Note: Within nine months of the publication of the mention of the grant of the European patent in the European Patent Bulletin, any person may give notice to the European Patent Office of opposition to that patent, in accordance with the Implementing Regulations. Notice of opposition shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

Description

BACKGROUND OF THE INVENTION

[0001] CGRP (Calcitonin Gene-Related Peptide) is a naturally occurring 37-amino acid peptide that is generated by tissue-specific alternate processing of calcitonin messenger RNA and is widely distributed in the central and peripheral nervous system. CGRP is localized predominantly in sensory afferent and central neurons and mediates several biological actions, including vasodilation. CGRP is expressed in alpha- and beta-forms that vary by one and three amino acids in the rat and human, respectively. CGRP-alpha and CGRP-beta display similar biological properties. When released from the cell, CGRP initiates its biological responses by binding to the CGRP receptor which is a heterodimer consisting of the G-protein coupled calcitonin-like receptor (CLR) in association with the single transmembrane protein known as receptor activity modifying protein 1 (RAMP₁). CGRP receptors are predominantly coupled to the activation of adenylyl cyclase and have been identified and pharmacologically evaluated in several tissues and cells, including those of brain, cardiovascular, endothelial, and smooth muscle origin.

[0002] CGRP is a potent neuromodulator that has been implicated in the pathology of cerebrovascular disorders such as migraine and cluster headache. In clinical studies, elevated levels of CGRP in the jugular vein were found to occur during migraine attacks (Goadsby et al. (1990) *Ann. Neurol.* 28, 183-187), salivary levels of CGRP are elevated in migraine subjects between (Bellamy et al. (2006) *Headache* 46, 24-33) and during attacks (Cady et al. (2009) *Headache* 49, 1258-1266), and CGRP itself has been shown to trigger migrainous headache (Lassen et al. (2002) *Cephalalgia* 22, 54-61). In clinical trials, the CGRP receptor antagonist BIBN4096BS has been shown to be effective in treating acute attacks of migraine (Olesen et al. (2004) *New Engl. J. Med.* 350, 1104-1110) and was able to prevent headache induced by CGRP infusion in a control group (Petersen et al. (2005) *Clin. Pharmacol. Ther.* 77, 202-213). The orally bioavailable CGRP receptor antagonist telcagepant has also shown antimigraine effectiveness in phase III clinical trials (Ho et al. (2008) *Lancet* 372, 2115-2123; Connor et al. (2009) *Neurology* 73, 970-977).

[0003] CGRP-mediated activation of the trigeminovascular system may play a key role in migraine pathogenesis. Additionally, CGRP activates receptors on the smooth muscle of intracranial vessels, leading to increased vasodilation, which is thought to contribute to headache pain during migraine attacks (Lance, *Headache Pathogenesis: Monoamines, Neuropeptides, Purines and Nitric Oxide*, Lippincott-Raven Publishers, 1997, 3-9). The middle meningeal artery, the principle artery in the dura mater, is innervated by sensory fibers from the trigeminal ganglion which contain several neuropeptides, including CGRP. Trigeminal ganglion stimulation in the cat resulted in increased levels of CGRP, and in humans, activation of the trigeminal system caused facial flushing and increased levels of CGRP in the external jugular vein (Goadsby et al. (1988) *Ann. Neurol.* 23, 193-196). Electrical stimulation of the dura mater in rats increased the diameter of the middle meningeal artery, an effect that was blocked by prior administration of CGRP(8-37), a peptide CGRP receptor antagonist (Williamson et al. (1997) *Cephalalgia* 17, 525-531). Trigeminal ganglion stimulation increased facial blood flow in the rat, which was inhibited by CGRP(8-37) (Escott et al. (1995) *Brain Res.* 669, 93-99). Electrical stimulation of the trigeminal ganglion in marmoset produced an increase in facial blood flow that could be blocked by the non-peptide CGRP receptor antagonist BIBN4096BS (Doods et al. (2000) *Br. J. Pharmacol.* 129, 420-423). Thus the vascular effects of CGRP may be attenuated, prevented or reversed by a CGRP receptor antagonist.

[0004] CGRP-mediated vasodilation of rat middle meningeal artery was shown to sensitize neurons of the trigeminal nucleus caudalis (Williamson et al., *The CGRP Family: Calcitonin Gene-Related Peptide (CGRP), Amylin, and Adrenomedullin*, Landes Bioscience, 2000, 245-247). Similarly, distention of dural blood vessels during migraine headache may sensitize trigeminal neurons. Some of the associated symptoms of migraine, including extra-cranial pain and facial allodynia, may be the result of sensitized trigeminal neurons (Burstein et al. (2000) *Ann. Neurol.* 47, 614-624). A CGRP antagonist may be beneficial in attenuating, preventing or reversing the effects of neuronal sensitization.

[0005] The ability of the compounds of the present invention to act as CGRP receptor antagonists makes them useful pharmacological agents for disorders that involve CGRP in humans and animals, but particularly in humans. Such disorders include migraine and cluster headache (Doods (2001) *Curr. Opin. Invest. Drugs* 2, 1261-1268; Edvinsson et al. (1994) *Cephalalgia* 14, 320-327); chronic tension type headache (Ashina et al. (2000) *Neurology* 14, 1335-1340); pain (Yu et al. (1998) *Eur. J. Pharmacol.* 347, 275-282); chronic pain (Hulsebosch et al. (2000) *Pain* 86, 163-175); neurogenic inflammation and inflammatory pain (Holzer (1988) *Neuroscience* 24, 739-768; Delay-Goyet et al. (1992) *Acta Physiol. Scand.* 146, 537-538; Salmon et al. (2001) *Nature Neurosci.* 4, 357-358); eye pain (May et al. (2002) *Cephalalgia* 22, 195-196), tooth pain (Awawdeh et al. (2002) *Int. Endocrin. J.* 35, 30-36), non-insulin dependent diabetes mellitus (Molina et al. (1990) *Diabetes* 39, 260-265); vascular disorders; inflammation (Zhang et al. (2001) *Pain* 89, 265); arthritis, bronchial hyperreactivity, asthma, (Foster et al. (1992) *Ann. NY Acad. Sci.* 657, 397-404; Schini et al. (1994) *Am. J. Physiol.* 267, H2483-H2490; Zheng et al. (1993) *J. Virol.* 67, 5786-5791); shock, sepsis (Beer et al. (2002) *Crit. Care Med.* 30, 1794-1798); opiate withdrawal syndrome (Salmon et al. (2001) *Nature Neurosci.* 4, 357-358); morphine tolerance (Menard et al. (1996) *J. Neurosci.* 16, 2342-2351); hot flashes in men and women (Chen et al. (1993) *Lancet* 342, 49; Spetz et al. (2001) *J. Urology* 166, 1720-1723); allergic dermatitis (Wallengren (2000) *Contact Dermatitis* 43,

137-143); psoriasis; encephalitis, brain trauma, ischaemia, stroke, epilepsy, and neurodegenerative diseases (Rohrenbeck et al. (1999) Neurobiol. Dis. 6, 15-34); skin diseases (Geppetti and Holzer, Eds., Neurogenic Inflammation, 1996, CRC Press, Boca Raton, FL), neurogenic cutaneous redness, skin rosaceousness and erythema; tinnitus (Herzog et al. (2002) J. Membr. Biol. 189, 225); obesity (Walker et al. (2010) Endocrinology 151, 4257-4269); inflammatory bowel disease, irritable bowel syndrome, (Hoffman et al. (2002) Scand. J. Gastroenterol. 37, 414-422) and cystitis. Of particular importance is the acute or prophylactic treatment of headache, including migraine and cluster headache.

[0006] Spirolactam compounds shown to be useful as CGRP antagonists are disclosed in WO 2011/014383, WO 2009/120652, US 2011/021516 and US 2011/306626.

SUMMARY OF THE INVENTION

[0007] The present invention is directed to spirolactam analogues which are potent antagonists of CGRP receptors and may be useful in the treatment or prevention of diseases in which the CGRP is involved, such as migraine. The invention is also directed to pharmaceutical compositions comprising these compounds and the use of these compounds and compositions in the prevention or treatment of such diseases in which CGRP is involved.

DETAILED DESCRIPTION OF THE INVENTION

[0008] The present invention is directed to a compound selected from:

(3'S)-3-(3-(6-Methyl-2-oxo-1-(2,2,2-trifluoroethyl)-5-(2,3,5-trifluorophenyl)piperidin-3-yl)prop-1-en-1-yl)-5,7-dihydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridin]-2'(1'H)-one;

(6S)-3-(1,1-Difluoro-2-(((3S,5S,6R)-6-methyl-2-oxo-5-phenyl-1-(2,2,2-trifluoroethyl)piperidin-3-yl)amino)ethyl)-5,7-dihydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridin]-2'(1'H)-one; and

(6S)-N-[(3S,5S,6R)-6-Methyl-2-oxo-5-phenyl-1-(2,2,2-trifluoroethyl)piperidin-3-yl]-2'-oxo-1',2',5,7-tetrahydros-piro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridine]-3-sulfonamide;

or a pharmaceutically acceptable salt thereof.

[0009] The invention also encompasses a pharmaceutical composition which comprises an inert carrier and a compound of the invention, or a pharmaceutically acceptable salt thereof.

[0010] The invention also encompasses a compound of the invention, or a pharmaceutically acceptable salt thereof for use in treating headache in a mammalian patient in need of such treatment. In a specific embodiment of the invention, the headache is migraine headache.

[0011] The invention is also directed to medicaments or pharmaceutical compositions for treating diseases or disorders in which CGRP is involved, such as migraine, which comprise a compound of the invention, or a pharmaceutically acceptable salt thereof, and a pharmaceutically acceptable carrier.

[0012] The invention is also directed to the use of a compound of the invention for treating diseases or disorders in which CGRP is involved, such as migraine.

[0013] Also described is a method for the manufacture of a medicament or a composition for treating diseases or disorders in which CGRP is involved, such as migraine, comprising combining a compound of the invention with one or more pharmaceutically acceptable carriers.

[0014] The compounds of the present invention may contain one or more asymmetric centers and can thus occur as racemates and racemic mixtures, single enantiomers, diastereomeric mixtures and individual diastereomers. Additional asymmetric centers may be present depending upon the nature of the various substituents on the molecule. Each such asymmetric center will independently produce two optical isomers and it is intended that all of the possible optical isomers and diastereomers in mixtures and as pure or partially purified compounds are included within the ambit of this invention. Unless a specific stereochemistry is indicated, the present invention is meant to comprehend all such isomeric forms of these compounds.

[0015] The independent syntheses of these diastereomers or their chromatographic separations may be achieved as known in the art by appropriate modification of the methodology disclosed herein. Their absolute stereochemistry may be determined by the x-ray crystallography of crystalline products or crystalline intermediates which are derivatized, if necessary, with a reagent containing an asymmetric center of known absolute configuration.

[0016] If desired, racemic mixtures of the compounds may be separated so that the individual enantiomers are isolated. The separation can be carried out by methods well known in the art, such as the coupling of a racemic mixture of compounds to an enantiomerically pure compound to form a diastereomeric mixture, followed by separation of the individual diastereomers by standard methods, such as fractional crystallization or chromatography. The coupling reaction

is often the formation of salts using an enantiomerically pure acid or base. The diastomeric derivatives may then be converted to the pure enantiomers by cleavage of the added chiral residue. The racemic mixture of the compounds can also be separated directly by chromatographic methods utilizing chiral stationary phases, which methods are well known in the art.

[0017] Alternatively, any enantiomer of a compound may be obtained by stereoselective synthesis using optically pure starting materials or reagents of known configuration by methods well known in the art.

[0018] In the compounds of the invention, the atoms may exhibit their natural isotopic abundances, or one or more of the atoms may be artificially enriched in a particular isotope having the same atomic number, but an atomic mass or mass number different from the atomic mass or mass number predominantly found in nature. The present invention is meant to include all suitable isotopic variations of the compounds of generic Formula I. For example, different isotopic forms of hydrogen (H) include protium (^1H) and deuterium (^2H). Protium is the predominant hydrogen isotope found in nature. Enriching for deuterium may afford certain therapeutic advantages, such as increasing *in vivo* half-life or reducing dosage requirements, or may provide a compound useful as a standard for characterization of biological samples. Isotopically-enriched compounds within generic Formula I can be prepared without undue experimentation by conventional techniques well known to those skilled in the art or by processes analogous to those described in the Schemes and Examples herein using appropriate isotopically-enriched reagents and/or intermediates.

[0019] Tautomers of compounds of the invention are also included within the scope of the present invention. For example, compounds including carbonyl $-\text{CH}_2\text{C}(\text{O})-$ groups (keto forms) may undergo tautomerism to form hydroxyl $-\text{CH}=\text{C}(\text{OH})-$ groups (enol forms). Both keto and enol forms are included within the scope of the present invention.

[0020] When any variable (e.g. R^b , etc.) occurs more than one time in any constituent, its definition on each occurrence is independent at every other occurrence. Also, combinations of substituents and variables are permissible only if such combinations result in stable compounds. Lines drawn into the ring systems from substituents represent that the indicated bond may be attached to any of the substitutable ring atoms. If the ring system is bicyclic, it is intended that the bond be attached to any of the suitable atoms on either ring of the bicyclic moiety.

[0021] It is understood that one or more silicon (Si) atoms can be incorporated into the compounds of the instant invention in place of one or more carbon atoms by one of ordinary skill in the art to provide compounds that are chemically stable and that can be readily synthesized by techniques known in the art from readily available starting materials. Carbon and silicon differ in their covalent radius leading to differences in bond distance and the steric arrangement when comparing analogous C-element and Si-element bonds. These differences lead to subtle changes in the size and shape of silicon-containing compounds when compared to carbon. One of ordinary skill in the art would understand that size and shape differences can lead to subtle or dramatic changes in potency, solubility, lack of off-target activity, packaging properties, and so on. (Diass, J. O. et al. *Organometallics* (2006) 5:1188-1198; Showell, G.A. et al. *Bioorganic & Medicinal Chemistry Letters* (2006) 16:2555-2558).

[0022] It is understood that substituents and substitution patterns on the compounds of the instant invention can be selected by one of ordinary skill in the art to provide compounds that are chemically stable and that can be readily synthesized by techniques known in the art, as well as those methods set forth below, from readily available starting materials. If a substituent is itself substituted with more than one group, it is understood that these multiple groups may be on the same carbon or on different carbons, so long as a stable structure results. The phrase "optionally substituted with one or more substituents" should be understood as meaning that the group in question is either unsubstituted or may be substituted with one or more substituents.

[0023] As used herein, "alkyl" is intended to mean linear or branched structures having no carbon-to-carbon double or triple bonds. Thus, $\text{C}_{1-4}\text{alkyl}$ is defined to identify the group as having 1, 2, 3 or 4 carbons in a linear or branched arrangement, such that $\text{C}_{1-4}\text{alkyl}$ specifically includes, but is not limited to, methyl, ethyl, n-propyl, iso-propyl, n-butyl, iso-butyl and tert-butyl.

[0024] The term "cycloalkyl" means a monocyclic saturated aliphatic hydrocarbon group having the specified number of carbon atoms. For example, "cycloalkyl" includes cyclopropyl, methyl-cyclopropyl, 2,2-dimethyl-cyclobutyl, 2-ethyl-cyclopentyl, cyclohexyl, and so on.

[0025] As appreciated by those of skill in the art, "halo" or "halogen" as used herein is intended to include chloro (Cl), fluoro (F), bromo (Br) and iodo (I).

[0026] The phrase "pharmaceutically acceptable" is employed herein to refer to those compounds, materials, compositions, and/or dosage forms which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of human beings and animals without excessive toxicity, irritation, allergic response, or other problem or complication, commensurate with a reasonable benefit/risk ratio.

[0027] As used herein, "pharmaceutically acceptable salts" refer to derivatives wherein the parent compound is modified by making acid or base salts thereof. Salts in the solid form may exist in more than one crystal structure, and may also be in the form of hydrates. Examples of pharmaceutically acceptable salts include, mineral or organic acid salts of basic residues such as amines; alkali or organic salts of acidic residues such as carboxylic acids; and the like. The pharmaceutically acceptable salts include the conventional non-toxic salts or the quaternary ammonium salts of the parent

compound formed, for example, from non-toxic inorganic or organic acids. For example, such conventional non-toxic salts include those derived from inorganic acids such as hydrochloric, hydrobromic, sulfuric, sulfamic, phosphoric, nitric and the like; and the salts prepared from organic acids such as acetic, propionic, succinic, glycolic, stearic, lactic, malic, tartaric, citric, ascorbic, pantoic, maleic, hydroxymaleic, phenylacetic, glutamic, benzoic, salicylic, sulfanilic, 2-acetoxy-benzoic, fumaric, toluenesulfonic, methanesulfonic, ethane disulfonic, oxalic, isethionic, and the like. Salts derived from inorganic bases include aluminum, ammonium, calcium, copper, ferric, ferrous, lithium, magnesium, manganic salts, manganous, potassium, sodium, zinc, and the like.

