and provided to a signal processor **134** and a MIMO processor **136** for processing.

[0056] As previously discussed above, the delay element **122** is provided in the central unit **42(1)** to phase shift the electrical downlink MIMO communications signal **50D(4)**. This phase shift in turn causes the second and fourth electrical downlink MIMO communications signals **82D(2)**, **82D(4)** to be received by the second MIMO receiver antennas **130(2)** out of phase with the receipt of the first and third electrical downlink

MIMO communications signals **82D(1)**, **82D(3)** by the first MIMO receiver **132(1)** which are in the first polarization **128(1)**. This reduces or eliminate the first and third electrical downlink MIMO communications signals **82D(1)**, **82D(3)** being received by the first MIMO receiver **132(1)** and the second and fourth electrical downlink MIMO communications signals **82D(2)**, **82D(4)** being received by the second MIMO receiver **132(2)**.

[0057] The phase shift can be provided in other areas of a MIMO distributed antenna system other than in the central unit, as provided in the MIMO distributed antenna system **40(1)** in **FIG. 4A**. In this regard, **FIG. 4B** is a schematic diagram of another MIMO optical fiber-based distributed antenna system **40(2)** (“MIMO distributed antenna system **40(2)**”) employing a delay element **140** in the form of an optical phase shifter in the optical fiber communications medium **47(1)**. The delay element **140** can be tunable to allow for the phase shift to be controlled and tuned. The delay element **140** may be an additional length of optical fiber to make the corresponding downlink optical fibers in the optical fiber communications medium **47(1)** carrying the optical downlink MIMO communications signal **72D(1)** longer than the other downlink optical fibers of the optical fiber communications medium **47(1)**. Common elements between the MIMO distributed antenna system **40(1)** in **FIG. 4A** and the MIMO distributed antenna system **40(2)** in **FIG. 4B** are noted with common element numbers and will not be re-described. In this embodiment, the delay element **140** is configured to optically phase shift the optical downlink MIMO communications signal **72D(4)** received by the second MIMO transmitter **124(2)** and transmitted by the second MIMO transmitter **124(2)** to the client device **46(1)**. The central unit **42(2)** in **FIG. 4B** does not include a delay element to phase shift downlink electrical communications signals like provided in the central unit **42(1)** in **FIG. 4A**.

[0058] As previously discussed above with regard to **FIGS. 4A** and **4B**, a delay element can be provided in the central unit **42(1)**, **42(2)** and/or the optical fiber communications medium **47(1)** to phase shift the electrical downlink MIMO communications signal **50D(4)**. In this regard, **FIG. 4C** is a schematic diagram of another MIMO optical fiber-based distributed antenna system **40(3)** (“MIMO distributed antenna system **40(3)**”) employing a delay element **142** in the form of an electrical phase shifter in the remote unit **44(2)**. Common elements between the MIMO distributed antenna system

40(3) in **FIG. 4C** and the MIMO distributed antenna systems **40(1)**, **40(2)** in **FIGS. 4A** and **4B** are noted with common element numbers and will not be re-described. In this embodiment, a signal processor **144** in the remote unit **44(2)** receives the optical downlink MIMO communications signals **72D(1)-72D(4)** and converts these signals into electrical downlink MIMO communications signals **82D(1)-82D(4)** in an optical-to-electrical converter. The delay element **142** is configured to electrically phase shift the electrical downlink MIMO communications signal **82D(4)** received and transmitted by the second MIMO transmitter **124(2)** in the remote unit **44(2)** to the client device **46(1)** so that a MIMO algorithm can solve the channel matrix for the electrical downlink MIMO communications signal **82D(1)-82D(4)**.

