(54) Title: GAMBLING HYBRID GAME WITH VARIABLE CHARACTERISTIC FEEDBACK LOOP

(57) Abstract: A gambling hybrid game that provides a game world engine that changes a set entertainment game variables based on the results of a gambling event in a gambling game. The gambling hybrid game includes an entertainment system engine that provides an entertainment game to a user, a real world engine that provides gambling games to users, and a game world engine that monitors the entertainment game and provides gambling games when appropriate. The entertainment system engine provides an entertainment games that provides values for a set of entertainment game variables. The game world engine receive the values of set entertainment game variables and determines whether a gambling event in a gambling game is triggered based upon the values one or more entertainment game variables in the set. The real world engine determines the results of the gambling event and provides the results to the game world engine.

GAMBLING HYBRID GAME WITH VARIABLE CHARACTERISTIC FEEDBACK LOOP

CROSS-REFERENCE TO RELATED APPLICATIONS

FIELD OF THE INVENTION

[0002] Embodiments of the present invention are generally related to gaming and more specifically to systems and processes that change game characteristics in an entertainment game based upon the results of a gambling event in a gambling game.

BACKGROUND

[0003] The gaming machine manufacturing industry provides a variety of gaming machines to enable wagering for interested parties whilst providing an entertainment experience. An exemplary gaming machine is a slot machine. As the demographic of eligible players has shifted with time to newer generations who have grown accustomed to highly sophisticated graphics and interactive video games, a need has arisen to increase the entertainment content present on a gaming machine to keep it relevant, at least to a growing portion of a casino’s patronage. The subject design is a form of gaming machine, designed for use in a physical or virtual casino environment, which provides players an environment in which to play for cash, prizes and points, either against the casino or in head to head modes in a controlled and regulated manner while being allowed to use their skills and adeptness at a particular type of game. An example of such a game would be a challenging word spelling game, or an interactive action game such as is found on video game consoles popular today, such as a PlayStation®, an Xbox®, a Wii® or a PC based game.
SUMMARY OF THE INVENTION

[0004] The disclosed embodiments relate generally to an interactive entertainment game where skill and chance may coalesce to provide a rich arcade-style gaming experience, visually exciting and challenging, where players may wager cash, credits prizes and points in order to win more of the foregoing. Many of the embodiments of the design provide an enticing method of gaming to the players who expect a high level of entertainment content in their gaming experience compared to the relatively simple game methods in use today.

[0005] In accordance with embodiments of this invention, a method for providing a gambling hybrid game using a computing system includes configuring at least one processor as an entertainment system engine constructed to execute an entertainment game, configuring at least one processor as a real world engine constructed to determine a wager outcome in accordance with a gambling proposition, configuring at least one processor as a game world engine constructed to request the wager outcome in response to a player's actions during play of the entertainment game executed by the entertainment system engine, executing the entertainment game using the at least one processor configured as the entertainment system engine to update a value for each entertainment game variable in a set of entertainment game variables, where the set of entertainment game variables represents a state of the entertainment game and includes at least one entertainment game variable, requesting the wager outcome in response to the player's actions during play of the entertainment game using the at least one processor configured as the game world engine, determining the wager outcome using the at least one processor configured as the real world engine, providing the wager outcome to the at least one processor configured as the game world engine from the at least one processor configured as the real world engine, determining a change to a set of entertainment game variables based upon the wager outcome using the at least one processor configured as the game world engine, and providing the change in the set of entertainment game variables from the at least one processor configured as the game world engine to the at least one processor configured as the entertainment system engine for use in executing the entertainment game.
In some embodiments, the method further includes receiving player information from a player management system using the at least one processor configured as a game world engine, wherein the determining of the change to the set of entertainment game variables by the at least one processor configured as the game world engine is based upon the wager outcome and the player information.

In various embodiments, the player information includes at least one of player preferences for the entertainment game and a player skill level for the entertainment game.

In some embodiments, method further includes providing the value for each entertainment game variable in the set of entertainment game variables during execution of the entertainment game from the at least one processor configured as the entertainment system engine to the at least one processor configured as the game world engine, determining to request the wager outcome based upon the provided value for each entertainment game variable in the set of entertainment game variables using the at least one processor configured as the game world engine, and requesting the wager outcome by the at least one processor configured as the game world engine from the at least one processor configured as the real world engine in response to the determination to request the wager outcome.

In several embodiments, the change in the set of entertainment game variables includes providing additional enabling elements for the entertainment game wherein an enabling element is an element in the entertainment game used to invoke an action in the entertainment game.

In some embodiments, the additional enabling elements provided are based upon an enabling element expended to trigger the request for the wager outcome.

In many embodiments, the additional enabling elements provided are a different type of enabling element than an enabling element that was expended to trigger the request for the wager outcome.

In some embodiments, a gambling hybrid game includes one or more processors, and memory coupled to the one or more processors, the memory storing processor-executable instructions that when executed by the one or more processors cause the one or more processors to: configure at least one processor as an
entertainment system engine constructed to execute an entertainment game; configure at least one processor as a real world engine constructed to determine a wager outcome in accordance with a gambling proposition; configure at least one processor as a game world engine constructed to request the wager outcome in response to a player’s actions during play of the entertainment game executed by the entertainment system engine; execute the entertainment game using the at least one processor configured as the entertainment system engine to update a value for each entertainment game variable in a set of entertainment game variables, where the set of entertainment game variables represents a state of the entertainment game and includes at least one entertainment game variable; request the wager outcome in response to the player’s actions during play of the entertainment game using the at least one processor configured as the game world engine; determine the wager outcome using the at least one processor configured as the real world engine; provide the wager outcome to the at least one processor configured as the game world engine from the at least one processor configured as the real world engine; determine a change to a set of entertainment game variables based upon the wager outcome using the at least one processor configured as the game world engine; and provide the change in the set of entertainment game variables from the at least one processor configured as the game world engine to the at least one processor configured as the entertainment system engine for use in executing the entertainment game.

[0013] In various embodiments, the instructions when executed further cause the one or more processors to: receive player information from a player management system using the game world engine; and wherein the determination of the change to the set of entertainment game variables by the game world engine is based upon the wager outcome and the player information.

[0014] In many embodiments, the player information includes at least one of player preferences for the entertainment game and a player skill level for the entertainment game.

[0015] In various embodiments, the instructions when executed further cause the one or more processors to: provide the value for each entertainment game variable in the set of entertainment game variables during execution of the entertainment game.
from the at least one processor configured as the entertainment system engine to the at least one processor configured as the game world engine; determine to request the wager outcome based upon the provided value for each entertainment game variable in the set of entertainment game variables using the at least one processor configured as the game world engine; and request the wager outcome by the at least one processor configured as the game world engine from the at least one processor configured as the real world engine in response to the determination to request the wager outcome.

[0016] In many embodiments, the change in the set of entertainment game variables includes providing additional enabling elements for the entertainment game.

[0017] In several embodiments, the additional enabling elements provided are based upon an enabling element expended to trigger the request for the wager outcome.

[0018] In many embodiments, the additional enabling elements provided are a different type of enabling element than an enabling element expended to trigger the request for the wager outcome.

[0019] In an embodiment, non-transitory machine readable media accessible by one or more processors containing processor-executable instructions for the one or more processors is provided. The processor-executable instructions when executed by the one or more processors cause the one or more processors to: configure at least one processor as an entertainment system engine constructed to execute an entertainment game; configure at least one processor as a real world engine constructed to determine a wager outcome in accordance with a gambling proposition; configure at least one processor as a game world engine constructed to request the wager outcome in response to a player's actions during play of the entertainment game executed by the entertainment system engine; execute the entertainment game using the at least one processor configured as the entertainment system engine to update a value for each entertainment game variable in a set of entertainment game variables, where the set of entertainment game variables represents a state of the entertainment game and includes at least one entertainment game variable; request the wager outcome in response to the player's actions during play of the entertainment game using the at least one processor configured as the game world engine; determine the wager outcome using the at least one processor configured as the real world engine; provide
the wager outcome to the at least one processor configured as the game world engine from the at least one processor configured as the real world engine; determine a change to a set of entertainment game variables based upon the wager outcome using the at least one processor configured as the game world engine; and provide the change in the set of entertainment game variables from the at least one processor configured as the game world engine to the at least one processor configured as the entertainment system engine for use in executing the entertainment game.

BRIEF DESCRIPTION OF THE DRAWINGS

[0008] FIG. 1 illustrates a conceptual diagram of components of a gambling hybrid game in accordance with an embodiment of the invention.

[0009] FIG. 2 illustrates a conceptual diagram of aspects of a Real World Engine (RWE) of a gambling hybrid game in accordance with some embodiments of the invention.

[0010] FIG. 3 illustrates a conceptual diagram of aspects of a Real World Engine (RWE) of a gambling hybrid game in accordance with some other embodiments of the invention.

[0011] FIG. 4 illustrates a signaling diagram of communications between a Real World Engine (RWE) and an external system to provide various functions in accordance with embodiments of the invention.

[0012] FIG. 5 illustrates a diagram of a process flow and signaling in a Real World Engine (RWE) to provide various functions in accordance with embodiments of the invention.

[0013] FIG. 6 illustrates a conceptual diagram of aspects of an Entertainment System Engine (ESE) in accordance with embodiments of the invention.

[0014] FIG. 7 illustrates a conceptual diagram of interactions between a user and a gambling hybrid game in accordance with embodiments of the invention.

