HETEROARYL SUCCINAMIDES AND THEIR USE AS METALLOPROTEINASE INHIBITORS

Matrix metalloproteases ("MMPs") are a family of proteases (enzymes) involved in the degradation and remodeling of connective tissues. Members of this family of endopeptidase enzymes are secreted as proenzymes from various cell types that reside in or are associated with connective tissue, such as fibroblasts, monocytes, macrophages, endothelial cells, and invasive or metastatic tumor cells. MMP expression is stimulated by growth factors and cytokines in the local tissue environment, where these enzymes act to specifically degrade protein components of the extracellular matrix, such as collagen, proteoglycans (protein core), fibronectin and laminin. These ubiquitous extracellular matrix components are present in the linings of joints, interstitial connective tissues, basement membranes and cartilage.

The MMPs share a number of properties, including zinc and calcium dependence, secretion as zymogens, and 40-50% amino acid sequence homology. Eleven metalloenzymes have been well-characterized as MMP's in humans, including three collagenases, three stromelysins, two gelatinases, matrilysin, metalloelastase, and membrane-type MMP, as discussed in greater detail below.

Interstitial collagenases catalyze the initial and rate-limiting cleavage of native collagen types I, II and III. Collagen, the major structural protein of mammals, is an essential component of the matrix of many tissues, for example, cartilage, bone, tendon and skin. Interstitial collagenases are very specific matrix metalloproteases which cleave these collagens to give two fragments which spontaneously denature at physiological temperatures and therefore become susceptible to cleavage by less specific enzymes. Cleavage by the collagenases results in the loss of structural integrity of the target tissue, essentially an irreversible process. There are currently three known human collagenases, the first two of which are relatively well-characterized (FASEG
J., 5, 2145-54 (1991)). Human fibroblast-type collagenase (HFC, MMP-1, or collagenase-1) is produced by a wide variety of cells including fibroblasts and macrophages. Human neutrophil-type collagenase (HNC, MMP-8, or collagenase-2) has so far only been demonstrated to be produced by neutrophils. The most recently discovered member of this group of MMPs is human collagenase-3 (MMP-13), which was originally found in breast carcinomas (J. Biol. Chem., 269, 16,766-16,773) (1994)), but has since shown to be produced by chondrocytes (J. Clin. Invest., 97, 761-768, 1996).

The gelatinases include two distinct, but highly related, enzymes: a 72-kD enzyme (gelatinase A, HFG, MMP-2) secreted by fibroblasts and a wide variety of other cell types, and a 92-kD enzyme (gelatinase B, HNG, MMP-9) released by mononuclear phagocytes, neutrophils, corneal epithelial cells, tumor cells, cytotrophoblasts and keratinocytes. These gelatinases have been shown to degrade gelatins (denatured collagens), collagen types IV (basement membrane) and V, fibronectin and insoluble elastin.

Stromelysins 1 and 2 have been shown to cleave a broad range of matrix substrates, including laminin, fibronectin, proteoglycans, and collagen types IV and IX in their non-helical domains.

Matrilysin (MMP-7, PUMP-1) has been shown to degrade a wide range of matrix substrates including proteoglycans, gelatins, fibronectin, elastin and laminin. Its expression has been documented in mononuclear phagocytes, rate uterine explants and sporadically in tumors. Other less characterized MMPs include macrophage metalloelastase (MME, MMP-12), membrane type MMP (MMP-14), and stromelysin-3 (MMP-11).
Excessive degradation of extracellular matrix by MMPs is implicated in the pathogenesis of many diseases of both chronic and acute nature. For example, numerous studies, as reviewed in *Exp. Opin. Invest. Drugs*, 5, 323-335, (1996), have established that expression and activation of MMPs are critical events in tumor growth, invasion and metastasis. In addition, MMP activity has been found to be required for angiogenesis, which is necessary for tumor growth as well for other pathological conditions such as macular degeneration.

Inhibitors of MMPs are expected to provide useful treatments for the diseases described above in which degradation of the extracellular matrix by MMPs contributes to the pathogenesis of the disease. In general, selective MMP inhibitors of particular subsets of MMPs may offer therapeutic advantages, as it has been typically observed that a limited number of members of the MMP family are involved in any one of the disease states listed above. For example, the involvement of individual collagenases in the degradation of tissue collagens probably depends markedly on the tissue. The tissue distribution of human collagenases suggests that collagenase-3 is the major participant in the degradation of the collagen matrix of cartilage, while collagenase-1 is more likely to be involved in tissue remodeling of skin and other soft tissues. In addition, stromelysin-1 appears to be largely responsible for excessive loss of proteoglycan from cartilage. Thus, the inventive compounds disclosed herein that are selective inhibitors for collagenase-3 and stromelysin over collagenase-1 are preferred for treatment of diseases associated with cartilage erosion, such as rheumatoid and osteoarthritis. Similarly, among the MMPs, metalloelastase has been specifically implicated in the pathology of pulmonary emphysema. See J. Biol. Chem. 270, 14568-14575 (1995).

The design and uses of MMP inhibitors are reviewed, for example, in J. Enzyme Inhibition, 2, 1-22 (1987); Progress in Medicinal Chemistry 29, 271-334 (1992); Current Medicinal Chemistry, 2, 743-762 (1995); Exp. Opin. Ther. Patents, 5, 1287-1296 (1995); and Drug Discovery Today, 1, 16-26 (1996). MMP inhibitors are also the subject of numerous patents and patent applications. In the majority of these publications, the preferred inventive compounds are hydroxamic acids, as it has been well-established that the hydroxamate function is the optimal zinc-coordinating functionality for binding to the active site of MMPs. For
example, the hydroxamate inhibitors described in the literature are generally 100 to 1000-fold more potent than the corresponding inhibitors wherein the hydroxamic acid functionality is replaced by a carboxylic acid functionality. Nevertheless, hydroxamic acids tend to exhibit relatively poor bioavailability. The preferred compounds disclosed herein are carboxylic acid inhibitors that possess inhibitory potency against certain of the MMPs that is comparable to the potency of the hydroxamic acid inhibitors that have been reported in the literature. The following patents and patent applications disclose carboxylic acid inhibitors that are, as are the inventive carboxylic acid inhibitors disclosed herein, monoamine derivatives of substituted succinic acids: Celltech Ltd.: EP-A-0489577 (WO 92/099565), EP-A-0489579, WO 93/24475, WO 93/244449; British Biotech Pharmaceuticals Ltd.: WO 95/32944, WO 95/19961; Sterling Winthrop, Inc.: US 5,256,657; Sanofi Winthrop, Inc.: WO 95/22966; and Syntex (U.S.A.) Inc. WO 94/04735, WO 95/12603, and WO 96/16027.

SUMMARY OF THE INVENTION

The present invention is directed to compounds of the formula I:

The present invention is further directed to pharmaceutical compositions comprising a therapeutically effective amount of a compound of formula 1, or a pharmaceutically acceptable salt or solvate thereof, or a pharmaceutically acceptable prodrug thereof, said prodrug being different from a compound of the formula (I).

The present invention is even further directed to methods of using the the compounds of formula (I), and pharmaceutically acceptable salts and solvates thereof, and pharmaceutically acceptable prodrugs thereof, said prodrug being different from a compound of the formula (I).
DETAILED DESCRIPTION OF THE INVENTION

The present invention is directed to compounds of the formula I:

(I)

wherein

X is a single bond or a straight or branched, saturated or unsaturated chain containing 1 to 6 carbon atoms, wherein one or more of the carbon atoms are optionally independently replaced with O or S, and wherein one or more of the hydrogen atoms are optionally replaced with F;

Y is a single bond, -CH(OH)-, or -C(O)-;

R₁ is H, an alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, or a heterocycloalkyl group;

R₂ is H, an alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, a heterocycloalkyl group, or C(O)R₁₀,

wherein R₁₀ is H, an alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, a heterocycloalkyl group, an O-aryl group, an O-alkyl group, or NR₁₁R₁₂;

wherein R₁₁ is H, an alkyl group, an O-alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, or a heterocycloalkyl group, and
wherein $R_{12}$ is H, an alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, or a heterocycloalkyl group,

or wherein $R_{11}$ and $R_{12}$ form, together with the nitrogen to which they are attached, a heteroaryl group or a heterocycloalkyl group; and

$R_3$ is H, an alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, a heterocycloalkyl group, $NR_{11}R_{12}$, or $OR_{11}$, wherein $R_{11}$ and $R_{12}$ are as defined above,

or $R_2$ and $R_3$, together with the atom(s) to which they are attached, form a cycloalkyl group or a heterocycloalkyl group;

$R_4$ is H or any suitable organic moiety;

$R_5$ is $C(O)\text{NHOH}$, $C(O)\text{OR}_{13}$, SH, $\text{N(OH)CHO}$, $\text{SC(O)R}_{14}$, $\text{P(O)(OH)R}_{15}$, or $\text{P(O)(OH)OR}_{13}$,

wherein $R_{13}$ is H, an alkyl group, or an aryl group;

$R_{14}$ is an alkyl group or an aryl group; and

$R_{15}$ is an alkyl group; and

is a heteroaryl group having five ring atoms, including 1, 2 or 3 heteroatoms selected from O, S, and N;
and pharmaceutically acceptable salts and solvates thereof, and pharmaceutically acceptable prodrugs thereof, said prodrugs being different from compounds of the formula (I); with the proviso that if the compound of formula (I) is:

![Chemical Structure](image)

wherein $R_1$, $R_4$, and $R_5$ are as defined above, $W$ is H, OH, a halo group, an alkyl group, or an O-alkyl group, and further wherein

- when $m$ is 2, 3, or 4, $n$ is 1, 2, 3, or 4, and $A$ is $\text{CH}_2$, $\text{O}$, $\text{NH}$, or $\text{N}$-alkyl; or
- when $m$ is 4, 5, or 6, $n$ is 0, and $A$ is $-\text{CHJ}$, wherein J is carboxy, alkoxy carbonyl, or carbamoyl;

or a pharmaceutically acceptable salt or solvate thereof, or a pharmaceutically acceptable prodrug thereof, said prodrug being different from a compound of the formula (I), said prodrug being different from a compound of the formula (I); then

\[\text{is pyrrolyl.}\]
More preferably the compounds of the present invention are selected from compounds of the formula I wherein

X is a single bond;

Y is a single bond, -CH(OH)- or -C(O)-;

R₁ is an aryl group or a heteroaryl group;

R₂ is H, an alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, a heterocycloalkyl group, or C(O)R₁₀, wherein R₁₀ is as defined above;

R₃ is H, an alkyl group, a heteroaryl group, NR₁₁R₁₂ or OR₁₁, wherein R₁₁ and R₁₂ are as defined above

or R₂ and R₃, together with the atoms to which they are attached, form a cycloalkyl group or heterocycloalkyl group;

R₄ is H, an alkyl group, OH, an O-alkyl group, NH₂, NH-alkyl, or a cycloalkyl group;

R₅ is C(O)NH₂H, C(O)OR₁₃, SH, or SC(O)R₁₄,

wherein R₁₃ is H, an alkyl group, or an aryl group, and R₁₄ is an alkyl group or an aryl group; and

is pyrrolyl, imidazolyl, pyrazolyl, furyl, thiényl, thiazolyl, oxazolyl, isoxazolyl, isothiazolyl, oxadiazolyl, or triazolyl;

or a pharmaceutically acceptable salt or solvate thereof, or a pharmaceutically acceptable prodrug thereof, said prodrug being different from a compound of the formula (I).

In the compounds of the present invention, and the pharmaceutically acceptable salts and solvates thereof, and pharmaceutically acceptable prodrugs thereof, preferably X is a single bond.
In particularly preferred embodiments, when $Y$ is -CH(OH)-, preferably $R_3$ is H or an alkyl group or together with $R_2$ and the atom(s) to which $R_2$ and $R_3$ are attached forms a cycloalkyl group or heterocycloalkyl group, and more preferably $R_3$ is H. When $Y$ is -C(O)-, preferably $R_3$ is an alkyl group, NR$_{11}$R$_{12}$, or OR$_{11}$, wherein $R_{11}$ and $R_{12}$ are as defined above, or together with $R_2$ and the atoms to which $R_2$ and $R_3$ are attached, forms a cycloalkyl group or heterocycloalkyl group. When $Y$ is a single bond, preferably $R_3$ is a heteroaryl group, more preferably the heteroaryl group:

![Diagram](image)

wherein $R_{21}$ and $R_{22}$ are independently any suitable organic moiety or together with the carbon atoms to which they are attached form an aryl group, a heteroaryl group, a cycloalkyl group, or a heterocycloalkyl group. Preferably $R_{21}$ and $R_{22}$ are selected from hydrogen, an alkyl group, an aryl group, a heteroaryl group, a halo group, a C(O)O-alkyl group, a carbamoyl group, a cycloalkyl group, or a heterocycloalkyl group.

Preferably $R_1$ is an aryl group or a heteroaryl group. More preferably $R_1$ is an aryl group of the formula:

![Diagram](image)
wherein Z is H, halogen, an alkyl group, an O-alkyl group, a cyano group, a hydroxy group, an aryl group, a heteroaryl group, or a heterocycloalkyl group.

Preferably \( R_4 \) is H, an alkyl group, or OH. More preferably \( R_4 \) is H or an alkyl group selected from \( \text{CHR}_{16}\text{OH} \) and \( \text{CH(NHR}_{17}\text{)}\text{R}_{16} \), wherein \( R_{16} \) is H, an alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, or a heterocycloalkyl group, and \( R_{17} \) is \( \text{C(O)R}_{18} \), \( \text{SO}_2\text{R}_{18} \), H, an alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, or a heterocycloalkyl group, or \( R_{16} \) and \( R_{17} \), together with the atoms to which they are attached, form a heterocycloalkyl group; wherein \( R_{18} \) is H, an alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, a heterocycloalkyl group, an O-aryl group, an O-alkyl group, or \( \text{NR}_{19}\text{R}_{20} \);

wherein \( R_{19} \) and \( R_{20} \) independently are H, an alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, or a heterocycloalkyl group, or \( R_{19} \) and \( R_{20} \), together with the nitrogen atom to which they are attached, form a heterocycloalkyl group.

Preferably

\[
\text{HET}
\]

is pyrrolyl, imidazolyl, pyrazolyl, furyl, thieryl, thiazolyl, oxazolyl, isoxazolyl, isothiazolyl, oxadiazolyl, or triazolyl, more preferably is pyrrolyl, fuyl or thieryl, and most preferably is pyrrolyl.

Preferably \( R_5 \) is \( \text{C(O)NH}_{10} \) or \( \text{C(O)OR}_{13} \), wherein \( R_{13} \) is hydrogen.

Particularly preferred compounds according to the invention include:

(methylcarbamoyl)propyl)-2(S)-(hydroxy)succinamic Acid;

and the pharmaceutically acceptable salts and solvates thereof, and the pharmaceutically
acceptable prodrugs thereof.

As used in the present application, the following definitions apply:

An "alkyl group" is intended to mean a straight or branched chain monovalent radical of
saturated and/or unsaturated carbon atoms and hydrogen atoms, such as methyl, ethyl, propyl,
isopropyl, butyl, isobutyl, t-butyl, ethenyl, pentenyl, butenyl, propenyl, ethynyl, butynyl,
propynyl, pentynyl, hexynyl, and the like, which may be unsubstituted (i.e., containing only
carbon and hydrogen) or substituted by one or more suitable substituents as defined below.

An "O-alkyl group" is intended to mean an oxygen bonded to an alkyl group, wherein the
alkyl group is as defined above.