[0028] When the compound of the present invention is basic, salts may be prepared from pharmaceutically acceptable non-toxic acids, including inorganic and organic acids. Such acids include acetic, benzenesulfonic, benzoic, camphorsulfonic, citric, ethanesulfonic, fumaric, gluconic, glutamic, hydrobromic, hydrochloric, isethionic, lactic, maleic, malic, mandelic, methanesulfonic, mucic, nitric, pantoic, pantothenic, phosphoric, succinic, sulfuric, tartaric, p-toluenesulfonic acid, and the like. In one aspect of the invention the salts are citric, hydrobromic, hydrochloric, maleic, phosphoric, sulfuric, fumaric, and tartaric acids. It will be understood that, as used herein, references to the compounds of the invention are meant to also include the pharmaceutically acceptable salts.

[0029] Exemplifying the invention is the use of the compounds disclosed in the Examples and herein. Specific compounds within the present invention include a compound which may be selected from the group consisting of the compounds disclosed in the following Examples and pharmaceutically acceptable salts thereof and individual diastereomers thereof.

[0030] The present invention is directed to the compounds disclosed herein for use as antagonists of CGRP receptors. In addition to primates, especially humans, a variety of other mammals can be treated with the compounds of the present invention.

[0031] Another embodiment of the present invention is directed to a compound of the invention for use in the treatment, control, amelioration, or reduction of risk of a disease or disorder in which the CGRP receptor is involved in a patient.

[0032] The subject treated by the present compounds is generally a mammal, for example a human being, male or female, in whom antagonism of CGRP receptor activity is desired. The term "therapeutically effective amount" means the amount of the subject compound that will elicit the biological or medical response of a tissue, system, animal or human that is being sought by the researcher, veterinarian, medical doctor or other clinician. As used herein, the term "treatment" refers both to the treatment and to the prevention or prophylactic therapy of the mentioned conditions, particularly in a patient who is predisposed to such disease or disorder.

[0033] The term "composition" as used herein is intended to encompass a product comprising the specified ingredients in the specified amounts, as well as any product which results, directly or indirectly, from combination of the specified ingredients in the specified amounts. Such term in relation to pharmaceutical composition, is intended to encompass a product comprising the active ingredient(s), and the inert ingredient(s) that make up the carrier, as well as any product which results, directly or indirectly, from combination, complexation or aggregation of any two or more of the ingredients, or from dissociation of one or more of the ingredients, or from other types of reactions or interactions of one or more of the ingredients. Accordingly, the pharmaceutical compositions of the present invention encompass any composition made by admixing a compound of the present invention and a pharmaceutically acceptable carrier. By "pharmaceutically acceptable" it is meant the carrier, diluent or excipient must be compatible with the other ingredients of the formulation and not deleterious to the recipient thereof.

[0034] Also described are prodrugs of the compounds of this invention. In general, such prodrugs will be functional derivatives of the compounds of this invention which are readily convertible *in vivo* into the required compound. Thus, in the treatments of the present invention, the terms "administration of" or "administering a" compound shall encompass the treatment of the various conditions described with the compound specifically disclosed or with a compound which may not be specifically disclosed, but which converts to the specified compound *in vivo* after administration to the patient. Conventional procedures for the selection and preparation of suitable prodrug derivatives are described, for example, in "Design of Prodrugs," ed. H. Bundgaard, Elsevier, 1985. Metabolites of these compounds include active species produced upon introduction of compounds of this invention into the biological milieu.

[0035] The ability of the compounds of the present invention to act as CGRP receptor antagonists makes them useful pharmacological agents for disorders that involve CGRP in humans and animals, but particularly in humans.

[0036] The compounds of the present invention may have utility in treating, preventing, ameliorating, controlling or reducing the risk of one or more of the following conditions or diseases: headache; migraine; cluster headache; chronic tension type headache; pain; chronic pain; neurogenic inflammation and inflammatory pain; neuropathic pain; eye pain; tooth pain; diabetes; non-insulin dependent diabetes mellitus; vascular disorders; inflammation; arthritis; bronchial hyperreactivity, asthma; shock; sepsis; opiate withdrawal syndrome; morphine tolerance; hot flashes in men and women; allergic dermatitis; psoriasis; encephalitis; brain trauma; epilepsy; neurodegenerative diseases; skin diseases; neurogenic cutaneous redness, skin rosaceousness and erythema; obesity; inflammatory bowel disease, irritable bowel syndrome, cystitis; and other conditions that may be treated or prevented by antagonism of CGRP receptors. Of particular importance is the acute or prophylactic treatment of headache, including migraine and cluster headache.

[0037] The subject compounds may be further useful for the prevention, treatment, control, amelioration, or reduction of risk of the aforementioned diseases, disorders and conditions in combination with other agents.

[0038] The compounds of the present invention may be used in combination with one or more other drugs in the treatment, prevention, control, amelioration, or reduction of risk of diseases or conditions for which compounds of the invention or the other drugs may have utility, where the combination of the drugs together are safer or more effective than either drug alone. Such other drug(s) may be administered, by a route and in an amount commonly used therefor, contemporaneously or sequentially with a compound of the invention. When a compound of the invention is used contemporaneously with one or more other drugs, a pharmaceutical composition in unit dosage form containing such other drugs and the compound of the invention is preferred. However, the combination therapy may also include therapies in which the compound of the invention and one or more other drugs are administered on different overlapping schedules. It is also contemplated that when used in combination with one or more other active ingredients, the compounds of the present invention and the other active ingredients may be used in lower doses than when each is used singly. Accordingly, the pharmaceutical compositions of the present invention include those that contain one or more other active ingredients, in addition to a compound of the invention.

[0039] For example, the present compounds may be used in conjunction with an anti-migraine agent, such as ergotamine and dihydroergotamine, or other serotonin agonists, especially a 5-HT_{1B/1D} agonist, for example sumatriptan, naratriptan, zolmitriptan, eletriptan, almotriptan, frovatriptan, donitriptan, and rizatriptan, a 5-HT_{1D} agonist such as PNU-142633 and a 5-HT_{1F} agonist such as LY334370; a cyclooxygenase inhibitor, such as a selective cyclooxygenase-2 inhibitor, for example rofecoxib, etoricoxib, celecoxib, valdecoxib or paracoxib; a non-steroidal anti-inflammatory agent or a cytokine-suppressing anti-inflammatory agent, for example with a compound such as ibuprofen, ketoprofen, fenoprofen, naproxen, indomethacin, sulindac, meloxicam, piroxicam, tenoxicam, lornoxicam, ketorolac, etodolac, mefenamic acid, meclofenamic acid, flufenamic acid, tolfenamic acid, diclofenac, oxaprozin, apazone, nimesulide, nabumetone, tenidap, etanercept, tolmetin, phenylbutazone, oxyphenbutazone, diflunisal, salsalate, olsalazine or sulfasalazine and the like; or glucocorticoids. Similarly, the instant compounds may be administered with an analgesic such as aspirin, acetaminophen, phenacetin, fentanyl, sufentanil, methadone, acetyl methadol, buprenorphine or morphine.

[0040] Additionally, the present compounds may be used in conjunction with an interleukin inhibitor, such as an interleukin-1 inhibitor; an NK-1 receptor antagonist, for example aprepitant; an NMDA antagonist; an NR2B antagonist; a bradykinin-1 receptor antagonist; an adenosine A1 receptor agonist; a sodium channel blocker, for example lamotrigine; an opiate agonist such as levomethadyl acetate or methadyl acetate; a lipooxygenase inhibitor, such as an inhibitor of 5-lipoxygenase; an alpha receptor antagonist, for example indoramin; an alpha receptor agonist; a vanilloid receptor antagonist; a renin inhibitor; a granzyme B inhibitor; a substance P antagonist; an endothelin antagonist; a norepinephrine precursor; anti-anxiety agents such as diazepam, alprazolam, chlordiazepoxide and chlorazepate; serotonin 5HT₂ receptor antagonists; opioid agonists such as codeine, hydrocodone, tramadol, dextropropoxyphene and fentanyl; an mGluR5 agonist, antagonist or potentiator; a GABA A receptor modulator, for example acamprosate calcium; nicotinic antagonists or agonists including nicotine; muscarinic agonists or antagonists; a selective serotonin reuptake inhibitor, for example fluoxetine, paroxetine, sertraline, duloxetine, escitalopram, or citalopram; an antidepressant, for example amitriptyline, nortriptyline, clomipramine, imipramine, venlafaxine, doxepin, protriptyline, desipramine, trimipramine, or imipramine; a leukotriene antagonist, for example montelukast or zafirlukast; an inhibitor of nitric oxide or an inhibitor of the synthesis of nitric oxide.

[0041] Also, the present compounds may be used in conjunction with gap junction inhibitors; neuronal calcium channel blockers such as civamide; AMPA/KA antagonists such as LY293558; sigma receptor agonists; and vitamin B2.

[0042] Also, the present compounds may be used in conjunction with ergot alkaloids other than ergotamine and dihydroergotamine, for example ergonovine, ergonovine, methylegonovine, metergoline, ergoloid mesylates, dihydroergocornine, dihydroergocristine, dihydroergocryptine, dihydro- α -ergocryptine, dihydro- β -ergocryptine, ergotoxine, ergocornine, ergocristine, ergocryptine, α -ergocryptine, β -ergocryptine, ergosine, ergostane, bromocriptine, or methysergide.

[0043] Additionally, the present compounds may be used in conjunction with a beta-adrenergic antagonist such as timolol, propanolol, atenolol, metoprolol or nadolol, and the like; a MAO inhibitor, for example phenelzine; a calcium channel blocker, for example flunarizine, diltiazem, amlodipine, felodipine, nisalipine, isradipine, nimodipine, lomerizine, verapamil, nifedipine, or prochlorperazine; neuroleptics such as olanzapine, droperidol, prochlorperazine, chlorpromazine and quetiapine; an anticonvulsant such as topiramate, zonisamide, tonabersat, carabersat, levetiracetam, lamotrigine, tiagabine, gabapentin, pregabalin or divalproex sodium; an anti-hypertensive such as an angiotensin II antagonist, for example losartan, irbesartan, valsartan, eprosartan, telmisartan, olmesartan, medoxomil, candesartan and candesartan cilexetil, an angiotensin I antagonist, an angiotensin converting enzyme inhibitor such as lisinopril, enalapril, captopril, benazepril, quinapril, perindopril, ramipril andtrandolapril; or botulinum toxin type A or B.

[0044] The present compounds may be used in conjunction with a potentiator such as caffeine, an H₂-antagonist, simethicone, aluminum or magnesium hydroxide; a decongestant such as oxymetazoline, epinephrine, naphazoline, xylometazoline, propylhexedrine, or levo-desoxyephedrine; an antitussive such as caramiphen, carbapentane, or

dextromethorphan; a diuretic; a prokinetic agent such as metoclopramide or domperidone; a sedating or non-sedating antihistamine such as acrivastine, azatadine, bromodiphenhydramine, brompheniramine, carbinoxamine, chlorpheniramine, clemastine, dexbrompheniramine, dexchlorpheniramine, diphenhydramine, doxylamine, loratadine, phenindamine, pheniramine, phenyltoloxamine, promethazine, pyrilamine, terfenadine, triprolidine, phenylephrine, phenylpropanolamine, or pseudoephedrine. The present compounds also may be used in conjunction with anti-emetics.

[0045] In an embodiment of the invention the present compounds may be used in conjunction with an anti-migraine agent, such as: ergotamine or dihydroergotamine; a 5-HT₁ agonist, especially a 5-HT_{1B/1D} agonist, in particular, sumatriptan, naratriptan, zolmitriptan, eletriptan, almotriptan, frovatriptan, donitriptan, avitriptan and rizatriptan, and other serotonin agonists; and a cyclooxygenase inhibitor, such as a selective cyclooxygenase-2 inhibitor, in particular, rofecoxib, etoricoxib, celecoxib, valdecoxib or paracoxib.

[0046] The above combinations include combinations of a compound of the present invention not only with one other active compound, but also with two or more other active compounds. Likewise, compounds of the present invention may be used in combination with other drugs that are used in the prevention, treatment, control, amelioration, or reduction of risk of the diseases or conditions for which compounds of the present invention are useful. Such other drugs may be administered, by a route and in an amount commonly used therefore, contemporaneously or sequentially with a compound of the present invention. When a compound of the present invention is used contemporaneously with one or more other drugs, a pharmaceutical composition containing such other drugs in addition to the compound of the present invention is preferred. Accordingly, the pharmaceutical compositions of the present invention include those that also contain one or more other active ingredients, in addition to a compound of the present invention.

[0047] The weight ratio of the compound of the present invention to the other active ingredient(s) may be varied and will depend upon the effective dose of each ingredient. Generally, an effective dose of each will be used. Thus, for example, when a compound of the present invention is combined with another agent, the weight ratio of the compound of the present invention to the other agent will generally range from about 1000:1 to about 1:1000, or from about 200:1 to about 1:200. Combinations of a compound of the present invention and other active ingredients will generally also be within the aforementioned range, but in each case, an effective dose of each active ingredient should be used.

[0048] In such combinations the compound of the present invention and other active agents may be administered separately or in conjunction. In addition, the administration of one element may be prior to, concurrent to, or subsequent to the administration of other agent(s), and via the same or different routes of administration.

[0049] The compounds of the present invention may be administered by oral, parenteral (e.g., intramuscular, intraperitoneal, intravenous, ICV, intracisternal injection or infusion, subcutaneous injection, or implant), by inhalation spray, nasal, vaginal, rectal, sublingual, buccal or topical routes of administration and may be formulated, alone or together, in suitable dosage unit formulations containing conventional non-toxic pharmaceutically acceptable carriers, adjuvants and vehicles appropriate for each route of administration. In addition to the treatment of warm-blooded animals the compounds of the invention are effective for use in humans.

[0050] The pharmaceutical compositions for the administration of the compounds of this invention may conveniently be presented in dosage unit form and may be prepared by any of the methods well known in the art of pharmacy. All methods include the step of bringing the active ingredient into association with the carrier which constitutes one or more accessory ingredients. In general, the pharmaceutical compositions are prepared by uniformly and intimately bringing the active ingredient into association with a liquid carrier or a finely divided solid carrier or both, and then, if necessary, shaping the product into the desired formulation. In the pharmaceutical composition the active compound is included in an amount sufficient to produce the desired effect upon the process or condition of diseases. As used herein, the term "composition" is intended to encompass a product comprising the specified ingredients in the specified amounts, as well as any product which results, directly or indirectly, from combination of the specified ingredients in the specified amounts.

[0051] The pharmaceutical compositions containing the active ingredient may be in a form suitable for oral use, for example, as tablets, troches, lozenges, aqueous or oily suspensions, dispersible powders or granules, emulsions, solutions, hard or soft capsules, or syrups or elixirs. Compositions intended for oral use may be prepared according to any method known to the art for the manufacture of pharmaceutical compositions and such compositions may contain one or more agents selected from the group consisting of sweetening agents, flavoring agents, coloring agents and preserving agents in order to provide pharmaceutically elegant and palatable preparations. Tablets contain the active ingredient in admixture with non-toxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets. These excipients may be for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn starch, or alginic acid; binding agents, for example starch, gelatin or acacia; and lubricating agents, for example magnesium stearate, stearic acid or talc. The tablets may be uncoated or they may be coated by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate may be employed. They may also be coated by the techniques described in the U.S. Patents 4,256,108; 4,166,452; and 4,265,874 to form osmotic therapeutic tablets for control release.

Oral tablets may also be formulated for immediate release, such as fast melt tablets or wafers, rapid dissolve tablets or fast dissolve films.

[0052] Formulations for oral use may also be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredient is mixed with water or an oil medium, for example peanut oil, liquid paraffin, or olive oil.