[0015] FIG. 8 illustrates a conceptual diagram of the interplay between aspects of a gambling hybrid game in accordance with some embodiments of the invention using Real World Currency (RC).
FIG. 9 illustrates a conceptual diagram of the interplay between aspects of a gambling hybrid game in accordance with other embodiments of the invention using Virtual Real World Currency (VRC).

FIG. 10 illustrates a system diagram of an implementation of a network based gambling hybrid game in accordance with another embodiment of the invention.

FIG. 11 illustrates a system diagram of an implementation of an Internet based gambling hybrid game in accordance with an embodiment of the invention.

FIG. 12 illustrates a system diagram of an implementation of a cloud based gambling hybrid game in accordance with an embodiment of the invention.

FIG. 13 illustrates a block diagram of components of a device implementing a gambling hybrid game in accordance with an embodiment of the invention.

FIG. 14 illustrates a flow diagram of a gambling hybrid game having a game world engine that triggers gambling events in a gambling game based upon game play of an entertainment game and changes entertainment game characteristics based on the result of a gambling event in the gambling game in accordance with an embodiment of the invention.

FIG. 15 illustrates a diagram showing components of a gambling hybrid game and the information passed between the components to provide a game world engine that triggers gambling events in a gambling game based upon game play of an entertainment game and changes entertainment game characteristics based on the result of a gambling event in accordance with an embodiment of the invention.

FIG. 16 illustrates a diagram showing components of a gambling hybrid game and the information passed between the components to provide a game world engine that triggers gambling events in a gambling game based upon game play of an entertainment game and changes entertainment game characteristics based on the result of a gambling event in accordance with another embodiment of the invention.

DETAILED DISCLOSURE OF THE INVENTION

Turning now to the drawings, systems and methods for providing a gambling hybrid game with a game world engine that triggers a gambling event in a gambling game based upon game play of an entertainment game and changes entertainment
game characteristics based on the result of the gambling event in accordance with embodiments of the invention are disclosed. In accordance with many embodiments of the invention, a gambling hybrid game includes an entertainment system engine that executes an entertainment game, a real world engine that determines a result of a gambling event in a gambling game, and a game world engine that manages the entertainment game, determines when a gambling event in the gambling game occurs based upon game play of the entertainment game, and requests that the gambling event be resolved by the real world engine. In accordance with some embodiments of the invention, the game world engine monitors the state of game play in the entertainment game to determine whether to trigger a gambling event in a gambling game. When the game world engine determines that a gambling event in the gambling game is triggered, the game world engine sends a request to the real world engine to resolve the gambling event in the gambling game. The real world engine resolves the gambling event to determine the results of the gambling event and provides the results of the gambling event to the game world engine. The game world engine uses the results of the gambling event to determine changes to be made to game characteristics in the entertainment game and provides the changes to the entertainment system engine for incorporation into the entertainment game.

[0027] Systems and methods for providing a gambling hybrid game in which gambling events are triggered by the game world engine based upon the entertainment game variables in accordance with embodiments of this invention are described below with reference to the provided drawings.

GAMBLING HYBRID GAMES

[0028] In accordance with many embodiments of this invention, a gambling hybrid game integrates high-levels of entertainment content with a game of skill (an entertainment game) and a gambling experience with a game of chance (a gambling game). A gambling hybrid game provides for random outcomes independent of player skill while providing that the user's gaming experience (as measured by obstacles/challenges encountered, time of play and other factors) is shaped by the player's skill. The wager outcome of a gambling proposition that is determined on the basis of a Random Number Generator (RNG) or other such device that provides a
pseudo random or random outcome in response to a request. In accordance with some embodiments, the wager game may be initiated in response to a player action taken in an entertainment game. A gambling hybrid game in accordance with an embodiment of the invention is illustrated in FIG. 1. The gambling hybrid game 128 includes a Real World Engine (RWE) 102, a Game World Engine (GWE) 112, an Entertainment System Engine (ESE) 120, a gambling game user interface 122 and an entertainment game user interface 124. The two user interfaces can be part of the same user interface but are separate in the illustrated embodiment. The RWE 102 is connected with the GWE 112 and the gambling game user interface 122. The ESE 120 is connected with the GWE 112 and the entertainment game user interface 124. The GWE 112 is connected also with the entertainment game user interface 124.

[0029] In accordance with several embodiments, the RWE 102 is the operating system for the gambling game of the gambling hybrid game 128 and controls and operates the gambling game. The operation of a gambling game is enabled by Real World Currency (RC), such as money or other real world funds. A gambling game can increase or decrease an amount of RC based on random gambling outcomes, where the gambling proposition of a gambling game is typically regulated by gaming control bodies. In many embodiments, the RWE 102 includes a Real World (RW) operating system (OS) 104, RNG 106, level n real-world credit pay tables (Table Ln-RC) 108, RC meters 110 and other software constructs that enable a game of chance to offer a fair and transparent gambling proposition, and to contain the auditable systems and functions that can enable the game to obtain gaming regulatory body approval.

[0030] A random number generator (RNG) 106 includes software and/or hardware algorithms and/or processes, which are used to generate pseudo random or random outcomes. A level n real-world credit pay table (Table Ln-RC) 108 is a table that can be used in conjunction with an RNG 106 to dictate the RC earned as a function of gameplay and is analogous to the pay tables used in a conventional slot machine. Table Ln-RC payouts are independent of player skill. There can be one table or multiple tables included in Ln-RC pay tables 108 contained in a gambling game, the selection of which can be determined by factors including (but not limited to) game progress that a player has earned, and/or bonus rounds for which a player can be
eligible. RCs are credits analogous to slot machine game credits, which are entered into a gambling game by the user, either in the form of money such as hard currency or electronic funds. RCs can be decremented or augmented based on the outcome of a random number generator according to the table Ln-RC real world credits pay table 108, independent of player skill. In certain embodiments, an amount of RC can be used as criteria in order to enter higher ESE game levels. RC can be carried forward to higher game levels or paid out if a cash out is opted for by a player. The amount of RC used to enter a specific level of the game, level n, need not be the same for each level.

[0031] In accordance with some embodiments of this invention, the GWE 112 manages the overall gambling hybrid game operation, with the RWE 102 and the ESE 120 effectively being support units to the GWE 112. In accordance with some of these embodiments, the GWE 112 contains mechanical, electronic, and software systems for an entertainment game. The GWE 112 includes an Operating System (OS) 114 that provides control of the entertainment game. The GWE additionally contains a level n game world credit pay table (table Ln-GWC) 116 from where to take input from this table to affect the play of the entertainment game. The GWE 112 can further couple to the RWE 102 to determine the amount of RC available on the game and other metrics of wagering on the gambling game (and potentially affect the amount of RC in play on the RWE). The GWE additionally contains various audit logs and activity meters (such as the GWC meter) 118. The GWE 112 can also couple to a centralized server for exchanging various data related to the player and his or her activities in the game. The GWE 112 furthermore couples to the ESE 120.

[0032] In accordance with some embodiments, a level n game world credit pay table (Table Ln-GWC) 116 dictates the Game World Credit (GWC) earned as a function of player skill in the nth level of the game. The payouts governed by this table are dependent upon player skill and sponsored gameplay at large and can or cannot be coupled to a RNG. In accordance with some embodiments, GWCs are player points earned or depleted as a function of player skill, specifically as a function of player performance in the context of the entertainment game. GWC is analogous to the score in a typical video game. Each entertainment game has one or more scoring criterion, embedded within the table Ln-GWC 116 that reflects player performance against the
goal(s) of the game. GWCs can be carried forward from one level of sponsored gameplay to another, and ultimately paid out in various manners such as directly in cash, or indirectly such as by earning entrance into a sweepstakes drawing, or earning participation in, or victory in, a tournament with prizes. GWCs can be stored on a player tracking card or in a network-based player tracking system, where the GWCs are attributed to a specific player.

[0033] In accordance with certain embodiments, the operation of the GWE does not affect the RWE's gambling operation except for player choice parameters that are allowable in slot machines, including but not limited to, wager terms such as, but not limited to, a wager amount, how fast the player wants to play (by pressing a button or pulling the handle of a slot machine), and/or agreement to wager into a bonus round. In this sense, the RWE 102 provides a fair and transparent, non-skill based gambling proposition co-processor to the GWE 112. In the illustrated embodiment, the communication link shown between the GWE 112 and the RWE 102 allows the GWE 112 to obtain information from the RWE 102 as to the amount of RC available in the gambling game. The communication link can also convey a status operation of the RWE (such as on-line or tilt). The communication link can further communicate the various gambling control factors which the RWE 102 uses as input, such as the number of RC consumed per game or the player's election to enter a jackpot round. In FIG. 1, the GWE 112 is also shown as connecting to the player's user interface directly, as this can be utilized to communicate certain entertainment game club points, player status, control the selection of choices and messages which a player can find useful in order to adjust the entertainment game experience or understand their gambling status in the RWE 102.

[0034] In accordance with various embodiments of this invention, the ESE 120 manages and controls the visual, audio, and player control for the entertainment game. In accordance with certain embodiments, the ESE 120 accepts input from a player through a set of hand controls, and/or head, gesture, and/or eye tracking systems and outputs video, audio and/or other sensory output to a user interface. In accordance with many embodiments, the ESE 120 can exchange data with and accept control information from the GWE 112. In accordance with some of these embodiments, an
ESE 120 can be implemented using a Personal Computer (PC), a Sony PlayStation® (a video game console developed by Sony Computer Entertainment of Tokyo Japan), or Microsoft Xbox® (a video game console developed by Microsoft Corporation of Redmond, Washington) running a specific entertainment game software program. In accordance with some of these embodiments, ESE 120 can be an electromechanical game system of a gambling hybrid game that is an electromechanical hybrid game. An electromechanical hybrid game executes an electromechanical game for player entertainment. The electromechanical game can be any game that utilizes both mechanical and electrical components, where the game operates as a combination of mechanical motions performed by at least one player or the electromechanical game itself. Various electromechanical hybrid games are discussed in Patent Cooperation Treaty Application No. PCT/US12/58156, filed September 29, 2012, the contents of which are hereby incorporated by reference in their entirety.