A "cycloalkyl group" is intended to mean a non-aromatic, monovalent monocyclic,
bicyclic, or tricyclic radical containing 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, or 14 carbon ring atoms,
each of which may be saturated or unsaturated, and which may be unsubstituted or substituted by
one or more suitable substituents as defined below, and to which may be fused one or more
heterocycloalkyl groups, aryl groups, or heteroaryl groups, which themselves may be
unsubstituted or substituted by one or more suitable substituents. Illustrative examples of
cycloalkyl groups include, but are not limited to, cyclopropyl, cyclobutyl, cyclopentyl,
cyclopentenyl, cyclohexyl, cyclohexenyl, cycloheptyl, cyclooctyl, bicyclo[2.2.1]heptyl,

A "heterocycloalkyl group" is intended to mean a non-aromatic, monovalent monocyclic, bicyclic, or tricyclic radical, which is saturated or unsaturated, containing 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, or 18 ring atoms, and which includes 1, 2, 3, 4, or 5 heteroatoms selected from nitrogen, oxygen and sulfur, wherein the radical is unsubstituted or substituted by one or more suitable substituents as defined below, and to which may be fused one or more cycloalkyl groups, aryl groups, or heteroaryl groups, which themselves may be unsubstituted or substituted by one or more suitable substituents. Illustrative examples of heterocycloalkyl groups include, but are not limited to, azetidinyl, pyrrolidyl, piperidyl, piperazinyl, morpholinyl, tetrahydro-2H-1,4-thiazinyl, tetrahydrofuryl, dihydrofuryl, tetrahydropyranyl, dihydropyranyl, 1,3-dioxolanyl, 1,3-dioxanyl, 1,4-dioxany1, 1,3-oxathiolanyl, 1,3-oxathianyl, 1,3-dithianyl, azabicyclo[3.2.1]octyl, azabicyclo[3.3.1]nonyl, azabicyclo[4.3.0]nonyl, oxabicyclo[2.2.1]heptyl, 1,5,9-triazacyclobdocdecyl, and the like.

An "aryl group" is intended to mean an aromatic, monovalent monocyclic, bicyclic, or tricyclic radical containing 6, 10, 14, or 18 carbon ring atoms, which may be unsubstituted or substituted by one or more suitable substituents as defined below, and to which may be fused one or more cycloalkyl groups, heterocycloalkyl groups, or heteroaryl groups, which themselves may be unsubstituted or substituted by one or more suitable substituents. Illustrative examples of aryl groups include, but are not limited to, phenyl, naphthyl, fluoren-2-yl, indan-5-yl, and the like.

A "heteroaryl group" is intended to mean an aromatic monovalent monocyclic, bicyclic, or tricyclic radical containing 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, or 18 ring atoms,
including 1, 2, 3, 4, or 5 heteroatoms selected from nitrogen, oxygen and sulfur, which may be unsubsti-
tuted or substituted by one or more suitable substituents as defined below, and to which may be fused one or more cycloalkyl groups, heterocycloalkyl groups, or aryl groups, which themselves may be unsubsti-
tuted or substituted by one or more suitable substituents. Illustrative examples of heteroaryl groups include, but are not limited to, pyrrolyl, imidazolyl, pyrazolyl, furyl, thienyl, thiazolyl, oxazolyl, isoxazolyl, isothiazolyl, oxadiazolyl, triazolyl, tetrazolyl, pyrazinyl, pyridyl, pyrimidyl, pyridazinyl, indolyl, isoindolyl, benzimidazolyl, benzofurlyl, isobenzofurlyl, benzothienyl, quinolyl, isoquinolyl, phthalazinyl, carbazolyl, purinyl, pteridinyl, acridinyl, phenanthrolinyl, phenoxazinyl, phenothiazinyl, and the like.

An "acyl group" is intended to mean a -C(O)-R- radical, wherein R is any suitable sub-
tiuent as defined below.

A "sulfonyl group" is intended to mean a -S(O)(O)-R- radical, wherein R is any suitable sub-
tiuent as defined below.

The term "suitable substituent" is intended to mean any of the substituents recognizable to those skilled in the art as not adversely affecting the inhibitory activity of the inventive com-
ounds. Illustrative examples of suitable substituents include, but are not limited to, oxo groups, alkyl groups, hydroxy groups, halo groups, cyano groups, nitro groups, cycloalkyl groups, heterocycloalkyl groups, aryl groups, heteroaryl groups, trialkylsilyl groups,
groups of formula (A)

wherein $R_a$ is hydrogen, an alkyl group, a cycloalkyl group, a heterocycloalkyl group, an aryl group, or a heteroaryl group,

groups of formula (B)

wherein $R_a$ is hydrogen, an alkyl group, a cycloalkyl group, a heterocycloalkyl group, an aryl group, or a heteroaryl group,

The term "suitable organic moiety" is intended to mean any organic moiety recognizable to those skilled in the art as not adversely affecting the inhibitory activity of the inventive compounds. Illustrative examples of suitable organic moieties include, but are not limited to oxo groups, alkyl groups, hydroxy groups, halo groups, cyano groups, nitro groups, cycloalkyl groups, heterocycloalkyl groups, aryl groups, heteroaryl groups, trialkylsilyl groups, and groups of formulas (A), (B), (C), (D), (E), (F), (G), (H), (J), and (K), as defined above.

A "hydroxy group" is intended to mean the radical \(-\text{OH}\).

An "oxo group" is intended to mean the divalent radical \(=\text{O}\).

A "halo group" is intended to mean any of the radicals \(-\text{F}\), \(-\text{Cl}\), \(-\text{Br}\), or \(-\text{I}\).

A "cyano group" is intended to mean the radical \(-\text{C}≡\text{N}\).

A "nitro group" is intended to mean the radical \(-\text{NO}_2\).

A "trialkylsilyl group" is intended to mean the radical \(-\text{Si}R_pR_qR_s\), where \(R_p\), \(R_q\), and \(R_s\) are each independently an alkyl group.

A "carboxy group" is intended to mean a group of formula (B) wherein \(R_t\) is hydrogen.

A "alkoxycarbonyl group" is intended to mean a group of formula (B) wherein \(R_t\) is an alkyl group as defined above.

A "carbamoyl group" is intended to mean a group of formula (C) wherein \(R_t\) and \(R_r\) are both hydrogen.

An "amino group" is intended to mean the radical \(-\text{NH}_2\).

An "alkylamino group" is intended to mean the radical \(-\text{NHR}_\text{a}\), wherein \(R_a\) is an alkyl group as defined above.
A "dialkylamino group" is intended to mean the radical -NR₂R₃, wherein R₂ and R₃, which are the same or different, are each an alkyl group as defined above.

A "pharmaceutically acceptable prodrug" is intended to mean a compound that may be converted under physiological conditions or by solvolysis to a compound of the formula I.

A "pharmaceutically acceptable solvate" is intended to mean a solvate that retains the biological effectiveness and properties of the biologically active components of compounds of formula I.

Examples of pharmaceutically acceptable solvates include, but are not limited to, compounds of formula I in combination with water, isopropanol, ethanol, methanol, DMSO, ethyl acetate, acetic acid, or ethanolamine.

In the case of solid formulations, it is understood that the inventive compounds may exist in different forms, such as stable and metastable crystalline forms and isotropic and amorphous forms, all of which are intended to be within the scope of the present invention.

A "pharmaceutically acceptable salt" is intended to mean those salts that retain the biological effectiveness and properties of the free acids and bases and that are not biologically or otherwise undesirable.

Examples of pharmaceutically acceptable salts include, but are not limited to, sulfates, pyrosulfates, bisulfates, sulfites, bisulfites, phosphates, monohydrogen phosphates, dihydrogen phosphates, metaphosphates, pyrophosphates, chlorides, bromides, iodides, acetates, propionates, decanoates, caprylates, acrylates, formates, isobutyrates, caproates, heptanoates, propiolates, oxalates, malonates, succinates, suberates, sebacates, fumarates, maleates, butyne-1,4-dioates, hexyne-1,6-dioates, benzoates, chlorobenzoates, methyl benzoates, dinitrobenzoates,
hydroxybenzoates, methoxybenzoates, phthalates, sulfonates, xylenesulfonates, phenylacetates, phenylpropionates, phenylbutyrates, citrates, lactates, γ-hydroxybutyrates, glycolates, tartrates, methanesulfonates, propanesulfonates, naphthalene-1-sulfonates, naphthalene-2-sulfonates, and mandelates.

If the inventive compound is a base, the desired salt may be prepared by any suitable method known to the art, including treatment of the free base with an inorganic acid, such as hydrochloric acid, hydrobromic acid, sulfuric acid, nitric acid, phosphoric acid and the like, or with an organic acid, such as acetic acid, maleic acid, succinic acid, mandelic acid, fumaric acid, malonic acid, pyruvic acid, oxalic acid, glycolic acid, salicylic acid, pyranosidyl acids such as glucuronic acid and galacturonic acid, alpha-hydroxy acids such as citric acid and tartaric acid, amino acids such as aspartic acid and glutamic acid, aromatic acids such as benzoic acid and cinnamic acid, sulfonic acids such a p-toluenesulfonic acid or ethanesulfonic acid, or the like.

If the inventive compound is an acid, the desired salt may be prepared by any suitable method known to the art, including treatment of the free acid with an inorganic or organic base, such as an amine (primary, secondary or tertiary), an alkali metal or alkaline earth metal hydroxide or the like. Illustrative examples of suitable salts include organic salts derived from amino acids such as glycine and arginine, ammonia, primary, secondary and tertiary amines, and cyclic amines such as piperidine, morpholine and piperazine, and inorganic salts derived from sodium, calcium, potassium, magnesium, manganese, iron, copper, zinc, aluminum and lithium.

The inventive compounds may exist as single stereoisomers, racemates and/or mixtures of enantiomers and/or diastereomers. All such single stereoisomers, racemates and mixtures thereof are intended to be within the scope of the present invention. Preferably, the compounds
of the present invention are used in a form that contains at least 90% of a single isomer (80% enantiomeric or diastereomeric excess), more preferably at least 95% (90% e.e. or d.e.), even more preferably at least 97.5% (95% e.e. or d.e.), and most preferably at least 99% (98% e.e. or d.e.). Compounds identified herein as single stereoisomers are meant to describe compounds used in a form that contains at least 90% of a single isomer.

The present invention is further directed to methods of inhibiting matrix metalloproteinase activity that comprise contacting the protease with an effective amount of a compound of formula I or a pharmaceutically acceptable prodrug or a pharmaceutically acceptable salt or solvate thereof. For example, one can inhibit matrix metalloproteinase activity in mammalian tissue by administering a compound of formula I or a pharmaceutically acceptable prodrug or a pharmaceutically acceptable salt or solvate thereof.

The activity of the inventive compounds as inhibitors of matrix metalloproteinase activity may be measured by any of the methods available to those skilled in the art, including in vivo and in vitro assays. Examples of suitable assays for activity measurements include the fluorometric determination of the hydrolysis rate of a fluorescently-labelled peptide substrate, which is described herein.

Administration of the compounds of the formula I, or their pharmaceutically acceptable prodrugs or pharmaceutically acceptable salts or solvates, may be performed according to any of the accepted modes of administration available to those skilled in the art. Illustrative examples of suitable modes of administration include, but are not limited to, oral, nasal, intraocular, parenteral, topical, transdermal and rectal.
The inventive compounds of formula I, and their pharmaceutically acceptable prodrugs and pharmaceutically acceptable salts and solvates, may be administered as a pharmaceutical composition in any suitable pharmaceutical form recognizable to the skilled artisan. Suitable pharmaceutical forms include, but are not limited to, solid, semisolid, liquid, or lyophilized formulations, such as tablets, powders, capsules, suppositories, suspensions and aerosols. The pharmaceutical composition may also include suitable excipients, diluents, vehicles and carriers, as well as other pharmaceutically active agents, depending upon the intended use.

Acceptable methods of preparing suitable pharmaceutical forms of the pharmaceutical compositions are known to those skilled in the art. For example, pharmaceutical preparations may be prepared following conventional techniques of the pharmaceutical chemist involving steps such as mixing, granulating and compressing when necessary for tablet forms, or mixing, filling and dissolving the ingredients as appropriate, to give the desired products for oral, parenteral, topical, intravaginal, intranasal, intrabronchial, intraocular, intraural and/or rectal administration.

Solid or liquid pharmaceutically acceptable carriers, diluents, vehicles or excipients may be employed in the pharmaceutical compositions. Illustrative solid carriers include starch, lactose, calcium sulphate dihydrate, terra alba, sucrose, talc, gelatin, pectin, acacia, magnesium stearate, and stearic acid. Illustrative liquid carriers may include syrup, peanut oil, olive oil, saline solution, and water. The carrier or diluent may include a suitable prolonged-release material, such as glyceryl monostearate or glyceryl distearate, alone or with a wax. When a liquid carrier is used, the preparation may be in the form of a syrup, elixir, emulsion, soft gelatin capsule, sterile injectable liquid (e.g. solution), or a nonaqueous or aqueous liquid suspension.
A dose of the pharmaceutical composition contains at least a therapeutically effective amount of the active compound (i.e., a compound of formula I or a pharmaceutically acceptable prodrug or a pharmaceutically acceptable salt or solvate thereof) and preferably is made up of one or more pharmaceutical dosage units. The selected dose may be administered to a mammal, for example, a human patient, in need of treatment mediated by inhibition of matrix metalloproteinase activity, by any known method of administering the dose including topical, for example, as an ointment or cream; orally, rectally, for example, as a suppository; parenterally by injection; or continuously by intravaginal, intranasal, intrabronchial, intraural or intraocular infusion.

A "therapeutically effective amount" is intended to mean that amount of a compound of formula I or II that, when administered to a mammal in need thereof, is sufficient to effect treatment for disease conditions alleviated by the inhibition of the activity of one or more matrix metalloproteinases, such as tumor growth, invasion or metastasis, osteoarthritis, rheumatoid arthritis, osteoporosis, periodontitis, gingivitis, chronic dermal wounds, corneal ulcerations, degenerative skin disorders, multiple sclerosis, stroke, diabetic retinopathy, macular degeneration, angiofibromas, hemangiomas, chronic obstructive pulmonary disease, such as emphysema, atherosclerosis, glomerular disease, cardiac arrhythmia, endometriosis or disease conditions characterized by unwanted angiogenesis. The amount of a given compound of formula I that will correspond to a "therapeutically effective amount" will vary depending upon factors such as the particular compound, the disease condition and the severity thereof, and the identity of the mammal in need thereof, but can nevertheless be readily determined by one of skill in the art.
"Treating" or "treatment" is intended to mean at least the mitigation of a disease condition in a mammal, such as a human, that is alleviated by the inhibition of the activity of one or more matrix metalloproteinase, such as tumor growth, invasion or metastasis, osteoarthritis, rheumatoid arthritis, osteoporosis, periodontis, gingivitis, chronic dermal wounds, corneal ulcerations, degenerative skin disorders, multiple sclerosis, stroke, diabetic retinophathy, macular degeneration, angiofibromas, hemangiomas, or disease conditions characterized by unwanted angiogenesis, and includes:

(a) prophalactic treatment in a mammal, particularly when the mammal is found to be predisposed to having the disease condition but not yet diagnosed as having it;

(b) inhibiting the disease condition; and/or

(c) alleviating, in whole or in part, the disease condition.

The inventive compounds, and their salts, solvates and prodrugs, may be prepared by employing the techniques available in the art using starting materials that are readily available. Certain novel and exemplary methods of preparing the inventive compounds are described below.
METHODS FOR PREPARING CARBOXYLATE MATRIX METALLOPROTEASE INHIBITORS

PREPARATION OF COMPOUNDS OF FORMULA I

The methods of preparing compounds of Formula I, where R₅ is carboxyl, culminate in the deprotection of esters (1) to the corresponding carboxylates as illustrated in Reaction Scheme I below. Appropriate types of esters (1) and the cleavage of R₅ are described, for example, in Greene, T; Wuts, P.G.M. "Protective Groups in Organic Synthesis," Wiley: 1991 and Kocienski, P.J. "Protecting Groups," Thieme: 1994, which are incorporated herein by reference. Some examples and conditions encountered herein are given below.
As an example of a typical ester cleavage, an ester of Formula (1) where \( R_6 \) is benzyl is placed in a suspension with solvent, for example, ethyl acetate also containing metal catalyst, preferably palladium(0) in a hydrogen source such as hydrogen gas at one atmosphere or above, at ambient temperature for 30 minutes to three days, preferably four hours. The carboxylates of Formula I, where \( R_5 \) is -COOH, are amenable to customary isolation and purification.

For esters of Formula (1) where \( R_6 \) is t-butyl, the ester (1) is deprotected in a solution of solvent, preferably chloroform or dichloromethane, with excess trifluoroacetic acid, at ambient temperature for 15 minutes to 12 hours to obtain a carboxylate of Formula I.