[0059] To illustrate the performance in the MIMO distributed antenna systems **40(1)-40(3)** in **FIGS. 4A-4C**, **FIG. 5A** illustrates a graph **150** illustrating the exemplary measured performance degradation for a given placement distance between the MIMO transmitters **124(1)**, **124(2)**. The graph **102** in **FIG. 3B** illustrates the capacity on the y-axis in Gigabits per second (Gbs/s) versus the MIMO transmitter antennas **78(1)**, **78(2)** separation distance in centimeters. As illustrated in the graph **150**, for a given separation distance the communications capacity illustrated by a capacity curve **152** is not substantially degraded for received electrical downlink MIMO communication signals **82D(1)**, **82D(2)** by the MIMO receiver antennas **86(1)**, **86(2)**. The degradation curve **154** in **FIG. 5A** illustrates the effect of a MIMO algorithm having issues solving a channel matrix that may be present when techniques described above for MIMO distributed antenna systems **40(1)-40(3)** are not employed. **FIG. 5B** illustrates a graph **160** representing an exemplary effective communication coverage area provided by the MIMO distributed antenna systems **40(1)-40(3)** in **FIGS. 4A-4C** according to the MIMO transmitter **124(1)**, **124(2)** separated by a given distance. As illustrated in **FIG. 5B**, a desired antenna coverage area **162** is shown as being provided by the area formed inside the boundary line **164**.

[0060] **FIG. 5C** is a graph **170** illustrating an exemplary effective antenna coverage versus placement distance between MIMO transmitters **124(1)**, **124(2)** in the distributed antenna systems **40(1)-40(3)** in **FIGS. 4A-4C**, for a two (2) cm placement distance between the MIMO receivers **132(1)**, **132(2)**. **FIG. 5D** is a graph **180** illustrating an exemplary effective antenna coverage versus placement distance between MIMO

transmitters **124(1)**, **124(2)** in the distributed antenna systems **40(1)-40(3)** in **FIGS. 4A-4C**, for a 10 cm placement distance between the MIMO receivers **132(1)**, **132(2)**. Coverage curves **172**, **182** illustrate the capacity when the techniques described above for the MIMO distributed antenna systems **40(1)-40(3)** are employed. Coverage curves **174**, **184** illustrate the capacity that may be present when the techniques described above for the MIMO distributed antenna systems **40(1)-40(3)** are not employed.

[0061] Other configurations and techniques may also be possible to provide phase separation of MIMO communication signals received by MIMO receivers in client devices, multiple MIMO transmitters in a remote unit are each configured to employ multiple transmitter antennas. In this regard, **FIG. 6** is a schematic diagram of another exemplary remote unit **44(3)** that provides phase separation of the downlink electrical MIMO communication signals **82D(1)-82D(4)** received by the MIMO receivers **132(1)**, **132(2)**. The remote unit **44(3)** may be employed in a MIMO distributed antenna system, including the MIMO distributed antenna systems **40(1)-40(3)** described in **FIGS. 4A-4C** above. Common elements between the components in **FIG. 6** and the MIMO distributed antenna systems **40(1)-40(3)** in **FIGS. 4A-4C** are noted with common element numbers and will not be re-described. In this embodiment, instead of providing a delay element to provide phase shift, the MIMO transmitter antennas **126(1)(1)**, **126(1)(2)** in the MIMO transmitter **124(1)**, **124(2)** are offset in distance at distance D_4 . A small offset distance may be sufficient to significantly improve capacity. This separation distance provides a phase shift in the electrical downlink MIMO communications signal **82D(1)**.

[0062] **FIG. 7A** is a graph **190** illustrating an exemplary effective antenna coverage versus placement distance between MIMO transmitters **124(1)**, **124(2)** in a MIMO distributed antenna system **40(1) – 40(3)** employing the remote unit **44(3)** in **FIG. 6**, for a two (2) cm placement distance between the MIMO receivers **132(1)**, **132(2)**. **FIG. 7B** is a graph **200** illustrating an exemplary effective antenna coverage versus placement distance between MIMO transmitters **124(1)**, **124(2)** in a MIMO distributed antenna system **40(1) – 40(3)** employing the remote unit **44(3)** in **FIG. 6**, for a ten (10) cm placement distance between the MIMO receivers **132(1)**, **132(2)**. Coverage curves **192**, **202** illustrate the capacity when the remote unit **44(3)** is employed. Coverage curves **194**, **204** illustrate the capacity that may be present when the techniques described above for the MIMO distributed antenna systems **40(1)-40(3)** and the remote unit **44(3)** are not employed. **FIG.**

7C is a graph **210** illustrating an exemplary effective antenna coverage for a given offset distance between MIMO transmitter antennas **126(1)(1)**, **126(1)(2)** in the first MIMO transmitter **124(1)** of the remote unit **44(3)** in FIG. 6.