[0035] The ESE 120 operates mostly independently from the GWE 112, except that via the interface, the GWE 112 can send certain entertainment game control parameters and elements to the ESE 120 to affect its play, such as (but not limited to) what level of character to be using, changing the difficulty level of the game, changing the type of gun or car in use, and/or requesting potions to become available or to be found by the character. These game control parameters and elements can be based on a wager outcome in accordance with a gambling proposition where the wager was triggered by an element in the entertainment game being acted upon by the player. The ESE 120 can accept this input from the GWE 112, make adjustments, and continue entertainment game gameplay all the while running seamlessly from the player's perspective. The ESE's operation is mostly skill based, except for where the ESE's processes can inject complexities into the game by chance in its normal operation to create unpredictability in the entertainment game. Utilizing this interface, the ESE 120 can also communicate player choices made in the game to the GWE 112, such as but not limited to selection of a different gun, and/or the player picking up a special potion in the GW environment. The GWE's function in this architecture, being interfaced with the ESE 120, is to allow the transparent coupling of entertainment software to a fair and transparent random chance gambling game, providing a seamless perspective to the
player that they are playing a typical popular entertainment game (which is skill based). In accordance with certain embodiments, the ESE 120 can be used to enable a wide range of entertainment games including but not limited to popular titles from arcade and home video games, such as but not limited to Gears of War (a third person shooter game developed by Epic Games of Cary, North Carolina), Time Crisis (a shooter arcade game developed by Namco Ltd of Tokyo, Japan), or Madden Football (an American football video game developed by EA Tiburon of Maitland, Florida). Providers of such software can provide the previously described interface by which the GWE 120 can request amendments to the operation of the ESE software in order to provide seamless and sensible operation as both a gambling game and an entertainment game.

[0036] In accordance with some embodiments, the RWE 102 can accept a trigger to run a gambling game in response to actions taken by the player in the entertainment game as conveyed by the ESE 120 to the GWE 112, or as triggered by the GWE 112 based on its algorithms, background to the overall game from the player's perspective, but can provide information to the GWE 112 to expose the player to certain aspects of the gambling game, such as (but not limited to) odds, amount of RC in play, and amount of RC available. The RWE 102 can accept modifications in the amount of RC wagered on each individual gambling try, or the number of gambling games per minute the RWE 102 can execute, entrance into a bonus round, and other factors, all the while these factors can take a different form than that of a typical slot machine. An example of a varying wager amount that the player can choose can include, but is not limited to, gameplay with a more powerful character, a more powerful gun, or a better car. These choices can increase or decrease the amount wagered per individual gambling game, in the same manner that a standard slot machine player can decide to wager more or less credits for each pull of the handle. In accordance with some of these embodiments, the RWE 102 can communicate a number of factors back and forth to the GWE 112, via an interface, such increase/decrease in wager being a function of the player's decision making as to their operational profile in the entertainment game (such as but not limited to the power of the character, gun selection or car choice). In this manner, the player is always in control of the per game wager amount, with the choice mapping to some parameter or component that is applicable to the entertainment game experience of the
hybrid game. In accordance with a particular embodiment, the RWE 102 operation can be a game of chance as a gambling game running every 10 seconds where the amount wagered is communicated from the GWE 112 as a function of choices the player makes in the operation profile in the entertainment game.

[0037] In many embodiments, a gambling hybrid game integrates a video game style gambling machine, where the gambling game (including an RWE 102 and RC) is not player skill based, while at the same time allows players to use their skills to earn club points which a casino operator can translate to rewards, tournament opportunities and prizes for the players. The actual exchange of monetary funds earned or lost directly from gambling against a game of chance in a gambling game, such as a slot machine, is preserved. At the same time, a rich environment of rewards to stimulate gamers can be established with the entertainment game. In accordance with some of these embodiments, the gambling hybrid game can leverage very popular titles with gamers and provides a sea change environment for casinos to attract players with games that are more akin to the type of entertainment that a younger generation desires. In accordance with various embodiments, players can use their skill towards building and banking Game World Credit (GWC) that in turn can be used to win tournaments and various prizes as a function of their gamer prowess. Numerous embodiments minimize the underlying changes needed to the aforementioned entertainment software for the hybrid game to operate within an entertainment game construct, thus making a plethora of complex game titles and environments, rapid and inexpensive to deploy in a gambling environment.

[0038] In accordance with some embodiments, gambling hybrid games also allow players to gain entry into subsequent competitions through the accumulation of Game World Credits (GWC) as a function of the user's demonstrated skill at the game. These competitions can pit individual players or groups of players against one another and/or against the casino to win prizes based upon a combination of chance and skill. These competitions can be either asynchronous events, whereby players participate at a time and/or place of their choosing, or they can be synchronized events, whereby players participate at a specific time and/or venue.
In accordance with some embodiments, one or more players engage in playing an entertainment game, resident in the ESE, the outcomes of which are dependent at least in part on skill. The gambling hybrid game can include an entertainment game that includes head to head play between a single player and the computer, between two or more players against one another, or multiple players playing against the computer and/or each other, as well as the process by which players bet on the outcome of the entertainment game. The entertainment game can also be a game where the player is not playing against the computer or any other player, such as in games where the player is effectively playing against himself or herself (such as but not limited to Solitaire and Babette).

In accordance with some embodiments, the use of the RWE, GWE and ESE allows for the separation of control of a gambling hybrid game between different devices. For example, the ESE may be hosted by a device that is separate from any devices that host the RWE and/or GWE. Through separation of control of the functions of the ESE, RWE and GWE, the RWE may be isolated from the player's device, thus preventing player interference with the RWE and the gambling game. In addition, as the ESE is responsible for providing the entertainment game, gambling hybrid games may provide for complex entertainment games for the player as the ESE need not include the tightly regulated components of the RWE, thus providing for more freedom in ESE design. Also, separation of control allows a GWE to provide complex wager initiation rules that would not be possible if the either the ESE or the RWE were to be in control of the wager initiation.

In accordance with various embodiments, a gambling hybrid game allows for interleaving of continuous wagering within an entertainment game. For example, instead of wagering once, and then playing an entertainment game to completion, or playing an entertainment game to completion and then placing a wager, a gambling hybrid game allows a gaming system or device to be provided to a player where the gaming system or device provides a complex and interesting entertainment game with wagering incorporated throughout the entertainment game.

In various embodiments, a gambling hybrid game provides for feedback into the entertainment game of additional entertainment game resources that are made
available in the ESE for the use of the player as the result of wagering outcomes. The additional entertainment game resources may enable portions of the entertainment game that were not available to the player without the resources.

[0043] In many embodiments, a gambling hybrid game provides the ability to use the gambling hybrid game in more than one jurisdiction, as the ESE is a component separate from the GWE and RWE. For example, the ESE may be operated as either a pure entertainment game, or as a gambling game depending on the type of characteristics of the RWE that the ESE is coupled to.

[0044] In some embodiments, a gambling hybrid game provides for display of an entertainment game on a player's device that the player is using to interact with the entertainment game, as well as providing a separate display of a state of a gambling game on a separate gambling game display. The separate gambling game display may be on the player's device within the same physical display device, on a separate device having a separate physical screen, or on a separate physical display device on the player's device.

[0045] The components provided by the RWE for a gambling hybrid game in accordance with embodiments of the invention are shown in FIG. 2. In accordance with embodiments of the invention, the RWE includes an internal bus 225 that connects an operating system OS 221, a Pseudo Random or Random Number Generator (P/RNG) 220, one or more pay tables (Table Ln-RC) 223, a wagering control module 222, an authorization access module 224, and a RC credit meter 226 that are included in the RWE 204. The RW OS 221 controls the functions of the RWE 204. The P/RNG 220 includes one or more RNGs that are used to produce random numbers for use in resolving gambling events and other process requiring a random number to determine an outcome. The one or more pay tables (Table Ln-RC) 223 control the functions of the RWE and contain a plurality of factors indexed by the random number to be multiplied with the RC wagered to determine the payout on a successful wager. A wagering control module 222 performs the processes to resolve a wager on a proposition of a gambling event. The resolution process includes, but is not limited to, pulling random numbers, looking up factors in Pay Tables, multiplying the factors by the amount of RC wagered, and administering a RC credit meter 226. A repository (a credit meter) 226
maintains a record of the amount of RC which a player has deposited in the game and has been accumulated by the player.

[0046] An external connection allows the RWE 204 to interface to another system or device, which is shown in FIG. 2 as the Internet 205 but may be any other network and/or device. The authorization access module 224 of RWE 204 is connected to the external connection and provides a method to permit access and command exchange between an external system and the RWE 204. The RWE 204 also contains storage for statuses, wagers, wager outcomes, meters and other historical events in a storage device 116.