For esters of Formula (1) where \( R_6 \) is allyl, the ester (1) undergoes cleavage in an inert solvent, preferably acetonitrile, with a catalytic amount of palladium catalyst, such as tetrakis(triphenylphosphine)-palladium(0), with an excess of secondary amine, such as morpholine, for 15 minutes to 12 hours at ambient temperature.
Where the above conditions are incompatible with functional groups contained in either \( R_4 \) or \( R_5 \), other protective strategies may be used. For example, simultaneous protection where \( R_4 \) is olefinic and \( R_5 \) is carboxylate may occur through their connection as in a halolactone of Formula (2) where \( X \) is halogen, as displayed in Reaction Scheme II below. The halolactone (2) undergoes reductive opening to compounds of Formula I, where \( R_4 \) is allyl and \( R_5 \) is carboxylate.

**REACTION SCHEME II**

![Reaction Scheme II](image)

**Preparation of Compounds of Formula I, where \( R_4 \) is Allyl and \( R_5 \) is Carboxylate**

A solution of halolactone (2) is exposed to a reductive environment, preferably excess zinc powder in acetic acid. The resulting carboxylate of Formula I where \( R_4 \) is allyl is isolated and purified via conventional methods.

Compounds (5) of Formula I where \( R_5 \) is hydroxamic acid (-C(O)NHOH) may be obtained from compounds (3) of Formula I where \( R_5 \) is carboxyl. Any of the numerous commercially available coupling reagents can be used for conversion either to a protected version
of a compound of Formula (4) where $R_7$ is alkyl or directly to hydroxamate (5), as outlined by the Reaction Scheme III below:

**REACTION SCHEME III**

![Reaction Scheme III](image)

**Step 1 - Preparation of Compounds of Formula (4) or (5)**

Carboxylic acids of Formula (3) and hydroxylamine or its O-alkyl derivatives in inert solvent, preferably dimethylformamide (DMF), are coupled with any of the numerous available coupling reagents, preferably benzotriazol-1-yloxytris(dimethylamino)-phosphonium hexafluorophosphate (BOP), at ambient temperature for one to 24 hours to provide either hydroxamates (5) or O-alkyl hydroxamates (4), respectively. The products are amenable to routine handling and purification.

**Step 2 - Preparation of Compounds of Formula (5) from Compounds of Formula (4)**

Protected hydroxamates of Formula (4) are deprotected as determined by the nature of the protecting group $R_7$. Where $R_7$ is a trialkylsilyl, mild acid hydrolysis or fluoride cleavage in protic or aprotic solvent at ambient temperature or below for one to 12 hours is sufficient. Where
R_7 is benzyl, selective deprotection without N-O bond cleavage proceeds in the presence of palladium on carbon, with a hydrogen source, such as hydrogen gas at atmospheric pressure, in a suitable solvent, such as dimethylformamide or methanol.

**PREPARATION OF COMPOUNDS OF FORMULA II**

Pyrrole compounds of Formula II can be prepared from cyclocondensation of amines of Formula (6) with tetrahydrofurans of Formula (7), as shown below in Reaction Scheme IV:

**REACTION SCHEME IV**

\[
\begin{align*}
\text{R}_5\text{NH}_3^+\text{X} & \quad + \quad \text{MeO} \quad \xrightarrow{\text{Y-R}_3} \quad \text{R}_5\text{H} \quad \text{N} \quad \text{Y-R}_3 \\
(6) & \quad \text{O} & \quad \text{OMe} & \quad \text{II} \\
(7) &
\end{align*}
\]

**Preparation of Compounds of Formula II**

Condensation of amine salts of Formula (6) and 2,5-dimethoxytetrahydrofurans of Formula (7) may be carried out in acetic acid for a period of one to 24 hours at temperatures from 40°-90°C. Another effective set of conditions includes heating a solution of compounds (6) and (7) in inert organic solvent, for example 1,2-dichloroethane, with or without acid, such as trifluoroacetic acid, and with or without stoichiometric amounts of water, for a period of one to 48 hours at 40°-90°C. The product of Formula II is isolated and purified by conventional means.
ALTERNATE PREPARATION OF COMPOUNDS OF FORMULA II

Another method for preparation of pyrrole compounds of Formula II involves earlier ring formation. Cyclocondensation of D-amino acids of Formula (8) with tetrahydrofurans of Formula (7) and subsequent coupling is shown below in Reaction Scheme V:

**REACTION SCHEME V**

![Reaction Scheme V](image)

(8) + (7) $\xrightarrow{\text{step 1}}$ (9)

(9) + $\text{H}_2\text{N}Y\text{R}_3$ $\xrightarrow{\text{step 2}}$ II
Step 1 - Preparation of Compounds of Formula (9)

Amino acids of Formula (8) and 2,5-dimethoxytetrahydrofurans of Formula (7) are dissolved or suspended in solution in an inert organic solvent, for example 1,2-dichloroethane, with chlorotrimethylsilane, with or without acid, such as trifluoroacetic acid, and with or without a base, such as pyridine, for a period of one to 48 hours at ambient temperature to 80°C, preferably the latter. The product (9) is isolated and purified by conventional means.

Step 2 - Preparation of Compounds of Formula II from Compounds of Formulas (9) and (10)

Carboxylates of Formula (9) and amines of Formula (10) are coupled under typical coupling conditions. Acids of Formula (9) may first be converted to a corresponding activated ester (i.e., acid fluoride) or used with a reagent, for example BOP, along with the amine (10) in an inert solvent such as chloroform, and with or without a base such as N-methylmorpholine (NMM), for a period of one to 48 hours at 0°C to ambient temperature, preferably the latter. The product II is isolated and purified by conventional means.

PREPARATION OF STARTING MATERIALS

Preparation of Amines of Formula (6)

Amines of Formula (6), where \( R_4 \) is hydrogen and \( R_5 \) is an ester (-COOR_6) are available after two steps as shown in Reaction Scheme VI: coupling of commercially available D-aspartate derivatives (11) and various amines (10) of commercial or synthetic origin. Subsequent deprotection of protected amines (12) furnish amine salts (6).
Step 1 - Preparation of Compounds of Formula (12)

Carboxylates of Formula (11) and amines (10) are condensed as described above for the preparation of a compounds of formula II according to Reaction Scheme V. Typical coupling reagents, for example BOP, are used in an inert solvent such as chloroform, and with or without a base such as N-methylmorpholine, at 0°C to ambient temperature, preferably the latter, for a period of one to 48 hours to furnish the product of Formula (12), which is isolated and purified by conventional means.

Step 2 - Preparation of Amines of Formula (6)

t-Butoxycarbonylamines of Formula (12) are deprotected traditionally, for example, in an inert solvent, preferably dichloromethane or chloroform, with an excess of trifluoroacetic acid, at 0°C to ambient temperature, preferably the former, for 30 minutes to 18 hours to obtain amine salts (6), which can be immediately used without further purification but are amenable to customary handling and purification.
Preparation of Compounds of Formula (18)

Aspartates of Formula (8) where $R_4$ is hydrogen are available for purchase, or from synthesis according to methods understood by those skilled in the art, such as those described in the literature. However, aspartates of Formula (8) where $R_4$ is alkyl must be synthesized. An example of this synthesis is shown in Reaction Scheme VII below. D-Aspartate (13) is converted via diallyl ester (14) to aspartate (15), which undergoes Ireland-Claisen rearrangement of the β-ester to allyl compound (16). Appropriate processing provides carboxylates of Formula (18) where $R_4$ is allyl, which are suitable for later conversion to lower alkyls, for example, reduction to where $R_4$ is propyl.

**REACTION SCHEME VII**

Step 1: Preparation of Compounds of Formula (14)

D-Aspartate dual esters can be produced in any of a variety of ways. For example, D-aspartate (13) is esterified with an excess of allyl alcohol, preferably in inert solvent such as
benzene with stoichiometric amounts of acid, such as p-toluenesulfonic acid, for one to 12 hours, at reflux under conditions to azeotropically remove water. The salt (14) precipitates or is otherwise isolated and purified by conventional means.

**Step 2 - Preparation of Compounds of Formula (15)**

Protection of an amine is well documented and understood by those skilled in the art. For example, amine salt (14) is treated with excess di-t-butyl-dicarbonate in appropriate solvent, preferably dichloromethane, in the presence of base, preferably triethylamine for one to 24 hours at ambient temperature. The product (15) is isolated and purified by conventional means.

**Step 3 - Preparation of Compounds of Formula (16)**

Esters of Formula (15) are treated with a specified stoichiometric amount of hindered lithium amide base, preferably two equivalents of lithium hexamethyldisilazide, in an inert aprotic solvent, preferably tetrahydrofuran, at -78°C for 15 to 45 minutes, whereupon preferably two equivalents or more of trialkylsilyl chloride, preferably chlorotrimethylsilane, are added and the reaction solution is subsequently warmed at 50 to 70°C or reflux for 30 minutes to 4 hours, then allowed to cool, and quenched with methanol. Subsequent routine aqueous workup leads to isolation of allyl compound (16), which is purified by conventional means.

**Step 4 - Preparation of Compounds of Formula (17)**

Acids of formula (16) are esterified to distinguish carboxyl termini. This esterification can be carried out by any of a number of means understood by those skilled in the art, preferably with an appropriate isourea to prevent racemization, for example with O-benzyl-N,N'-diisopropylurea, in inert solvent such as chloroform, at reflux for 3 to 6 hours. The diester (17) is isolated and purified by conventional means.
Step 5 - Preparation of Compounds of Formula (18)

Selective mono-deprotection of diesters of Formula (17) is effected preferentially by means of routine allyl ester cleavage conditions, as discussed above for Reaction Scheme I. A solution of the diester (17) is placed in polar aprotic solvent, preferably acetonitrile, with palladium catalyst, for example with palladium (0) tetrakis-(triphenylphosphine) and excess secondary amine base, preferably morpholine at ambient temperature for 15 minutes to four hours, preferably 30 minutes. The product acid of Formula (18) is isolated and purified in routine manner.

Preparation of Compounds of Formula (2)

For the simultaneous protection of R₄ and R₅ functionality for certain compounds of Formula I, for example where R₄ is allyl and R₅ is carboxyl, the halolactone-amide of Formula (2) is prepared. The synthesis of these compounds of Formula (2) uses methods described for Formula II in Reaction Scheme V, as shown in Reaction Schemes VIII and IX below.

In Reaction Scheme VIII, the monoacid (19) undergoes conventional coupling (as described for Reaction Scheme V) with amine of Formula (10) to give amide of Formula (20), which is deprotected to amine of Formula (21). The pyrrole ring is formed (as in the preparation of pyroles in Reaction Scheme V) on amine (21) with dimethoxy-furan (7) to obtain products of Formula (2).
**Step 1 - Preparation of Compounds of Formula (20)**

The coupling of acid (19) and amine (10) is accomplished with the routine peptide amide forming conditions as described above in Reaction Scheme V, Step 2.

**Step 2 - Preparation of Compounds of Formula (21)**

The deprotection of amine (20) to amine salt (21) is accomplished as described above for the preparation of amines of Formula (6) in Reaction Scheme VI, Step 2.

**Step 3 - Preparation of Compounds of Formula (2)**

The formation of pyrroles of Formula (2) from (21) and (7) can be accomplished as described above in Reaction Scheme V, Step 1.

An alternate route to compounds of Formula (2) proceeds via formation of pyrrole (23) prior to a coupling, as illustrated by Reaction Scheme IX below:
Step 1 - Preparation of Compounds of Formula (22)

The deprotection of monoacid (19) to amine salt (22) is as described above for the preparation of amines of Formula (6) in Reaction Scheme VI, Step 2.

Step 2 - Preparation of Compounds of Formula (23)

The condensation and cyclization of compounds (22) and (7) provides pyrroles of
Formula (23) in the same manner as discussed above for Reaction Scheme V, Step 1.

**Step 3 - Alternate Preparation of Compounds of Formula (2)**

The coupling of acid (23) and amine (10) is accomplished with the routine peptide amide formation conditions described above for Reaction Scheme V, Step 2.

For the preparation of late stage intermediates of Formula (2), aspartate derivatives of Formula (19) are needed. As shown in Reaction Scheme X below, intermediate (16) is alternatively cyclized to afford halolactones (25), which simultaneously protect the ultimate R₅ carboxylate and olefin of R₄ at an early stage.

**REACTION SCHEME X**

![Reaction Scheme X](image)

**Step 1: Preparation of Compounds of Formula (25)**

Carboxy-olefins of Formula (16) in a suspension of inert solvent, for example tetrahydrofuran or acetonitrile, and excess aqueous alkali, preferably sodium bicarbonate, are exposed to excess halogen, preferably iodine, initially at -10 to 0°C, then allowed to warm and equilibrate at ambient temperature over a period of 2 to 24 hours. The product halolactone (25) is isolated and purified according to routine methods.
Step 2: Preparation of Compounds of Formula (19)

Compound (19) is prepared from compound of Formula (25) in a manner identical to that described above for the preparation of compounds of Formula (18) in Reaction Scheme VII, Step 5.

Preparation of Tetrahydrofurans of Formula (7)

The tetrahydrofuran of Formula (7) where \( R_1 \) is hydrogen and \( X \) is a single bond is commercially available. More often 3-substituted furans (26) are treated with bromine in methanol to provide 2,5-dimethoxy-dihydrofurans (27), which are in turn hydrogenated to produce tetrahydrofurans (7). The overall approach is illustrated in Reaction Scheme XI below:

![Reaction Scheme XI](image)

Step 1 - Preparation of Compounds of Formula (27)

Furans of Formula (26) are treated with stoichiometric amounts of bromine in methanol as solvent or in mixtures with less polar solvents, at temperatures of -20°C to ambient temperature, preferably -10°C, for 10 minutes to 8 hours, preferably for 90 minutes. The products (27) are isolated and purified by conventional means.
Step 2 - Preparation of Compounds of Formula (7)

Olefins of Formula (27) are reduced in a suitable protic or aprotic solvent under hydrogen at one atmosphere or above in the presence of metal catalyst, preferably rhodium on alumina or palladium on carbon, in the temperature range from about 0°C to 40°C, for about 1-8 hours, preferably 3 hours. Compounds (7) are isolated and purified by conventional means.

The tetrahydrofuran (7a) of Formula (7) where X is a single bond and R₁ is formyl (−CHO) is commercially available. Construction of various X and R₁ combinations are possible through elaboration upon the carboxaldehyde. One possible scenario is displayed in Reaction Scheme XII below.

**REACTION SCHEME XII**

![Reaction Scheme XII](image)

Step 1 - Preparation of the Compound of Formula (28)

As an example, the aldehyde of Formula (7a) is added to a mixture with at least two equivalents of the reagent formed from carbon tetrabromide, triphenylphosphine, and zinc.
powder in dichloromethane over 24 hours at ambient temperature. After 60 minutes at ambient temperature, the desired intermediate 1,1-dibromoolefin can be isolated and purified in conventional manner. The alkyne product of Formula (28) is produced from treatment of 1,1-dibromoolefin with alkyllithium, preferably n-butyllithium, in inert, aprotic solvent, preferably tetrahydrofuran, at low temperature, -78°C to 0°C after 60 minutes, and subsequent capping with trialkylstannyl halide, such as chlorotributyl-tin (IV). The product (28) can be handled and purified with routine methods.

**Step 2 - Preparation of the Compounds of Formula (29)**

The alkyne (28) is elaborated through an alkylation with the corresponding anion for compounds of Formula (7) where X is -C≡C- and R₁ is alkyl, or the alkyne (28) is coupled in a Stille-type reaction to a compound of Formula (7) where X is a -C≡C- and R₁ is aryl. For the former compounds of Formula (29) where R₁ is alkyl, a solution of the alkyne (28) in inert solvent at low temperature, ambient or below, undergoes metal exchange with a suitable alkyllithium, and is subsequently alkylated with a suitable alkylating reagent, for example primary alkyl halides. For compounds of Formula (29) where R₁ is vinyl or aryl, the alkyne (28) and vinyl or aryl halide couple in the presence of palladium catalyst, such as tetrakis-(triphenylphosphine)palladium(0), with aprotic solvent at below or above ambient temperature. The products of Formula (29) are isolable and can be purified by conventional techniques.