[0053] Aqueous suspensions contain the active materials in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients are suspending agents, for example sodium carboxymethylcellulose, methylcellulose, hydroxy-propylmethylcellulose, sodium alginate, polyvinyl-pyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents may be a naturally-occurring phosphatide, for example lecithin, or condensation products of an alkylene oxide with fatty acids, for example polyoxyethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol anhydrides, for example polyethylene sorbitan monooleate. The aqueous suspensions may also contain one or more preservatives, for example ethyl, or n-propyl, p-hydroxybenzoate, one or more coloring agents, one or more flavoring agents, and one or more sweetening agents, such as sucrose or saccharin.

[0054] Oily suspensions may be formulated by suspending the active ingredient in a vegetable oil, for example arachis oil, olive oil, sesame oil or coconut oil, or in a mineral oil such as liquid paraffin. The oily suspensions may contain a thickening agent, for example beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set forth above, and flavoring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

[0055] Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water provide the active ingredient in admixture with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients, for example sweetening, flavoring and coloring agents, may also be present.

[0056] The pharmaceutical compositions of the invention may also be in the form of oil-in-water emulsions. The oily phase may be a vegetable oil, for example olive oil or arachis oil, or a mineral oil, for example liquid paraffin or mixtures of these. Suitable emulsifying agents may be naturally- occurring gums, for example gum acacia or gum tragacanth, naturally-occurring phosphatides, for example soy bean, lecithin, and esters or partial esters derived from fatty acids and hexitol anhydrides, for example sorbitan monooleate, and condensation products of the said partial esters with ethylene oxide, for example polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening and flavoring agents.

[0057] Syrups and elixirs may be formulated with sweetening agents, for example glycerol, propylene glycol, sorbitol or sucrose. Such formulations may also contain a demulcent, a preservative and flavoring and coloring agents.

[0058] The pharmaceutical compositions may be in the form of a sterile injectable aqueous or oleagenous suspension. This suspension may be formulated according to the known art using those suitable dispersing or wetting agents and suspending agents which have been mentioned above. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example as a solution in 1,3-butane diol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

[0059] The compounds of the present invention may also be administered in the form of suppositories for rectal administration of the drug. These compositions can be prepared by mixing the drug with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug. Such materials are cocoa butter and polyethylene glycols.

[0060] For topical use, creams, ointments, jellies, solutions or suspensions and the like, containing the compounds of the present invention are employed. Similarly, transdermal patches may also be used for topical administration.

[0061] The pharmaceutical composition and uses of the present invention may further comprise other therapeutically active compounds as noted herein which are usually applied in the treatment of the above mentioned pathological conditions.

[0062] In the treatment, prevention, control, amelioration, or reduction of risk of conditions which require antagonism of CGRP receptor activity an appropriate dosage level will generally be about 0.01 to 500 mg per kg patient body weight per day which can be administered in single or multiple doses. A suitable dosage level may be about 0.01 to 250 mg/kg per day, about 0.05 to 100 mg/kg per day, or about 0.1 to 50 mg/kg per day. Within this range the dosage may be 0.05 to 0.5, 0.5 to 5 or 5 to 50 mg/kg per day. For oral administration, the compositions are may be provided in the form of tablets containing 1.0 to 1000 milligrams of the active ingredient, particularly 1.0, 5.0, 10.0, 15.0, 20.0, 25.0, 50.0, 75.0, 100.0, 150.0, 200.0, 250.0, 300.0, 400.0, 500.0, 600.0, 750.0, 800.0, 900.0, and 1000.0 milligrams of the active ingredient

for the symptomatic adjustment of the dosage to the patient to be treated. The compounds may be administered on a regimen of 1 to 4 times per day, or may be administered once or twice per day.

[0063] When treating, preventing, controlling, ameliorating, or reducing the risk of headache, migraine, cluster headache, or other diseases for which compounds of the present invention are indicated, generally satisfactory results are obtained when the compounds of the present invention are administered at a daily dosage of from about 0.1 milligram to about 100 milligram per kilogram of animal body weight, given as a single daily dose or in divided doses two to six times a day, or in sustained release form. For most large mammals, the total daily dosage is from about 1.0 milligrams to about 1000 milligrams, or from about 1 milligrams to about 50 milligrams. In the case of a 70 kg adult human, the total daily dose will generally be from about 7 milligrams to about 350 milligrams. This dosage regimen may be adjusted to provide the optimal therapeutic response.

[0064] It will be understood, however, that the specific dose level and frequency of dosage for any particular patient may be varied and will depend upon a variety of factors including the activity of the specific compound employed, the metabolic stability and length of action of that compound, the age, body weight, general health, sex, diet, mode and time of administration, rate of excretion, drug combination, the severity of the particular condition, and the host undergoing therapy.

[0065] The utility of the compounds in accordance with the present invention as antagonists of CGRP receptor activity may be demonstrated by methodology known in the art. Inhibition of the binding of ^{125}I -CGRP to receptors and functional antagonism of CGRP receptors were determined as follows:

NATIVE RECEPTOR BINDING ASSAY: The binding of ^{125}I -CGRP to receptors in SK-N-MC cell membranes was carried out essentially as described (Edvinsson et al. (2001) Eur. J. Pharmacol. 415, 39-44). Briefly, membranes (25 μg) were incubated in 1 mL of binding buffer [10 mM HEPES, pH 7.4, 5 mM MgCl_2 and 0.2% bovine serum albumin (BSA)] containing 10 pM ^{125}I -CGRP and antagonist. After incubation at room temperature for 3 h, the assay was terminated by filtration through GFB glass fibre filter plates (PerkinElmer) that had been blocked with 0.5% polyethyleneimine for 3 h. The filters were washed three times with ice-cold assay buffer (10 mM HEPES, pH 7.4 and 5 mM MgCl_2), then the plates were air dried. Scintillation fluid (50 μL) was added and the radioactivity was counted on a Topcount (Packard Instrument). Data analysis was carried out by using Prism and the K_i was determined by using the Cheng-Prusoff equation (Cheng & Prusoff (1973) Biochem. Pharmacol. 22, 3099-3108).

[0066] RECOMBINANT RECEPTOR: Human CL receptor (Genbank accession number L76380) was subcloned into the expression vector pIRESHyg2 (BD Biosciences Clontech) as a 5'NheI and 3' PmeI fragment. Human RAMP1 (Genbank accession number AJ001014) was subcloned into the expression vector pIRESpuo2 (BD Biosciences Clontech) as a 5'NheI and 3'NotI fragment. HEK 293 cells (human embryonic kidney cells; ATCC #CRL-1573) were cultured in DMEM with 4.5 g/L glucose, 1 mM sodium pyruvate and 2 mM glutamine supplemented with 10% fetal bovine serum (FBS), 100 units/mL penicillin and 100 $\mu\text{g}/\text{mL}$ streptomycin, and maintained at 37 °C and 95% humidity. Cells were subcultured by treatment with 0.25% trypsin with 0.1% EDTA in HBSS. Stable cell line generation was accomplished by co-transfecting 10 μg of DNA with 30 μg Lipofectamine 2000 (Invitrogen) in 75 cm^2 flasks. CL receptor and RAMP1 expression constructs were co-transfected in equal amounts. Twenty-four hours after transfection the cells were diluted and selective medium (growth medium + 300 $\mu\text{g}/\text{mL}$ hygromycin and 1 $\mu\text{g}/\text{mL}$ puromycin) was added the following day. A clonal cell line was generated by single cell deposition utilizing a FACS Vantage SE (Becton Dickinson). Growth medium was adjusted to 150 $\mu\text{g}/\text{mL}$ hygromycin and 0.5 $\mu\text{g}/\text{mL}$ puromycin for cell propagation.

[0067] RECOMBINANT RECEPTOR BINDING ASSAY: Cells expressing recombinant human CL receptor/RAMP1 were washed with PBS and harvested in harvest buffer containing 50 mM HEPES, 1 mM EDTA and Complete™ protease inhibitors (Roche). The cell suspension was disrupted with a laboratory homogenizer and centrifuged at 48,000 g to isolate membranes. The pellets were resuspended in harvest buffer plus 250 mM sucrose and stored at -70°C. For binding assays, 20 μg of membranes were incubated in 1 mL binding buffer (10 mM HEPES, pH 7.4, 5 mM MgCl_2 , and 0.2% BSA) for 3 h at room temperature containing 10 pM ^{125}I -hCGRP (GE Healthcare) and antagonist. The assay was terminated by filtration through 96-well GFB glass fiber filter plates (PerkinElmer) that had been blocked with 0.05% polyethyleneimine. The filters were washed 3 times with ice-cold assay buffer (10 mM HEPES, pH 7.4, and 5 mM MgCl_2). Scintillation fluid was added and the plates were counted on a Topcount (Packard). Non-specific binding was determined and the data analysis was carried out with the apparent dissociation constant (K_i) determined by using a non-linear least squares fitting the bound CPM data to the equation below:

$$Y_{\text{obsd}} = \frac{(Y_{\text{max}} - Y_{\text{min}})(\%I_{\text{max}} - \%I_{\text{min}} / 100) + Y_{\text{min}} + (Y_{\text{max}} - Y_{\text{min}})(100 - \%I_{\text{max}} / 100)}{1 + ([\text{Drug}] / K_i (1 + [\text{Radiolabel}] / K_d))^{nH}}$$

Where Y is observed CPM bound, $Y_{\max}$ is total bound counts, $Y_{\min}$ is non specific bound counts, $(Y_{\max} - Y_{\min})$ is specific bound counts, % $I_{\max}$ is the maximum percent inhibition, % $I_{\min}$ is the minimum percent inhibition, radiolabel is the probe, and the K_d is the apparent dissociation constant for the radioligand for the receptor as determined by hot saturation experiments.

[0068] RECOMBINANT RECEPTOR FUNCTIONAL ASSAY: Cells were resuspended in DMEM/F12 (Hyclone) supplemented with 1 g/L BSA and 300 μ M isobutyl-methylxanthine. Cells were then plated in a 384-well plate (Proxiplate Plus 384; 509052761; Perkin-Elmer) at a density of 2,000 cells/well and incubated with antagonist for 30 min at 37 °C. Human α -CGRP was then added to the cells at a final concentration of 1.2 nM and incubated an additional 20 min at 37 °C. Following agonist stimulation, the cells were processed for cAMP determination using the two-step procedure according to the manufacturer's recommended protocol (HTRF cAMP dynamic 2 assay kit; 62AM4PEC; Cisbio). Raw data were transformed into concentration of cAMP using a standard curve then dose response curves were plotted and inflection point (IP) values were determined.

[0069] Representative K_i values in the recombinant receptor binding assay for exemplary compounds of the invention are provided in the table below:

Example	K_i (nM)
2	409

[0070] Representative IC_{50} values in the recombinant functional assay for exemplary compounds of the invention are provided in the table below:

Example	IC_{50} (nM)
1	7.2
3	3720

[0071] The following abbreviations are used throughout the text:

Me:	methyl
Et:	ethyl
<i>t</i> -Bu:	<i>tert</i> -butyl
Bu:	butyl
<i>i</i> -Pr:	isopropyl
Ar:	aryl
Ph:	phenyl
Bn:	benzyl
Py:	pyridyl
Ac:	acetylate
OAc:	acetate
DCE:	1,2-dichloroethane
TFA:	trifluoroacetic acid
TEA:	triethylamine
Boc:	<i>tert</i> -butoxycarbonyl
BOP:	(benzotriazol-1-yloxy) <i>tris</i> (dimethylamino)phosphonium hexafluorophosphate
DIEA:	<i>N,N</i> -diisopropylethylamine
HOBt:	1-hydroxybenzotriazole
EDC:	<i>N</i> -(3-dimethylaminopropyl)- <i>N'</i> -ethylcarbodiimide hydrochloride
PyCIU:	chlorodipyrrolidinocarbenium
<i>n</i> -BuLi:	<i>n</i> -butyllithium
<i>n</i> -HexLi:	<i>n</i> -hexyllithium
HATU:	O-(7-azabenzotriazol-1-yl)- <i>N,N,N',N'</i> -tetramethyluronium hexafluorophosphate
EDTA:	ethylenediaminetetraacetic acid

[0072] Methods for preparing the compounds of this invention are illustrated in the following Schemes and Examples. Starting materials are made according to procedures known in the art or as illustrated herein.

[0073] The compounds of the present invention can be prepared readily according to the following Schemes and specific examples, or modifications thereof, using readily available starting materials, reagents and conventional synthesis procedures. In these reactions, it is also possible to make use of variants which are themselves known to those of ordinary skill in this art but are not mentioned in greater detail. The general procedures for making the compounds claimed in this invention can be readily understood and appreciated by one skilled in the art from viewing the following Schemes.

[0074] While the invention has been described and illustrated with reference to certain particular embodiments thereof, those skilled in the art will appreciate that various adaptations, changes, modifications, substitutions, deletions, or additions of procedures and protocols may be made. For example, effective dosages other than the particular dosages as set forth herein above may be applicable as a consequence of variations in the responsiveness of the mammal being treated for any of the indications with the compounds of the invention indicated above. Likewise, the specific pharmacological responses observed may vary according to and depending upon the particular active compounds selected or whether there are present pharmaceutical carriers, as well as the type of formulation and mode of administration employed.

REACTION SCHEMES

[0075] The compounds of the present invention can be prepared readily according to the following Schemes and specific examples, or modifications thereof, using readily available starting materials, reagents and conventional synthetic procedures. In these reactions, it is also possible to make use of variants which are themselves known to those of ordinary skill in this art but are not mentioned in greater detail. The general procedures for making the compounds claimed in this invention can be readily understood and appreciated by one skilled in the art from viewing the following

Schemes.

[0076] Scheme 1 illustrates a route to 3-aminopiperidinone intermediates of type **1.5** which may be used to prepare compounds of the present invention. Aryl acetone **1.1** can be alkylated using the iodoalanine derivative **1.2** under basic conditions to provide keto ester **1.3**. Reductive amination followed by cyclization and epimerization provides primarily *cis*-substituted lactam **1.4** as a racemic mixture. Chiral resolution using normal-phase liquid chromatography, for example, and removal of the Boc protecting group with HCl in EtOAc furnishes 3-aminopiperidinone **1.5** as a hydrochloride salt.

SCHEME 1

[0077] An alternative sequence to 3-aminopiperidinone intermediates of type **1.5** is shown in Scheme 2. Reductive amination of keto ester **1.3** with ammonia followed by epimerization provides **2.1** as a mostly *cis*-substituted racemic mixture. Chiral resolution of the enantiomers provides **2.2**. *N*-Alkylation with LiHMDS as base, for example, and an alkyl halide or epoxide affords **2.3**. Removal of the Boc protecting group with HCl then affords **1.5** as a hydrochloride salt.

SCHEME 2

[0078] A third method to 3-aminopiperidinone intermediates of type **1.5** is shown in Scheme 3. *N*-Alkylation of 5-bromo-6-methylpyridin-2(1*H*)-one (**3.1**) using cesium carbonate as base and an alkyl halide followed by nitration provides **3.2**. Palladium-catalyzed cross-coupling with an aryl boronic acid then affords **3.3**. Hydrogenation using platinum oxide under acidic conditions and chiral resolution of the mostly *cis*-substituted racemic product mixture provides **1.5** as a single enantiomer.

SCHEME 3

[0079] A synthetic route to 3-aminopiperidinone intermediates of type **4.4** is shown in Scheme 4. Aryl acetonitrile **4.1** can be alkylated using the iodoalanine derivative **1.2** under basic conditions to provide cyano ester **4.2**. Reductive cyclization using hydrogen and palladium hydroxide on carbon or Raney nickel, epimerization, and chiral resolution affords *cis* lactam **4.3** as a single enantiomer. *N*-Alkylation and removal of the Boc protecting group then provides **4.4**.

as a hydrochloride salt.

SCHEME 4

[0080] Scheme 5 illustrates an alternative route to 3-aminopiperidinone intermediates of type **4.4**. The arylacetonitrile **5.1** may be condensed with acrylate **5.2** at elevated temperature to give the 4-cyanobutanoate ester **5.3**. Hydrogenation of nitrile **5.3** using Raney nickel catalyst and an ethanolic solution of ammonia affords the corresponding amine product, which typically cyclizes *in situ* to provide piperidinone **5.4**. *N*-Alkylation of lactam **5.4** may be accomplished by a variety of methods known to those skilled in the art of organic synthesis, the exact choice of conditions being influenced by the nature of the alkylating agent, R^1X . Electrophilic azidation of the resulting substituted lactam **5.5** can be accomplished using similar methodology to that described by Evans and coworkers (Evans et al. (1990) J. Am. Chem. Soc. 112, 4011-4030) to provide the azide **5.6** as a mixture of diastereoisomers, which can be separated by chromatography. The desired *cis* diastereomer of azide **5.6** may be reduced by catalytic hydrogenation in the presence of di-*tert*-butyl dicarbonate to give the corresponding Boc-protected amine **5.7**, and separation of the enantiomers using chiral HPLC or SFC leads to the (3*S*,5*S*)-isomer **5.8**. Finally, standard deprotection affords the desired 3-aminopiperidinone intermediate **4.4** as a hydrochloride salt.