[0063] It may also be desired to provide high-speed wireless digital data service connectivity with remote units in the MIMO distributed antenna systems disclosed herein. One example would be WiFi. WiFi was initially limited in data rate transfer to 12.24 Mb/s and is now provided at data transfer rates of up to 54 Mb/s using WLAN frequencies of 2.4 GHz and 5.8 GHz. While interesting for many applications, WiFi has proven to have too small a bandwidth to support real time downloading of uncompressed high definition (HD) television signals to wireless client devices. To increase data transfer rates, the frequency of wireless signals could be increased to provide larger channel bandwidth. For example, an extremely high frequency in the range of 30 GHz to 300 GHz could be employed. For example, the sixty (60) GHz spectrum is an EHF that is an unlicensed spectrum by the Federal Communications Commission (FCC) and that could be employed to provide for larger channel bandwidths. However, high frequency wireless signals are more easily attenuated or blocked from traveling through walls or other building structures where distributed antenna systems are installed.

[0064] Thus, the embodiments disclosed herein can include distribution of extremely high frequency (EHF) (i.e., approximately 30 – approximately 300 GHz), as a non-limiting example. The MIMO distributed antenna systems disclosed herein can also support provision of digital data services to wireless clients. The use of the EHF band allows for the use of channels having a higher bandwidth, which in turn allows more data intensive signals, such as uncompressed HD video to be communicated without substantial degradation to the quality of the video. As a non-limiting example, the distributed antenna systems disclosed herein may operate at approximately sixty (60) GHz with approximately seven (7) GHz bandwidth channels to provide greater bandwidth to digital data services. The distributed antenna systems disclosed herein may be well suited to be deployed in an indoor building or other facility for delivering of digital data services.

[0065] It may be desirable to provide MIMO distributed antenna systems, according to the embodiments disclosed herein, that provide digital data services for client devices. For example, it may be desirable to provide digital data services to client devices located within a distributed antenna system. Wired and wireless devices may be located in the

building infrastructures that are configured to access digital data services. Examples of digital data services include, but are not limited to, Ethernet, WLAN, WiMax, WiFi, DSL, and LTE, etc. Ethernet standards could be supported, including but not limited to, 100 Mb/s (i.e., fast Ethernet) or Gigabit (Gb) Ethernet, or ten Gigabit (10G) Ethernet. Examples of digital data services include, but are not limited to, wired and wireless servers, wireless access points (WAPs), gateways, desktop computers, hubs, switches, remote radio heads (RRHs), baseband units (BBUs), and femtocells. A separate digital data services network can be provided to provide digital data services to digital data devices.

[0066] FIG. 8 is a schematic diagram representation of additional detail illustrating components that could be employed in any of the components or devices disclosed herein, but only if adapted to execute instructions from an exemplary computer-readable medium to perform any of the functions or processing described herein. In this regard, such component or device may include a computer system **220** within which a set of instructions for performing any one or more of the location services discussed herein may be executed. The computer system **220** may be connected (e.g., networked) to other machines in a LAN, an intranet, an extranet, or the Internet. While only a single device is illustrated, the term “device” shall also be taken to include any collection of devices that individually or jointly execute a set (or multiple sets) of instructions to perform any one or more of the methodologies discussed herein. The computer system **220** may be a circuit or circuits included in an electronic board card, such as, a printed circuit board (PCB), a server, a personal computer, a desktop computer, a laptop computer, a personal digital assistant (PDA), a computing pad, a mobile device, or any other device, and may represent, for example, a server or a user’s computer.