**Step 3 - Preparation of the Compounds of Formula (7b)**

The alkyne (29) can be hydrogenated in suitable solvent, with a hydrogen source, such as hydrogen gas at atmospheric pressure, in the presence of a catalyst, such as palladium on carbon,
to furnish, for example, compounds (7b) of Formula (7) where X is \(-\text{CH}_2\text{CH}_2\). The products of Formu
hours. Suitable metal catalysts include palladium(0) tetrakis(triphenylphosphine) or palladium(II) acetate as examples. The product (32) is isolable and can be processed in routine fashion.

Alternatively, the roles of the reaction partners can be reversed, for example as shown in Scheme XIV below wherein furan-3-yl-boronic acid (33) and unsaturated halides of Formula (34), where X is bromide, iodide, or triflate and R₈ is vinyl or aryl, couple to result in compounds (32).

**REACTION SCHEME XIV**

![REACTION SCHEME XIV](image)

**Preparation of Compounds of Formula (32)**

Furan-3-ylboronic acid (33) and vinyl or aryl halides of Formula (34) are reacted under conditions similar to those described above for Reaction Scheme XIII.

The Heck coupling represents additional useful methodology to introduce and elaborate substituents on unsaturated systems as displayed in Reaction Scheme XV as follows:

**REACTION SCHEME XV**

![REACTION SCHEME XV](image)
Alternate Preparation of Compounds of Formula (32)

3-Bromofuran (30) and olefinic compounds of Formula (35) where \( R_8 \) is aryl or vinyl, are placed in a suspension of inert solvent, in the presence of metal catalyst, preferably palladium(0) tetrakis(triphenylphosphine) or palladium(II) acetate with catalytic tertiary phosphine, preferably tri(o-toly)phosphine or tri(o-toly)arsine, at ambient to reflux temperature for one to 24 hours. The product (32) is isolable and can be processed in routine fashion.

For larger \( R_1 \) groups, further elaboration of smaller \( R_1 \) groups can be obtained from different coupling conditions, complimentary to those reactions depicted in Reaction Schemes XIII, XIV, and XV above. For example, once the above methods are used to prepare a furan of Formula (36), it can in turn be manipulated to join an additional vinyl or aryl group as shown in Reaction Scheme XVI below:

**REACTION SCHEME XVI**

![Reaction Scheme XVI](image)
Step 1: Preparation of Compounds of Formula (37)

Phenol of Formula (36) in a solution of inert solvent, for example chloroform, in the presence of amine base, preferably 2,6-lutidine, at a temperature of -10°C or above, preferably 0°C, is treated with a stoichiometric amount of trifluoromethanesulfonic anhydride. The product triflate (37) is potentially reactive; it may be isolated and purified under anhydrous conditions in inert atmosphere, and should be used quickly.

Step 2: Alternate Preparation of Compounds of Formula (32b)

Either triflate of Formula (37) or vinyl halide of Formula (37a) is coupled with trialkyl-vinyl or aryl tin(IV) of Formula (38) in a solution of inert solvent, such as benzene, in the presence of metal catalyst, such as palladium(II) acetate, with a stoichiometric amount of lithium chloride at ambient temperature or above. The coupled product (32b) is amenable to conventional isolation and purification.

The furan building components in Reaction Schemes XIII, XIV, XV, and XVI are readily available. 3-Bromofuran (30) can be purchased from Aldrich. Furan-3-yl-boronic acid can be prepared, for example, as described in Thompson, W. J.; Gaudino, G. *J. Org. Chem.* 1984, 49, 5237-5243. Furans of Formula (36) can be synthesized using the methodology outlined above for Reaction Schemes XIII, XIV, XV, and XVI. Boronic acids of Formula (31) are known in the literature or can be synthesized. Organotin(IV) compounds of Formula (38) are also known in the literature or can be synthesized.
PREPARATION OF COMPOUNDS OF FORMULAS III, IV, V, VI, VII, AND VIII

All compounds of Formulas III, IV, V, VI, VII, and VIII where \( R_5 \) is carboxyl can be produced from the corresponding esters as described, above for Formula I in Reaction Scheme I. Compounds of Formulas III, IV, V, VI, VII, and VIII where \( R_5 \) is N-hydroxycarbamoyl (-C(O)NHOH) can be produced by the method described above for Reaction Scheme II.

The heterocyclic acetic acid derivatives of Formula (40) where \( R_9 \) is alkoxy, alkylamino, or oxazolidin-3-yl, are alkylated with \( \alpha \)-haloesters of Formula (39) where \( X \) is chloride, bromide, iodide, or triflate to target esters of Formula (41) as shown below in Reaction Scheme XVII. The \( R_9 \) group of compounds of Formula (40) can serve as a chiral auxiliary to help establish the absolute stereochemistry of compounds of Formula (41).

**REACTION SCHEME XVII**

![Reaction Scheme XVII](image)

Solutions of compounds of Formula (40) in inert solvent, preferably tetrahydrofuran, are added to solutions with stoichiometric and/or defined amounts of a suitable base, for example, sodium hexamethyldisilazane or lithium diisopropylamide, in inert solvent, preferably tetrahydrofuran, at low temperature, preferably -78 to -15°C, for five minutes to one hour, are
suitable to effect formation of the corresponding anion. Then α-haloesters of Formula (39) are added alone or in a solution of inert solvent. The cold reaction mixture is allowed to stir for 30 minutes to 24 hours, preferably one hour, to form target esters (41), which are isolated and purified by routine methods.

For an example of the alkylation process outlined by Reaction Scheme XVII where R₉ is a chiral auxiliary, see Reaction Scheme XVIII below. According to this scheme, amides of Formula (40) where R₉ are chiral oxazolidines (see Formula (42) below) can undergo stereoselective alkylation to provide products of Formula (43), which in turn can furnish hydroxyethylamides of Formula (44) (Formula I where R₅ is an ester, Y is -CH(OH)-).

**REACTION SCHEME XVIII**

![Reaction Scheme XVIII Diagram](image-url)
Step 1 - Preparation of Compounds of Formula (43)

Compounds of Formula (43) are prepared from compounds of Formula (40) where \( R_s \) is a chiral oxazolidine under conditions identical to those described above for the preparation of compounds of Formula (41) from compounds of Formulas (39) and (40) in Reaction Scheme XVII, except with compounds of Formula (42) substituted for compounds of Formula (40). The product of Formula (43) is amenable to conventional isolation and purification.

Step 2 - Preparation of Compounds of Formula (44)

Compounds of Formula (43) in solvent, such as tetrahydrofuran, is treated with excess acid, preferably dilute, 0.5 molar aqueous hydrochloric acid, at ambient to reflux temperature, preferably the former. The product of Formula (44) is isolated and purified via routine methods.

The disubstituted heterocycles of Formula (41) may also be assembled in a variation in the order of execution shown above in Reaction Scheme XVIII. The alkylations in the above Schemes XVII and XVIII can precede the installation or elaboration of the portion that contains \( X \) and \( R_1 \). Late stages use appropriate sequences of coupling methods discussed in Reaction Schemes XIII, XIV, XV, and XVI. For example, in Reaction Scheme XIX below, monosubstituted heterocycle of Formula (46) might be halogenated to an appropriately disubstituted heterocycle of Formula (47), which in turn is a coupling partner for methodology outlined in Reaction Schemes XIII, XIV, XV, and XVI. In this example, a Suzuki coupling with boronic acid of Formula (31) is used to give a compound of Formula (48).
**PREPARATION OF STARTING MATERIALS**

\( \alpha \)-Haloesters of Formula (39) where \( R_4 \) is hydrogen are commercially available. When \( R_4 \) is alkyl, many compounds of Formula (39) can be prepared by syntheses described in literature. For example, many amino acids can be converted to optically active compounds of Formula (39) where \( R_4 \) is alkyl as described in Coppola, G. M., Schuster, H. F. *Asymmetric Synthesis: Construction of chiral molecules using amino acids*; J. Wiley & Sons: New York, 1987.

Certain heterocyclic acetic acid derivatives of Formula (40) are commercially available in certain cases (for example, 2- or 3-thiophene acetic acid), but usually must be synthesized in various ways, as described below.
Direct alkylation on the nitrogen of an appropriate heterocycle of Formula (49), where T, U, and V are each independently carbon or nitrogen, by the α-haloacetic acid derivatives of Formula (50), where X is halogen or triflate, produces the desired intermediates of Formula (51), as shown in Reaction Scheme XX below:

**REACTION SCHEME XX**

\[
\begin{align*}
&\text{U} = \text{V} = \text{X} \rightarrow \text{R}_1 \\
&\text{H} \\
&(49) \\
&\text{X} \rightarrow \text{R}_9 \\
&\text{H} \\
&(50) \\
&\text{U} = \text{V} = \text{X} \rightarrow \text{R}_1 \\
&\text{H} \\
&(51)
\end{align*}
\]

**Step 1 - Preparation of Compounds of Formula (51)**

Nitrogen-containing heterocycles of Formula (49) (for example, pyrazole) are placed in aprotic solvent such as N,N-dimethylformamide, and if warranted, deprotonated with a base such as sodium hydride and treated with α-haloacetamides of Formula (50) where X is halogen or triflate, at room temperature or above for one to 24 hours. The products of Formula (51) are amenable to routine techniques for isolation and purification.

An analogous straightforward substitution of the heterocyclic ring involves the alkylation of an organometallic derivative of Formula (53) where M is, for example, lithium,
magnesium, or copper, with an $\alpha$-haloacetic acid derivative of Formula (50), as shown in Reaction Scheme XXI below:

**REACTION SCHEME XXI**

![Reaction Scheme](image)

**Step 1 - Preparation of Compounds of Formula (53)**

Heterocyclic metallo derivatives of Formula (53) are available in customary fashion from a heterocycle of Formula (52). Principal methods include deprotonation of parent of Formula (52) where $W$ is hydrogen, or from halogen-metal exchange of the corresponding halo-heterocycle of Formula (52) where $W$ is halogen. These reactions are typically carried out in inert, aprotic solvent such as tetrahydrofuran, at ambient temperature or below, in 15 minutes to 24 hours. The organometallics of Formula (53) are typically unstable to atmosphere and moisture. They are routinely formed *in situ* and used immediately without isolation.
Step 2 - Alternate Preparation of Compounds of Formula (40)

The organometallics of Formula (53) are alkylated by stoichiometric or excess amounts of acetate or acetamide of Formula (50) in inert solvent, preferably tetrahydrofuran, at low temperatures of -78 to 0°C, in ten to 90 minutes. The product of Formula (40) is isolated and purified with routine methods.

As another alternative, an acylation can be carried out with oxalates or oxamates of Formula (54) where R₁₀ is, for example, halogen, alkoxy, or imidazol-1-yl, to ketoesters or ketoamides of Formula (55), which are subsequently deoxygenated in several steps to ester or amides of Formula (40), as shown in Reaction Scheme XXII below.
Step 1 - Preparation of Compounds of Formula (55)

Heterocyclic organometallic derivatives of Formula (53) where M is lithium can be prepared as shown in Reaction Scheme XXI above and acylated by an oxalate or oxamate of Formula (54) where \( R_{10} \) is typically halogen, alkoxy, or imidazol-1-yl in inert solvent, preferably tetrahydrofuran, at low temperatures of -78 to 0°C, in ten to 90 minutes. The product of Formula (55) is isolated and purified with routine methods.

Step 2 - Preparation of Compounds of Formula (56)

The ketoester or amide of Formula (55) in solvent, preferably ethanol, at temperatures of -15 to 0°C, is treated with hydride reducing agent, preferably sodium borohydride, for five minutes to four hours to provide products of Formula (56), which are isolable and purified with conventional techniques.
Step 3 - Preparation of Compounds of Formula (57)

Alcohols of Formula (56) can be processed for deoxygenation by conversion to various moieties designated Q, preferably where Q is an ester or halide. Typically they are acylated in aprotic solution, for example chloroform, with excess acylating agent, for example acetic anhydride or acetyl chloride in the presence of excess amine base, preferably pyridine, with or without catalytic amounts of (4-dimethylamino)pyridine to give acetates of Formula (57) where Q is acetoxy, which are handled and purified in usual fashion.

Step 4 - Preparation of Compounds of Formula (40)

α-Halides or acetates of Formula (57) where Q is halogen or acetoxy, respectively, are reduced to products of Formula (40) with a metal catalyst, preferably palladium on carbon, and a source of hydrogen, preferably ammonium formate. The products (40) are handled and purified in customary manner.

The disubstituted heterocycles of Formula (40) can also be constructed in a differently ordered sequence: late formation of the portion that contains X and R1 utilizing appropriate sequences of coupling methods discussed in Reaction Schemes XIII, XIV, XV, and XVI.

Many of the monosubstituted heterocycles that are commercially available bear only one carbon in the substituent, and additional processing is necessary to prepare disubstituted heterocycles of Formula (40), as shown in Reaction Scheme XXIII below. Commercially available mono-substituted heterocycles of Formula (58) where R11 is hydrogen, hydroxy, or alkoxy (for example, 3-furan carboxaldehyde or 3-furfural, where R11 is hydrogen) can be homologated through any of numerous suitable methods known to those skilled in the art, for example, that described in Martin, S. F. Synthesis 1979, 633-665, to furnish 2-heterocyclic acetic
acid derivatives (59), which can be further substituted, for example as a halide of Formula (60). Alternatively, the heterocycles Formula (58) are substituted as halides of Formula (61), then homologated to derivatives of Formula (60). Subsequent linkage of a compound of Formula (60) with an appropriate coupling partner such as a compound of Formula (31) gives esters or amides of Formula (62). As recognized by those skilled in the art, the versatility of the methods in Reaction Scheme XXIII allows interchangability of the steps. For example, the substitution of halides of Formula (61) with boronic acids of Formula (31) may precede a homologation to desired intermediates of Formula (62) (not shown).

**REACTION SCHEME XXIII**

![Diagram](attachment:image.png)
Step 1 - Preparations of Compounds of Formulas (59) and (60)

The heterocycles of Formulas (58) and (61) are homologated to compounds of Formulas (59) and (60), respectively, depending upon the nature of $R_{11}$ and $R_9$. See, for example, Martin, S. F. *Synthesis* 1979, 633-665. As an example, for compounds (58) and (61) when $R_{11}$ is hydrogen, the anion of 2-trimethylsilyl-1,3-dithiane is used in inert aprotic solvent, preferably tetrahydrofuran at low temperature, 0°C to -78°C for 30 minutes to several hours, to obtain the corresponding dithiane adduct, which is subsequently converted through any of a variety of methods to derivatives of Formula (59). An example of dithiane removal uses mercuric chloride in water and alcohol to afford an ester of Formula (59) where $R_9$ is alkoxy. The products of Formula (59) are amenable to conventional handling and purification.

Step 2 - Preparations of Compounds of Formulas (60) and (61)

As an example of the introduction of the second heteroaromatic substituents, compounds of Formulas (59) and (58) in an inert solvent are halogenated, for example, with a bromine source, such as bromine or N-bromosuccinimide, at ambient temperature or below, for an hour to a day. The resultant heteroaryl halides of Formulas (60) and (61), respectively, are subject to routine purification and manipulation.

Step 3 - Preparations of Compounds of Formula (62)

The coupling of heteroaryls of Formula (60) are carried out analogous to that described for Reaction Schemes XIII, XV, or XVI to obtain compounds of Formula (62).

Amides with the generic Formula (40) where $R_9$ is alkylamino are often available from the corresponding carboxylic acid or activated esters of Formula (40) where $R_9$ is alkoxy or hydroxy, as exemplified in Reaction Scheme XXIV below:

62
The formation of amides (64) (i.e., Formula (40) where R₃ is alkylamine) results from acids of Formulas (63) coupling with amines of Formula (10) under the same conditions as described above for Reaction Scheme V, Step 2. The products of Formula (64) are isolated and purified by conventional methods.

Oxazolidines of Formula (42) can be made from the acetamides of Formula (65) where Y in terms of formula I is -CH(OH)-, as shown in Reaction Scheme XXV below:
The hydroxyamides of Formula (65) are placed in solution containing acetone or its equivalent, preferably 2-methoxypropene, with a catalytic amount of acid, such as p-toluenesulfonic acid, under dehydrating conditions, such as trapping of water with a Dean-Stark apparatus, at ambient temperature to reflux, for a suitable amount of time to convert starting material (65). The product (42) is amenable to routine processing for isolation and purification.