SCHEME 5

[0081] Another approach to 3-aminopiperidinone intermediates of interest, which is particularly useful for preparing 3-amino-6-methyl-5-arylpiperidin-2-ones such as **1.5**, is outlined in Scheme 6. The pyridin-2(1*H*)-one **3.1** may be converted to the *N*-substituted pyridinone **6.1** by treatment with a suitable electrophile (R^1X) under basic conditions. Pyridinone **6.1** can then be subjected to Suzuki coupling with the boronic acid **6.2**, and the resulting 5-arylpiperidinone **6.3** may be hydrogenated using, for example, platinum(IV) oxide catalyst to afford the corresponding 5-arylpiperidinone **6.4**, which is usually obtained as predominantly the *cis* isomer. Further elaboration of piperidinone **6.4** may be achieved using analogous methodology to that described in Scheme 5. Specifically, electrophilic azidation followed by one-pot reduction and Boc protection leads to carbamate **6.6**, and the desired enantiomer may be obtained using chiral chromatography. In some cases, the desired diastereomer of azide **6.5** may be isolated as a racemic mixture of the (3*S*,5*S*,6*R*)- and (3*R*,5*R*,6*S*)-isomers following silica gel chromatography of the crude product, and this mixture may be elaborated as outlined in Scheme 6. In other cases, it may be advantageous to take a mixture of diastereomers of azide **6.5** forward to the corresponding carbamate **6.6**. The mixture of carbamate **6.6** diastereomers may be epimerized under basic conditions, such as potassium carbonate in EtOH, to afford a mixture that is significantly enriched in the desired (3*S*,5*S*,6*R*)- and (3*R*,5*R*,6*S*)-isomers, further purification may be employed to obtain the enantiomer of interest as outlined herein.

SCHEME 6

[0082] Scheme 7 illustrates a route to 3-allylpiperidinone intermediates of type **7.1**. Piperidinones of the type **7.1** can be allylated by lithiation with lithium *bis*(trimethylsilyl)amide or other strong bases, followed by introduction of the electrophile, in this case allyl bromide, to afford predominantly the 5,6-*cis* allyl piperidinone **7.2**.

SCHEME 7

[0083] A synthetic route to the indanyl iodide and alcohol intermediates **8.2** and **8.4**, respectively, is shown in Scheme 8. Diazotization of an arylamine derivative **8.1**, such as those described in WO 2008/020902, followed by treatment with potassium iodide provides iodide **8.2**. Palladium-catalyzed carbonylation in methanol then affords ester **8.3**, which may be reduced with DIBAL to furnish **8.4**.

SCHEME 8

[0084] Scheme 9 depicts a synthetic route to benzothioate intermediates such as **9.2**. SEM protection of iodide **8.2** followed by copper-catalyzed addition of thiobenzoic acid to **9.1** affords benzothioate **9.2**.

SCHEME 9

[0085] A synthetic route to the difluoroindanyl alcohol intermediate **10.2** is shown in Scheme 10. Treatment of SEM protected iodide **9.1** with ethyl difluorobromoacetate in the presence of copper bronze may afford a difluoroester of the type **10.1**. Reduction of this ester with sodium borohydride in the presence of calcium chloride affords the alcohol **10.2**.

SCHEME 10

[0086] One method for preparing the allyl compound 11.1 is shown in Scheme 11. Treatment of allylpiperidinone 7.2 with iodide 8.2 in the presence of a catalyst such as *bis*(tri-*t*-butylphosphinyl) palladium(0) and a ligand such as *N,N*-dicyclohexylmethylamine may afford allyl linked piperidinone 11.1.

SCHEME 11

[0087] Alternatively, as shown in Scheme 12, allyl piperidinone 7.2 may also be coupled to the SEM-protected indanilydiodide 9.1 by treatment with a catalyst such as *bis*(tri-*t*-butylphosphinyl)palladium(0) to afford the SEM-protected allyl-linked piperidinone 12.1. Deprotection of the SEM group may be effected by exposure to acid and then basic conditions to afford 11.1.

SCHEME 12

[0088] A method to prepare difluoroamines such as **13.3** is depicted in Scheme 13. Treatment of an alcohol such as **10.2** with triflic anhydride in the presence of 2,6-di-*t*-butyl-4-methylpyridine affords intermediate triflate **13.1**, which is immediately exposed to an amine such as **1.5** in the presence of Hunig's base to afford compound **13.2**. Removal of the SEM group may be effected by treatment with acid and then base, to afford the product **13.3**.

SCHEME 13

[0089] A synthetic route to sulfonamides such as **14.2** is outlined in Scheme 14. Based on the reported method of Ho et al. (Tetrahedron Lett. (2011) 52, 820-823), treatment of benzothioates **9.2** with trichloroisocyanuric acid (TCCA) and benzyltrimethylammonium chloride in the presence of sodium carbonate, followed by the addition of amines **1.5**, can provide sulfonamides **14.1**. Removal of the SEM protecting group may be accomplished using HCl followed by a basic work-up to furnish sulfonamides **14.2**.

SCHEME 14

[0090] A method to prepare ethers such as **15.1** is depicted in Scheme 15. Diazotization of amine **1.5** with isoamyl nitrite followed by a rhodium-mediated carbene insertion into the alcohol **8.4** may proceed to give ether **15.1**.

SCHEME 15

[0091] In some cases, alternative coupling conditions may be used to prepare the compounds of the present invention. In some cases, various protecting group strategies familiar to one skilled in the art of organic synthesis may be employed to allow preparation of a particular compound of the present invention.

[0092] It is understood that alternative methodologies may also be employed in the synthesis of these key intermediates.

For instance, racemic reaction sequences may be utilized, followed by chiral separations at appropriate steps to provide compounds of the present invention. The exact choice of reagents, solvents, temperatures, and other reaction conditions, depends upon the nature of the intended product. In some cases, appropriate protecting group strategies may be used.

[0093] In some cases the final product may be further modified, for example, by manipulation of substituents. These manipulations may include, but are not limited to, reduction, oxidation, alkylation, acylation, and hydrolysis reactions which are commonly known to those skilled in the art.

[0094] In some cases the order of carrying out the foregoing reaction schemes may be varied to facilitate the reaction or to avoid unwanted reaction products. Additionally, various protecting group strategies may be employed to facilitate the reaction or to avoid unwanted reaction products. The following examples are provided so that the invention might be more fully understood.

INTERMEDIATE 1

[0095]

(2R)-5-iodo-1,3-dihydrospiro[indene-2,3'-pyrrolo[2,3-b]pyridin]-2'(1'H)-one Step A: Dimethyl 4-aminobenzene-1,2-dicarboxylate

[0096]

Materials	FW	Mass	Volume	mol	Equiv.	d (g/mL)
4-nitrophthalic acid	211.13	5.3 kg		25.1	1	
MsOH	96	3.62 kg	2.45 L	37.7	1.5	1.48
MeOH			26 L			
10% Pd/C (wet)		159 g				
K ₃ PO ₄	212	8.0 kg		37.7	1.5	
EtOAc			27 L			

[0097] 4-Nitrophthalic acid was dissolved in 26 L MeOH (slightly endothermic) and 3.62 kg of methanesulfonic acid (MsOH, exothermic). The solution was heated under nitrogen at 80 °C in the hydrogenation vessel for 16 h (if preferred, the reaction can also be carried out at reflux in a regular vessel). The solution was cooled to 40 °C and sampled to ensure < 6% of remaining monomethyl ester.

[0098] The solution was further cooled to 20 °C and seeded (seeds can be readily prepared by taking out ca. 500 mL of the solution and stirred at 23 °C with traces of seeds that form on simple evaporation on a spatula) to form a very thick slurry.

[0099] 10% Pd/C was charged with ca. 1 L MeOH and the slurry at 23 °C was carefully stirred under 60 psi of H₂ gas to maintain temp < 40 °C.

[0100] After complete reduction of the nitro group, the mixture became a solution containing the catalyst. An additional 16 L of MeOH was added to the mixture to ensure product stays in solution (without this, some product crystallized out after 3 days); if the vessel volume permits, this 16 L of MeOH can be added at the beginning of the reaction to dilute the exotherm of the hydrogenation.

[0101] The reaction was repeated at the same scale. The two batches were combined and the catalyst was filtered off with MeOH rinse. The filtrate was concentrated to 25 L to give a slurry. EtOAc (44 L) was added followed by a slow addition of aq K₃PO₄ (made from 16 kg solid + 32 L water, solution ca. 36 L, used all but 1 L) to keep temp < 25 °C. The mixture became very thick after 2-4 L addition, but then lightened. The pH of the mixture should be about 9 (otherwise adjust with more K₃PO₄ or 1 N HCl). The bottom aqueous layer (ca. 50 L, 0.3% loss) was cut away. The organic layer was washed with 32 L water (aq loss ca 2%), concentrated, solvent switched to toluene to a target volume of ca. 36 L

with < 4 L EtOAc left. Seed if necessary to induce crystallization. Heptane (20 L) was then added. The slurry was aged at 23 °C for > 2 h when LC revealed < 3% loss in the mother liquor. The crystals were collected by filtration and rinsing with 1/1 toluene/heptane (18 L) and then heptane (6 L), and dried to give the title product.

Step B: Dimethyl 4-(dibenzelamino)benzene-1,2-dicarboxylate

[0102]

Materials	FW	Mass	Volume	mol	Equiv.	d (g/mL)
dimethyl 4-aminobenzene-1,2-dicarboxylate	209.20	4.33 kg		20.7	1	
BnCl	126.58	6.55 kg	6.01 L	51.7	2.5	1.09
K ₂ CO ₃	138.21	7.72 kg		55.9	2.7	
KI	166.00	687 g		4.14	0.2	
DMAC			21.6 L			

[0103] A 100-L, four-necked, round-bottomed flask was charged with the dimethyl 4-aminobenzene-1,2-dicarboxylate, K₂CO₃, KI (anhydrous), and 21.6 L of *N,N*-dimethylacetamide (DMAC, 200 ppm of water; however, the reaction can tolerate more water). Benzyl chloride (BnCl) was added in one portion, and the reaction mixture (brown slurry) was heated to 60 °C over 20 min using a steam bath. The steam bath was then shutoff, and the reaction temperature continued to increase to 76.8 °C over the next 30 min (exotherm). After cooling to 75 °C, the reaction mixture was stirred at this temperature for 2 h and then stirred at 90 °C until <1.5% of the monobenzyl intermediate remained (ca. 8-12 h) (yellow/white slurry). [note, the reaction mixture gets very thick during the reaction]. The steam bath was turned off and the reaction mixture was allowed to cool to room temperature (18 °C), then diluted with 21.6 L (5 volumes) of methyl *t*-butyl ether (MTBE) and 43.2 L (10 volumes) of water. The resulting organic layer was separated, washed with water (2 × 28 L), and concentrated to ca. 18 L (ca. 3 volumes). The brown oil was then solvent-switched to THF (60 L) and concentrated to ca. 38 L (< 1000 ppm water). The product mixture containing the title compound was used in the next step without further purification.

Step C: [4-(Dibenzylamino)benzene-1,2-diyl]dimethanol

[0104]

Materials	FW	Mass	Volume	mol	Equiv.
dimethyl 4-(dibenzylamino)benzene-1,2-dicarboxylate	389.44	8.06 kg		20.7	1.0
LiAlH ₄	1.0 M		27.2 L	27.2	1.3
THF			38 L		

[0105] A 100-L, four-necked, round-bottomed flask was charged with dimethyl 4-(dibenzylamino)benzene-1,2-dicarboxylate in 38 L of THF from the previous step. While cooling with a dry ice-acetone bath (ca. -50 °C), a solution of lithium aluminum hydride (LiAlH₄) in THF (1.0 M, 26 L) was added dropwise via an addition funnel keeping the internal temperature <5 °C (ca. 1.5 h addition). The resulting reaction mixture was aged at -12 to 1 °C for 3 h. Additional LiAlH₄ (1.2 L) was added via addition funnel and the reaction mixture was allowed to slowly warm to room temperature over 16 h. A solution of aqueous THF (1.03 L of water diluted with 4 L of THF) was then added slowly keeping the internal temperature <15 °C. Next, 1.03 L of a 15% NaOH solution were added in one portion followed by the addition of 3.1 L of water in 5 portions. [note, the reaction mixture gets extremely thick during the second water addition step] The reaction mixture was allowed to warm to room temperature, and then filtered through Solka-Floc® with the aid of 40 L of THF [note, the filtration is slow, ca. 5 h] and concentrated to ca. 21 L (ca. 3 volumes). Toluene (56 L, 8 volumes) was added and the solution was concentrated to ca. 35 L (ca. 5 volumes). Seed crystals were then added to initiate crystallization and the reaction mixture was further concentrated to ca. 28 L (4 volumes). Heptane (70 L) was then added over 90 min and the crystallization was aged at room temperature until <3% of the diol remained in the mother liquor (ca. 3 h). The crystals were collected by filtration, washed with 20 L of a 1:2 toluene:heptane solution and 30 L of heptane, and dried under vacuum with a nitrogen sweep to give the title compound.

Step D: [2-(Chloromethyl)-4-(dibenzylamino)phenyl]methanol

[0106]

Materials	FW	Mass	Volume	mol	Equiv.	d (g/mL)
[4-(dibenzylamino)benzene-1,2-diyl]dimethanol	333.42	6.00 kg		18.0	1.0	
SOCl ₂	118.97	6.42 kg	3.94 L	54.0	3.0	1.63
CH ₃ CN			18.0 L			

[0107] A 100-L, four-necked, round-bottomed flask was charged with SOCl₂ and 18 L of CH₃CN. While cooling with an ice-water bath (ca. 5 °C), [4-(dibenzylamino)benzene-1,2-diyl]dimethanol was added in portions over 1.5 h keeping the internal temperature < 18 °C [note, excessive HCl/SO₂ gas, recommend using a HCl scrubber].

[0108] After the addition, the reaction mixture was warmed to 23 °C and diluted with 36 L (ca. 6 vol.) of methyl *t*-butyl ether (MTBE). The reaction mixture was seeded to initiate crystallization and then diluted with an additional 18 L of MTBE and aged at 23 °C for ca. 2 h (usually < 5% chloride in the mother liquor). The crystals were collected by filtration, washed with 50 L of MTBE (to ensure the complete removal of HCl), and dried under vacuum with a nitrogen sweep to give the title compound as a hydrochloride salt.

Step A1 : *N*-*tert*-Butyl-3-methylpyridin-2-amine

[0109]

Material	FW	Equivalents	mol	Amount
2-Bromo 3-methylpyridine, 98%	172.02	1	28.3	4.97 kg
<i>t</i> -Butylamine, 99%	73.14	1.5	42.7	4.51 L
Sodium <i>t</i> -butoxide	96.10	2.0	56.5	5.60 kg
BINAP	622.67	0.006	0.171	106 g
Pd ₂ (dba) ₃	915.72	0.0025	0.071	65 g
Toluene				50 L
Water				40 L
HCl, 2.0 N				~24 L
NaOH, 10 N				4.6 L
MTBE				50 L

[0110] To a 3 or 4-necked flask (100 L) with water cooling condenser, mechanical stirring and N₂ was charged toluene (40 L), 2-bromo-3-methyl pyridine (4.966 kg), sodium *t*-butoxide (5.60 kg). The slurry was then sparged N₂ for 10 min; then tris(dibenzylideneacetone)dipalladium (0) (Pd₂(dba)₃, 0.065 kg, 0.071 mol), 2,2'-bis(diphenylphosphino)-1,1'-binaphthalene (BINAP, 0.106 kg, 0.171 mol) and *t*-butylamine (4.51 L) were charged. The resulting dark mixture was stirred 10 min at 23 °C under N₂ and then heated to 70 °C (internal temp) with a steam bath. No *t*-butyl amine reflux was noticed.

[0111] At 70 °C, the heating was stopped, however the reaction temp rose to 83 °C in a few minutes due to exotherm and an ice-water bath was immediately applied to cool the reaction (very minor refluxing of solvent observed). The reaction temp rose to 90 °C and stayed at that temp for 10 min before dropping.