[0047] In some embodiments, the RWE 204 communicates with external systems to provide various functions of a gambling hybrid game in accordance with embodiments of the invention. The components of an RWE 204 that communicate with an external system to provide a component of the RWE 204 in accordance with embodiments of the invention are shown in FIG 3. The RWE 204 shown in FIG.3 is similar to the RWE shown in FIG. 2. However, the P/RNG 220 is an external system connected to the RWE 204 by the Internet 205 in accordance with embodiments of the invention. The P/RNG 220 could be a system, such as a regulated and controlled random numbered ball selection device, a pari-mutuel wagering system for sporting events, or the like, which provides random or pseudo random outcomes for a gambling proposition to one or a plurality of connected RWEs 204. One skilled in the art will recognize that only P/RNG 220 is an external system in the embodiment illustrated in FIG. 3. However, any of the components could be external systems without departing from the invention and P/RNG 220 is shown as an example only.

[0048] In FIGS. 2 and 3, the RWE 204 interfaces with other systems/devices or to an external P/RNG 220 using the Internet 205. However, one skilled in the art will note that nothing would preclude using a different interface than the Internet 205 in other embodiments of the invention. Other examples of interfaces include, but are not limited to, a LAN, a USB interface, or some other method by which two electronic and software constructs could communicate with each other.

[0049] The RWE and an external system typically communicate to provide the resolution of gambling events to resolve wagers on the events. The signals between
the RWE and an external system to provide some process related to resolving gambling events in accordance with embodiments of the invention are shown in FIG. 4. In accordance with many embodiments of the invention, the primary function of the RWE 204 is to manage wagering events and to provide random (or pseudo random) numbers from an RNG. At the top of the figure, a 6 component communication exchange grouped by the "1" box is shown for a wager on a proposition in a gambling event during a gambling hybrid game in accordance with embodiments of the invention. An external system 450 that is requesting wagering support from the RWE 204 instructs the RWE 204 as to the pay table (Table Ln-RC) to use (41 0), followed by the amount of RC to wager on the proposition of the gambling event (41 2). Next, the external system 450 signals the RWE to trigger a wager or perform the gambling event (41 4). The RWE 204 resolves the gambling event. The RWE 204 then informs external system 450 as to the outcome of the wager (41 6), the amount of RC won (41 8), and the amount of RC in the player's account (in the credit repository) (42 0).

[0050] A second communication exchange between the RWE 204 and an external system 450 in accordance with embodiments of the invention that is shown in FIG. 4 is grouped by the "2" box in FIG. 4 and relates to the external system 450 needing an P/RNG result support from the RWE 204. In this exchange, the external system 450 requests an P/RNG result from the RWE 204 (43 0). The RWE 204 returns a P/RNG result to the external system 450 in response to the request (43 2). The result may be generated as a function of the internal P/RNG in the RWE 204, or from a P/RNG external to the RWE 204 to which the RWE 204 is connected.

[0051] A third communication exchange between the RWE 204 and the external system 450 in accordance with embodiments of the invention that is shown in FIG. 4 is grouped by the "3" box in the figure and relates to the external system 450 wanting support on coupling an P/RNG result to a particular Pay Table contained in the RWE 204. In this exchange, the external system 450 instructs the RWE as to the pay table (Table Ln-RC) to use (44 0). The external system (45 0) then requests a result whereby the P/RNG result is coupled to the requested Pay Table (44 2). The result is returned to the external system 450 by RWE 204 (44 4). Such an aspect is different from the first exchange shown by the box "1" sequence in that no actual RC wager is conducted.
However, such a process, t, might be useful in coupling certain non-RC wagering entertainment game behaviors and propositions to the same final resultant wagering return which is understood for the gambling hybrid game to conduct wagering.

[0052] In regards to FIG. 4, one skilled in the art will note that the thrust of the FIG. 4 is to convey overall functional exchanges between an RWE 204 and an external system 450. As such, various protocol layers necessary for error free and secure communication, and other status, setup, and configuration commands which one might expect in any protocol between two connected systems have been omitted for clarity. Furthermore, some or all of the various commands and responses illustrated could be combined into one or more communication packets without departing from the invention.

[0053] The process flow for functional communication exchanges, such as communication exchanges described above with reference to FIG. 4, between a RWE and an external system in accordance with embodiments of the invention are shown in FIG. 5. The process begins by a RWE 204 receiving signals from an external system requesting a connection to RWE 204 (502). The Access Authorization Module determines that the external system is authorized to connect to RWE 204 (504) and transmits an authorization response to the external system. The external systems provide a request for a gambling event to be performed to the RWE 294 (506). The request may include an indication of a wager amount on a proposition in the gambling event, and a proper pay table to use to resolve the wager. The external system then sends a signal to trigger the gambling event (508).

[0054] The OS 221 instructs the Wager Control Module 222 as to the RC wager and the Pay Table to select as well as to resolve the wager execution (510). In response to the request to execute the gambling event, the wager control module 222 requests an P/RNG result from the P/RNG 220 (512); retrieves a proper pay table or tables from the pay tables 223 (514); adjusts the RC of the player in the RC repository 226 as instructed (516); applies the P/RNG result to the particular pay table or tables (518); and multiplies the resultant factor from the Pay Table by the amount of RC to determine the result of the wager (518). Wager Control Module 222 then adds the amount of RC won by the wager to the RC repository 226 (520); and provides he outcome of the wager,
and the amount of RC in the RWE and the RC won (522). One skilled in the art will
recognize that there may be many embodiments of an RWE 204 which could be
possible, including forms where many modules and components of the RWE are
located in various servers and locations, so the foregoing is not meant to be exhaustive
or all inclusive, but rather provide information about an RWE 204 in accordance with
some embodiments of the invention.

[0055] A block diagram of components of an ESE being provided by an ESE host
600 for a gambling hybrid game in accordance with embodiments of the invention is
shown in FIG. 6. An ESE 610 may be part of the entertainment game itself, may be a
software module that is executed by the entertainment game, or may provide an
execution environment for the entertainment game for a particular host. The ESE 610
and associated entertainment game are hosted by an ESE host 600. The ESE host 600
is a computing device that is capable of hosting the ESE 610 and the entertainment
game. Exemplary hosts include video game consoles, smart phones, personal
computers, tablet computers, or the like. The entertainment game includes a game
engine 612 that generates a player interface 605 for interaction with by a player. The
player interface includes a player presentation 635 that is presented to a player through
the player interface. The player presentation 635 may be audio, visual or tactile, or any
combination of such. The player interface 635 further includes one or more Human
Input Devices (HIDs) 630 that the player uses to interact with the entertainment game.
Various components or sub-engines of the game engine read data from a game state in
order to implement the features of the game. Components of the game engine include a
physics engine 640 used to simulate physical interactions between virtual objects in the
game state, a rules engine 645 for implementing the rules of the game, an P/RNG that
may be used for influencing or determining certain variables and/or outcomes to provide
a randomizing influence on gameplay, a graphics engine 650 used to generate a visual
representation of the game state to the player, an audio engine to generate audio
outputs for the player interface, and any other engine needed to provide the
entertainment game. The game engine 612 reads and writes game resources 615
stored on a data store of the ESE host. The game resources 615 include game objects
655 having graphics and/or control logic used to implement game world objects of the
game engine. The game resources 615 also include video files 675 that are used to
generate cut-scenes for the entertainment game. The game resources 615 may also
include audio files 660 used to generate music, sound effects, etc. within the
entertainment game. The game resources 615 may also include configuration files 670
used to configure the features of the entertainment game. The game resources 615
may also include scripts 665 or other types of control code used to implement various
playback features of the entertainment game. The game resources 615 may also
include graphics resources 680 including, but not limited to, textures, and objects that
are used by the game engine to render objects displayed in the entertainment game.

[0056] In operation, components of the game engine 612 read portions of the game
state 625 and generate the player presentation for the player which is presented to the
player using the player interface 605. The player perceives the presentation 635 and
provides player inputs using the HIDs 630. The corresponding player inputs are
received as player actions or inputs by various components of the game engine 612.
The game engine translates the player actions into interactions with the virtual objects
of the game world stored in the game state 625. Components of the game engine 612
use the player interactions with the virtual objects of the game and the game state 625
to update the game state 625 and update the presentation 635 presented to the user.
The process can loop in a game loop continuously while the player plays the game.

[0057] In some embodiments, the ESE 610 is a host running a browser that
communicates with a server serving documents in a markup language, such as
Hypertext Markup Language 5 (HTML 5) or the like, and the functions of the game
engine are performed by the browser on the basis of the markup language found in the
documents. In some embodiments, the ESE 610 is a host hosting a specialized
software platform, such as Adobe Flash or the like, used to implement games or other
types of multimedia presentations, and the functions of the game engine are performed
by the specialized platform.

[0058] The ESE 610 provides one or more interfaces between an entertainment
game and other components 620 of a gambling hybrid game, such as a GWE. The
ESE 610 and the other gambling hybrid game component 620 communicate with each
other using the interfaces, such as by passing various types of data and sending and
receiving messages, status information, commands and the like. Examples of communications include, but are not limited to, requesting by the gambling hybrid game component 620 that the ESE 610 update the game state using information provided by the other component; requesting, by the gambling hybrid game component 620, that the ESE 610 update one or more game resources using information provided by the gambling hybrid game component 620; the ESE 610 providing all or a portion of the game state; the ESE 610 providing one or more of the game resources to the gambling hybrid game component 620; and the ESE 610 communicating player actions to the other gambling hybrid game component 620. The player actions may be low level player interactions with the player interface, such as manipulation of an HID, or may be high level interactions with objects as determined by the entertainment game. The player actions may also include resultant actions such as modifications to the game state or game resources resulting from the player's actions taken in the game. Other examples of player actions include actions taken by entities, such as Non-Player Characters (NPC) of the entertainment game, that act on behalf of, or under the control of, the player.