A preferable avenue to oxazolidines of Formula (42) involves coupling of oxazolidines of Formula (67) to acetic acids of Formula (63), as shown in Reaction Scheme XXVI below. The oxazolidines (67) in turn originate from amino-alcohols of Formula (66) of commercial and synthetic origin.

**REACTION SCHEME XXVI**
**Step 1 - Preparation of Compounds of Formula (67)**

Compounds of Formula (67) are prepared from compounds of Formula (66) using a method similar to that described above for the preparation of compounds of Formula (42) Reaction Scheme XXV, except lower temperatures are preferred. The products of Formula (67) can be somewhat unstable and are routinely used in situ or immediately in the next reaction without purification.

**Step 2 - Alternative Preparation of Compounds of Formula (42)**

Conditions for the formation of amides with typical coupling reagents as discussed above for Reaction Scheme V, Step 2, apply to the preparation of compounds of Formula (42).

For mono-substituted heterocycles that are not available commercially, the rings may be constructed. For example, for the compounds of Formula III, as shown below in Reaction Scheme XXVII, tetrahydrofurans of Formula (68) where \( R_{12} \) is hydrogen or alkyl are condensed with amines of Formula (69) to provide pyrroles of Formula (70). Depending on the nature of \( X \) and \( R_1, R_{12} \) of pyrrole (70) may be converted from hydrogen to a halogen and subsequently an alkyl (as in Reaction Scheme XXII, for example).

**REACTION SCHEME XXVII**

![Diagram of Reaction Scheme XXVII]
Preparation of Compounds of Formula (70)

Compounds of Formula (70) can be prepared from compounds of Formulas (68) and (69) using the conditions identical to those described for the preparation of pyrroles of Formula II in Reaction Scheme IV.

EXAMPLES

The following examples are merely illustrative of the invention and should not be construed as limiting the invention. The examples include preferred embodiments of the inventive compounds. One skilled in the art can make, without undue experimentation, various substitutions and variations.
Example 1(a). N-(1(S)-Benzy1-2-hydroxyethyl)-3(R)-[3-(biphenyl-4-yl)-1H-pyrrrol-1-yl]succinamic Acid

A suspension of 10% Pd/C (wet DeGussa type, 15 mg) and N-(1(S)-benzyl-2-hydroxyethyl)-3(R)-[3-(biphenyl-4-yl)-1H-pyrrrol-1-yl]succinamic acid benzyl ester (68 mg, 0.12 mmol) in EtOAc (5 mL) was stirred under H₂ for 20 hours. The catalyst was filtered onto Celite and rinsed with MeOH. The filtrate was concentrated under reduced pressure to give a yellow oil, which was purified via flash column chromatography with a 1% HOAc/2-5% MeOH/CH₂Cl₂ stepwise gradient elution to provide 47 mg (82%) of N-(1(S)-benzyl-2-hydroxyethyl)-3(R)-[3-(biphenyl-4-yl)-1H-pyrrrol-1-yl]succinamic acid as a white solid. ¹H NMR (CDCl₃): δ 7.66-7.48 (m, 3H), 7.42 (t, 2H, J = 7.2 Hz), 7.34-7.28 (m, 1H), 7.21-7.12 (m, 2H), 7.04-6.96 (m, 1H), 6.94 (bs, 1H), 6.68 (dd, 1H, J = 2.5, 2.5 Hz), 6.55 (dd, 1H, J = 1.6, 1.6 Hz), 5.78 (bd, 1H, J = 7.5 Hz), 4.90 (t, 1H, J = 7.2 Hz), 4.36-4.02 (m, 1H), 3.68 (dd, 1H, J = 3.4, 11.2 Hz), 3.50 (dd, 1H, J = 5.3, 9.0 Hz), 3.31 (dd, J = 5.9, 7.4 Hz), 3.12 (dd, 1H, J = 7.2, 17.1 Hz), 2.74 (dddd, 1H, J = 6.2, 14.3, 14.3 Hz), 2.68 (dddd, J = 8.7, 14.0, 14.3 Hz). IR (film): 3387, 3028, 2931, 1715, 1660, 1532, 1494, 1204, 702, 698 cm⁻¹. HRFABMS: Calculated for C₂₉H₂₈N₂O₄Cs (M + Cs⁺): 643.1209. Found: 643.1185. Anal. calculated for C₂₉H₂₈N₂O₄ • 0.1 CHCl₃ • 0.35 H₂O: C, 71.80; H, 5.96; N, 5.75. Found: C, 71.92; H, 5.87; N, 5.77.
The starting material, N-(1(S)-benzyl-2-hydroxyethyl)-3(R)-[3-(biphenyl-4-yl)-1H-pyrrrol-1-yl] succinamic acid benzyl ester, was prepared as follows:

To a solution of N-t-butoxycarbonyl-D-aspartic acid β-benzyl ester (2.00 g, 6.20 mmol) in CHCl₃ (80 mL) at 0°C was added in succession 1-(3-dimethylaminopropyl)-3-ethyl-carbodiimide hydrochloride (EDC, 1.30 g, 6.82 mmol) and N-hydroxybenzotriazole hydrate (HOBt • H₂O, 1.04 g, 6.82 mmol). After 10 min at 0°C, 2S-amino-3-phenyl-1-propanol (936 mg, 6.20 mmol) was added and the resultant mixture was allowed to warm to ambient temperature overnight. After 20 hours, the mixture was stirred with 10% aqueous HCl (5 mL) and saturated aqueous NH₄Cl (25 mL). The separated aqueous layer was extracted with more CHCl₃ (2 x 10 mL). The combined organic extracts were washed with saturated aqueous NaHCO₃:H₂O (25:25 mL) two times, dried over Na₂SO₄, and concentrated in vacuo to a yellow foam, 2.84 g, which was recrystallized from EtOAc/hex in successive crops to afford 2.34 g (83%) of N-(1(S)-benzyl-2-hydroxyethyl)-3(R)-(t-butoxycarbonylamino)succinamic acid benzyl ester as white microneedles, mp 94-95°C. ¹H NMR (CDCl₃): δ 7.40-7.10 (m, 10H), 6.81 (d, 1H, J = 10.8 Hz), 5.55 (d, 1H, J = 7.2 Hz), 5.11 (ddd, 2H, J = 1.2, 6.9, 7.4 Hz), 4.50-4.32 (bm, 1H), 4.21-4.04 (m, 1H), 3.68 (dd, 1H, J = 3.4, 11.2 Hz), 3.52 (dd, 1H, J = 5.3, 11.5 Hz), 3.03 (dd, 1H,

4-Biphenylboronic acid was prepared differently than described in the literature (see Yabroff, D. L.; Branch, G. E.; Bettman, B. J. Am. Chem. Soc. 1934, 56, 1850-1857). To a solution of 4-bromobiphenyl (2.00 g, 8.58 mmol) in THF (20 mL) at -78°C was added n-butyllithium (4.0 mL of 2.5 M in hexanes) in a slow stream via syringe. After 15 minutes, triisopropylborate (3.0 mL, 13 mmol) was added in a slow stream via syringe. After 10 minutes, the resultant homogeneous solution was allowed to warm to ambient temperature over 45 minutes and partitioned between EtOAc (50 mL) and 10% aqueous HCl (50 mL). The aqueous layer was separated and extracted with more EtOAc. The combined organic layers were washed with brine, dried over Na$_2$SO$_4$ and concentrated to give a crude product which was triturated with hexanes to yield 1.53 g (90%) of 4-biphenylboronic acid as a white solid. $^1$H NMR (DMSO-d$_6$): $\delta$ 8.05 (s, 2H), 7.83 (d, 2H, $J = 8.5 \text{ Hz}$), 7.65 (d, 2H, $J = 7.0 \text{ Hz}$), 7.60 (d, 2H, $J = 8.1 \text{ Hz}$), 7.43 (t, 2H, $J = 7.4 \text{ Hz}$), 7.33 (t, 1H, $J = 7.2 \text{ Hz}$). 3-(Biphenyl-4-yl)furan

A biphasic mixture of 3-bromofuran (2.90 mL, 32.1 mmol), benzene (70 mL), and 2N aqueous Na₂CO₃ (50 mL) was degassed and purged with argon. Tetrakis(triphenylphosphine) palladium(0) (3.7 g, 3.2 mmol) and a solution of 4-biphenylboronic acid (6.36 g, 32.1 mmol) in EtOH (50 mL) were added sequentially. The mixture was heated at 80°C for 18 hours, allowed to cool, and partitioned between CH₂Cl₂ and H₂O. The aqueous layer was separated and extracted with CH₂Cl₂ two times. The combined organic layers were washed with brine, dried over Na₂SO₄, and concentrated to a crude product, which was dissolved in a minimal amount of CH₂Cl₂ and applied to a flash chromatography column packed with hexanes. Elution with 10% CH₂Cl₂/hex led to some mixed fractions, which were rechromatographed. A total of 5.37 g (76%) of 3-(biphenyl-4-yl)furan was obtained as a pale yellow oil. ¹H NMR: δ 8.28 (s, 1H), 7.64-7.55 (m, 6H), 7.50 (s, 1H), 7.45 (t, 2H, J = 7.35 Hz), 7.40 (t, 1H, J = 7.35 Hz), 6.75 (s, 1H). 3-(Biphenyl-4-yl)-2,5-dihydro-2,5-dimethoxyfuran

To a slurry of 3-(biphenyl-4-yl)furan (100 mg, 0.450 mmol) and Na₂CO₃ (48 mg, 0.45 mmol) in benzene (1 mL) and MeOH (1 mL) at -10°C was added bromine (22 μL, 0.43 mmol) dropwise via syringe. After 30 minutes at -10°C, the mixture was diluted with EtOAc and filtered twice. The filtrate was concentrated to give a crude solid which was purified via flash column chromatography with a 0-1% EtOAc/CH₂Cl₂ gradient eluant to provide 90 mg (74%) of a diastereomeric mixture of 3-(biphenyl-4-yl)-2,5-dihydro-2,5-dimethoxyfuran as a colorless oil. 

¹H NMR (CDCl₃): δ 7.70-7.28 (m, 9H), 6.35 (dd, 0.75H, major isomer, J = 0.9, 0.9 Hz), 6.30 (d, 0.25H, minor isomer, J = 6.0 Hz), 6.04-6.03 (m, 1H, major+minor isomer), 5.71 (d, 0.75H, major isomer, J = 0.9Hz), 3.60-3.40 (m, 6H). 3-(Biphenyl-4-yl)-2,5-dimethoxytetrahydrofuran

A mixture of 3-biphenyl-4-yl-2,5-dihydro-2,5-dimethoxyfuran (1.00 g, 3.55 mmol) and 5% Pd/C (300 mg) in EtOH:EtOAc (1:2) was stirred under H₂ atmosphere for 1.75 hours. The catalyst was filtered onto Celite. The filtrate was concentrated to provide 0.97 g (97%) of a diastereomeric mixture of 3-biphenyl-4-yl-2,5-dimethoxy-tetrahydro-furan as a colorless oil which was typically used without purification. ¹H NMR: δ 7.60-7.53 (m, 4H), 7.45-7.28 (m,

**N-(1(S)-Benzyl-2-hydroxyethyl)-3(R)-(3-(biphenyl-4-yl)-1H-pyrrol-1-yl)succinamic Acid Benzyl Ester**

To a solution of N-(1(S)-benzyl-2-hydroxyethyl)-3(R)-(t-butoxycarbonylamino) succinamic acid benzyl ester (389 mg, 0.851 mmol) in CH₂Cl₂ (5 mL) was added trifluoroacetic acid (1 mL). After 2.5h at ambient temperature, the solvent was removed in vacuo to give 3(R)-amino-N-(1(S)-benzyl-2-hydroxyethyl)succinamic acid benzyl ester trifluoroacetate salt as a yellow foam that was placed with 3-(biphenyl-4-yl)-2,5-dimethoxytetrahydrofuran (182 mg, 0.641 mmol) in HOAc (1 mL) and heated to 50°C. After 2 hours, the mixture was allowed to cool, carefully stirred with saturated aqueous NaHCO₃ (25 mL), and extracted into CHCl₃ (3 x 15 mL). The combined organic layers were dried over Na₂SO₄ and evaporated to give a brown oil, 685 mg. Flash column chromatography with 10% MeOH/CH₂Cl₂ as eluant provided 276 mg (64%) of N-(1(S)-benzyl-2-hydroxyethyl)-3(R)-(3-(biphenyl-4-yl)-1H-pyrrol-1-yl)succinamic acid benzyl ester as a yellow solid. ¥H NMR (CDCl₃): δ 7.70-7.48 (m, 10H), 7.44 (dd, 2H, J = 7.2, 7.8 Hz), 7.38-7.12 (m, 5H), 7.08-6.98 (m, 2H), 6.89 (bm, 1H), 6.63 (dd, 1H, J = 2.5, 2.5 Hz), 6.54 (dd, 1H, J = 1.2, 1.2 Hz), 5.76 (d, 1H, J = 7.5 Hz), 5.10 (dd, 2H, J = 12.1, 15.9 Hz), 4.95

The starting material was furnished as follows:

3-Benzyloxy carbonyl-2,2-dimethyl-4R-(1-hydroxy-1-methylethyl)oxazolidine

To a solution of methyl 2-(3-benzyloxy carbonyl-2,2-dimethyloxazolidin-4R-yl)acetate (see Delacotte, J.-M.; Galons, H.; Schott, D.; Morgat, J.-L. J. Labelled Comp. Radiopharm. 93
1991, 29, 1141-1146; 500 mg, 1.70 mmol) in dry THF (10 mL) at -78°C was added dropwise via syringe a solution of methylmagnesium bromide (1.5 mL of 3M in ether). After 15 minutes, the reaction vessel was placed in a 0°C ice bath. After 2 hours, the mixture was cooled to -78°C and more methylmagnesium bromide (0.5 mL of 3M in ether) was added. The mixture was allowed to warm to 0°C over 2 hours, then quenched with acetone (1 mL) and partitioned between EtOAc (50 mL) and 1M pH7 phosphate buffer (50 mL). The separated organic layer was washed with 1M pH7 phosphate buffer (50 mL) and brine (25 mL), dried over Na₂SO₄, and concentrated to a residue which was purified via flash column chromatography with 0-12% EtOAc/CH₂Cl₂ gradient eluant to furnish 280 mg (56%) of 3-benzyloxy carbonyl-2,2-dimethyl-4R-(1-hydroxy-1-methyl-ethyl)-oxazolidine as a colorless oil. ¹H NMR (CD₃CN): δ 7.52-7.45 (m, 5H), 5.35-5.2 (bm, 2H), 4.68 (bs, 1H), 4.15-3.95 (bm, 3H), 1.67 (s, 3H), 1.57 (s, 3H), 1.21 (s, 6H). The starting materials were available as follows:
4-[2S-(3-Benzylxoycarbonyl-2(R)-t-butoxycarbonylamino-propionylamino)-4-methylpentanoyl-amino]-benzoic Acid Ethyl Ester

According to the procedure described in Example 1(a) for the preparation of N-(1(S)-benzyl-2-hydroxyethyl)-3(R)-t-butoxycarbonylamino-succinamic acid benzyl ester, N-t-butoxycarbonyl-D-aspartate β-benzyl ester and 4-(2S-amino-4-methylpentanoylamino)benzoic acid ethyl ester (Castelhano, A. L.; Yuan, Z.; Horne, S.; Liak, T. J. WO95/12603-A1, May 11, 1995) were coupled with EDC to furnish 2.4 g (67%) of 4-[2S-(3-benzylxoycarbonyl-2(R)-t-butoxycarbonylamino-propionylamino)-4-methyl-pentanoyl-amino]-benzoic acid ethyl ester as a glassy solid, which was used without further purification.

4-[2S-(2(R)-Amino-3-benzylxoycarbonyl-propionylamino)-4-methyl-pentanoyl-amino]-benzoic Acid Ethyl Ester

As described in Example 1(b) for the preparation of 3(R)-amino-N-(2,2-dimethyl-1(S)-(methylcarbamoyl)propyl)succinamic acid benzyl ester trifluoroacetate salt, 4-[2S-(3-benzylxoycarbonyl-2(R)-t-butoxycarbonylamino-propionylamino)-4-methyl-pentanoyl-amino]-benzoic acid ethyl ester was deprotected with trifluoroacetic acid, except that a solution of the resultant salt was neutralized by washing a CH₂Cl₂ solution with 1N aqueous
NaOH. Removal of the solvent under reduced pressure afforded 2.00 g (100%) of 4-[2S-(2(R)-amino-3-benzylxycarbonyl-propionyl-amino)-4-methyl-pentanoyl-amino]-benzoic acid ethyl ester as a viscous yellow oil, which was used without further purification.