[0067] The exemplary computer system **220** in this embodiment includes a processing device or processor **222**, a main memory **224** (e.g., read-only memory (ROM), flash memory, dynamic random access memory (DRAM), such as synchronous DRAM (SDRAM), etc.), and a static memory **226** (e.g., flash memory, static random access memory (SRAM), etc.), which may communicate with each other via a data bus **228**. Alternatively, the processing device **222** may be connected to the main memory **224** and/or static memory **226** directly or via some other connectivity means. The processing

device **222** may be a controller, and the main memory **224** or static memory **226** may be any type of memory.

[0068] The processing device **222** represents one or more general-purpose processing devices, such as a microprocessor, central processing unit, or the like. More particularly, the processing device **222** may be a complex instruction set computing (CISC) microprocessor, a reduced instruction set computing (RISC) microprocessor, a very long instruction word (VLIW) microprocessor, a processor implementing other instruction sets, or other processors implementing a combination of instruction sets. The processing device **222** is configured to execute processing logic in instructions **230** for performing the operations and steps discussed herein.

[0069] The computer system **220** may further include a network interface device **232**. The computer system **220** also may or may not include an input **234**, configured to receive input and selections to be communicated to the computer system **220** when executing instructions. The computer system **220** also may or may not include an output **236**, including but not limited to a display, a video display unit (e.g., a liquid crystal display (LCD) or a cathode ray tube (CRT)), an alphanumeric input device (e.g., a keyboard), and/or a cursor control device (e.g., a mouse).

[0070] The computer system **220** may or may not include a data storage device that includes instructions **238** stored in a computer-readable medium **240**. The instructions **238** may also reside, completely or at least partially, within the main memory **224** and/or within the processing device **222** during execution thereof by the computer system **220**, the main memory **224** and the processing device **222** also constituting computer-readable medium. The instructions **238** may further be transmitted or received over a network **242** via the network interface device **232**.

[0071] While the computer-readable medium **240** is shown in an exemplary embodiment to be a single medium, the term “computer-readable medium” should be taken to include a single medium or multiple media (e.g., a centralized or distributed database, and/or associated caches and servers) that store the one or more sets of instructions. The term “computer-readable medium” shall also be taken to include any medium that is capable of storing, encoding, or carrying a set of instructions for execution by the processing device and that cause the processing device to perform any one or more of the methodologies of the embodiments disclosed herein.

[0072] The embodiments disclosed herein include various steps. The steps of the embodiments disclosed herein may be formed by hardware components, software components, and combinations thereof.

[0073] The embodiments disclosed herein may be provided as a computer program product, or software, that may include a machine-readable medium (or computer-readable medium) having stored thereon instructions, which may be used to program a computer system (or other electronic devices) to perform a process according to the embodiments disclosed herein.

[0074] Unless specifically stated otherwise and as apparent from the previous discussion, it is appreciated that throughout the description, discussions utilizing terms such as “processing,” “computing,” “determining,” “displaying,” or the like, refer to the action and processes of a computer system, or similar electronic computing device, that manipulates and transforms data and memories represented as physical (electronic) quantities within the computer system’s registers into other data similarly represented as physical quantities within the computer system memories or registers or other such information storage, transmission, or display devices.

[0075] The algorithms and displays presented herein are not inherently related to any particular computer or other apparatus. In addition, the embodiments described herein are not described with reference to any particular programming language.

[0076] Those of skill in the art will further appreciate that the various illustrative logical blocks, modules, circuits, and algorithms described in connection with the embodiments disclosed herein may be implemented as electronic hardware, instructions stored in memory or in another computer-readable medium and executed by a processor or other processing device, or combinations of both. The components of the distributed antenna systems described herein may be employed in any circuit, hardware component, integrated circuit (IC), or IC chip, as examples. Memory disclosed herein may be any type and size of memory and may be configured to store any type of information desired. To clearly illustrate this interchangeability, various illustrative components, blocks, modules, circuits, and steps have been described above generally in terms of their functionality. How such functionality is implemented depends on the particular application, design choices, and/or design constraints imposed on the overall system.