[0059] Elements are a limited resource consumed within an entertainment game to advance entertainment game gameplay. In playing the entertainment game using the elements, a player can (optionally) consume and accrue game world credits (GWC) within the entertainment game. These credits can be in the form of (but are not limited to) game world credits, experience points, or points generally. Wagers can be made in the gambling game as triggered by the player's use of one or more elements of the entertainment game. The wagers are made using real world credits (RC). The real world credits can be credits in an actual currency, or can be credits in a virtual currency which may have a real world value. Wagering outcomes in accordance with a gambling proposition of the gambling game can cause consumption, loss or accrual of RC. In addition, gambling outcomes in the gambling game can influence elements in the entertainment game such as (but not limited to) by restoring a consumed element, causing the loss of an element, restoration or placement of a fixed element. In certain embodiments, gambling games can facilitate the wager of GWC for a randomly generated payout of GWC or a wager of elements for a randomly generated payout of
elements. In particular embodiments, an amount of GWC and/or elements used as part of a wager can have a RC value if cashed out of a gameplay session.

[0060] Example elements include enabling elements (EE) which are elements that enable a player's play of the entertainment game and whose consumption by the player while playing the entertainment game can trigger a wager in a gambling game. Another non limiting example of an element is a reserve enabling element (REE), which is an element that converts into one or more enabling elements upon occurrence of a release event in skill wagering interleaved game gameplay. Other types of elements include actionable elements (AE) which are elements that are acted upon to trigger a wager in the gambling game and may or may not be restorable during normal play of the entertainment game. Another type of element is a common enabling element (CEE) which as an element that may be shared by two or more players and the use of which by any of the players causes a wager to be triggered.

[0061] In progressing through entertainment game gameplay, elements can be utilized by a player during interactions with a controlled entity (CE) which is a character, entity, inanimate object, device or other object under control of a player.

[0062] Also, entertainment game gameplay progress and wager triggers can be dependent upon a game world variable such as, but not limited to: a required game object (RGO) which is a specific game object in an entertainment game acted upon for an AE to be completed (such as but not limited to a specific key needed to open a door); a required environmental condition (REC) which is a game state present within an entertainment game for an AE to be completed (such as but not limited to daylight whose presence enables a character to walk through woods); or a controlled entity characteristic (CEC) which is a status of the CE within an entertainment game for an AE to be completed (such as but not limited to a CE to have full health points before entering battle). Although various gameplay resources, such as but not limited to GWC, RC and elements as discussed above, any gameplay resource can be utilized to advance gameplay as well as form the basis for a trigger of a wager as appropriate to the specification of a specific application in accordance with various embodiments of the invention. Various hybrid games are discussed in PCT Application Nos. PCT/US1 1/26768, filed March 1, 2011, PCT/US1 1/63587, filed December 6, 2011, and
In accordance with some embodiments, a player can interact with a gambling hybrid game by using RC in interactions with a gambling game along with GWC and elements in interactions with an entertainment game. The gambling game can be executed by a RWE while an entertainment game can be executed with an ESE and managed with a GWE. A conceptual diagram that illustrates how resources such as GWC, RC and elements, such as but not limited to enabling elements (EE), are utilized in a gambling hybrid game in accordance with an embodiment of the invention is illustrated in FIG. 7. The conceptual diagram illustrates that RC 704, EE 708 and GWC 706 can be utilized by a player 702 in interactions with the RWE 710, GWE 712 and ESE 714 of a gambling hybrid game 716. The contribution of elements, such as EE 708, can be linked to a player's access to credits, such as RC 704 or GWC 706. Electronic receipt of these credits can come via a smart card, voucher or other portable media, or as received over a network from a server. In accordance with certain embodiments, these credits can be drawn on demand from a player profile located in a database locally on a gambling hybrid game or in a remote server.

A conceptual diagram that illustrates the interplay between aspects of a gambling hybrid game in accordance with an embodiment of the invention using real world credit (RC) is illustrated in FIG. 8. Similar to FIG. 7, a player's actions and/or decisions can affect functions 806 that consume and/or accumulate GWC 802 and/or EE 804 in an entertainment game executed by an ESE 810. A GWE 812 can monitor the activities taking place within an entertainment game executed by an ESE 810 for gameplay gambling event occurrences. The GWE 812 can also communicate the gameplay gambling event occurrences to an RWE 814 that triggers a wager of RC 816 in a gambling game executed by the RWE 814.

In accordance with some embodiments of the invention, the following may occur during use of the gambling hybrid game. The user enters an input that represents an action or decision (850). The ESE 810 signals the GWE 812 with the input decision or action (852). The GWE 812 responds by signaling to ESE 810 with the amount of EE that is consumed by the player action or decision (854). The signaling from the GWE
812 configures a function 806 to control the EE consumption, decay, and/or accumulation.

[0066] The ESE 810 then adjusts the EE 804 accordingly (856). The GWE 812 signals the RWE 814 as to the profile of the wager proposition associated with the action or decision and triggers the wager (858). The RWE 814 consumes the appropriate amount of RC 816 and executes the wager (860). The RWE 814 then adjusts the RC 816 based upon the outcome of the wager (862) and informs the GWE 812 as to the outcome of the wager (864).

[0067] The GWE 812 signals the ESE 810 to adjust EE to one or more of the EEs of the ESE entertainment game (866). Function 806 of the ESE 810 performs the adjustment of EE 804 (868). The ESE 810 signals the GWE 812 as to the updated status (870). In response, the GWE 812 signals the ESE 810 to update GWC of the entertainment game. The ESE updates the GWC 802 using a function 806 (872).

[0068] The following is an example of the above flow in a first person shooter game, such a Call of Duty®, using a gambling hybrid game sequence in accordance with embodiments of the invention.

[0069] The process begins by a player selecting a machine gun to use in the game and then fires a burst of bullets at an opponent (850). The ESE 810 signals the GWE 812 of the player's choice of weapon, that a burst of bullets was fired, and the outcome of the burst (852). GWE 812 processes the information received and signals ESE 810 to consume 3 bullets (EE) with each pull of the trigger (854). The ESE 810 consumes 3 bullets for the burst using function 806 (856).

[0070] The GWE 812 signals the RWE 814 that 3 credits (RC) are to be wagered to match the three bullets consumed. The RWE 814 then determines the result of the wager and may determine the winnings from a pay table. On a particular pay table (Table Ln-RC), a determination is made by RWE 814 as to the amount of damage that the opponent has sustained. The RWE 814 consumes 3 credits of RC 816 for the wager and executes the specified wager (860). The RWE 814 determines that the player hit a jackpot of 6 credits and returns the 6 credits to the RC 816 (862) and signals the GWE 812 that 3 net credits were won by the player (864).

[0071] The GWE 812 signals ESE 810 to add 3 bullets to an ammunition clip (866).
ESE 810 adds 3 bullets back to the ammo clip (EE 804) using a function 806 (868). The ammunition may be added by directly adding the ammunition to the clip or by allowing the user to find extra ammunition during gameplay. The GWE 812 logs the new player score (GWC 802) in the game (as a function of the successful hit on the opponent) based on the ESE 810 signaling, and the signals the ESE 810 to add 2 extra points to the player score since a jackpot has been won (870). The ESE 810 then adds 10 points to the player score (GWC 802) given the success of the hit which in this example is worth 8 points, plus the 2 extra points requested by GWE 812 (872). Note that the foregoing example is only intended to provide an illustration of how credits flow in a gambling hybrid game, but is not intended to be exhaustive and only lists only one of numerous possibilities of how a gambling hybrid game may be configured to manage its fundamental credits.

[0072] A conceptual diagram that illustrates the interplay between aspects of a gambling hybrid game in accordance with an embodiment of the invention using virtual real world credit (VRC) is illustrated in FIG. 9. As seen in the FIG. 9, substituting VRC in place of RC is effected without impact to the architecture or operation of the gambling hybrid game. The implementation of FIG. 9 is not the only embodiment using virtual currency within a gambling hybrid game, but shows only one permutation of which many could exist.

[0073] Similar to FIG. 8, a player’s actions and/or decisions can affect functions 906 that consume and/or accumulate GWC 902 and/or EE 904 in an entertainment game executed by an ESE 910 in the process shown in Fig. 9. A GWE 912 can monitor the activities taking place within an entertainment game executed by an ESE 910 for gameplay gambling event occurrences. The GWE 912 can also communicate the gameplay gambling event occurrences to a RWE 914. Unlike the process shown in FIG. 8, RWE 914 triggers a wager of virtual real world credit (VRC) 916 in a gambling game executed by the RWE 914.

[0074] For purposes of this discussion, VRC can be thought of as a form of alternate currency, which can be acquired, purchased or transferred, in unit or in bulk, by/to a player, but does not necessarily directly correlate to RC or real currency. As an example, there is a virtual currency called "Triax Jacks", 1000 units of which are given
to a player by an operator of a gambling hybrid game, with additional blocks of 1000 units being available for purchase for $5 USD each block. Triax Jacks could be redeemed for various prizes, or could never be redeemed but simply used and traded purely for entertainment value by players. It would be completely consistent with the architecture of the gambling hybrid game that Triax Jacks would be wagered in place of RC, such that the gambling hybrid game could be played for free, or with played with operator sponsored Triax Jacks.