4-[2S-(3-Carbobenzylxy-2(R)-1H-pyrrol-1-yl-propionylamido)-4-methyl-pentanoylamino]-benzoic Acid Ethyl Ester

A mixture of 4-[2S-(2(R)-amino-3-benzylxycarbonyl-propionyl-amino)-4-methyl-pentanoyl-amino]-benzoic acid ethyl ester (150 mg, 0.310 mmol), 2,5-dimethoxy-tetrahydrofuran (43 mg, 0.33 mmol), sodium acetate (153 mg, 1.86 mmol), and glacial HOAc (3 mL) was heated at reflux for 30 minutes. The mixture was allowed to cool, poured onto ice, diluted with H2O (30 mL), and extracted with EtOAc (2 x 50 mL). The combined extracts were washed with brine, dried over MgSO4, and concentrated in vacuo. Flash column chromatography with 15-20-25-30% EtOAc/hex stepwise gradient furnished 107 mg (65%) of 4-[2S-(3-carbobenzylxy-2(R)-1H-pyrrol-1-yl-propionylamido)-4-methyl-pentanoylamino]-benzoic acid ethyl ester.

Example 1(o). N-(9-Oxo-1,8-diaza-tricyclo[10.6.1.013,18]nonadeca-12(19),13,15,17-tetraen-10S-yl)-3(R)-1H-pyrrol-1-yl-succinamic Acid

According to the procedure described in Example 1(a), N-(9-oxo-1,8-diaza-
tricyclo[10.6.1.0^{13,18}]nonadeca-12(19),13,15,17-tetraen-10S-yl)-3(R)-1H-pyrrol-1-yl-
succinamic acid benzyl ester was hydrogenolyzed in EtOH and THF. Crystallization from
CH$_2$Cl$_2$ provided 120 mg (36%) of N-(9-oxo-1,8-diaza-tricyclo[10.6.1.0^{13,18}]nonadeca-
12(19),13,15,17-tetraen-10S-yl)-3(R)-1H-pyrrol-1-yl-succinamic acid as fluffy colorless

3-(2,2-Dibromoethenyl)-2,5-dimethoxy-tetrahydrofuran
A mixture of Zn powder (1.65 g, 25.0 mmol), triphenylphosphine (6.54 g, 25.0 mmol), and CBr₄ (8.30 g, 25.0 mmol) in dry CH₂Cl₂ (40 mL) was stirred at ambient temperature. After 24 hours, 2,5-dimethoxy-tetrahydrofuran-3-carboxaldehyde (2.00 g, 12.5 mmol) was added and an exothermic reaction ensued. After 30 minutes, pet ether (100 mL) was added and the resultant upper layer separated. The lower layer was twice diluted with CH₂Cl₂ (50 mL) and pet ether (50 mL), and the upper layer reserved. The combined upper layers were combined, passed through a pad of SiO₂, and concentrated under reduced pressure at 30°C or below to give 2.18 g (55%) of 3-(2,2-dibromoethyl)-2,5-dimethoxy-tetrahydrofuran as a volatile colorless oil, which was a mixture of diastereomers by ¹H NMR and used immediately without further purification.

![2,5-Dimethoxy-3-(2-tributylstannylyethynyl)-tetrahydrofuran](image)

To solution of crude 3-(2,2-dibromoethyl)-2,5-dimethoxy-tetrahydrofuran (1.78g, 5.64 mmol) in ether (30 mL) at -78°C was added n-butyllithium (9.02 mL of 1.25 M in hex). After 1 hour at -78°C, tributyltin chloride (1.68 mL, 6.20 mmol) was added, and the mixture was allowed to warm to ambient temperature. After 16 hours, ether (35 mL) and saturated aqueous NH₄Cl (30 mL) were added. The organic layer was separated, washed with saturated aqueous NH₄Cl (30 mL), H₂O (25 mL), and saturated aqueous NaHCO₃ (25 mL), dried over K₂CO₃, and evaporated to give an orange oil, which was purified via flash column chromatography with 2% MTBE/hex to furnish 1.92 g (77%) of 2,5-dimethoxy-3-(2-tributylstannylyethynyl)-tetrahydrofuran as a colorless oil. A mixture of diastereomers was
evident in the $^1$H NMR spectrum, which was used immediately without further purification.

A mixture of 2,5-dimethoxy-3-(2-tributylstannylethynyl)-tetrahydrofuran (1.86 g, 4.18 mmol), 4-iodobenzonitrile (1.15 g, 5.02 mmol), and tetrakis(triphenylphosphine)
palladium(0) (145 mg, 0.125 mmol) in toluene (25 mL) was heated at 100°C. After 5.5
hours, the resultant red solution was allowed to cool, and the solvent was removed under
reduced pressure. Flash column chromatography twice with 10% EtOAc/hex provided 1.10 g
(100%) of 3-[(2-(4-cyanophenyl)-ethynyl]-2,5-dimethoxy-tetrahydrofuran as an orange oil. A
mixture of diastereomers was observed by $^1$H NMR, which was used without further

2S-aminocarbonylamino-3,3-dimethyl-N-pyridin-4-yl-butanamide

To a solution of 2S-t-butoxycarbonylamino-3,3-dimethyl-N-pyridin-4-yl-butanamide (3.00 g, 9.75 mmol) in CH₂Cl₂ (10 mL) was added trifluoroacetic acid (3 mL). After 3 hours
at ambient temperature, the solvent was removed in vacuo and azeotropically dried with hexane twice to furnish a colorless foam, which was dissolved in MeOH (50 mL) and neutralized upon stirring with IRA-400 anion exchange resin (HCO₃ form; 3 g) over 3 hours. The resin was filtered off and the solution concentrated in vacuo to furnish a white solid, which recrystallized from hexanes to give 1.18 g (90%) of 2S-amino-3,3-dimethyl-N-4-pyridinyl-butanamide as a white powder (cited in Chapman, K. 1-(4(S)-Benzyl-2,2-dimethyl-oxazolidin-3-yl)-2-[1-(biphenyl-4-yl)1H-pyrrol-3-yl]-2-hydroxy-ethanone

To a solution of 1-(4(S)-benzyl-2,2-dimethyl-oxazolidin-3-yl)-2-[1-(biphenyl-4-yl)-1H-pyrrol-3-yl]ethane-1,2-dione (250 mg, 0.54 mmol) in EtOAc (6 mL) and MeOH (2mL) at 0°C was added NaBH₄ (20 mg, 0.54 mmol). After 2.75 hours at 0°C, more NaBH₄ (20 mg, 0.54 mmol) was added. After 1.25 hours at 0°C, the reaction was quenched with HOAc (few drops) and H₂O (2mL). The pH was adjusted to 5 (by pH paper) with HOAc and partitioned between H₂O (25 mL) and EtOAc (25 mL). The organic layers were dried over Na₂SO₄ and concentrated to provide 0.25 g (99%) of 1-(4(S)-benzyl-2,2-dimethyl-oxazolidin-3-yl)-2-[1-(biphenyl-4-yl)1H-pyrrol-3-yl]-2-hydroxy-ethanone as a crisp foam.

The starting material was prepared in the following fashion:

\[ \text{2-(2,5-Dimethoxy-tetrahydrofuran-3-yl-methylidene)-1,3-dithiane} \]

According to a procedure described in Boger, D.L.; Brotherton, C.E. *J. Org. Chem.* 1984, 49, 4050-4055, to a solution of 2-trimethylsilyl-1,3-dithiane (1.2 mL, 6.3 mmol) in dry THF (40 mL) at 0°C was added n-butyllithium (4 mL of 1.6 M in hexanes). After 15 minutes at 0°C and 20 minutes at 4 mL of 1.6 M ambient temperature, a solution of 2,5-dimethoxtetrahydrofuran-3-carboxaldehyde (1.00 g, 6.00 mmol) in dry THF (10 mL) was added dropwise. After 17 hours at ambient temperature, the resultant mixture was treated with saturated aqueous NH₄Cl (10 mL) and partitioned between EtOAc and H₂O. The layers were separated and the aqueous phase was extracted with EtOAc:hex (1:1) two times. The combined organic layers were washed with brine, dried over Na₂SO₄, and concentrated to afford a residue which was purified via flash column chromatography with 10% EtOAc/hex as eluent to yield 1.06g (70%) of a mixture of diastereomeric 2-(2,5-dimethoxy-tetrahydrofuran-3-yl-methylidene)-1,3-dithiane as a yellow oil, which was used without any further purification. \( ^1 \text{H NMR: } \delta \text{ 6.00 (d, 1H, } J = 9.6 \text{ Hz), 5.93 (d, 1H, } J = 9.6 \text{ Hz), 5.77 (d, 1H, } J = 9.6 \text{ Hz). Methyl 2-(2,5-Dimethoxy-tetrahydrofuran-3-yl)-acetate

Also according to a procedure from Boger, D.L.; Brotherton, C.E. J. Org. Chem. 1984, 49, 4050-4055, to a solution of 2-(2,5-dimethoxy-tetrahydrofuran-3-yl-methylidene)-1,3-dithiane (200 mg, 0.76 mmol) in a mixture of MeOH:THF:H₂O (8:1:1; 10 mL) was added mercuric chloride (450 mg, 1.66 mmol). Upon heating at 80°C, a white precipitate formed, and after 5 hours at 80°C, the mixture was filtered through Celite. The collected solid was washed with EtOAc followed by aqueous NH₄Cl. The filtrates were combined, and the biphasic mixture separated. The aqueous layer was extracted twice with EtOAc. The combined organic layers were washed with brine, dried over Na₂SO₄, and concentrated to yield 120 mg (77%) of methyl 2-(2,5-dimethoxy-tetrahydrofuran-3-yl)-acetate as an oil, which was a mixture of diastereomers as evident by NMR, and which was used without further purification. An analytical sample was obtained by flash column chromatography with 0-20% EtOAc/hex as gradient eluant. ¹H NMR: δ 3.68 (s, 3H), 3.67 (s, 3H). Anal. Calculated for C₉H₁₆O₅: C, 53.27; H, 7.90. The starting material was furnished in the following fashion:

2,4-Diphenyl-4-yl-furan

To a mixture of 4-bromobiphenyl (1.00 g, 4.80 mmol) and bis(triphenylphosphine)palladium(II) chloride (0.3 g, 0.4 mmol) in THF (10 mL) was added 2-tributylstannylfuran (1.6 mL, 5.0 mmol). After heating at reflux for 1 h, the resultant mixture was concentrated to a residue which was dissolved in minimal CH₂Cl₂ and applied to a flash chromatography column. Elution with 10% CH₂Cl₂/hex led to isolation of a mixture, which upon successive triturations with hexanes or pentane gave pure product. The mother liquor was partitioned with acetonitrile and hexanes. The separated acetonitrile layer was evaporated to obtain more pure product. A total of 0.55 g (58%) of pure 2-biphenyl-4-yl-furan as pale yellow solid, mp 155-7°C (d), was made. ¹H NMR: δ 7.75 (d, 2H, J = 8.1 Hz), 7.63 (d, 4H, J = 8.5 Hz), 7.49-7.43 (m, 3H), 7.35 (t, 1H, J = 7.0 Hz), 6.69 (d, 1H, J = 3.3 Hz), 6.50 (dd, 1H, J = 1.5, 3.3 Hz). To a suspension of hexane-washed sodium hydride (from 15 mg of 60% dispersion in oil, 0.38 mmol) in THF (2mL) at 0°C was added a solution of pyrazole (62 mg, 0.32 mmol) in THF (1 mL) dropwise via cannula. After 15 minutes at 0°C, a solution of 3-(2-bromoacetyl)-2,2-dimethyl-4(S)-phenylmethyl-oxazolidine (100 mg, 0.320 mmol) in THF (1 mL) was added via cannula. After 5 minutes at 0°C, the mixture was allowed to stir at ambient temperature for 30 minutes. The resultant mixture was partitioned between EtOAc and pH7 phosphate buffer. The aqueous layer was extracted with more EtOAc. The combined organic layers were dried over Na$_2$SO$_4$ and concentrated to an oily residue, which spontaneously crystallized. The crystals were triturated with MTBE/hex to obtain a white solid. The filtrate yielded another crop and in total 100 mg (75%) of 1-(4(S)-benzyl-2,2-dimethyl-oxazolidinyl)-2-(4-iodopyrazol-1-yl)-ethanone as white crystals, mp 117-20°C, were obtained. $^1$H NMR (DMSO-d$_6$): δ 7.76 (s, 1H), 7.51 (s, 1H), 7.37-7.24 (m, 5H), 5.25,

4-(4(S)-Benzyl-2,2-dimethyl-oxazolidin-3-yl)-3(R)-(4-biphenyl-4-yl-pyrazol-1-yl)succinic acid Benzyl Ester

To a solution of diisopropylamine (0.10 mL, 0.76 mmol) in THF (2 mL) at 0°C was added n-butyllithium (0.4 mL of 2.5M in hexanes). After 30 minutes at 0°C, the solution was added dropwise to a solution of 1-(4(S)-benzyl-2,2-dimethyl-oxazolidinyl)-2-(4-biphenyl-4-yl-pyrazol-1-yl)-ethanone (325 mg, 0.720 mmol) in THF (8 mL) at -78°C. After 15 minutes at -78°C, the bright yellow solution was cooled to -100°C and benzyl 2-bromoacetate (freshly passed through Al₂O₃; 0.16 mL, 1.0 mmol) was added. After 1 hour at -100 to -70°C, the mixture was partitioned between EtOAc and water and the aqueous layer was extracted with more EtOAc. The combined organic layers were dried over Na₂SO₄ and concentrated to furnish a crude oil which was purified via flash column chromatography with 0-5% EtOAc/CH₂Cl₂ gradient eluant to give 150 mg (35%) of 4-(2,2-dimethyl-oxazolidin-3-yl)-3(R)-(4-biphenyl-4-yl-pyrazol-1-yl)succinic acid benzyl ester as an oil, which was used without further purification. An analytical sample was obtained after trituration with MTBE/hex and drying to an amorphous solid. ¹H NMR: δ 8.01 (s, 1H), 7.82 (s, 1H), 7.62-7.53 (m, 7H), 7.44 (t, 2H, J = 7.7 Hz), 7.36-7.30 (m, 10H), 5.83 (dd, 1H, J = 4.2, 10.5 Hz), 5.14 (s, 2H), 4.44-4.39 (m, 1H), 3.85 (d, 1H, J = 9.2 Hz), 3.79-3.74 (m, 1H).