[0077] The various illustrative logical blocks, modules, and circuits described in connection with the embodiments disclosed herein may be implemented or performed with a processor, a Digital Signal Processor (DSP), an Application Specific Integrated Circuit (ASIC), a Field Programmable Gate Array (FPGA), or other programmable logic device, a discrete gate or transistor logic, discrete hardware components, or any combination thereof designed to perform the functions described herein. Furthermore, a controller may be a processor.

[0078] The embodiments disclosed herein may be embodied in hardware and in instructions that are stored in hardware, and may reside, for example, in RAM, flash memory, ROM, Electrically Programmable ROM (EPROM), Electrically Erasable Programmable ROM (EEPROM), registers, a hard disk, a removable disk, a CD-ROM, or any other form of computer-readable medium known in the art. An exemplary storage medium is coupled to the processor such that the processor can read information from, and write information to, the storage medium. In the alternative, the storage medium may be integral to the processor.

[0079] It is also noted that the operational steps described in any of the exemplary embodiments herein are described to provide examples and discussion. The operations described may be performed in numerous different sequences other than the illustrated sequences. Furthermore, operations described in a single operational step may actually be performed in a number of different steps.

[0080] Further and as used herein, it is intended that terms “fiber optic cables” and/or “optical fibers” include all types of single mode and multi-mode light waveguides, including one or more optical fibers that may be upcoated, colored, buffered, ribbonized, and/or have other organizing or protective structure in a cable such as one or more tubes, strength members, jackets, or the like.

[0081] It is to be understood that the description and claims are not to be limited to the specific embodiments disclosed, and that modifications and other embodiments are intended to be included within the scope of the appended claims. Although specific terms are employed herein, they are used in a generic and descriptive sense only and not for purposes of limitation.

What is claimed is:

1. A MIMO remote unit configured to wirelessly distribute MIMO communications signals to wireless client devices in a distributed antenna system, comprising:

a first MIMO transmitter comprising: a first MIMO transmitter antenna configured to transmit MIMO communications signals in a first polarization and a second MIMO transmitter antenna configured to transmit MIMO communications signals in a second polarization different from the first polarization; and

a second MIMO transmitter comprising a third MIMO transmitter antenna configured to transmit MIMO communications signals in the first polarization and a fourth MIMO transmitter antenna configured to transmit MIMO communications signals in the second polarization;

the first MIMO transmitter configured to:

receive a first downlink MIMO communications signal in a first phase over a first downlink communications medium, and transmit the first downlink MIMO communications signal wirelessly as a first electrical downlink MIMO communications signal over the first MIMO transmitter antenna in the first polarization; and

receive a second downlink MIMO communications signal in the first phase over a second downlink communications medium, and transmit the second downlink MIMO communications signal wirelessly as a second electrical downlink MIMO communications signal over the second MIMO transmitter antenna in the second polarization;

the second MIMO transmitter configured to:

receive a third downlink MIMO communications signal in the first phase over a third downlink communications medium, and transmit the third downlink MIMO communications signal wirelessly as a third electrical downlink MIMO communications signal over the third MIMO transmitter antenna in the first polarization; and

receive a fourth downlink MIMO communications signal over a fourth downlink communications medium, and transmit the fourth downlink MIMO communications signal in a second phase shifted from the first phase, wirelessly as

a fourth electrical downlink MIMO communications signal over the fourth MIMO transmitter antenna in the second polarization.

2. The remote unit of claim 1, wherein:

the first MIMO transmitter is further configured to transmit the first and second downlink MIMO communications signals wirelessly to a line-of-sight (LOS) wireless client; and

the second MIMO transmitter is configured to transmit the third and fourth downlink MIMO communications signals wirelessly to a line-of-sight (LOS) wireless client.

3. The remote unit of claim 1, further comprising at least one phase shifter configured to phase shift the fourth downlink MIMO communications signal in the second phase.

4. The remote unit of any of the preceding claims, wherein the second MIMO transmitter is configured to receive the fourth downlink MIMO communications signal in the second phase as a result of a phase shift of the fourth downlink MIMO communications signal in a central unit.