[0075] Returning to the process in FIG. 9, the following may occur during use of the gambling hybrid game in accordance with embodiments of the invention. The user enters an input that represents an action or decision (950). The ESE 910 signals the GWE 912 with the input decision or action (952). The GWE 912 responds by signaling to ESE 910 with the amount of EE that is consumed by the player action or decision (954). The signaling from the GWE 912 configures a function 906 to control the EE consumption, decay, and/or accumulation.

[0076] The ESE 910 then adjusts the EE 904 accordingly (956). The GWE 912 signals the RWE 914 as to the profile of the wager proposition associated with the action or decision and triggers the wager (958). The RWE 914 consumes the appropriate amount of RC 916 and executes the wager (960). The RWE 914 then adjusts the RC 916 based upon the outcome of the wager (962) and informs the GWE 912 as to the outcome of the wager (964).

[0077] The GWE 912 signals the ESE 910 to adjust EE to one or more of the EEs of the ESE entertainment game (966). Function 906 of the ESE 910 performs the adjustment of EE 904 (968). The ESE 910 signals the GWE 912 as to the updated status (970). In response, the GWE 912 signals the ESE 910 to update GWC 902 of the entertainment game. The ESE updates the GWC 902 using a function 906 (972).

NETWORK BASED GAMBLING HYBRID GAME

[0078] A system diagram that illustrates an implementation of a network distributed gambling hybrid game with a GWE local server in accordance with embodiments of the invention is illustrated in FIG. 10. In the figure, the gambling hybrid game 1000 includes components, RWE 1002 embedded in a device used as the user interface for player
1003. The device provides both a RWE/GWE user interface 1005 and an ESE user
interface 1007 for the player. The ESE is provisioned by an ESE hosting server 1004
via ESE interface 1009, and the GWE is provisioned by GWE server 1006 as indicated
by the dashed line. Also pictured in the diagram are a number of other peripheral
systems, such as player management 1008, casino management 1010, regulatory
1012, hybrid game player account management 1014, and taxation authority 1016
hosting servers that may be present in such an implementation. Fig. 10 also illustrates
various other systems, which may reside outside the bounds of the casino and are
connected to the framework via communications network, such as the Internet 1020,
depicted by the connection lines past the casino firewall 1022. The end devices utilized
for user interfaces for a gambling hybrid game include, but are not limited to, casino
electronic game machines 1030 and wireless or portable devices, such as smart phone
1032, personal digital assistants, tablet computers, video gaming consoles or the like.
These disparate devices are connected within and without the casino through the
casino's information technology structure as illustrated by routers 1040a, 1040b and
1040c. It should be understood that Fig. 10 does not attempt to illustrate all servers
and systems to which a gambling hybrid game 1000 might be inevitably be connected,
and indeed one might expect there would be others, but rather provides an example of
a set of a sub-set of systems which would be present in an exemplary embodiment of
an installation.

[0079] Fig. 11 is a diagram showing another implementation of a gambling hybrid
game in accordance with an exemplary embodiment. In the figure, the gambling hybrid
game 1101 includes components, RWE 1104 embedded in a device used as the user
interface for player 1103. The device provides both a RWE/GWE user interface 1105
and an ESE user interface 1007 for the player. The ESE is provisioned by an ESE
hosting server 1104 via ESE interface 1109. Also pictured in the diagram are a number
of other peripheral systems, such as player management 1108, casino management
1110, regulatory 1112, hybrid game player account management 1114, and taxation
authority 1116 hosting servers that may be present in such an implementation. In the
figure, note that the GWE is composed of two sub-components, a local GWE server
1120, and a cloud server 1122 (components within the dash line area 1124). In the
figure, certain of the components are located within the bounds of the casino, namely
the RWE, the ESE and a portion of the GWE, namely the local GWE server 1120. The
Cloud Server GWE 1122 is located in the cloud connected to the casino bounded
gambling hybrid game components via communications network such as the Internet
1130 through a firewall 1132. Fig. 11 also illustrates various other systems, which may
reside outside the bounds of the casino and are connected to the framework via
communications network. The end devices utilized for user interfaces for a gambling
hybrid game include, but are not limited to, casino electronic game machines, 1134a
and 1134b, and wireless or portable devices, such as smart phone 1136, personal
digital assistants, tablet computers, video gaming consoles or the like. These disparate
devices are connected within and without the casino through the casino's information
technology structure as illustrated by routers 1140a, 1140b and 1140c. It should be
understood that Fig. 11 does not attempt to illustrate all servers and systems to which a
gambling hybrid game might be inevitably be connected, and indeed one might expect
there would be others, but rather provides an example of a set of a sub-set of systems
which would be present in an exemplary embodiment of an installation.

A system diagram that illustrates an implementation of network a cloud based
gambling hybrid game over the Internet in accordance with an embodiment of the
invention is illustrated in FIG. 12. The system includes an ESE server 1202, GWE
server 1204 and RWE server 1206 that each connect to a user interface, 1210a or
1210b, (such as, but not limited to, a television screen, computer terminal, tablet,
touchscreen or PDA) of gambling hybrid games over the Internet 1208. Each gambling
hybrid game includes a local ESE 1212a or 1212b (such as, but not limited to, a video
game console or a gaming computer system) that interfaces with a remote ESE server
1002. Processes performed by an ESE 1212a services can be performed in multiple
locations, such as, but not limited to, remotely on an ESE server 1202 and locally on a
local ESE 1212a. In addition, a gambling hybrid game may include a Personal Digital
Assistant (PDA) 1214 or other type of mobile computing device game coupled to the
ESE hosting server 1202, thus providing the opportunity for a player to play a gambling
hybrid game on the PDA through a mobile phone or data network.
[0081] There are many possible permutations of how a gambling hybrid game could be constructed, with Figs. 10, 11 and 12 showing only three possible permutations and provided as examples, which are not intended to suggest limitations to the forms of the architecture. Other embodiments include a version where the entire gambling hybrid game is in the cloud with only a client running on player terminal within the bounds of the casino, or a version where the RWE and GWE are casino bound and the ESE exists in the cloud, accessed by a client running on a terminal in the casino.

PROCESSING APPARATUSES

[0082] Any of a variety of processing apparatuses can host various components of a gambling hybrid game in accordance with embodiments of the invention. In accordance with embodiments of the invention, these processing apparatuses can include, but are not limited to, a server, a client, a mobile device such as a smartphone, a personal digital assistant or the like, a wireless device such as a tablet computer or the like, an electronic gaming machine, a general purpose computer, a gaming console, a computing device and/or a controller. A processing apparatus that is constructed to implement a gambling hybrid game in accordance with embodiments of the invention is illustrated in FIG. 13. In the processing apparatus 1300, a processor 1304 is coupled to memory 1306 by a bus 1328. The processor 1304 is also coupled to non-transitory machine-readable storage media, such as a storage device 1308 that stores executable instructions 1312 and data 1310 through the system bus 1328 to an I/O bus 1326 through a storage controller 1318. The processor 1304 is also coupled to one or more interfaces that can be used to connect the processor to other processing apparatuses as well as networks as described herein. The processor 1304 is also coupled via the bus to user input devices 1314, such as tactile devices including, but not limited to, keyboards, keypads, foot pads, touch screens, and/or trackballs; as well as non-contact devices such as audio input devices, motion sensors and motion capture devices that the processing apparatus can use to receive inputs from a user when the user interacts with the processing apparatus. The processor 1304 is connected to these user input devices 1314 through the system bus 1328, to the I/O bus 1326 and through the input controller 1320. The processor 1304 is also coupled via the bus to user output devices
13:16 such as (but not limited to) visual output devices, audio output devices, and/or tactile output devices that the processing apparatus uses to generate outputs perceivable by the user when the user interacts with the processing apparatus. In accordance with some embodiments, the processor is coupled to visual output devices such as (but not limited to) display screens, light panels, and/or lighted displays. In accordance with particular embodiments, the processor is coupled to audio output devices such as (but not limited to) speakers, and/or sound amplifiers. In accordance with many of these embodiments, the processor 1304 is coupled to tactile output devices like vibrators, and/or manipulators. The processor 1304 is connected to output devices from the system bus 1328 to the I/O bus 1326 and through the output controller 1322. The processor 1304 can also be connected to a communications interface 1302 from the system bus 1328 to the I/O bus 1326 through a communications controller 1324.

[0083] In accordance with various embodiments, a processor 1304 can load instructions and data from the storage device into the memory 1306. The processor 1304 can also execute instructions that operate on the data to implement various aspects and features of the components of a gambling hybrid game. The processor 1304 can utilize various input and output devices in accordance with the instructions and the data in order to create and operate user interfaces for players or operators of a gambling hybrid game (such as but not limited to a casino that hosts the gambling hybrid game).

[0084] Although the processing apparatus 1300 is described herein as being constructed from a processor and instructions stored and executed by hardware components, the processing apparatus can be composed of only hardware components in accordance with other embodiments. In addition, although the storage device is described as being coupled to the processor through a bus, those skilled in the art of processing apparatuses will understand that the storage device can include removable media such as, but not limited to, a USB memory device, an optical CD ROM, magnetic media such as tape and disks. Also, the storage device can be accessed by processor 1304 through one of the interfaces or over a network. Furthermore, any of the user input devices or user output devices can be coupled to the processor 1304 via one of
the interfaces or over a network. In addition, although a single processor 1304 is described, those skilled in the art will understand that the processor 1304 can be a controller or other computing device or a separate computer as well as be composed of multiple processors or computing devices including one or more processors.

