WO 2008/090395 A1

PRODUCTION OF A LIPID ACYLTRANSFERASE FROM TRANSFORMED BACILLUS LICHENIFORMIS  
CELLS

5

10

15

## FIELD OF THE PRESENT INVENTION

The present invention relates to the production of lipid acyltransferases. In particular,  
20 methods for the production of a lipid acyltransferase by expressing a lipid  
acyltransferase in a *Bacillus* host cell, preferably a *B. licheniformis* host cell. In  
addition, the present invention relates to the use of *Bacillus* (preferably *B. licheniformis*)  
to express a lipid acyltransferase and to a *Bacillus* host cell, preferably a *B.*  
*licheniformis* host cell, comprising in its genome a gene encoding a lipid  
25 acyltransferase.

## BACKGROUND OF THE PRESENT INVENTION

Lipid acyltransferases are known to be advantageous in food applications. Lipid  
30 acyltransferases have been found to have significant acyltransferase activity in  
foodstuffs. This activity has surprising beneficial applications in methods of preparing  
foodstuffs.

For instance, WO 2004/064537 discloses a method for the *in situ* production of an  
35 emulsifier by use of a lipid acyltransferase and the advantages associated therewith.

Accordingly, there is a need for a method for the commercial production of lipid acyltransferases.

- 5 However, generally genes can be difficult to express in heterologous hosts and expression of lipid acyltransferases in host cells can be problematic.

WO 2004/064537 discloses the expression of two *Aeromonas* lipid acyltransferases in *Bacillus subtilis* and *Escherichia Coli*. However, expression in *B. subtilis* is low whilst *E. coli* is not a GRAS organism and is, therefore, unsuitable as a host for enzymes that are to be used in the food industry.

US 6,255,076 discloses a method of producing a polypeptide in a *Bacillus* host cell. However, such a method requires the use of a tandem promoter in which each promoter sequence is operably linked to a single copy of a nucleic acid sequence encoding the polypeptide sequence. Thus, there is a need in the art for an improved method for the production of lipid acyltransferases.

#### SUMMARY ASPECTS OF THE PRESENT INVENTION

20

Aspects of the present invention are presented in the claims and in the following commentary.

One aspect of the present invention relates to a method for the production of a lipid acyltransferase comprising the steps of:

- 25 (i) providing a host cell, preferably a *Bacillus* host cell wherein the *Bacillus* host cell is one other than *Bacillus subtilis*, preferably a *Bacillus licheniformis* cell;
- (ii) transforming the host cell, preferably the *Bacillus* host cell wherein the *Bacillus* host cell is one other than *Bacillus subtilis*, preferably the *Bacillus licheniformis* cell,
- 30 with a heterologous nucleotide sequence encoding a lipid acyltransferase and
- (iii) expressing the lipid acyltransferase in the cell under the control of a promoter sequence.

In another aspect, the present invention relates to a *Bacillus* host cell wherein the *Bacillus* host cell is one other than *Bacillus subtilis*, preferably a *Bacillus licheniformis* host cell, comprising a heterologous lipid acyltransferase.

- 5 In a further aspect, the present invention relates to the use of a *Bacillus* host cell wherein the *Bacillus* host cell is one other than *Bacillus subtilis*, preferably a *Bacillus licheniformis* host cell, in the production of a heterologous lipid acyltransferase.

Suitably expression in the *Bacillus* host wherein the *Bacillus* host is one other than  
10 *Bacillus subtilis*, and preferably wherein the *Bacillus* host is *B. licheniformis*, may result in increased expression when compared to expression in *B. subtilis*.

In yet another aspect, the present invention relates to an expression vector comprising a nucleotide sequence encoding a lipid acyltransferase operably linked to  
15 one or more regulatory sequence(s) such that the regulatory sequence(s) is capable of expressing the nucleotide sequence encoding a lipid acyltransferase in a suitable host or host cell, preferably in a *Bacillus* host (or cell) wherein the *Bacillus* host (or cell) is one other than *Bacillus subtilis*, preferably in *B. licheniformis* or a *B. licheniformis* cell.

20

Suitably the lipid acyltransferase may be a recombinant lipid acyltransferase.

#### DETAILED ASPECTS OF THE PRESENT INVENTION

25 According to a first aspect of the present invention there is provided a method for the production of a lipid acyltransferase comprising the steps of:

- (i) providing a host cell, preferably a *Bacillus* host cell wherein the *Bacillus* host cell is one other than *Bacillus subtilis*, preferably a *Bacillus licheniformis* cell;
- (ii) transforming the host cell, preferably a *Bacillus* host cell wherein the *Bacillus*  
30 host cell is one other than *Bacillus subtilis*, preferably a *Bacillus licheniformis* cell, with an heterologous nucleotide sequence encoding a lipid acyltransferase; and
- (iii) expressing the lipid acyltransferase in the cell under the control of a promoter sequence.

Additionally, a nucleotide sequence encoding a signal peptide may be operably linked to said heterologous nucleotide sequence encoding a lipid acyltransferase.

Suitably the method of the present invention may further comprise the additional step of  
5 isolating/recovering the lipid acyltransferase.

In another aspect, the present invention relates to a *Bacillus licheniformis* host cell comprising a heterologous lipid acyltransferase.