[0112] When the temperature decreased to 86 °C, the ice-water bath was removed; the reaction was assayed and found to be complete (30 minutes after heating was stopped). The reaction mixture was then cooled with an ice bath and became extremely thick and difficult to stir upon reaching 46 °C; ~35 L water was added to quench the reaction (ice-bath was sufficient to maintain temp during quench). (The mixture was stable overnight at 23 °C).

[0113] The mixture was transferred to a 100 L extractor for separation. The aqueous layer (35 L) was cut, and the organic layer (50 L) was treated with HCl (2.0 N, ~24 L) to pH 0.45.

[0114] Layers were separated (50 L organic waste); the aqueous layer was collected and transferred back to the

EP 2 846 798 B1

extractor. 50 L of methyl *t*-butyl ether (MTBE) was charged and the pH was adjusted to 9.3 (suggest range: 8.5 to 10) with NaOH (10 N, ~ 4.6 L. The aqueous layer was cut (2% loss by LC); the organic layer was washed with water (10 L), and transferred to 100 L flask with in-line filtration. The batch was concentrated and then flushed with THF to remove MTBE and water (water < 150 ppm) to give the title compound in THF.

Step A2: Methyl 1-*tert*-butyl-2-hydroxy-1*H*-pyrrolo[2,3-*b*]pyridine-3-carboxylate

Part 1:

[0115]

Material	FW	Equiv.	mol	Amount
<i>N</i> - <i>tert</i> -butyl-3-methylpyridin-2-amine	164.25	1	26.36	4.33 kg
<i>n</i> -Hexyl Lithium	@ 2.09 M/hexane	1.0	26.36	12.60 L
Methyl chloroformate, 98%	94.50/d1.228	1.04	26.36	2.13 L
THF				28+6 L

Part 2:

[0116]

Material	FW	Equiv.	mol	Amount
<i>n</i> -Hexyllithium	@ 2.09 M	0.7	18.45	9.10 L
Diisopropylamine, 99%	101.2/d0.716	1.4	36.90	5.27 L
<i>n</i> -Hexyllithium	@ 2.09 M	1.6	39.54	20.9 L

Part 3:

[0117]

Material	FW	Equiv.	mol	Amount
Methyl Chloroformate, 98%	94.5/d1.228	1.3	34.27	2.66 L

Work-up:

[0118]

Material	FW	Equiv.	mol	Amount
HCl, 5.0N				14.5 L
KOH, 4.0 N				4L
K ₂ CO ₃ , 22% (made from K ₂ CO ₃ 99%)				12.6 L

Part 1:

[0119] To a 4-necked RB flask (100 L) was charged a solution of *N*-*tert*-butyl-3-methylpyridin-2-amine (~28 L, 17.5%wt, 24.7 Kg, 23.36 mol) under N₂ and extra THF (6 L). This solution was cooled to < -10 °C with dry-ice acetone bath (external temp @ -35 °C). To this solution was added *n*-hexyllithium (12.6 L, 2.09 M in hexane, 1.0 eq.) via addition funnel while controlling temp < -5 °C over 45 min (exothermic).

[0120] After addition, the reaction was aged for 20 min at the temp of -6 to -8 °C. Methyl chloroformate (2.05 L, 1.00 equiv.) was slowly added via addition funnel over 43 min (exothermic, internal temp was controlled < 14.2 °C); 10 min

EP 2 846 798 B1

after addition (when temp became steady), the reaction was aged for about 1.5 h at 15 to 20 °C (@ 92% conversion based on the ratio of LCAP). Another 0.04 eq. (82 mL) of methyl chloroformate was added to increase the conversion to 94% (before addition, temp was about 15 °C).

Part 2:

[0121] The above reaction mixture was cooled to -18 to -25 °C; 0.7 eq of *n*-hexyllithium (9.10 L, 2.09 N) was added (very exothermic - controlled internal temp at -15 °C to -20 °C) and the reaction was aged at -15 °C to -20 °C for 30 min. Diisopropylamine (5.27 L, 1.4 eq) followed by *n*-hexyllithium (20.9 L, 2.09 N, 1.6 equiv.) was added via an additional funnel (controlling temp -15 °C to -20 °C during addition). The reaction was then aged for 20 min at < -15 °C (temp became steady), then changed to ice-water bath and temp was gradually warmed to 15 °C during overnight aging.

Part 3:

[0122] After the above reaction was complete, it was cooled to 0 °C with dry ice-acetone bath and methyl chloroformate (2.66 L, 1.3 equiv.) was added via an addition funnel over 25 min (controlling temp below 13 °C during addition. The reaction went from a dark solution to an orange slurry). The reaction was aged for 40 min around 8 to 10 °C and LC showed complete conversion.

Work-up:

[0123] THF (6.4 L) was charged. The reaction was quenched with 5 N HCl (14.5 L) at < 20 °C over 2 h to pH 4.28 (mixed solution), pH 3.88 (aqueous layer). Some precipitate was formed. 5 L of water was added and the precipitate was dissolved. This mixture was transferred into an extractor. The aqueous layer (30 L) was cut; the organic was washed with water (8 L). (The organic solution could be stored at 23 °C under N₂ for 2 days, but extended storage could result in decarboxylation.)

[0124] The organic layer was then transferred to a 100 L RB flask and concentrated to give 20 L of a slurry.

[0125] To the concentrated batch was charged THF (30 L) and heptane (6 L), and this solution was transferred to a 100 L extractor containing 12.6 L 22 wt/wt% aqueous K₂CO₃ solution, cooled to 10 °C, The pH was adjusted to 13.1 (suggest PH range: 12.5 to 13.5) with KOH (4 L, 4.0 N). After warming up to 16 to 20 °C, the aqueous layer was cut (no loss); the organic layer was washed with 15% K₂CO₃ (9 L) (15% K₂CO₃ was used to wash out residual KOH which could decompose the potassium salt) and transferred to 100 RB flask (this solution was stable at 23 °C /N₂ for overnight). The batch was concentrated and flushed with 80 L THF to remove water.

[0126] To the concentrated batch (~ total 10 L with 2.5 L THF content) was charged THF (2 L).

[0127] The product had begun to crystallize out and 60 L of *n*-heptane (6.7% loss in supernatant with only 30 L heptane) was charged via additional funnel over about 60 min. The resulting pale yellow slurry was aged for ca. 2 h (overnight aging is fine too). The product was collected by filtration, rinsed with 13 L of a solution of THF/heptane (1:13) and then 10 L heptane. The pale yellow product was dried under vacuum/N₂ to give the title compound as a potassium salt.

Salt break and neutral form isolation:

[0128] To a 100 L R.B. flask was charge the potassium salt (4.565 kg, 15.94 mol) and 16 L methanol, and the resulting mixture was chilled in ice bath to 6 °C. Acetic acid (1.369 L, 23.91 mol) was added over 5 min. Near the end of addition, the mixture became very thick. 48 L water was added, and the resultant mixture was aged 1.5 hours at 15-20 °C (*pH reading* 6.1). The solid was filtered and the cake washed with 15 L water and dried under a nitrogen stream to give the title compound.

Step B1: (9*R*)-1-[3,5-Bis(trifluoromethyl)benzyl]cinchonan-1-ium-9-ol bromide

[0129]

Materials	FW	Mass	Volume	mol	Equiv.	d (g/mL)
Cinchonidine	294.39	6.1 kg		20.72	1	
3,5-Bis(trifluoromethyl)benzyl bromide	307.03	7.0 kg	4.19 L	22.8	1.1	1.671
IPA			66 L			

[0130] 3,5-Bis(trifluoromethyl)benzyl bromide (7.0 kg) was dissolved in isopropyl alcohol (IPA, 60 L) at 23 °C under nitrogen. To the stirred light yellow solution was added cinchonidine (6.1 kg) in portions over 20 minutes (no exotherm), affording a white slurry. Additional IPA (6 L) was added to rinse all the cinchonidine down into the reaction mixture. The slurry was heated to gentle reflux, reaching an internal temperature of 80-82.5 °C. The mixture became less viscous while being heated, and once the temperature had reached 60.6 °C the last of the cinchonidine had dissolved to give a dark yellow solution. Once the mixture had reached gentle reflux, the reaction was seeded by the addition of **12** (62.3 g, 0.104 mol, 0.5 mol% relative to cinchonidine starting material), which led to the immediate precipitation of the product. The mixture was maintained at gentle reflux for 3.5 h, then heating was ceased and the orange slurry was allowed to cool to room temperature (21 °C) with stirring overnight.

[0131] After cooling, the mixture was filtered, and the pink product cake was washed with fresh IPA (1 × 10 L then 1 × 30 L) to remove unreacted starting materials and most of the color, and dried under vacuum with a nitrogen sweep to afford the title product.

Step E: (2*R*)-1'-*tert*-Butyl-5-(dibenzylamino)-1,3-dihydrospiro[indene-2,3'-pyrrolo[2,3-*b*]pyridin]-2'(1'*H*)-one

[0132]

Materials	FW	Mass	Volume	mol	Equiv.	d (g/mL)
methyl 1- <i>tert</i> -butyl-2-hydroxy-1 <i>H</i> -pyrrolo[2,3- <i>b</i>]pyridine-3-carboxylate (0.1143 wt% solution in PhMe)	248.28	1.429 kg	12.49 L	5.755	1.01	
[2-(chloromethyl)-4-(dibenzylamino)phenyl]methanol hydrochloride (93.5 wt%)	388.83	2.367 kg		5.698	1.0	
(9 <i>R</i>)-1-[3,5-bis(trifluoromethyl)benzyl]cinchonan-1-ium-9-ol bromide	601.42	0.171 kg		0.285	0.05	
toluene			31.14 L			
KOH _(s)	56.1	15.966 kg				
H ₂ O		9.725 kg				

[0133] To water (9.725 kg) was added KOH (15.966 kg of 88.5 wt% pellets) in portions with ice-bath cooling under nitrogen, at such a rate as to maintain the internal temperature at ca. 30 °C. After addition of ca. 80% of the KOH pellets, the water was drained from the ice-bath and the remaining KOH added rapidly, to achieve a maximum internal temperature of 37 °C and complete dissolution of the KOH.

[0134] The mixture was then allowed to cool to 32 °C, then placed in an ice bath. Once the temperature reached 28 °C, KOH began to crystallize (slightly exothermic). 15 minutes after the onset of crystallization, toluene (28 L) was added, and the stirring rate increased to maximum.

[0135] Once the temperature had reached 12.5 °C, [2-(chloromethyl)-4-(dibenzylamino)phenyl]methanol hydrochloride (2.367 kg, 93.5 wt%, remainder MTBE and MeCN) was added in two equal portions over 5 minutes (minor exotherm), rinsing with toluene (1 L). After a further 15 minutes, 0.50 eq. methyl 1-*tert*-butyl-2-hydroxy-1*H*-pyrrolo[2,3-*b*]pyridine-3-carboxylate (6.246 kg of a 0.11438 wt % solution in toluene, 0.715 kg oxindole) was added in two portions over 2 minutes (exotherm from 11.9 to 14.0 °C). After a further 15 minutes 0.45 eq. of methyl 1-*tert*-butyl-2-hydroxy-1*H*-pyrrolo[2,3-*b*]pyridine-3-carboxylate (5.622 kg of a 0.11438 wt% solution in toluene, 0.643 kg oxindole) was added in two portions over 2 minutes (exotherm from 13.3 to 14.6 °C).

[0136] Fifteen minutes after addition of the second batch of methyl 1-*tert*-butyl-2-hydroxy-1*H*-pyrrolo[2,3-*b*]pyridine-3-carboxylate, an aliquot was removed and analyzed by HPLC.

[0137] After a further 15 minutes, a further charge of 0.06 eq. of methyl 1-*tert*-butyl-2-hydroxy-1*H*-pyrrolo[2,3-*b*]pyridine-3-carboxylate (0.750 kg of a 0.11438 wt% solution in toluene, 0.086 kg oxindole) was made, rinsing with toluene (1.1 L). The mixture was analyzed by HPLC again 30 minutes after addition of the third batch of methyl 1-*tert*-butyl-2-hydroxy-1*H*-pyrrolo[2,3-*b*]pyridine-3-carboxylate.

[0138] (9*R*)-1-[3,5-Bis(trifluoromethyl)benzyl]cinchonan-1-ium-9-ol bromide (0.171 kg) was added in one portion, rinsing with toluene (1.1 L). The mixture was stirred at ca. 10 °C for a further 16 h.

[0139] HPLC analysis at this point indicated formation of the title compound. Cooling of the vessel was ceased, THF (11.25 L) and H₂O (11.25 L) were added sequentially (exotherm to 14 °C), and stirring continued until the mixture had returned to 23 °C. The mixture was then transferred into an extractor, and the layers were allowed to settle, leaving an

orange organic phase, a colorless translucent aqueous phase, and a small amount of insoluble interfacial material. The aqueous layer was separated, H₂O (30 L) was added to the organic layer, and the mixture was stirred briefly and allowed to settle again, leaving virtually no interfacial material. The aqueous layer was separated, and the organic layer collected and stored.

[0140] The reaction was repeated three times on different scales to give a total theoretical yield of the title compound of 7.521 kg. The combined organic phases were concentrated at 30-35 °C to a target volume of 27 L, by which point the product had begun to precipitate. The slurry was then allowed to cool while MeOH (70 L) was added, and the mixture stirred at 23 °C for 16 h.

[0141] The product was then collected by filtration, washing the cake with 1:4 toluene:MeOH (1 × 20 L) and then MeOH (2 × 15 L), then dried under vacuum with a nitrogen sweep to afford the title compound.

Step F: (2R)-5-Amino-1,3-dihydrospiro[indene-2,3'-pyrrolo[2,3-b]pyridin]-2'(1'H)-one

[0142]

Materials	FW	Mass	Volume	mol	Equiv.	d (g/mL)
(2R)-1'- <i>tert</i> -butyl-5-(dibenzylamino)-1,3-dihydrospiro [indene-2,3'-pyrrolo[2,3-b]pyridin]-2'(1'H)-one	487.63	5.48 kg		11.2	1.0	
MsOH	96.11	12.6 kg	8.5 L	131	11.65	1.48
toluene			1 L			
MeOH			22 L			
10% Pd/C (wet)		224 g				

[0143] To a 50 L RBF was charged 8.5 L of methanesulfonic acid (MsOH). (2R)-1'-*tert*-butyl-5-(dibenzylamino)-1,3-dihydrospiro[indene-2,3'-pyrrolo[2,3-b]pyridin]-2'(1'H)-one (6.6 kg crude, 83 wt%, remainder is toluene) was added as a solid over 40 min while temperature increased to 50 °C due to the exotherm. Toluene (1 L) was added to rinse down the solid (small amount of toluene also gives gentle reflux to rinse down any SM stuck on the vessel's walls). The reaction was heated to 90 °C over 30 min and the solution was held at 90 °C with no obvious exotherm observed (very mild refluxing, used a condenser).

[0144] The solution was cooled to 38 °C and diluted with MeOH (22 L, exothermic for the first 4 L MeOH addition). The solution was further cooled to 23 °C and subdivided to two equal halves for hydrogenation.

[0145] The first half of the above solution was charged to a hydrogenation vessel with 2 L MeOH rinse followed by 112 g of 10% Pd/C (wet) and a 2 L MeOH rinse. 60 psi of H₂ gas was applied with slow agitation in the first 30 min when the temperature rose from 20 °C to 27 °C. The agitation was increased and the reaction was continued at 23 °C until LC revealed the reaction to be complete. The second half of the solution was hydrogenated under the same conditions. The two batches were combined and filtered through Solka-Floc® with MeOH rinse.

[0146] The filtrate was concentrated to 22 L, transferred to a 100 L extractor with 1 L MeOH and 1 L water rinse. Water (34 L) was added. The mixture was cooled to 20 °C and pH was adjusted to 1.5-2 with 9.6 L 10 N NaOH. Toluene (24 L) was added and the mixture was stirred for 10 min and settled for 30 min. The top toluene layer was analyzed to confirm no product loss and then discarded. The aqueous layer was collected and transferred back to the 100 L RBF and acidified to pH adjusted 4 over 30 min with 2.8 L of 5 N NaOH (crystals started to come out at pH 2.2 after ~300 mL of the NaOH solution addition). A water bath was used to cool the very slight exothermic process. Another 480 mL of 5 N NaOH raised the pH to 6.3 (target pH 6-8, can be fine tuned with 5 N HCl if necessary). After aging for 30 min, the slurry was filtered with 6 L of 1/7 MeOH/water and then 12 L water. LC showed mother liquor loss of ~1% (0.3g/L). Drying with nitrogen sweep and vacuum on a filter funnel provided the title compound. MS: *m/z* = 252.0 (M + 1).