GAMBLING HYBRID GAME WITH A VARIABLE ENTERTAINMENT GAME CHARACTERISTIC FEEDBACK LOOP

[0085] In accordance with many embodiments of this invention, a gambling hybrid game allows a player to play an entertainment game and provides gambling events in a gambling game based on game play of the entertainment game. A flow diagram of operation of a gambling hybrid game interacting with a single player and providing a gambling event in accordance with embodiments of this invention is shown in FIG 14. In FIG. 14, a player 1405 enters an input to the ESE directing a Controllable Element (CE) 1410 in an entertainment game to use an Enabling Element (EE) 1415 during game play of the entertainment game. The ESE receives the instruction and determines the proper Action Event (AE) 1420 to occur during game play that is requested by the input. For purposes of this discussion, an AE is an event that is caused by the input and may include, but is not limited to, a character performing a specific action; or a modification of the inventory of a character or another game element. The AE 1420 is provided to a function 1425, f1, of the GWE that determines whether the AE triggers a gambling event gambling game. A gambling event is an event that includes probabilities that a certain outcome will result playing the gambling game. A proposition of a gambling event is a bet that a certain outcome in the gambling event will occur. A wager is an amount bet on the proposition as to whether or not the outcome will occur. The gambling event includes a wager 1432 of Real World Credits (RWC or RC) 1430. The wager may be input by the user or may be a set amount that is wagered based upon the gambling event occurring. The RWE 1435 is informed of the gambling event and determines the outcome 1445 of the gambling event and the wager (1440). The outcome of the gambling event is provided to a function f2 1450 of the GWE. The function f2 1450 is the function within the GWE that establishes the amount of EE (or AE, CEE, etc.) to be returned in the context of the entertainment game as a
function of the result of the gambling event in the gambling game resolved by the RWE (and potentially other variables from the ESE, GWE, etc.). In accordance with some embodiments, the function \( f_2 \, 1450 \) may be a scaling function that awards more or less EE to the player as a function of the results of the gambling event in the gambling game using a pre-established single- or multi-variable formula or formulae. In accordance with a number of embodiments, the function \( f_2 \, 1450 \) can award not only a variable amount of EE (or AE, CEE, etc. if those are the element of interest) but can alter the character or nature of the EE.

[0086] For example, a gambling hybrid game provides a first person shooter game as an entertainment game. In the first person shooter game, the bullets fired from a weapon are one form of EE. The consumption of a bullet in the context of the entertainment game, can serve as one of the inputs to the function \( f_1 \, 1425 \) within the GWE. In many embodiments, the formula or formulae within the function \( f_1 \, 1425 \) will, given the appropriate inputs, commit RC to and trigger a gambling event in a game within the RWE. The RWE provides the results of the gambling event to the function \( f_2 \, 1450 \). The function \( f_2 \, 1450 \) determines the amount and type of EE to provide to the entertainment game based upon the results of the gambling event. In accordance with some embodiments, the player may receive a standard pistol bullet for a modest gambling game win and the player may receive a special bullet that does extra damage to targets it hits, a smart bullet that can be fired more accurately, or in a game where the player is fighting off vampires, a wood tipped bullet that acts as a stake when it strikes a vampire, killing the vampire immediately for a very high gambling game win (or in another case, after a string of poor gambling game outcomes). The output of function \( f_2 \, 1450 \) is communicated to the EE \( 1415 \), where it can be used by the player in the flow of standard game play.

[0087] Although a specific process for game world engine triggering of gambling events in a gambling game based on entertainment game variables is described above with reference to FIG. 14, any of a variety of processes may be used in accordance with various embodiments of the invention.
EMBODIMENTS OF GAMBLING HYBRID GAMES THAT INCLUDE A GWE THAT MODIFIES VARIABLES OF AN ENTERTAINMENT GAME BASED ON THE RESULTS OF A GAMBLING EVENT IN A GAMBLING GAME

[0088] In accordance with several embodiments of the invention, a gambling hybrid game (HyG) is provided in which the GWE determines a quantity and nature of changes to an entertainment game (EG) based upon the results of a gambling event in a game. Components of a gambling hybrid game in accordance with these embodiments and the information passed between the components of the gambling hybrid game are shown in FIG. 15. In accordance with the shown embodiment, the ESE 102 provides the entertainment game. During game play, the ESE receives inputs from a user 1501 that cause changes in one or more EG variable in an EG game variable set 1505. The EG game variable set 1505 is provided by the ESE to the GWE through an ESE socket 1525 and a GWE socket 1530. In FIG. 15, an example of an input changing the game state is shown as the occurrence of an enabling element (EE) 1515 through a Controllable Element (CE) 1510 controlled by the user. The EE 1515 is registered as having occurred within the ESE socket 1525, such that the GWE socket 1530 receives an update indicating the occurrence, either by polling data within the ESE socket 1525, or by virtue of receiving an information packet from the ESE socket 1525.

[0089] In the illustrated embodiment, a function 11 1540 is a function within the GWE that receives information about the EG variable set 1505 from the GWE socket 1530. The function 11 1540 may also receive other information from the GWE 112 as well as information from other sources including, but not limited to, a player management system 1520; casino or provider systems 1550; and/or regulatory systems. The function 11 1540 applies a gambling event determination function to the received inputs to determine whether a gambling event is triggered. If a gambling event is triggered, the function 11 1540 can send a request for resolution of a gambling event to the RWE 102 that may include a specified amount of real credit (RC) 1545 in a wager 1555 on a proposition about the outcome of the gambling event. The RWE 102 undertakes the gambling game to provide the gambling event and returns a specific amount of RC 1547 and/or an indication of the results of the gambling event 1548 to the GWE 112.
[0090] The function \( f_2 \) 1552 is a function within the GWE 112 that receives the results of the gambling events from RWE 102 and determines any changes to be applied to the set of EG variables 1505 based on the results of the gambling events. In accordance with some embodiments, the function \( f_2 \) 1552 may receive other inputs from various sources including, but not limited to, the GWE 112; the player management system 1520; the casino or provider system 1550; and the regulatory systems. These other inputs and the result of the gambling event may be used by function \( f_2 \) 1552 in the determination of the change in the set of EG variables 1505 in accordance with a number of embodiments. Based upon the received inputs and the results of the gambling event of the gambling game (and possibly including other parameters about the gambling game outcome relative to the distribution of possible outcomes, for example, or historical gambling data for that player, game, and/or casino, etc.), the function \( f_2 \) can determine the quantity, and nature, of the EE to be returned to the player. For example, the function \( f_2 \) 1552 may provide the player with a standard pistol bullet for a modest gambling event win. But, for a very high gambling game win (or in another case, after a string of poor gambling game outcomes), the player may receive a special bullet that does extra damage to targets it hits, a smart bullet that can be fired more accurately, or in a game where the player is fighting off vampires, a wood tipped bullet that acts as a stake when it strikes a vampire, killing the vampire immediately. The output of the function \( f_2 \) 1552 can be communicated back to the ESE via the GWE socket 1530-ESE Socket 1525 Interface.

[0091] Although a specific process for providing a GWE that changes EG variables based on the results of a gambling event in a gambling hybrid system is described above with reference to FIG. 15, any of a variety of processes may be used in accordance with various embodiments of the invention.

[0092] A GWE within a gambling hybrid game in accordance with some embodiments of the invention determines the change to the set of EG variables based upon the results of a gambling event in a gambling game and information from a player management system. The components of a gambling hybrid game and the information passed between components of the gambling hybrid game to allow the GWE to determine the changes to the set of EG variable based upon the results of a gambling
event and information from the player management system in accordance with an embodiment of the invention are shown in FIG. 16. In accordance with the shown embodiment, the ESE 102 provides the entertainment game. During game play, the ESE receives inputs from the user 1601 that cause changes in one or more EG variables in an EG game variable set 1605 that are provided to the GWE 112 through an ESE socket 1625 and a GWE socket 1630. In some embodiments, the entertainment game variable set 1605 may require or accept input from the player, regarding aspects of game play. In FIG. 16, an example of an input changing the game state is shown as the occurrence of an EE 1615 through a CE 1610 controlled by the user. The EE 1615 is registered as having occurred within the ESE socket 1625, such that the GWE socket 1630 receives an update indicating the occurrence, either by polling data within the ESE socket 1625, or by virtue of receiving an information packet from the ESE socket 1625.

[0093] The function f 1 1640 is a function within the GWE that receives information about the EG variable set 1605 from the GWE socket 1630. The function f 1 1640 may also receive other information from the GWE 112 as well as information from other sources including, but not limited to, a player management system 1620; casino or provider systems 1650; and regulatory systems. The function f 1 1640 then applies a gambling event determination function to the received inputs to determine whether a gambling event is triggered. If a gambling event is triggered, the function f 1 1640 can send a request to resolve a gambling event in the gambling game to RWE 102. In accordance with some embodiments, the request may include a specified amount of real credit (RC) 1645 in a wager 1655 on a proposition about the outcome of the gambling event (in a real-money context, virtual currency (VC) may also be used). The RWE 102 undertakes the gambling event in the gambling game to provide the gambling game results and can return a specific amount of RC 1647 and/or an indication of the results of the gambling game 1648 to the GWE 112.