According to the procedure described in Example 1(f) for the preparation of N-(1(S)-benzyl-2-methoxy-ethyl)-3(R)-t-butoxycarbonyl-aminosuccinamic acid benzyl ester, 2(R)-thien-3-yl-succinamic acid 4-t-butyl ester and 4-(2S-amino-4-methylpentanoylamino)benzoic acid methyl ester (see Castellano, A.L.; Yuan, Z; Horne, S.; Liak, T.J. W095/12603-A1, May 11, 1995) were coupled with BOP. Precipitation with H2O and recrystallization from toluene gave in 55% yield 4-[2S-(2(R)-t-butoxycarbonylmethyl-2-thien-3-vlacetamino)-4-methylvaleroyl]-aminobenzoic acid methyl ester as a white solid, mp 168-70°C. ^1H NMR: δ 8.62 (s, 1H), 7.96 (d, 2H, J = 8.6 Hz), 7.56 (d, 2H, J = 8.8 Hz), 7.33 (dd, 1H, J = 3.0, 4.8 Hz), 7.19 (s, 1H), 7.02 (d, 1H, J = 5.1 Hz), 5.86 (bd, 1H, J = 6.7 Hz), 4.57-4.51 (m, 1H), 4.04 (t, 1H, J = 6.6 Hz), 3.89 (s, 3H), 3.04 (dd, 1H, J = 7.4, 16.9 Hz), 2.88 (dd, 1H, J = 5.6, 16.9 Hz), 1.88-1.81 (m, 1H), 1.42 (s, 9H), 0.92 (t, 6H, J = 6.5 Hz). Anal. Calculated for C_{28}H_{34}N_{2}O_{6}S: C, 62.13; H, 6.82; N, 5.57; S, 6.38. Found: C, 62.08; H, 6.79; N, 5.64; S, 6.46.
Example 17(c). N-[2,2-Dimethyl-1(S)-(pyridin-4-ylcarbamoyl)-propyl]-3(R)-thien-3-yl-succinamic Acid

According to the procedure described in Example 17(a), N-[2,2-dimethyl-1(S)-(pyridin-4-ylcarbamoyl)-propyl]-3(RS)-thien-3-yl-succinamic acid t-butyl ester was deprotected. Flash column chromatography with 1% HOAc/5% MeOH/CH₂Cl₂ as eluant led to isolation of the major isomer; 15 mg (21%) of N-[2,2-dimethyl-1(S)-(pyridin-4-ylcarbamoyl)-propyl]-3(R)-thien-3-yl-succinamic acid as a white solid, mp 205°C (d). ¹H NMR (DMSO-d₆): δ 8.30 (d, 2H, J = 6.0 Hz), 7.45 (dd, 2H, J = 1.5, 6.0 Hz), 7.26 (dd, 1H, J = 3.0, 5.0 Hz), 7.21-7.18 (m, 1H), 7.04 (dd, 1H, J = 1.0, 5.0 Hz), 4.38 (s, 1H), 4.26 (dd, 1H, J = 5.0, 10.0 Hz), 3.04 (dd, 1H, J = 10.0, 16.5 Hz), 2.65 (dd, 1H, J = 5.0, 16.5 Hz), 1.01 (s, 9H). Anal. Calculated for C₁₉H₂₃N₃O₄S • 0.6 HOAc: C, 57.02; H, 6.02; N, 9.88; S, 7.54. Found: C, 56.99; H, 6.06; N, 9.88; S, 7.55.

The starting material was made as follows:
N-[2,2-Dimethyl-1(S)-(pyridin-4-ylcarbamoyl)-propyl]-3(RS)-thien-3-yl-succinamic Acid t-Butyl Ester

According to the procedure described in Example 1(f) for the preparation of N-(1(S)-benzyl-2-methoxy-ethyl)-3(R)-t-butoxycarbonylamino-succinamic acid benzyl ester, 2(R)-thien-3-yl-succinamic acid 4-t-butyl ester (prepared as described in Example 17(b)) and 2S-amino-3,3-dimethyl-N-4-pyridinyl-butanamide (prepared as described in Example 5(d)) were coupled with BOP in 48h at ambient temperature. Flash column chromatography with 10% MeOH in CH₂Cl₂ gave 718mg (39%) of N-[2,2-dimethyl-1(S)-(pyridin-4-ylcarbamoyl)-propyl]-3(RS)-thien-3-yl-succinamic acid t-butyl ester as a white solid, mp 205°C (d), which was an inseparable mixture of isomers by NMR (3(R):S; 87:13, respectively) and used without further purification. ¹H NMR (DMSO-d₆): δ 8.48 (d, 1.74H, J = 5.5 Hz, major isomer), 8.38 (d, 0.87H, J = 9.0 Hz, major isomer), 7.65 (d, 1.74H, J = 5.5 Hz, major isomer), 7.59 (d, 0.26H, J = 5.0 Hz, minor isomer), 7.49 (dd, 0.87H, J = 3.0, 4.0 Hz, major isomer), 7.43 (m, 0.87H, major isomer), 7.30 (m, 0.13H, minor isomer), 7.23 (d, 0.87H, J = 5.0 Hz, major isomer), 7.12 (d, 0.13H, J = 5.0 Hz, minor isomer), 4.52 (d, 0.87H, J = 9.0 Hz, major isomer), 4.37 (dd, 0.87H, J = 5.0, 10.0 Hz, major isomer), 4.08 (dd, 0.13H, J = 7.0, 15.5 Hz, minor isomer), 3.00 (dd, 0.87H, J = 10.0, 16.0 Hz, major isomer), 1.40 (s, 1.17H, minor isomer), 1.29 (s, 7.83H, major isomer), 1.03 (s, 0.13H, minor isomer), 0.84 (s, 7.83H, major isomer).
Example 18(a). 3(RS)-(3-Biphenyl-4-yl-1H-imidazol-1-yl)-N-(hexahydroazepin-2-on-3(S)-yl)succinamic Acid

According to the procedure described in Example 1(a), a suspension of 3(RS)-(3-biphenyl-4-yl-1H-imidazol-1-yl)-N-(hexahydroazepin-2-on-3(S)-yl)succinamic acid benzyl ester in EtOH was hydrogenolyzed after 90 minutes to provide 779 mg (94%) of 3(RS)-(3-biphenyl-4-yl-1H-imidazol-1-yl)-N-(hexahydroazepin-2-on-3(S)-yl)succinamic acid as a solid. FABMS: 447 (C_{25}H_{27}N_{4}O_{4}; M +H^+).

The starting materials were prepared as follows:

2(RS)-(3-Biphenyl-4-yl-1H-imidazol-1-yl)-succinic Acid Dibenzyl Ester

A mixture of dibenzyl fumarate (5.30 g, 18.0 mmol) and 4-biphenyl-4-yl-1H-imidazole (see Ellis, et al. J. Pharm. Pharmacol. 1964, 400-3; 3.94 g, 18.0 mmol) was heated at 110-5°C. After 4 hours, the mixture was allowed to cool, diluted with ether, washed with 0.05% aqueous HCl, 0.01N aqueous NaOH, and brine, dried over Na_{2}SO_{4}, and concentrated
under reduced pressure to give 5.75 g (62%) of 2(RS)-(3-biphenyl-4-yl-1H-imidazol-1-yl)-succinic acid dibenzyl ester. FABMS: 517.3 (C_{33}H_{29}N_{2}O_{4}; M + H^+).

2(RS)-(3-Biphenyl-4-yl-1H-imidazol-1-yl)-succinic Acid 4-Benzyl Ester

A suspension of 2(RS)-(3-biphenyl-4-yl-1H-imidazol-1-yl)-succinic acid dibenzyl ester (551 mg, 1.07 mmol) in H$_2$O (0.5 mL) was refluxed overnight. Once allowed to cool to ambient temperature, the resultant precipitate was collected and dried in vacuo to provide 436 mg (96%) of 2(RS)-(3-biphenyl-4-yl-1H-imidazol-1-yl)-succinic acid 4-benzyl ester. FABMS: 427 (C_{26}H_{23}N_{2}O_{4}; M + H^+).

3(RS)-(3-Biphenyl-4-yl-1H-imidazol-1-yl)-N-(hexahydroazepin-2-on-3(S)-yl)succinamic Acid Benzyl Ester

According to the procedure described in Example 8(a), 2(RS)-(3-biphenyl-4-yl-1H-imidazol-1-yl)-succinic acid 4-benzyl ester (1.20 g, 2.82 mmol) and L-\(\alpha\)-amino-\(\varepsilon\)-caprolactam (469 mg, 3.67 mmol) was coupled in DMF with pyBOP to furnish 1.02 g (67%)
of 3(RS)-(3-biphenyl-4-yl-1H-imidazol-1-yl)-N-(hexahydroazepin-2-on-3(S)-yl)succinic acid benzyl ester. FABMS: 537.5 (C_{32}H_{33}N_{4}O_{4}; M +H^{+}).

The following were made in a similar manner:

**Example 18(b).** 3(RS)-(3-Biphenyl-4-yl-1H-imidazol-1-yl)-N-(2,2-dimethyl-1(S)-hydroxymethylpropyl)succinic Acid

![Chemical Structure](image)

According to the procedure described in Example 1(a), a suspension of 3(RS)-(3-biphenyl-4-yl-1H-imidazol-1-yl)-N-(2,2-dimethyl-1(S)-hydroxymethylpropyl)succinic acid benzyl ester in EtOH was hydrogenated to provide 3(RS)-(3-biphenyl-4-yl-1H-imidazol-1-yl)-N-(2,2-dimethyl-1(S)-hydroxymethylpropyl)succinic acid as a solid, mp 145-50°C. FABMS: 436.1 (C_{25}H_{30}N_{3}O_{4}; M +H^{+}).

**Example 18(c).** 3(RS)-(3-Biphenyl-4-yl-1H-imidazol-1-yl)-N-(2,2-dimethyl-1(S)-methylcarbamoylpropyl)succinic Acid

![Chemical Structure](image)

According to the procedure described in in Example 1(a), a suspension of 3(RS)-(3-biphenyl-4-yl-1H-imidazol-1-yl)-N-(2,2-dimethyl-1(S)-methylcarbamoylpropyl)succinic acid
acid benzyl ester in EtOH was hydrogenated to provide 3(RS)-(3-biphenyl-4-yl-1H-imidazol-1-yl)-N-(2,2-dimethyl-1(S)-methylcarbamoylpropyl)succinamic acid as a solid, mp 187.0-8.2°C. FABMS: 463.2 (C_{25}H_{31}N_{4}O_{4}; M +H^+).

Example 19(a). 3(RS)-(3-Biphenyl-4-yl-1H-imidazol-1-yl)-N^4-(2,2-dimethyl-1(S)-hydroxymethylpropyl)-N^1-hydroxy-succindiamide

![Chemical Structure]

A suspension of crude N^1-benzyloxy-3(RS)-(3-biphenyl-4-yl-1H-imidazol-1-yl)-N^4-(hexahydropyrazin-2-on-3(S)-yl)-succindiamide (800 mg, 1.45 mmol) and 10% Pd/C (800 mg) in EtOH (100 mL) was stirred under H_2 atmosphere. After 6 hours, more catalyst (300 mg) was added. After 2 hours, the catalyst was filtered onto Celite and rinsed. The filtrate was concentrated to provide 301 mg (45%) of 3(RS)-(3-biphenyl-4-yl-1H-imidazol-1-yl)-N-(hexahydropyrazin-2-on-3(S)-yl)-N^1-hydroxy-succindiamide as a solid, which effervesced at 180.5°C. FABMS: 462.2 (C_{25}H_{28}N_{5}O_{4}; M +H^+).

The starting materials were furnished as follows:
\[ \text{N}^{1}\text{-Benzylxoy-3(RS)-(3-biphenyl-4-yl-1H-imidazol-1-yl)-N}^{4}\text{-hexahydroazepin-2-on-3(S)-yl)-succindiamide} \]

According to the procedures described in Example 8(a), 3(RS)-(3-biphenyl-4-yl-1H-imidazol-1-yl)-N-(hexahydroazepin-2-on-3(S)-yl)succinamic acid (prepared as described in Example 18(a); 779 mg, 1.74 mmol) and benzylxoyamine hydrochloride (334 mg, 2.09 mmol) were coupled with pyBOP to afford 800 mg (83%) of \( \text{N}^{1}\text{-benzylxoy-3(RS)-(3-biphenyl-4-yl-1H-imidazol-1-yl)-N}^{4}\text{-hexahydroazepin-2-on-3(S)-yl)-succindiamide} \).

FABMS: 552.2 \( (\text{C}_{32}\text{H}_{34}\text{N}_{5}\text{O}_{4} ; \text{M} + \text{H}^{+}) \).

The following were made in a similar manner:

**Example 19(b).** 3(RS)-(3-Biphenyl-4-yl-1H-imidazol-1-yl)-N\(^4\)-(2,2-dimethyl-1(S)-hydroxymethylpropyl)-N\(^1\)-hydroxy-succindiamide

According to the procedure described in Example 19(a), \( \text{N}^{1}\text{-benzylxoy-3(RS)-(3-biphenyl-4-yl-1H-imidazol-1-yl)-N}^{4}\text{(2,2-dimethyl-1(S)-hydroxymethylpropyl)-succindiamide} \) was selectively hydrogenated to provide 3(RS)-(3-biphenyl-4-yl-1H-imidazol-1-yl)-N\(^4\)(2,2-dimethyl-1(S)-hydroxymethylpropyl)-succindiamide.
1-yl)-N⁴-(2,2-dimethyl-1(S)-hydroxymethylpropyl)-N¹-hydroxy-succindiamide. FABMS: 451.3 (C25H31N4O4; M +H⁺).

FABMS: 478.2 (C_{26}H_{32}N_{5}O_{4}; M +H^+).

The results obtained during biological testing of some preferred embodiments of the inventive compounds are described below.

**BIOLOGICAL DATA**

**Isolation of MMP's for Assays**

The catalytic domain of human collagenase-1 was expressed as a fusion protein with ubiquitin in *E. coli* (see Gehring, E.R., *J Biol. Chem.*, 1995, 270, 22507). After purification of the fusion protein, the fibroblast collagenase-1 catalytic domain (HFC) was released either by treatment with purified, active stromelysin-1 (1:50 w/w ratio), which generated nearly
100% N-terminal Phel, or by autoprocessing the concentrated collagenase-1 fusion and then incubating at 37 °C for 1 hour. Final purification was completed using zinc chelate chromatography.

The propeptide and catalytic domain of human collagenase-3 (Coll3) was expressed in *E. coli* as an N-terminal fusion protein with ubiquitin. After purification of the fusion from inclusion bodies, the catalytic domain was liberated by treatment with 2mM APMA at room temperature overnight. Final purification was completed using copper chelate chromatography.

The catalytic domain of human stromelysin (Hsln) was obtained by expression and purification of a C-terminally truncated prostromelysin-1 from *E. coli* host BL21 (see Marcy et al. *Biochem.*, 1991, 30, 6476). The subsequent activation of the mature form (Hsln) was completed with 2mM APMA for 1 hour at 37 °C, followed by separation using a sizing column.

Human matrilysin (Matr) was expressed in *E. coli* as a fusion protein with ubiquitin. After purification of the matrilysin/ubiquitin fusion from inclusion bodies, the catalytic domain was liberated by treatment with 2mM APMA at 37 °C for 2 hours. Final purification was complete using copper chelate chromatography.

The catalytic and fibronectin-like portion of human progelatinase A (GelA) was expressed as a fusion protein with ubiquitin in *E. Coli*. Assays were carried out on autocatalytically activated material.
Compounds of Formula I exhibited the ability to inhibit MMPs when tested in the following assay.

*In Vitro Assay Procedure*

Assays were performed in assay buffer (50 mM Tricine pH 7.5, 200 mM sodium chloride, 10 mM calcium chloride, 0.5 mM zinc acetate containing 2% dimethyl sulfoxide (DMSO)) once the substrate and inhibitor were diluted into it. Stock solutions of inhibitors were prepared in 100% DMSO. Stock solutions of the substrate were prepared in 100% DMSO at a concentration of 6 mM.

The assay method was based on the hydrolysis of MCA-Pro-Leu-Gly-Leu-DPA-Ala-Arg-NH$_2$ (American Peptide Co.) at 37 °C (see Knight, C.G. *et al.*, *FEBS*, 1992, 296, 263-266). The fluorescence changes were monitored with a Perkin-Elmer LS-50B fluorimeter using an excitation wavelength of 328 nm and an emission wavelength of 393 nm. The substrate concentration used in the assays was 10 μM. The inhibitor was diluted into the assays from a solution in 100% DMSO, and controls substituted an equal volume of DMSO so that the final DMSO concentration from inhibitor and substrate dilution in all assays was 2%. The concentration of enzyme in the assay ranged from 60 pM for gelatinase A to 1.5 nM for stromelysin and is a function of the enzymes respective $k_{cat}/K_m$ for the MCA peptide substrate. Proper determination of steady-state rates of substrate cleavage required assay lengths of 60 minutes to allow for complete equilibration of the enzyme-inhibitor complex.
The $K_m$ for the MCA peptide substrate with the matrix metalloproteinases is quite high and exceeds its solubility under assay conditions. Consequently, the apparent $K_i$ ($K_{i,app}$) was determined to describe the strength of inhibition. However, in this case, $K_{i,app}$ would be essentially equal to $K_i$ since $[S] \ll K_m$. For the determination of $K_{i,app}$, the concentration of the inhibitor was varied at a constant and low concentration of substrate and the steady-state rates of fluorescence change determined. In most cases absorptive quench due to the presence of ligand was not observed. For slow-binding inhibitors, onset of inhibition curves were collected for at least 45 minutes so that equilibrium was established. Steady-state rates of fluorescence change were obtained by fitting a curve to an equation for a single exponential decay containing a linear phase. The fitted value of the linear phase was taken as the steady-state rate. The steady-state rates were fitted to the Michaelis equation describing competitive inhibition by non-linear methods. Data resulting from tight-binding inhibition was analyzed, and $K_{i,app}$ determined by fitting the data to the tight-binding equation of Morrison (*Biochem. Biophys. Acta*, vol. 185, pp. 269-286 (1969)) by non-linear methods.