Step G: (2R)-5-Iodo-1,3-dihydrospiro[indene-2,3'-pyrrolo[2,3-b]pyridin]-2'(1'H)-one A

[0147] solution of sodium nitrite (107 g, 1.55 mol) in water (500 mL) was added dropwise over 15 min to a solution of (2R)-5-amino-1,3-dihydrospiro[indene-2,3'-pyrrolo[2,3-b]pyridin]-2'(1'H)-one (195 g, 0.776 mol) and p-toluenesulfonic acid (443 g, 2.33 mol) in acetonitrile (1.94 L) at 23 °C. After stirring for 30 min, a solution of potassium iodide (322 g, 1.94 mol) in water (500 mL) was then added over 15 minutes. The resulting mixture was stirred at ambient temperature for 40 minutes, then diluted with water (2 L) and basified by the addition of solid NaOH (98.0 g, 2.44 mol) with stirring. Iodine by-product was reduced by the addition of 10% aqueous sodium thiosulfate solution and stirring for an additional

30 minutes. The solids were collected by filtration, washed with water, and dried under nitrogen atmosphere to give the title compound, which was used without further purification. MS: m/z = 363.1 ($M + 1$).

INTERMEDIATE 2

[0148]

3-Bromo-1'-[2-(trimethylsilyl)ethoxy]methyl]-5,7-dihydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridin]-2'-(1'H)-one

Step A: Dimethyl 5-bromopyridine-2,3-dicarboxylate

[0149] Concentrated sulfuric acid (1 L, 18.7 mol) was added slowly over 10 min to a suspension of pyridine-2,3-dicarboxylic acid (5.00 kg, 29.9 mol) in MeOH (50 L), dissolving the suspension. The resulting mixture was heated at reflux for 48 h then cooled to 40 °C. Bromine (8.0 kg, 50 mol) was added slowly over 2 h in 1-kg portions, keeping the temperature below 55 °C. The reaction mixture was then heated at 55 °C for 24 h, cooled to 50 °C and additional Br₂ (4.0 kg, 25 mol) was added slowly over 1 h in 1-kg portions, keeping temperature below 55 °C. The reaction mixture was heated at 55 °C for 24 h, concentrated under reduced pressure to a minimum volume (internal temp ~30 °C, solution may occasionally foam), then diluted with isopropyl acetate (50 L) and washed with a saturated aqueous sodium sulfite solution (3 × 20 L) (final extract is pH ~ 8) followed by water (20 L). The organic layer was *concentrated in vacuo* to approximately 15 L then diluted with heptane (40 L). The resulting slurry was stirred for 24 h at ambient temperature. The solids were filtered, washed with heptane (10 L), and dried to give the title compound.

Step B: (5-Bromopyridine-2,3-diyl)dimethanol

[0150] Sodium borohydride (15.9 g, 420 mmol) was added portionwise over 30 min to a solution of dimethyl 5-bromopyridine-2,3-dicarboxylate (20 g, 73 mmol) in EtOH (460 mL) precooled to 0 °C. A solution of calcium chloride (23.3 g, 209 mmol) in 150 mL was added slowly at 0 °C, and the reaction mixture was warmed to ambient temperature and stirred for 18 h. Excess sodium borohydride was quenched by slow addition of aqueous 2 N HCl solution (230 mL, 460 mmol), followed by a stirring at ambient temperature for 2 h. The mixture was concentrated to dryness *in vacuo*. Saturated aqueous sodium bicarbonate solution was added to the residue until a pH of approximately 7 was reached. The aqueous mixture was extracted with 2-methyltetrahydrofuran (4 × 200 mL). The combined organic layers were dried over sodium sulfate then treated with a solution of 4 N HCl in dioxane (25 mL, 100 mmol). The resulting solid was filtered, washed with 2-methyltetrahydrofuran, and dried to give the title compound as a hydrochloride salt. MS: m/z = 218.1 ($M + 1$).

Step C: (5-Bromopyridine-2,3-diyl)dimethanediyl dimethanesulfonate

[0151] A slurry of (5-bromopyridine-2,3-diyl)dimethanol hydrochloride (12.9 g, 59.2 mmol) in tetrahydrofuran (400 mL) at 0 °C was treated with triethylamine (37.1 mL, 266 mmol). To the resulting mixture was added portionwise methanesulfonic anhydride (30.9 g, 177 mmol), keeping temperature below 5 °C. The reaction mixture was stirred at 0 °C for 1 h, then partitioned between saturated aqueous sodium bicarbonate solution (500 mL) and ethyl acetate (500 mL). The organic layer was washed saturated aqueous sodium bicarbonate solution, dried over magnesium sulfate, and concentrated *in vacuo* to give the title compound. MS: m/z = 376.0 ($M + 1$).

Step D: 3-Bromo-1'-[2-(trimethylsilyl)ethoxy]methyl]-5,7-dihydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridin]-2'-(1'H)-one

[0152] (5-Bromopyridine-2,3-diyl)dimethanediyl dimethanesulfonate (17.0 g, 45.4 mmol) was added to a mixture of 1-[2-(trimethylsilyl)ethoxy]methyl]-1,3-dihydro-2H-pyrrolo[2,3-b]pyridin-2-one (prepared according to the procedures described in WO2008/020902, 14.0 g, 53.0 mmol) and cesium carbonate (49.0 g, 150 mmol) in EtOH (500 mL) ambient temperature, and the resulting mixture was stirred for 20 h. The reaction mixture was concentrated then partitioned

between ethyl acetate (500 mL) and water (500 mL). The organic layer was dried over magnesium sulfate and concentrated *in vacuo*. The residue was purified by silica gel chromatography, eluting with a gradient of heptane:EtOAc - 100:0 to 0:100, to give the title compound. MS: m/z = 448.1 ($M + 1$).

INTERMEDIATE 3

[0153]

(2'-Oxo-1',2',5,7-tetrahydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridine]-3-carboxylic acid

Step A: Methyl 2'-oxo-1'-{[2-(trimethylsilyl)ethoxy]methyl}-1',2',5,7-tetrahydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridine]-3-carboxylate

[0154] A mixture of 3-bromo-1'-{[2-(trimethylsilyl)ethoxy]methyl}-5,7-dihydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridine]-2'(1'*H*)-one (described in Intermediate 2) (22.0 g, 49.3 mmol), $\text{PdCl}_2(\text{dppf}) \cdot \text{CH}_2\text{Cl}_2$ (2.012 g, 2.46 mmol), and sodium acetate (8.1 g, 99 mmol) in MeOH (150 mL) was pressurized to 300 psi of carbon monoxide and then heated at 85 °C for 72 h. The reaction mixture was allowed to cool then concentrated *in vacuo*. The residue was purified by silica gel chromatography, eluting with a gradient of heptane:EtOAc - 100:0 to 0:100, to give the title compound. MS: m/z = 426.1 ($M + 1$).

Step B: 2'-Oxo-1',2',5,7-tetrahydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridine]-3-carboxylic acid

[0155] A solution of methyl 2'-oxo-1'-{[2-(trimethylsilyl)ethoxy]methyl}-1',2',5,7-tetrahydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridine]-3-carboxylate (30.9 g, 73 mmol) in MeOH (400 mL) was saturated with HCl gas, allowing the internal temperature to increase to 55 °C. The reaction mixture was cooled to ambient temperature, stirred for 20 h, then concentrated *in vacuo*. Aqueous 10 N sodium hydroxide (50 mL, 500 mmol) was added to a solution of the residue in MeOH (400 mL), and the resulting mixture was heated at reflux for 2 h. The solution was cooled to ambient temperature and the pH was adjusted to 3 with concentrated HCl. The resulting solid was filtered, washed with water then heptane, and dried to give the title compound. MS: m/z = 282.2 ($M + 1$).

INTERMEDIATE 4

[0156]

(6*S*)-3-iodo-5,7-dihydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridine]-2'(1'*H*)-one

[0157] A solution of sodium nitrite (36.1 g, 523 mmol) in water (20 mL) was added dropwise over 5 min to a solution of (6*S*)-3-amino-5,7-dihydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridine]-2'(1'*H*)-one (prepared according to the procedures described in WO2008/020902, 66.0 g, 262 mmol) and *p*-toluenesulfonic acid (149 g, 785 mmol) in acetonitrile (650 mL) at ambient temperature. After stirring for 30 min, a solution of potassium iodide (109 g, 654 mmol) in water (20 mL) was added over 5 min. The resulting mixture was stirred at ambient temperature for 40 min, then diluted with water (1 L) and basified by the addition of solid NaOH (33.0 g, 824 mmol) with stirring. Iodine by-product was reduced by the addition of 10% aqueous sodium thiosulfate solution and stirring was continued for an additional 30 min. The solids were collected by filtration, washed with water, and dried under nitrogen atmosphere to give the title compound,

which was used without further purification. MS: $m/z = 363.9$ ($M + 1$).

INTERMEDIATE 5

[0158]

Methyl (6S)-2'-oxo-1',2',5,7-tetrahydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridine]-3-carboxylate

[0159] A solution of (6S)-3-iodo-5,7-dihydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridine]-2'(1'H)-one (described in Intermediate 4) (51.0 g, 140 mmol), sodium acetate (23.0 g, 281 mmol) and dichloro 1,1'-bis(diphenylphosphino)ferrocene palladium(II) dichloromethane adduct (2.9 g, 3.5 mmol) in MeOH (560 mL) was pressurized to 120 psi of CO at ambient temperature and then heated at 80 °C for 12 h with stirring. The reaction mixture was diluted with water (1 L), and the precipitate collected by filtration, washed with water, and dried under nitrogen atmosphere to give the title compound, which was used without further purification. MS: $m/z = 296.1$ ($M + 1$).

INTERMEDIATE 6

[0160]

5'-Bromo-3-methyl-1',3'-dihydro-2H,5H-spiro[imidazolidine-4,2'-indene]-2,5-dione

Step A: 1',3'-Dihydro-2H,5H-spiro[imidazolidine-4,2'-indene]-2,5-dione

[0161] A stirred mixture of 2-indanone (250 g, 1.89 mol), sodium cyanide (278 g, 5.68 mol) and ammonium carbonate (1.81 kg, 18.9 mol) in water (1.5 L) and EtOH (1.5 L) was heated at 70 °C for 3 h, then allowed to cool to ambient temperature. The precipitate was collected by filtration, washed with water, and dried *in vacuo* to give the title compound. MS: $m/z = 202.0$ ($M + 1$).

Step B: 5'-Bromo-1',3'-dihydro-2H,5H-spiro[imidazolidine-4,2'-indene]-2,5-dione

[0162] To a stirred solution of 1',3'-dihydro-2H,5H-spiro[imidazolidine-4,2'-indene]-2,5-dione (118 g, 0.584 mol) in 48% HBr (2 L) was added bromine (92 g, 0.584 mol) dropwise and the reaction mixture was allowed to stir at ambient temperature for 48 h. The reaction mixture was poured onto ice and the precipitate was collected by filtration, washed with water, and dried *in vacuo*. The crude product was recrystallized from EtOH to afford the title compound. MS: $m/z = 282.9$ ($M + 1$).

Step C: 5'-Bromo-1-(4-methoxybenzyl)-1',3'-dihydro-2H,5H-spiro[imidazolidine-4,2'-indene]-2,5-dione

[0163] To a stirred suspension of 5'-bromo-1',3'-dihydro-2H,5H-spiro[imidazolidine-4,2'-indene]-2,5-dione (164 g, 0.586 mol) and potassium carbonate (89 g, 0.645 mol) in DMF (2 L) at 0 °C was added 4-methoxybenzyl chloride (96 g, 0.615 mmol) dropwise. The resulting mixture was allowed to warm slowly to ambient temperature and stirred for 18 h. The reaction mixture was poured into water and the precipitate was collected by filtration, washed with water, and dried *in vacuo* to give the title compound. MS: $m/z = 403.1$ ($M + 1$).

Step D: 5'-Bromo-1-(4-methoxybenzyl)-3-methyl-1',3'-dihydro-2H,5H-spiro[imidazolidine-4,2'-indene]-2,5-dione

[0164] To a stirred solution of 5'-bromo-1-(4-methoxybenzyl)-1',3'-dihydro-2H,5H-spiro[imidazolidine-4,2'-indene]-2,5-dione (5.0 g, 12.5 mmol) in DMF (50 mL) at -10 °C was added sodium hydride (60% dispersion in oil, 1.50 g, 37.5 mmol) portionwise. The resulting mixture was stirred for 1 h at ambient temperature, then recooled to -10 °C. Iodomethane (5.30 g, 37.3 mmol) was added dropwise and stirring was continued for 1 h. The reaction mixture was partitioned between water (100 mL) and EtOAc (100 mL). The organic layer was removed and the aqueous phase was extracted further with EtOAc (2 × 50 mL). The combined organic extracts were dried over sodium sulfate, filtered, and concentrated to dryness *in vacuo*. The crude product was purified by silica gel chromatography, eluting with a gradient of hexanes:EtOAc - 100:0 to 0:100, to give the title compound. MS: m/z = 417.0 (M + 1).

Step E: 5'-Bromo-3-methyl-1',3'-dihydro-2H,5H-spiro[imidazolidine-4,2'-indene]-2,5-dione

[0165] To a stirred solution of 5'-bromo-1-(4-methoxybenzyl)-3-methyl-1',3'-dihydro-2H,5H-spiro[imidazolidine-4,2'-indene]-2,5-dione (90.0 g, 0.217 mol) in CH₃CN (900 mL) was added a solution of ammonium cerium(IV) nitrate (594 g, 1.08 mol) in water (900 mL). The resulting mixture was stirred at ambient temperature for 30 min then extracted with EtOAc (3 × 1 L). The combined organic extracts were washed with brine, dried over sodium sulfate, filtered, and concentrated to dryness *in vacuo*. The residue was triturated with EtOH and dried *in vacuo* to give the title compound. MS: m/z = 296.9 (M + 1).

INTERMEDIATE 7**[0166]**3-Iodo-1'-((2-(trimethylsilyl)ethoxy)methyl)-5,7-dihydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridin]-2'(1'H)-one

[0167] Sodium hydride (0.242 g, 6.06 mmol) was added portionwise to a solution of (6S)-3-iodo-5,7-dihydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridin]-2'(1'H)-one (described in Intermediate 4) (2.00 g, 5.51 mmol) in DMF (50 mL) at 0 °C. After stirring for 10 min, 2-(trimethylsilyl)ethoxymethyl chloride (1.01 g, 6.06 mmol) was added dropwise. The resulting mixture was warmed slowly to ambient temperature and stirred for 48 h. The reaction was partitioned between water (20 mL) and EtOAc (100 mL). The organic layer was removed and the aqueous phase was extracted further with EtOAc (30 mL). The combined organic extracts were washed with brine, then dried over sodium sulfate, filtered, and concentrated to dryness *in vacuo*. The crude product was purified by silica gel chromatography, eluting with a gradient of hexanes:EtOAc - 95:5 to 50:50, to give the title compound. MS: m/z = 493.9 (M + 1).

INTERMEDIATE 8**[0168]**(S)-S-(2'-Oxo-1'-((2-(trimethylsilyl)ethoxy)methyl)-1',2',5,7-tetrahydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridin]-3-yl) benzothioate

[0169] CuI (0.006 g, 0.03 mmol) was added to a nitrogen-purged solution of 3-iodo-1'-((2-(trimethylsilyl)ethoxy)methyl)-

5,7-dihydrospiro[cyclopenta[*b*]pyridine-6,3'-pyrrolo[2,3-*b*]pyridin]-2'-(1'*H*)-one (described in Intermediate 7) (0.15 g, 0.30 mmol), thiobenzoic acid (0.060 mL, 0.51 mmol), 1,10-phenanthroline (0.015 g, 0.083 mmol), and *N,N*-diisopropylethylamine (0.13 mL, 0.75 mmol) in anhydrous toluene (4.0 mL) at ambient temperature. The resulting mixture was sealed and heated at reflux for 16 h. The reaction mixture was concentrated and the residue was partitioned between water and EtOAc (3 × 30 mL). The combined organic layers were washed with water, then brine, dried over sodium sulfate and *concentrated in vacuo*. The residue was purified by flash column chromatography on silica gel, eluting with 23% EtOAc in petroleum ether, to afford the title compound. MS: *m/z* = 504.0 (*M* + 1).