[0094] The function f2 1652 is a function within the GWE 112 that receives the results of the gambling game 1647, 1648 from the RWE 102 and player information from player management system 1620. The player management information may include player preference information 1621 and player level information 1622. Depending on
the type of input used, player preference information 1621 may be set at the beginning of play of the entertainment game through the Host Mode, set as part of a generic player profile, attached to a specific avatar type, or changed during gameplay by the player. Similarly, player level information 1622 may be set at the beginning of gameplay, or change dynamically as the player progresses. The function f2 1652 uses the results of the gambling event and the player management information to shape the change to the set of EG variable awarded including, but not limited to, the type of EE awarded. In a number of embodiments, the type of EE awarded is based on player preferences, player level, and other characteristics as well as the results of the gambling event. In accordance with some embodiments, the output may not only change EE characteristics, but shift the species of EE characteristics as well. For example, a player may expend bullets, but in a high gambling win, the player may receive hand grenades, rockets, or other type of EE that is not a subset of the initial EE expended. This shifting of EE could be a result of a number of game, player and wagering factors depending on the algorithm applied by function f2 1652. For example, a gambling hybrid game that provides a racing game as an entertainment game may return fuel (an EE) with a higher or lower octane rating, depending upon the performance of the gambling game and the other variables feeding into function f2 1652. The higher the octane, the higher the effective HP of the race car’s engine, and thus, the higher the top end speed that can be achieved. Based upon the results of function f2 1652, updates to the set of EG variables 1605 are communicated to the ESE 120 via the GWE Socket 1630 and the ESE Socket 1625. The entertainment game variable set 1605 of the entertainment game, and/or EE (or AE, CEE, etc.) are then updated accordingly by the ESE.

[0095] Although certain specific features and aspects of a gaming system have been described herein, many additional modifications and variations would be apparent to those skilled in the art. For example, the features and aspects described herein may be implemented independently, cooperatively or alternatively without deviating from the spirit of the disclosure. It is therefore to be understood that a hybrid gaming system may be practiced otherwise than as specifically described. Thus, the foregoing description of the hybrid gaming system should be considered in all respects as
illustrative and not restrictive, the scope of the claims to be determined as supported by this disclosure and the claims' equivalents, rather than the foregoing description.
WHAT IS CLAIMED IS:

1. A method for providing a gambling hybrid game using a computing system, the method comprising:
   configuring at least one processor as an entertainment system engine constructed to execute an entertainment game;
   configuring at least one processor as a real world engine constructed to determine a wager outcome in accordance with a gambling proposition;
   configuring at least one processor as a game world engine constructed to request the wager outcome in response to a player's actions during play of the entertainment game executed by the entertainment system engine;
   executing the entertainment game using the at least one processor configured as the entertainment system engine to update a value for each entertainment game variable in a set of entertainment game variables, where the set of entertainment game variables represents a state of the entertainment game and includes at least one entertainment game variable;
   requesting the wager outcome in response to the player's actions during play of the entertainment game using the at least one processor configured as the game world engine;
   determining the wager outcome using the at least one processor configured as the real world engine;
   providing the wager outcome to the at least one processor configured as the game world engine from the at least one processor configured as the real world engine;
   determining a change to a set of entertainment game variables based upon the wager outcome using the at least one processor configured as the game world engine; and
providing the change in the set of entertainment game variables from the at least one processor configured as the game world engine to the at least one processor configured as the entertainment system engine for use in executing the entertainment game.

2. The method of claim 1 further comprising:
   receiving player information from a player management system using the at least one processor configured as a game world engine; and
   wherein the determining of the change to the set of entertainment game variables by the at least one processor configured as the game world engine is based upon the wager outcome and the player information.

3. The method of claim 2 wherein the player information at least one of player preferences for the entertainment game and a player skill level for the entertainment game.

4. The method of claim 1 further comprising:
   providing the value for each entertainment game variable in the set of entertainment game variables during execution of the entertainment game from the at least one processor configured as the entertainment system engine to the at least one processor configured as the game world engine;
   determining to request the wager outcome based upon the provided value for each entertainment game variable in the set of entertainment game variables using the at least one processor configured as the game world engine; and
   requesting the wager outcome by the at least one processor configured as the game world engine from the at least one processor configured as the real world engine in response to the determination to request the wager outcome.
5. The method of claim 4 wherein the change in the set of entertainment game variables includes providing additional enabling elements for the entertainment game wherein an enabling element is an element in the entertainment game used to invoke an action in the entertainment game.

6. The method of claim 5 wherein the additional enabling elements provided are based upon an enabling element expended to trigger the request for the wager outcome.

7. The method of claim 5 wherein the additional enabling elements provided are a different type of enabling element than an enabling element that was expended to trigger the request for the wager outcome.

8. A gambling hybrid game, comprising:
   one or more processors; and
   memory coupled to the one or more processors, the memory storing processor-executable instructions that when executed by the one or more processors cause the one or more processors to:
   - configure at least one processor as an entertainment system engine constructed to execute an entertainment game;
   - configure at least one processor as a real world engine constructed to determine a wager outcome in accordance with a gambling proposition;
   - configure at least one processor as a game world engine constructed to request the wager outcome in response to a player’s actions during play of the entertainment game executed by the entertainment system engine;
   - execute the entertainment game using the at least one processor configured as the entertainment system engine to update a value for each entertainment game variable in a set of
entertainment game variables, where the set of entertainment game variables represents a state of the entertainment game and includes at least one entertainment game variable;

request the wager outcome in response to the player's actions during play of the entertainment game using the at least one processor configured as the game world engine;

determine the wager outcome using the at least one processor configured as the real world engine;

provide the wager outcome to the at least one processor configured as the game world engine from the at least one processor configured as the real world engine;

determine a change to a set of entertainment game variables based upon the wager outcome using the at least one processor configured as the game world engine; and

provide the change in the set of entertainment game variables from the at least one processor configured as the game world engine to the at least one processor configured as the entertainment system engine for use in executing the entertainment game.

9. The system of claim 8 wherein the instructions when executed further cause the one or more processors to:

receive player information from a player management system using the game world engine; and

wherein the determination of the change to the set of entertainment game variables by the game world engine is based upon the wager outcome and the player information.

10. The system of claim 9 wherein the player information includes at least one of player preferences for the entertainment game and a player skill level for the entertainment game.
11. The system of claim 8 wherein the instructions when executed further cause the one or more processors to:

   provide the value for each entertainment game variable in the set of entertainment game variables during execution of the entertainment game from the at least one processor configured as the entertainment system engine to the at least one processor configured as the game world engine;

   determine to request the wager outcome based upon the provided value for each entertainment game variable in the set of entertainment game variables using the at least one processor configured as the game world engine; and

   request the wager outcome by the at least one processor configured as the game world engine from the at least one processor configured as the real world engine in response to the determination to request the wager outcome.

12. The system of claim 11 wherein the change in the set of entertainment game variables includes providing additional enabling elements for the entertainment game.

13. The system of claim 12 wherein the additional enabling elements provided are based upon an enabling element expended to trigger the request for the wager outcome.

14. The system of claim 12 wherein the additional enabling elements provided are a different type of enabling element than an enabling element expended to trigger the request for the wager outcome.

15. Non-transitory machine readable media accessible by one or more processors containing processor-executable instructions for the one or more processors that when executed by the one or more processors
cause the one or more processors to:

- configure at least one processor as an entertainment system engine constructed to execute an entertainment game;
- configure at least one processor as a real world engine constructed to determine a wager outcome in accordance with a gambling proposition;
- configure at least one processor as a game world engine constructed to request the wager outcome in response to a player's actions during play of the entertainment game executed by the entertainment system engine;
- execute the entertainment game using the at least one processor configured as the entertainment system engine to update a value for each entertainment game variable in a set of entertainment game variables, where the set of entertainment game variables represents a state of the entertainment game and includes at least one entertainment game variable;
- request the wager outcome in response to the player's actions during play of the entertainment game using the at least one processor configured as the game world engine;
- determine the wager outcome using the at least one processor configured as the real world engine;
- provide the wager outcome to the at least one processor configured as the game world engine from the at least one processor configured as the real world engine;
- determine a change to a set of entertainment game variables based upon the wager outcome using the at least one processor configured as the game world engine; and
- provide the change in the set of entertainment game variables from the at least one processor configured as the game world engine to the at least one processor configured as the entertainment system engine for use in executing the entertainment game.
16. The non-transitory machine readable media of claim 15 wherein the processor-executable instructions further cause the one or more processors to:

    receive player information from a player management system using the at least one processor configured as a game world engine; and

    wherein the determining of the change to the set of entertainment game variables by the at least one processor configured as the game world engine is based upon the results of wager outcome and the player information.

17. The non-transitory machine readable media of claim 16 wherein the player information includes at least one of player preferences for the entertainment game and a player skill level for the entertainment game.

18. The non-transitory machine readable media of claim 15 wherein the processor-executable instructions further cause the one or more processors to:

    provide the value for each entertainment game variable in the set of entertainment game variables during execution of the entertainment game from the at least one processor configured as the entertainment system engine to the at least one processor configured as the game world engine;

    determine to request the wager outcome based upon the provided value for each entertainment game variable in the set of entertainment game variables using the at least one processor configured as the game world engine; and

    request the wager outcome by the at least one processor configured as the game world engine from the at least one processor configured as the real world engine in response to the determination to request the wager outcome.

19. The non-transitory machine readable media of claim 15 wherein the
change in the set of entertainment game variables includes providing
additional enabling elements for the entertainment game wherein an
enabling element is an element in the entertainment game use to invoke
an action in the entertainment game.

20. The non-transitory machine readable media of claim 19 wherein the
additional enabling elements provided are based upon an enabling
element expended to trigger the request for the wager outcome.

21. The non-transitory machine readable media of claim 19 wherein the
additional enabling elements provided are a different type of enabling
element than an enabling element expended to trigger the request for the
wager outcome.