5. The remote unit of any of the preceding claims, wherein the second MIMO transmitter is configured to receive the fourth downlink MIMO communications signal in the second phase as a result of a phase shift of the fourth downlink MIMO communications signal in the fourth downlink communications medium.

6. The remote unit of any of the preceding claims, wherein the third MIMO transmitter antenna is phase offset from the fourth MIMO transmitter antenna.

7. The remote unit of claim 5, wherein the third MIMO transmitter antenna is phase offset from the fourth MIMO transmitter antenna by the third MIMO transmitter antenna being position offset from the fourth MIMO transmitter antenna.

8. The remote unit of any of the preceding claims, wherein the first MIMO transmitter is position offset from the second MIMO transmitter.
9. The remote unit of any of the preceding claims, wherein:
 - the first downlink MIMO communications signal further comprises a first optical downlink MIMO communications signal;
 - the second downlink MIMO communications signal further comprises a second optical downlink MIMO communications signal;
 - the third downlink MIMO communications signal further comprises a third optical downlink MIMO communications signal; and
 - the fourth downlink MIMO communications signal further comprises a fourth optical downlink MIMO communications signal.
10. The remote unit of claim 9, wherein
 - the first MIMO transmitter further comprises:
 - a first optical-to-electrical (O/E) converter configured to convert the first optical downlink MIMO communications signal to the first electrical downlink MIMO communications signal; and
 - a second optical-to-electrical (O/E) converter configured to convert the second optical downlink MIMO communications signal to the second electrical MIMO downlink communications signal; and
 - the second MIMO transmitter further comprises:
 - a third optical-to-electrical (O/E) converter configured to convert the third optical downlink MIMO communications signal to the third electrical downlink MIMO communications signal; and
 - a fourth optical-to-electrical (O/E) converter configured to convert the fourth optical downlink MIMO communications signal to the second electrical downlink MIMO communications signal
11. The remote unit of any of the preceding claims, wherein at least one of the first electrical downlink MIMO communications signal, the second electrical downlink MIMO communications signal, the third electrical downlink MIMO communications signal, and

the fourth electrical downlink MIMO communications signal include a carrier frequency having an extremely high frequency (EHF) between approximately 30 GHz and approximately 300 GHz.

12. A method of transmitting MIMO communications signals to wireless client devices in a distributed antenna system, comprising:

- receiving a first downlink MIMO communications signal in a first phase over a first downlink communications medium;

- transmitting the first downlink MIMO communications signal wirelessly as a first electrical downlink MIMO communications signal over a first MIMO transmitter antenna in a first polarization; and

- receiving a second downlink MIMO communications signal in the first phase over a second downlink communications medium;

- transmitting the second downlink MIMO communications signal wirelessly as a second electrical downlink MIMO communications signal over a second MIMO transmitter antenna in a second polarization;

- receiving a third downlink MIMO communications signal in the first phase over a third downlink communications medium;

- transmitting the third downlink MIMO communications signal wirelessly as a third electrical downlink MIMO communications signal over a third MIMO transmitter antenna in the first polarization;

- receiving a fourth downlink MIMO communications signal over a fourth downlink communications medium; and

- transmitting the fourth downlink MIMO communications signal in a second phase shifted from the first phase, wirelessly as a fourth electrical downlink MIMO communications signal over a fourth MIMO transmitter antenna in the second polarization.

13. The method of claim 12, further comprising:

- transmitting the first downlink MIMO communications signal wirelessly to a line-of-sight (LOS) wireless client;

transmitting the second downlink MIMO communications signal wirelessly to a line-of-sight (LOS) wireless client;

transmitting the third downlink MIMO communications signal wirelessly to a line-of-sight (LOS) wireless client; and

transmitting the fourth downlink MIMO communications signal wirelessly to a line-of-sight (LOS) wireless client.

14. The method of claim 12, further comprising phase shifting the fourth downlink MIMO communications signal in the second phase.

15. The method of claim 14, further comprising receiving the fourth downlink MIMO communications signal in the second phase shifted from the first phase in a central unit.