INTERMEDIATE 9

[0170]

(*S*)-3-(Hydroxymethyl)-5,7-dihydrospiro[cyclopenta[*b*]pyridine-6,3'-pyrrolo[2,3-*b*]pyridin]-2'-(1'*H*)-one

[0171] A solution of diisobutylaluminum hydride (DIBAL) in toluene (1 M, 2.2 mL, 2.2 mmol) was added dropwise to a solution of methyl (6*S*)-2'-oxo-1',2',5,7-tetrahydrospiro[cyclopenta[*b*]pyridine-6,3'-pyrrolo[2,3-*b*]pyridine]-3-carboxylate (described in Intermediate 5) (0.184 g, 0.62 mmols) in anhydrous THF at 0 °C. The resulting mixture was stirred for 1 h at 0 °C, then gradually warmed to ambient temperature and stirred for an additional 1 h. Excess DIBAL was quenched with ice and the mixture was partitioned between water and EtOAc (4 × 20 mL). The combined organic layers were washed with brine, dried over sodium sulfate, and *concentrated in vacuo*. The residue was purified by flash column chromatography on silica gel, eluting with 5% MeOH in chloroform, to afford the title compound. MS: *m/z* = 268.0 (*M* + 1).

INTERMEDIATE 10

[0172]

(*S*)-3-(1,1-Difluoro-2-hydroxyethyl)-1'-((2-(trimethylsilyl)ethoxy)methyl)-5,7-dihydrospiro[cyclopenta[*b*]pyridine-6,3'-pyrrolo[2,3-*b*]pyridin]-2'-(1'*H*)-one

Step A: (*S*)-Ethyl 2,2-difluoro-2-(2'-oxo-1'-((2-(trimethylsilyl)ethoxy)methyl)-1',2',5,7-tetrahydrospiro[cyclopenta[*b*]pyridine-6,3'-pyrrolo[2,3-*b*]pyridin]-3-yl)acetate

[0173] Copper bronze (0.522 g, 8.22 mmol) was added to a solution of (*S*)-3-iodo-1'-((2-(trimethylsilyl)ethoxy)methyl)-5,7-dihydrospiro[cyclopenta[*b*]pyridine-6,3'-pyrrolo[2,3-*b*]pyridin]-2'-(1'*H*)-one (described in Intermediate 7) (0.811 g, 1.644 mmol) and ethyl bromodifluoroacetate (1.056 mL, 8.22 mmol) in DMSO (10 mL) at ambient temperature. The resulting mixture was heated to 100 °C and stirred for 4 h. The reaction was cooled, partitioned between water (40 mL) and EtOAc (200 mL). The organic layer was removed and the aqueous phase was extracted further with EtOAc (30 mL). The combined organic extracts were washed with brine, then dried over sodium sulfate, filtered, and concentrated to *dryness in vacuo*. The crude product was purified by silica gel chromatography, eluting with a gradient of hexanes:EtOAc - 85:15 to 0:100, to give the title compound. MS: *m/z* = 489.1 (*M* + 1).

Step B: (S)-3-(1,1-Difluoro-2-hydroxyethyl)-1'-((2-(trimethylsilyl)ethoxy)methyl)-5,7-dihydrospiro[cyclopenta[*b*]pyridine-6,3'-pyrrolo[2,3-*b*]pyridin]-2'(1'*H*)-one

[0174] To a solution of (S)-ethyl 2,2-difluoro-2-(2'-oxo-1'-((2-(trimethylsilyl)ethoxy)methyl)-1',2',5,7-tetrahydrospiro[cyclopenta[*b*]pyridine-6,3'-pyrrolo[2,3-*b*]pyridin]-3-yl)acetate (0.542 g, 1.11 mmol) in MeOH (10 mL) at ambient temperature was added calcium chloride (0.184 g, 1.66 mmol) and sodium borohydride (0.128 g, 3.32 mmol). After stirring at ambient temperature for 24 h, the reaction was quenched with a saturated solution of sodium chloride (5 mL), partitioned between water (20 mL) and EtOAc (100 mL). The organic layer was removed and the aqueous phase was extracted further with EtOAc (30 mL). The combined organic extracts were washed with brine, then dried over sodium sulfate, filtered, and concentrated *dryness in vacuo*. The crude product was purified by silica gel chromatography, eluting with a gradient of CH₂Cl₂:MeOH - 100:0 to 93:7, to give the title compound. MS: *m/z* = 448.1 (*M* + 1).

INTERMEDIATE 11

[0175]

(3S,5S,6R)-3-Amino-6-methyl-5-phenyl-1-(2,2,2-trifluoroethyl)piperidin-2-one

Step A: Methyl 2-[(*tert*-butoxycarbonyl)amino]-4-(3-chlorophenyl)-5-oxohexanoate

[0176] A mixture of cesium carbonate (9.80 g, 30.1 mmol) and methyl *N*-(*tert*-butoxycarbonyl)-3-iodo-D-alaninate (9.90 g, 30.1 mmol) in DMF (75 mL) was stirred at ambient temperature for 45 min before 1-(3-chlorophenyl)propan-2-one (6.09 g, 36.1 mmol) and additional cesium carbonate (9.80 g, 30.1 mmol) were added. The resulting mixture was stirred for 2.5 h. The majority of the DMF was then removed under reduced pressure at a bath temperature of < 40 °C. The concentrated mixture was partitioned between water (500 mL) and ethyl acetate (2 × 200 mL). The combined organic layers were washed with brine, dried over sodium sulfate and *concentrated in vacuo* to give the title compound as a 1:1 racemic mixture of diastereomers, which was used without further purification. MS: *m/z* = 314.1 (*M* - *t*-Bu + 1).

Step B: *tert*-Butyl [(3S,5S,6R)-5-(3-chlorophenyl)-6-methyl-2-oxo-1-(2,2,2-trifluoroethyl)piperidin-3-yl]carbamate

[0177] A slurry of methyl 2-[(*tert*-butoxycarbonyl)amino]-4-(3-chlorophenyl)-5-oxohexanoate as a 1:1 racemic mixture of diastereomers (11.1 g, 30.0 mmol), 2,2,2-trifluoroethylamine (9.59 mL, 120 mmol), acetic acid (10.3 mL, 180 mmol), sodium triacetoxyborohydride (25.4 g, 120 mmol), and flame-dried 4 Å molecular sieves (50 g) in 1,2-dichloroethane (300 mL) was stirred at ambient temperature for 8 h. Additional 2,2,2-trifluoroethylamine (9.59 mL, 120 mmol), acetic acid (10.3 mL, 180 mmol), and sodium triacetoxyborohydride (25.4 g, 120 mmol) were added and stirring was continued for 20 h. The reaction mixture was diluted with dichloromethane (200 mL) then poured into water (500 mL). Molecular sieves were removed by filtration, and the organic layer was washed with water (3 × 500 mL), dried over sodium sulfate, and *concentrated in vacuo*. A solution of the residue in EtOH (200 mL) was stirred in the presence of solid potassium carbonate (12.4 g, 90 mmol) at 60 °C for 2 h, then ambient temperature for 16 h. The bulk of the EtOH was removed under reduced pressure and the remaining slurry was then partitioned between water (500 mL) and ethyl acetate (300 mL). The organic layer was washed with brine, dried over sodium sulfate and *concentrated in vacuo*. The residue was crystallized from a 2:1 mixture of hexane and ethyl ether to give the title compound as a racemate. The enantiomers were separated using normal-phase HPLC using a ChiralPak® AD column, eluting with 40% hexane in EtOH initially, stepping to 20% hexane in EtOH (0.1% diethylamine used as a modifier) to afford the title compound as the second enantiomer to elute. MS: *m/z* = 421.2 (*M* + 1).

Step C: (3S,5S,6R)-3-Amino-6-methyl-5-phenyl-1-(2,2,2-trifluoroethyl)piperidin-2-one

[0178] A mixture of *tert*-butyl [(3S,5S,6R)-5-(3-chlorophenyl)-6-methyl-2-oxo-1-(2,2,2-trifluoroethyl)piperidin-3-yl]carbamate (2.75 g, 6.53 mmol) and 20 wt. % palladium hydroxide on carbon (~50 wt. % wet, 700 mg, 0.50 mmol) in MeOH (100 mL) was stirred under a hydrogen balloon at ambient temperature for 16 h. The catalyst was removed by filtration through Celite® and washed thoroughly with MeOH and ethyl acetate. Following concentration of the filtrate *in vacuo*, a solution of the residue in ethyl acetate (100 mL) pre-cooled to 0 °C was sparged with HCl gas for ~1 min. The ice-bath was removed and the acidic solution was allowed to warm to ambient temperature as stirring was continued for 2 h. The mixture was then concentrated to *dryness in vacuo* to afford the title compound as a hydrochloride salt. HRMS: *m/z* = 287.1361, calculated *m/z* = 287.1366 for C₁₄H₁₈F₃N₂O. ¹H NMR (500 MHz, CD₃OD) δ 7.39 (t, 2H, *J* = 7.3 Hz), 7.31 (t, 1H, *J* = 7.3 Hz), 7.27 (d, 2H, *J* = 7.3 Hz), 4.81-4.73 (m, 1H), 4.24 (dd, 1H, *J* = 12.0, 6.8 Hz), 3.94 (p, 1H, *J* = 6.0 Hz), 3.76-3.67 (m, 2H), 2.56 (q, 1H, *J* = 12.7 Hz), 2.42 (m, 1H), 1.00 (d, 3H, *J* = 6.3 Hz).

INTERMEDIATE 12**[0179]**(5S,6R & 5R,6S)-3-Allyl-6-methyl-1-(2,2,2-trifluoroethyl)-5-(2,3,5-trifluorophenyl)piperidin-2-oneStep A: 5-Bromo-6-methyl-1-(2,2,2-trifluoroethyl)pyridin-2(1H)-one

[0180] To a stirred mixture of 3-bromo-6-hydroxy-2-methylpyridine (25.0 g, 133 mmol) and cesium carbonate (52.0 g, 160 mmol) in 1,4-dioxane (600 mL) was added 2,2,2-trifluoroethyl triflate (40.1 g, 173 mmol) and the resulting mixture was heated at 50 °C for 4 h and then allowed to cool to ambient temperature. The resulting mixture was filtered and the filtrate was concentrated to *dryness in vacuo*. The crude product was purified by silica gel chromatography, eluting with a gradient of CH₂Cl₂:EtOAc - 100:0 to 60:40, to give the title compound. MS: *m/z* = 269.9 (*M* + 1).

Step B: 6-Methyl-1-(2,2,2-trifluoroethyl)-5-(2,3,5-trifluorophenyl)pyridin-2(1H)-one

[0181] Argon was bubbled through a stirred solution of 5-bromo-6-methyl-1-(2,2,2-trifluoroethyl)pyridin-2(1H)-one (9.43 g, 34.9 mmol) in THF (280 mL) for 15 min. To this solution were added 2,3,5-trifluorophenylboronic acid (12.3 g, 69.8 mmol), then cesium fluoride (10.6 g, 69.8 mmol), and finally *bis*(tri-*tert*-butylphosphine)palladium(0) (892 mg, 1.75 mmol), and argon was bubbled through the mixture for 5 min after each addition. The reaction mixture was stirred at ambient temperature for 90 min and was then partitioned between saturated aqueous sodium bicarbonate (500 mL) and EtOAc (600 mL). The organic layer was removed and the aqueous phase was extracted further with EtOAc (300 mL). The combined organic extracts were washed with brine, then dried over sodium sulfate, filtered, and concentrated to *dryness in vacuo*. The crude product was purified by silica gel chromatography, eluting with a gradient of hexanes:EtOAc - 100:0 to 0:100, to give the title compound. MS: *m/z* = 322.0 (*M* + 1).

Step C: (5S,6R & 5R,6S)-6-Methyl-1-(2,2,2-trifluoroethyl)-5-(2,3,5-trifluorophenyl)piperidin-2-one

[0182] A mixture of 6-methyl-1-(2,2,2-trifluoroethyl)-5-(2,3,5-trifluorophenyl)pyridin-2(1H)-one (3.73 g, 11.6 mmol) and platinum(IV) oxide (659 mg, 2.90 mmol) in MeOH (200 mL) was shaken on a Parr hydrogenation apparatus under an atmosphere of hydrogen (*ca.* 45 psi) for 2 h. The reaction mixture was filtered through a pad of Celite®, washing with MeOH, and the filtrate was concentrated *in vacuo* to give a crude solid. The crude product was purified by silica gel chromatography, eluting with a gradient of hexanes:Et₂O - 100:0 to 0:100, to give the title compound. MS: *m/z* = 326.0 (*M* + 1).

Step D: (5S,6R & 5R,6S)-3-Allyl-6-methyl-1-(2,2,2-trifluoroethyl)-5-(2,3,5-trifluorophenyl)piperidin-2-one

[0183] To a cooled, stirred solution of lithium *bis*(trimethylsilyl)amide (1.0 M in THF, 2.0 mL, 2.0 mmol) in THF (10 mL) at -78 °C, was added a solution of (5S,6R & 5R,6S)-6-methyl-1-(2,2,2-trifluoroethyl)-5-(2,3,5-trifluorophenyl)piperidin-2-one (0.50 g, 1.54 mmol) in THF (10 mL) dropwise, keeping the internal temperature of the reaction mixture below -65 °C. The resulting mixture was stirred at -78 °C for 30 min, then a cold (-78 °C) solution of allyl bromide (0.242 g, 2.0 mmol) in THF (10 mL) was added dropwise, keeping the internal temperature of the reaction mixture below -65 °C. The reaction mixture was allowed to warm slowly to ambient temperature and stirred for 18 h. The reaction was quenched by the addition of a saturated solution of sodium chloride (20 mL) and partitioned between water (50 mL) and EtOAc (200 mL). The organic layer was removed and the aqueous phase was extracted further with EtOAc (50 mL). The combined organic extracts were washed with brine, then dried over sodium sulfate, filtered, and concentrated to dryness *in vacuo*. The crude product was purified by silica gel chromatography, eluting with a gradient of hexanes:EtOAc - 100:0 to 40:60, to give the title compound. MS: *m/z* = 366.1 (*M* + 1).

INTERMEDIATE 13**[0184]**(5S,6R & 5R,6S)-3-Allyl-6-methyl-5-(2,3,5,6-tetrafluorophenyl)-1-(2,2,2-trifluoroethyl)piperidin-2-one

[0185] Essentially following the procedures described in Intermediate 12, but using 2,3,5,6-tetrafluorophenylboronic acid in place of 2,3,5-trifluorophenylboronic acid, the title compound was obtained. MS: *m/z* = 384.1 (*M* + 1).

EXAMPLE 1**[0186]**(3'S)-3-(3-(6-Methyl-2-oxo-1-(2,2,2-trifluoroethyl)-5-(2,3,5-trifluorophenyl)piperidin-3-yl)prop-1-en-1-yl)-5,7-dihydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridin]-2'(1'H)-oneStep A: (3'S)-3-(3-(6-Methyl-2-oxo-1-(2,2,2-trifluoroethyl)-5-(2,3,5-trifluorophenyl)piperidin-3-yl)prop-1-en-1-yl)-1'-((2-(trimethylsilyl)ethoxy)methyl)-5,7-dihydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridin]-2'(1'H)-one

[0187] *Bis*(tri-*t*-butylphosphine)palladium(0) (0.102 g, 0.199 mmol) was added to a solution of (S)-3-iodo-1'-((2-(trimethylsilyl)ethoxy)methyl)-5,7-dihydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridin]-2'(1'H)-one (0.327 g, 0.663 mmol), (described in Intermediate 7) (5S,6R & 5R,6S)-3-allyl-6-methyl-1-(2,2,2-trifluoroethyl)-5-(2,3,5-trifluorophenyl)piperidin-2-one (described in Intermediate 12) (0.242 g, 0.663 mmol) in degassed DMF (3 mL) at ambient temper-

ature in a microwave vial. The resulting mixture was heated at 120 °C in a microwave reactor for 1 h. The reaction was cooled and partitioned between water (20 mL) and EtOAc (100 mL). The organic layer was removed and the aqueous phase was extracted further with EtOAc (30 mL). The combined organic extracts were washed with brine, then dried over sodium sulfate, filtered, and concentrated to dryness *in vacuo*. The crude product was purified by silica gel chromatography, eluting with a gradient of hexanes:EtOAc - 50:50 to 0:100, to give the title compound. MS: m/z = 731.2 ($M + 1$).