The results of the above-described tests are presented below in Table 1.

**Determination of Inhibitor Concentration in Plasma after Oral Dosing**

The dosing solution consisted of the inhibitor dissolved in either a molar equivalent of HCl in water (vehicle A), in 60% aq. propylene glycol (vehicle B), or in 2.8 mg/mL sodium bicarbonate in 60% aqueous propylene glycol (vehicle C), yielding a final concentration that ranged from 10-15 mg/ml. Sprague Dawley rats (Hilltop Lab Animals, Scottsdale, PA) were dosed as a function of drug weight per body weight, usually 50 mg per kg. Blood was taken from the rats and centrifuged, and the plasma was stored in the freezer. Drug was extracted from a 50 µl plasma aliquot by adding 1 ml of acetonitrile, shaking for 2 minutes, centrifuging for 15 minutes at 4000 rpm, collecting the supernatant, and then evaporating it to dryness under a stream of nitrogen. The samples were reconstituted with 130 µl of mobile phase, shook for 2 minutes, and centrifuged for 15 minutes at 4000 rpm. The supernatant was collected and the samples were analyzed by injecting 100 µl of supernatant onto HPLC.

Quantitation of drug levels was accomplished by generating a standard curve of known drug amounts that were extracted from added plasma. Drug levels were plotted as a function of time and analyzed to provide area under the curve (AUC) and maximum concentration (Cmax) values. The results are shown in Table 2.

*dosed as the benzyl ester prodrug*
We claim:

1. A compound of the formula I:

\[
\text{Chart Image}
\]

wherein

- \(X\) is a single bond or a straight or branched, saturated or unsaturated chain containing 1 to 6 carbon atoms, wherein one or more of the carbon atoms are optionally independently replaced with \(O\) or \(S\), and wherein one or more of the hydrogen atoms are optionally replaced with \(F\).

- \(Y\) is a single bond, \(-\text{CH(OH)}-\), or \(-\text{C(O)}-\);

- \(R_1\) is \(H\), an alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, or a heterocycloalkyl group;

- \(R_2\) is \(H\), an alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, a heterocycloalkyl group, or \(\text{C(O)R}_{10}\),

  wherein \(R_{10}\) is \(H\), an alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, a heterocycloalkyl group, an \(O\)-aryl group, an \(O\)-alkyl group, or \(\text{NR}_{11}\text{R}_{12}\);

  wherein \(R_{11}\) is \(H\), an alkyl group, an \(O\)-alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, or a heterocycloalkyl group, and

258
wherein R_{12} is H, an alkyl group, an aryl group, a heteroaryl group, a cycloalkyl
group, or a heterocycloalkyl group,

or wherein R_{11} and R_{12} form, together with the nitrogen to which they are
attached, a heteroaryl group or a heterocycloalkyl group, and

R_3 is H, an alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, a heterocycloalkyl
group, NR_{11}R_{12}, or OR_{11}, wherein R_{11} and R_{12} are as defined above,

or R_2 and R_3, together with the atom(s) to which they are attached, form a cycloalkyl group or a
heterocycloalkyl group;

R_4 is H or any suitable organic moiety;

R_5 is C(O)NHOH, C(O)OR_{13}, SH, N(OH)CHO, SC(O)R_{14}, P(O)(OH)R_{13}, or P(O)(OH)OR_{13},

\[
\begin{align*}
R_{13} & \text{ is } H, \text{ an alkyl group, or an aryl group,} \\
R_{14} & \text{ is an alkyl group or an aryl group, and} \\
R_{15} & \text{ is an alkyl group; and}

\]

\[
\text{is a heteroaryl group having five ring atoms, including 1, 2 or 3 heteroatoms}
\]

selected from O, S, and N;

or a pharmaceutically acceptable salt or solvate thereof, or a pharmaceutically acceptable prodrug
thereof, said prodrug being different from a compound of the formula (I);
with the proviso that if the compound of formula (I) is:

wherein \( R_1, R_4, \) and \( R_5 \) are as defined above, \( W \) is \( H, OH, \) a halo group, an alkyl group, or an \( O- \)alkyl group, and further wherein

when \( m \) is 2, 3, or 4, \( n \) is 1, 2, 3, or 4, and \( A \) is \( CH_2, O, NH, \) or \( N- \)alkyl; or

when \( m \) is 4, 5, or 6, \( n \) is 0, and \( A \) is \(-CHJ-, \) wherein \( J \) is carboxy, alkoxy carbonyl, or carbamoyl;

or a pharmaceutically acceptable salt or solvate thereof, or a pharmaceutically acceptable prodrug thereof, said prodrug being different from a compound of the formula (I); then

\[
\text{is pyrrolyl.}
\]

2. A compound of claim 1, wherein \( X \) is a single bond; or a pharmaceutically acceptable salt or solvate thereof, or a pharmaceutically acceptable prodrug thereof, said prodrug being different from a compound of the formula (I).
3. A compound of claim 1, wherein Y is -CH(OH)- or -C(O)-; or a pharmaceutically acceptable salt or solvate thereof, or a pharmaceutically acceptable prodrug thereof, said prodrug being different from a compound of the formula (I).

4. A compound of claim 3, wherein Y is -CH(OH)- and R₂ is H or an alkyl group or together with R₂ and the atom(s) to which R₂ and R₃ are attached forms a cycloalkyl group or heterocycloalkyl group; or a pharmaceutically acceptable salt or solvate thereof, or a pharmaceutically acceptable prodrug thereof, said prodrug being different from a compound of the formula (I).

5. A compound of claim 4, wherein Y is -CH(OH)- and R₂ is H; or a pharmaceutically acceptable salt or solvate thereof, or a pharmaceutically acceptable prodrug thereof, said prodrug being different from a compound of the formula (I).

6. A compound of claim 3, wherein Y is -C(O)- and R₂ is an alkyl group, NR₁₁R₁₂, OR₁₁, wherein R₁₁ is H, an alkyl group, an O-alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, or a heterocycloalkyl group, and wherein R₁₂ is H, an alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, or a heterocycloalkyl group, or wherein R₁₁ and R₁₂ form, together with the nitrogen to which they are attached, a heteroaryl group or a heterocycloalkyl group; or wherein Y is -C(O)- and R₂ and R₃, together with the atoms to which they are attached, form a cycloalkyl group or a heterocycloalkyl group; or a pharmaceutically acceptable salt or solvate thereof, or a pharmaceutically acceptable prodrug thereof, said prodrug being different from a compound of the formula (I).
7. A compound of claim 1, wherein \( R_1 \) is an aryl group or a heteroaryl group; or a pharmaceutically acceptable salt or solvate thereof, or a pharmaceutically acceptable prodrug thereof, said prodrug being different from a compound of the formula (I).

8. A compound of claim 7, wherein \( R_1 \) is an aryl group of the formula:

![Chemical Structure Diagram]

wherein \( Z \) is H, halogen, an alkyl group, an O-alkyl group, a cyano group, a hydroxy group, an aryl group, a heteroaryl group, or a heterocycloalkyl group; or a pharmaceutically acceptable salt or solvate thereof, or a pharmaceutically acceptable prodrug thereof, said prodrug being different from a compound of the formula (I).

9. A compound of claim 1, wherein \( R_2 \) is an aryl group or an alkyl group; or a pharmaceutically acceptable salt or solvate thereof, or a pharmaceutically acceptable prodrug thereof, said prodrug being different from a compound of the formula (I).

10. A compound of claim 1, wherein \( R_4 \) is H, an alkyl group, OH, O-alkyl, NH₂, NH-alkyl, or a cycloalkyl group; or a pharmaceutically acceptable salt or solvate thereof, or a pharmaceutically acceptable prodrug thereof, said prodrug being different from a compound of the formula (I).

11. A compound of claim 10, wherein \( R_4 \) is an alkyl group selected from CH₅OH and CH(NHR₁₇)R₁₆, wherein \( R₁₆ \) is H, an alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, or a heterocycloalkyl group, and \( R₁₇ \) is C(O)R₁₈, SO₂R₁₈, H, an alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, or a heterocycloalkyl group, or \( R₁₆ \) and \( R₁₇ \).
together with the atoms to which they are attached, form a heterocycloalkyl group; wherein R₁₈ is H, an alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, a heterocycloalkyl group, an O-aryl group, an O-alkyl group, or NR₁₉R₂₀; wherein R₁₉ and R₂₀ independently are H, an alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, or a heterocycloalkyl group, or R₁₉ and R₂₀, together with the nitrogen atom to which they are attached, form a heterocycloalkyl group; or a pharmaceutically acceptable salt or solvate thereof, or a pharmaceutically acceptable prodrug thereof, said prodrug being different from a compound of the formula (I).

12. A compound of claim 1, wherein

\[
\text{HET}
\]

is pyrrolyl, imidazolyl, pyrazolyl, furyl, thietyl, thiazolyl, oxazolyl, isoxazolyl, isothiazolyl, oxadiazolyl, or triazolyl; or a pharmaceutically acceptable salt or solvate thereof, or a pharmaceutically acceptable prodrug thereof, said prodrug being different from a compound of the formula (I).

13. A compound of claim 12, wherein

\[
\text{HET}
\]

is pyrrolyl; or a pharmaceutically acceptable salt or solvate thereof, or a pharmaceutically acceptable prodrug thereof, said prodrug being different from a compound of the formula (I).

14. A compound of claim 1 where R₁₅ is C(O)NH₂ or C(O)OR₁₃, wherein R₁₃ is hydrogen; or a pharmaceutically acceptable salt or solvate thereof, or a pharmaceutically acceptable prodrug thereof, said prodrug being different from a compound of the formula (I).
15. A compound of claim 1, wherein Y is a single bond and R₃ is a heteroaryl group.

16. A compound of claim 15, wherein R₃ is the heteroaryl group:

wherein R₂₁ and R₂₂ are independently any suitable organic moiety or together with the carbon atoms to which they are attached form an aryl group, a heteroaryl group, a cycloalkyl group, or a heterocycloalkyl group; or a pharmaceutically acceptable prodrug thereof, said prodrug being different from a compound of the formula (I).

17. A compound according to claim 16, wherein R₂₁ and R₂₂ are independently selected from hydrogen, an alkyl group, an aryl group, a heteroaryl group, a halo group, a C(O)O-alkyl group, a carbamoyl group, a cycloalkyl group, or a heterocycloalkyl group; or a pharmaceutically acceptable salt or solvate thereof, or a pharmaceutically acceptable prodrug thereof, said prodrug being different from a compound of the formula (I).
18. A compound of the formula I:

![Chemical Structure](image)

wherein

X is a single bond;

Y is a single bond, -CH(OH)- or -C(O)-;

R₁ is an aryl group or a heteroaryl group;

R₂ is H, an alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, a heterocycloalkyl group, or C(O)R₁₀,

wherein R₁₀ is H, an alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, a heterocycloalkyl group, an O-aryl group, an O-alkyl group, or NR₁₁R₁₂;

wherein R₁₁ is H, an alkyl group, an O-alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, or a heterocycloalkyl group, and

wherein R₁₂ is H, an alkyl group, an aryl group, a heteroaryl group, a cycloalkyl group, or a heterocycloalkyl group,

or wherein R₁₁ and R₁₂ form, together with the nitrogen to which they are attached, a heteroaryl group or a heterocycloalkyl group, and

R₃ is H, an alkyl group, a heteroaryl group, NR₁₁R₁₂, or OR₁₁

265
wherein R_{11} and R_{12} are as defined above,

or R_{2} and R_{3}, together with the atoms to which they are attached, form a cycloalkyl group or heterocycloalkyl group;

R_{4} is H, an alkyl group, or OH;

R_{5} is C(O)NH_{2}, C(O)OR_{13}, SH, or SC(O)R_{14},

wherein R_{13} is H, an alkyl group, or an aryl group, and R_{14} is an alkyl group or an aryl group; and

[HET] is pyrrolyl, imidazolyl, pyrazolyl, furyl, thi enyl, thiazolyl, oxazolyl, isoxazolyl, isothiazolyl, oxadiazolyl, or triazolyl;

or a pharmaceutically acceptable salt or solvate thereof, or a pharmaceutically acceptable prodrug thereof, said prodrug being different from a compound of the formula (III);

with the proviso that if the compound of formula (I) is:

\[
\begin{align*}

\end{align*}
\]

wherein R_{1}, R_{4}, and R_{5} are as defined above, W is H, OH, a halogen atom, an alkyl group, or an O-alkyl group, and further wherein
when \( m \) is 2, 3, or 4, \( n \) is 1, 2, 3, or 4, \( A \) is \( \text{CH}_2, \text{O}, \text{NH}, \) or \( \text{N}-\text{alkyl} \); or

when \( m \) is 4, 5, or 6, \( n \) is 0, and \( A \) is \(-\text{CHJ-} \), wherein \( J \) is carboxy, alkoxycarbonyl, or carbamoyl;

or a pharmaceutically acceptable salt or solvate thereof, or a pharmaceutically acceptable prodrug thereof, said prodrug being different from a compound of the formula (I); then

is pyrrolyl.
19. A compound selected from the group:

and the pharmaceutically acceptable salts and solvates thereof, and the pharmaceutically acceptable prodrugs thereof.

20. A pharmaceutical composition comprising:

(a) a therapeutically effective amount of a compound as defined in claim 1 or a pharmaceutically acceptable salt or solvate thereof, or a pharmaceutically acceptable prodrug thereof, said prodrug being different from a compound of the formula (I); and

(b) a pharmaceutically acceptable carrier, diluent, vehicle, or excipient.

21. A method of treating a mammalian disease condition mediated by metalloproteinase activity that comprises administering to a mammal in need thereof a therapeutically effective amount of a compound as defined in claim 1 or a pharmaceutically acceptable salt or solvate thereof, or a pharmaceutically acceptable prodrug thereof, said prodrug being different from a compound of the formula (I).

22. A method according to claim 21 wherein the mammalian disease condition is tumor growth, invasion or metastasis.
23. A method according to claim 21 wherein the mammalian disease condition is osteoarthritis, rheumatoid arthritis, osteoporosis, periodontitis, or gingivitis.

24. A method according to claim 21 wherein the mammalian disease condition is chronic dermal wounds, corneal ulceration, or degenerative skin disorders.

25. A method according to claim 21 wherein the mammalian disease condition is multiple sclerosis or stroke.

26. A method according to claim 21 wherein the mammalian disease condition is atherosclerosis, glomerular disease, or Alzheimer's disease.

27. A method according to claim 21 wherein the mammalian disease condition is characterized by unwanted angiogenesis.

28. A method according to claim 27, wherein the mammalian disease condition is diabetic retinopathy, macular degeneration, angiofibromas, or hemangiomas.

29. A method of inhibiting the activity of a metalloproteinase that comprises contacting the metalloproteinase with an effective amount of a compound as defined in claim 1 or a pharmaceutically acceptable salt or solvate thereof, or a pharmaceutically acceptable prodrug thereof, said prodrug being different from a compound of the formula (I).

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 6 C07D C07K

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

INTERNATIONAL SEARCH REPORT

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. X Claims Nos.: 21-29
   because they relate to subject matter not required to be searched by this Authority, namely:
   Although claims 21-29 are directed to a method of treatment of the animal/human body, the search has been carried out and based on the alleged effects of the compound/composition.

2. X Claims Nos.: 1-18, 20-29
   because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
   The above mentioned claims are so broad that for determining the scope of a meaningful international search due account has been taken of Rule 33.3 PCT; a special emphasis was put on the subject-matter of the examples during the search.

3.☐ Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1.☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2.☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3.☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.: 

4.☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.: 

Remark on Protest
☐ The additional search fees were accompanied by the applicant's protest.
☐ No protest accompanied the payment of additional search fees.