16. The method of claims 14 or 15, further comprising receiving the fourth downlink MIMO communications signal in the second phase shifted from the first phase in the fourth downlink communications medium.

17. The method of claims 14, 15, or 16, comprising phase shifting the fourth downlink MIMO communications signal in the second phase in the second MIMO transmitter.

18. The method of any of the preceding method claims, comprising phase offsetting the third MIMO transmitter antenna from the fourth MIMO transmitter antenna to phase shift the fourth downlink MIMO communications signal in the second phase.

19. The method of claim 18, further comprising phase offsetting the third MIMO transmitter antenna from the fourth MIMO transmitter antenna by position offsetting the third MIMO transmitter antenna from the fourth MIMO transmitter antenna.

20. The method of any of the preceding method claims, further comprising position offsetting the first MIMO transmitter from the second MIMO transmitter to phase shift the fourth downlink MIMO communications signal in the second phase.

21. A distributed antenna system for distributing MIMO communications signals to wireless client devices, comprising:

a central unit comprising a central unit transmitter configured to receive a downlink communications signal, and transmit the received downlink communications signal as a first downlink MIMO communications signal over a first downlink communications medium, a second downlink MIMO communications signal over a second downlink communications medium, a third downlink MIMO communications signal over a third downlink communications medium, and a fourth downlink MIMO communications signal over a fourth downlink communications medium; and

a remote unit, comprising:

a first MIMO transmitter comprising a first MIMO transmitter antenna configured to transmit MIMO communications signals in a first polarization and a second MIMO transmitter antenna configured to transmit MIMO communications signals in a second polarization different from the first polarization;

a second MIMO transmitter comprising a third MIMO transmitter antenna configured to transmit MIMO communications signals in the first polarization and a fourth MIMO transmitter antenna configured to transmit MIMO communications signals in the second polarization;

the first MIMO transmitter configured to:

receive a first downlink MIMO communications signal in a first phase over a first downlink communications medium, and transmit the first downlink MIMO communications signal wirelessly as a first electrical downlink MIMO communications signal over the first MIMO transmitter antenna in the first polarization; and

receive a second downlink MIMO communications signal in the first phase over a second downlink communications medium, and transmit the second downlink MIMO communications signal wirelessly as a second electrical downlink MIMO communications signal over the second MIMO transmitter antenna in the second polarization;

the second MIMO transmitter configured to:

receive a third downlink MIMO communications signal in the first phase over a third downlink communications medium, and transmit the

third downlink MIMO communications signal wirelessly as a third electrical downlink MIMO communications signal over the third MIMO transmitter antenna in the first polarization; and

receive a fourth downlink MIMO communications signal over a fourth downlink communications medium, and transmit the fourth downlink MIMO communications signal in a second phase shifted from the first phase, wirelessly as a fourth electrical downlink MIMO communications signal over the fourth MIMO transmitter antenna in the second polarization; and

at least one phase shifter configured to phase shift the fourth downlink MIMO communications signal to the second phase.

22. The distributed antenna system of claim 21, wherein:

the first MIMO transmitter is further configured to transmit the first and second downlink MIMO communications signals wirelessly to a line-of-sight (LOS) wireless client; and

the second MIMO transmitter is configured to transmit the third and fourth downlink MIMO communications signals wirelessly to a line-of-sight (LOS) wireless client.

23. The distributed antenna system of claim 21, wherein the at least one phase shifter is disposed in a central unit.

24. The distributed antenna system of any of the preceding system claims, wherein the at least one phase shifter is disposed in the fourth downlink communications medium.

25. The distributed antenna system of claim 23, wherein the central unit further comprises one or more electrical-to-optical (E/O) converters configured to:

convert the first downlink MIMO communications signal into a first optical downlink MIMO communications signal;

convert the second downlink MIMO communications signal into a second optical downlink MIMO communications signal;

convert the third downlink MIMO communications signal into a third optical downlink MIMO communications signal; and

convert the fourth downlink MIMO communications signal into a fourth optical downlink MIMO communications signal.