Step B: (3'S)-3-(3-(6-Methyl-2-oxo-1-(2,2,2-trifluoroethyl)-5-(2,3,5-trifluorophenyl)piperidin-3-yl)prop-1-en-1-yl)-5,7-dihydrospiro[cyclopenta[*b*]pyridine-6,3'-pyrrolo[2,3-*b*]pyridin]-2'(1'H)-one

[0188] HCl gas was bubbled into a solution of (3'S)-3-(3-(6-methyl-2-oxo-1-(2,2,2-trifluoroethyl)-5-(2,3,5-trifluorophenyl)piperidin-3-yl)prop-1-en-1-yl)-1'-((2-(trimethylsilyl)ethoxy)methyl)-5,7-dihydrospiro[cyclopenta[*b*]pyridine-6,3'-pyrrolo[2,3-*b*]pyridin]-2'(1'H)-one (0.091 g, 0.125 mmol) in MeOH (5 mL) cooled to 0 °C until saturated. The resulting mixture was stirred at 0 °C for 1 h and then concentrated to dryness *in vacuo*. To a solution of this crude mixture in MeOH (5 mL) was added ammonium hydroxide (0.27 mL, 1.99 mmol), and the reaction was stirred at ambient temperature for 30 min. The reaction was concentrated to dryness *in vacuo*. The crude product was purified by reverse-phase HPLC, eluting with 5% acetonitrile in water (0.1% TFA used as a modifier) initially, grading to 85% acetonitrile in water, to give the title compound as a mixture of ca. 1 major and 2 minor compounds (pairs of enantiomers). MS: m/z = 601.2 ($M + 1$). Major diastereoisomer: ¹H NMR (500 MHz, CDCl₃) δ 8.51 (s, 1 H), 8.15 (dd, 1 H, J = 5.7, 1.4 Hz), 7.90 (s, 1H), 7.42 (dd, 1 H, J = 7.4, 1.4 Hz), 7.06 (dd, 1 H, J = 7.4, 5.7 Hz), 6.94-6.90 (m, 1 H), 6.72-6.70 (m, 1 H), 6.49-6.46 (m, 1 H), 4.90-4.78 (m, 1 H), 4.00-3.90 (m, 2 H), 3.90-3.75 (m, 2 H), 3.75-3.60 (m, 1 H), 3.55 (d, 1 H, J = 17.5 Hz), 3.40-3.20 (m, 2 H), 2.92-2.80 (m, 2 H), 2.78-2.68 (m, 1 H), 2.55 (dt, 1 H, J = 13.7, 4.1 Hz), 1.86 (bd, 1 H, J = 13.7 Hz), 1.08 (d, 3 H, J = 6.6 Hz).

EXAMPLE 2

[0189]

(6S)-3-(1,1-Difluoro-2-(((3S,5S,6R)-6-methyl-2-oxo-5-phenyl-1-(2,2,2-trifluoroethyl)piperidin-3-yl)amino)ethyl)-5,7-dihydrospiro[cyclopenta[*b*]pyridine-6,3'-pyrrolo[2,3-*b*]pyridin]-2'(1'H)-one

Step A: (6S)-3-(1,1-Difluoro-2-(((3S,5S,6R)-6-methyl-2-oxo-5-phenyl-1-(2,2,2-trifluoroethyl)piperidin-3-yl)amino)ethyl)-1'-((2-(trimethylsilyl)ethoxy)methyl)-5,7-dihydrospiro[cyclopenta[*b*]pyridine-6,3'-pyrrolo[2,3-*b*]pyridin]-2'(1'H)-one

[0190] Trifluoromethanesulfonic anhydride (0.056 mL, 0.335 mmol) was added to a cooled solution of (S)-3-(1,1-difluoro-2-hydroxyethyl)-1'-((2-(trimethylsilyl)ethoxy)methyl)-5,7-dihydrospiro[cyclopenta[*b*]pyridine-6,3'-pyrrolo[2,3-*b*]pyridin]-2'(1'H)-one (described in Intermediate 10) (0.100 g, 0.223 mmol) and 2,6-di-*tert*-butyl-4-methylpyridine (0.070 g, 0.335 mmol) in CH₂Cl₂ (3 mL) at -78 °C. The resulting mixture was warmed slowly to ambient temperature and stirred for 18 h. The reaction was diluted with EtOAc (100 mL), filtered through a pad of Celite®, washing with EtOAc, and concentrated to dryness *in vacuo*. The crude product dissolved in CH₂Cl₂ (3 mL) at ambient temperature. To this solution was added (3S,5S,6R)-3-amino-6-methyl-5-phenyl-1-(2,2,2-trifluoroethyl)piperidin-2-one HCl salt (described in Intermediate 11) (0.033 g, 0.104 mmol) and *N,N*-diisopropylethylamine (0.033 mL, 0.190 mmol). The resulting mixture was stirred at ambient temperature for 18 h before being partitioned between water (20 mL) and EtOAc (100 mL). The organic layer was removed and the aqueous phase was extracted further with EtOAc (30 mL). The combined organic extracts were washed with brine, then dried over sodium sulfate, filtered, and concentrated to dryness *in vacuo*. The crude product was purified by silica gel chromatography, eluting with a gradient of hexanes:EtOAc - 80:20 to 0:100, to give the title compound MS: m/z = 716.3 ($M + 1$).

Step B: (6S)-3-(1,1-Difluoro-2-(((3S,5S,6R)-6-methyl-2-oxo-5-phenyl-1-(2,2,2-trifluoroethyl)piperidin-3-yl)amino)ethyl)-5,7-dihydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridin]-2'(1'H)-one

[0191] HCl gas was bubbled into a solution of (6S)-3-(1,1-difluoro-2-(((3S,5S,6R)-6-methyl-2-oxo-5-phenyl-1-(2,2,2-trifluoroethyl)piperidin-3-yl)amino)ethyl)-1'-((2-(trimethylsilyl)ethoxy)methyl)-5,7-dihydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridin]-2'(1'H)-one (0.012 g, 0.017 mmol) in MeOH (3 mL) cooled to 0 °C until saturated. The resulting mixture was stirred at 0 °C for 1 h and then concentrated to dryness *in vacuo*. To a solution of this crude mixture in MeOH (5 mL) was added ammonium hydroxide (0.047 mL, 0.335 mmol), and the reaction was stirred at ambient temperature for 30 min. The reaction was concentrated to dryness *in vacuo*. The crude product was purified by reverse-phase HPLC, eluting with 10% acetonitrile in water (0.1% TFA used as a modifier) initially, grading to 80% acetonitrile in water, to give the title compound. MS: m/z = 586.2 ($M + 1$). ^1H NMR (500 MHz, CDCl_3) δ 8.77 (s, 1 H), 8.04 (d, 1 H, J = 7.0 Hz), 8.00 (s, 1 H), 7.90 (bs, 1 H), 7.61 (d, 1 H, J = 7.0 Hz), 7.40-7.29 (m, 3 H), 7.26-7.10 (m, 3 H), 4.87-4.81 (m, 1 H), 4.07 (dd, 1 H, J = 11.4, 6.8 Hz), 3.98 (s, 2 H), 3.90-3.75 (m, 3 H), 3.73 (d, 1 H, J = 17.6 Hz), 3.57-3.48 (m, 2 H), 3.38 (d, 1 H, J = 17.1 Hz), 3.35-3.27 (m, 1 H), 2.63 (dt, 1 H, J = 12.5 Hz), 2.49-2.47 (m, 1H), 0.98 (d, 3H, J = 6.5 Hz).

EXAMPLE 3

[0192]

(6S)-N-[(3S,5S,6R)-6-Methyl-2-oxo-5-phenyl-1-(2,2,2-trifluoroethyl)piperidin-3-yl]-2'-oxo-1',2',5,7-tetrahydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridine]-3-sulfonamide

Step A: (S)-N-((3S,5S,6R)-6-Methyl-2-oxo-5-phenyl-1-(2,2,2-trifluoroethyl)piperidin-3-yl)-2'-oxo-1'-((2-(trimethylsilyl)ethoxy)methyl)-1',2',5,7-tetrahydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridine]-3-sulfonamide

[0193] Trichloroisocyanuric acid (0.038 g, 0.16 mmol) was added to a stirred suspension of benzyltrimethylammonium chloride (0.090 g, 0.49 mmol) in anhydrous acetonitrile (0.7 mL) at ambient temperature. After 30 min, the resulting solution was added dropwise to a solution of (S)-S-(2'-oxo-1'-((2-(trimethylsilyl)ethoxy)methyl)-1',2',5,7-tetrahydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridin]-3-yl) benzothioate (described in Intermediate 8) (0.070 g, 0.14 mmol) in acetonitrile (0.8 mL) at 0 °C. After 2 min, aqueous sodium carbonate solution (1 M, 0.40 mL, 0.40 mmol) was added. The resulting mixture was stirred at 0 °C for 20 min before (3S,5S,6R)-3-amino-6-methyl-5-phenyl-1-(2,2,2-trifluoroethyl)piperidin-2-one hydrochloride (described in Intermediate 11) (0.059 g, 0.18 mmol) was added. This final mixture was stirred for 20 min as it warmed to ambient temperature, then partitioned between aqueous saturated sodium carbonate solution and EtOAc. The combined organic layers were washed with brine, dried over sodium sulfate, and concentrated *in vacuo*. The residue was purified by flash column chromatography on silica gel (80% ethyl acetate in petroleum ether) to afford the title compound. MS: m/z = 716.2 ($M + 1$).

Step B: (6S)-N-[(3S,5S,6R)-6-Methyl-2-oxo-5-phenyl-1-(2,2,2-trifluoroethyl)piperidin-3-yl]-2'-oxo-1',2',5,7-tetrahydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridine]-3-sulfonamide

[0194] A solution of HCl in dioxane (4 M, 0.7 mL, 2.8 mmol) was added to a solution of (S)-N-((3S,5S,6R)-6-methyl-2-oxo-5-phenyl-1-(2,2,2-trifluoroethyl)piperidin-3-yl)-2'-oxo-1'-((2-(trimethylsilyl)ethoxy)methyl)-1',2',5,7-tetrahydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridine]-3-sulfonamide (0.027 g, 0.038 mmol) in dioxane (0.5 mL) pre-cooled to 0 °C. The mixture was gradually warmed to ambient temperature, then heated at 60 °C for 22 h. The reaction mixture was concentrated *in vacuo*, and the residue was purified by reverse-phase HPLC (C18 column), eluting with 30% MeOH in water (0.1% TFA used as a modifier) initially, grading to 100% MeOH over 30 min with a flow rate of 15 mL/min to furnish the title compound. MS: m/z = 586.2 ($M + 1$). ^1H NMR (400 MHz, CD_3OD) δ 8.92 (s, 1 H), 8.22 (s, 1

H), 8.11 (d, 1H, $J = 4.3$ Hz), 7.42 - 7.34 (m, 3 H), 7.32 - 7.23 (m, 3 H), 6.93 (dd, 1H, $J = 7.4, 5.4$ Hz), 4.88 (obscured m, 1H), 4.62 (dq, 1H, $J = 15.2, 9.4$ Hz), 4.30 (dd, 1H, $J = 11.7, 7.2$ Hz), 3.84 (quintet, 1H, $J = 6.0$ Hz), 3.68 - 3.57 (m, 3H), 3.36-3.29 (obscured m, 2H), 2.65 - 2.52 (m, 1 H), 2.45 - 2.36 (m, 1 H), 0.98 (d, 3H, $J = 6.5$ Hz).

Pharmaceutical Composition

[0195] As a specific embodiment of this invention, 100 mg of (3'S)-3-(3-(6-Methyl-2-oxo-1-(2,2,2-trifluoroethyl)-5-(2,3,5-trifluorophenyl)piperidin-3-yl)prop-1-en-1-yl)-5,7-dihydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridin]-2'(1'H)-one is formulated with sufficient finely divided lactose to provide a total amount of 580 to 590 mg to fill a size 0, hard-gelatin capsule.

Claims

1. A compound selected from:

(3'S)-3-(3-(6-Methyl-2-oxo-1-(2,2,2-trifluoroethyl)-5-(2,3,5-trifluorophenyl)piperidin-3-yl)prop-1-en-1-yl)-5,7-dihydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridin]-2'(1'H)-one;

(6S)-3-(1,1-Difluoro-2-(((3S,5S,6R)-6-methyl-2-oxo-5-phenyl-1-(2,2,2-trifluoroethyl)piperidin-3-yl)amino)ethyl)-5,7-dihydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridin]-2'(1'H)-one;

and

(6S)-N-[(3S,5S,6R)-6-Methyl-2-oxo-5-phenyl-1-(2,2,2-trifluoroethyl)piperidin-3-yl]-2'-oxo-1',2',5,7-tetrahydrospiro[cyclopenta[b]pyridine-6,3'-pyrrolo[2,3-b]pyridine]-3-sulfonamide;

or a pharmaceutically acceptable salt thereof.

2. A pharmaceutical composition comprising a compound of Claim 1 and a pharmaceutically acceptable carrier.

3. A compound of claim 1, or a pharmaceutically acceptable salt thereof, for use in medicine.

4. A compound of Claim 1, or a pharmaceutically acceptable salt thereof, for use in the treatment of migraine.

Patentansprüche

1. Eine Verbindung, ausgewählt aus:

(3'S)-3-(3-(6-Methyl-2-oxo-1-(2,2,2-trifluorethyl)-5-(2,3,5-trifluorphenyl)piperidin-3-yl)prop-1-en-1-yl)-5,7-dihydrospiro[cyclopenta[b]pyridin-6,3'-pyrrolo[2,3-b]pyridin]-2'(1'H)-on,

(6S)-3-(1,1-Difluor-2-(((3S,5S,6R)-6-methyl-2-oxo-5-phenyl-1-(2,2,2-trifluorethyl)piperidin-3-yl)amino)ethyl)-5,7-dihydrospiro[cyclopenta[b]pyridin-6,3'-pyrrolo[2,3-b]pyridin]-2'(1'H)on

und

(6S)-N-[(2S,5S,6R)-6-Methyl-2-oxo-5-phenyl-1-(2,2,2-trifluorethyl)piperidin-3-yl]-2'-oxo-1',2',5,7-tetrahydrospiro[cyclopenta[b]pyridin-6,3'-pyrrolo[2,3-b]pyridin]-3-sulfonamid,

oder ein pharmazeutisch annehmbares Salz davon.

2. Eine pharmazeutische Zusammensetzung, die eine Verbindung nach Anspruch 1 und einen pharmazeutisch annehmbaren Träger umfasst.

3. Eine Verbindung nach Anspruch 1 oder ein pharmazeutisch annehmbares Salz davon zur Verwendung in der Medizin.

4. Eine Verbindung nach Anspruch 1 oder ein pharmazeutisch annehmbares Salz davon zur Verwendung bei der Behandlung von Migräne.

Revendications

1. Composé choisi parmi:

- 5 (3'S)-3-(3-(6-méthyl-2-oxo-1-(2,2,2-trifluoroéthyl)-5-(2,3,5-trifluorophényl)pipéridin-3-yl)prop-1-én-1-yl)-5,7-dihydrospiro[cyclopenta[*b*]pyridine-6,3'-pyrrolo[2,3-*b*]pyridin]-2'(1'H)-one;
 (6S)-3-(1,1-difluoro-2-(((3S,5S,6R)-6-méthyl-2-oxo-5-phényl-1-(2,2,2-trifluoroéthyl)pipéridin-3-yl)amino)éthyl)-5,7-dihydrospiro[cyclopenta[*b*]pyridine-6,3'-pyrrolo[2,3-*b*]pyridin]-2'(1'H)-one;
 10 et
 (6S)-*N*-[(3S,5S,6R)-6-méthyl-2-oxo-5-phényl-1-(2,2,2-trifluoroéthyl)pipéridin-3-yl]-2'-oxo-1',2',5,7-tétrahydrospiro[cyclopenta[*b*]pyridine-6,3'-pyrrolo[2,3-*b*]pyridine]-3-sulfonamide;

ou un sel pharmaceutiquement acceptable de ceux-ci.

- 15 2. Composition pharmaceutique comprenant un composé selon la revendication 1 et un support pharmaceutiquement acceptable.
3. Composé selon la revendication 1, ou un sel pharmaceutiquement acceptable de celui-ci, pour une utilisation en médecine.
- 20 4. Composé selon la revendication 1, ou un sel pharmaceutiquement acceptable de celui-ci, pour une utilisation dans le traitement d'une migraine.