10 Suitably the lipid acyltransferase may be a recombinant lipid acyltransferase.

Suitably the promoter sequence used in accordance with the host cells, vectors, methods and/or uses of the present invention may be homologous to the host cell. "Homologous to the host cell" means originating within the host organism; i.e. a promoter  
15 sequence which is found naturally in the host organism. Suitably, the promoter sequence may be selected from the group consisting of a nucleotide sequence encoding: an  $\alpha$ -amylase promoter, a protease promoter, a subtilisin promoter, a glutamic acid-specific protease promoter and a levansucrase promoter. Suitably the promoter sequence may be a nucleotide sequence encoding: the LAT (e.g. the alpha-amylase  
20 promoter from *B. licheniformis*, also known as AmyL), AprL (e.g. subtilisin Carlsberg promoter), EndoGluC (e.g. the glutamic-acid specific promoter from *B. licheniformis*), AmyQ (e.g. the alpha amylase promoter from *B. amyloliquefaciens* alpha-amylase promoter) and SacB (e.g. the *B. subtilis* levansucrase promoter).

25 In one embodiment of the present invention the promoter sequence is the -35 to -10 sequence of an alpha amylase promoter, preferably the -35 to -10 sequence of a *B. licheniformis*  $\alpha$ -amylase promoter. The "-35 to -10 sequence" describes the position relative to the transcription start site. Both the "-35" and the "-10" are boxes, i.e. a number of nucleotides, each comprising 6 nucleotides and these boxes are separated by  
30 17 nucleotides. These 17 nucleotides are often referred to as a "spacer". This is illustrated in Figure 55, where the -35 and the -10 boxes are underlined. For the avoidance of doubt, where "-35 to -10 sequence" is used herein it refers to a sequence from the start of the -35 box to the end of the -10 box i.e. including both the -35 box, the 17 nucleotide long spacer and the -10 box.

In some aspects, the nucleotide sequence encoding a lipid acyltransferase for use in any one of the host cells, vectors, methods and/or uses of the present invention may comprise a GDSx motif and/ or a GANDY motif.

- 5 Preferably, the lipid acyltransferase enzyme is characterised as an enzyme which possesses acyltransferase activity and which comprises the amino acid sequence motif GDSX, wherein X is one or more of the following amino acid residues L, A, V, I, F, Y, H, Q, T, N, M or S.
- 10 Suitably, the nucleotide sequence encoding a lipid acyltransferase for use in any one of the vectors, host cells, methods and/or uses of the present invention may be obtainable, preferably obtained, from an organism from one or more of the following genera: *Aeromonas*, *Streptomyces*, *Saccharomyces*, *Lactococcus*, *Mycobacterium*, *Streptococcus*, *Lactobacillus*, *Desulfitobacterium*, *Bacillus*, *Campylobacter*,  
15 *Vibrionaceae*, *Xylella*, *Sulfolobus*, *Aspergillus*, *Schizosaccharomyces*, *Listeria*, *Neisseria*, *Mesorhizobium*, *Ralstonia*, *Xanthomonas* and *Candida*. Preferably, the lipid acyltransferase is obtainable, preferably obtained, from an organism from the genus *Aeromonas*.
- 20 In some aspects of the present invention, the nucleotide sequence encoding a lipid acyltransferase for use in any one of the vectors, host cells, methods and/or uses of the present invention encodes a lipid acyltransferase that comprises an aspartic acid residue at a position corresponding to N-80 in the amino acid sequence of the *Aeromonas hydrophila* lipid acyltransferase shown as SEQ ID No. 35.
- 25 In addition or in the alternative, the nucleotide sequence encoding a lipid acyltransferase for use in any one of the vectors, host cells, methods and/or uses of the present invention encodes a lipid acyltransferase that may comprise the amino acid sequence shown as SEQ ID No. 16, or an amino acid sequence which has 75%  
30 or more homology thereto. Suitably, the nucleotide sequence encoding a lipid acyltransferase encodes a lipid acyltransferase that may comprise the amino acid sequence shown as SEQ ID No. 16.

The term "heterologous" as used herein means a sequence derived from a separate  
35 genetic source or species. A heterologous sequence is a non-host sequence, a modified

sequence, a sequence from a different host cell strain, or a homologous sequence from a different chromosomal location of the host cell.

5 A "homologous" sequence is a sequence that is found in the same genetic source or species i.e. it is naturally occurring in the relevant species of host cell.

10 The term "recombinant lipid acyltransferase" as used herein means that the lipid acyltransferase has been produced by means of genetic recombination. For instance, the nucleotide sequence encoding the lipid acyltransferase has been inserted into a cloning vector, resulting in a *B. licheniformis* cell characterised by the presence of the heterologous lipid acyltransferase.

#### HOST CELL

15 In one embodiment of the present invention the host cell for use in the methods and/or uses of the present invention is a *Bacillus licheniformis* host cell.

20 It has been found that the use of a *Bacillus licheniformis* host cell results in increased expression of a lipid acyltransferase when compared with other organisms, such as *Bacillus subtilis*.

25 A lipid acyltransferase from *Aeromonas salmonicida* has been inserted into a number of conventional expression vectors, designed to be optimal for the expression in *Bacillus subtilis*, *Hansenula polymorpha*, *Schizosaccharomyces pombe* and *Aspergillus tubigenis*, respectively. Only very low levels were, however, detected in *Hansenula polymorpha*, *Schizosaccharomyces pombe* and *Aspergillus tubigenis*. The expression levels were below 1 µg/ml, and it was not possible to select cells which yielded enough protein to initiate a commercial production (results not shown). In contrast, *Bacillus licheniformis* was able to produce protein levels, which are attractive for an economically  
30 feasible production.

35 In particular, it has been found that expression in *B. licheniformis* is approximately 100-times greater than expression in *B. subtilis* under the control of aprE promoter or is approximately 100-times greater than expression in *S. lividans* under the control of an A4 promoter and fused to cellulose (results not shown herein).

In another embodiment the host cell may be any *Bacillus* cell other than *B.subtilis*. Preferably, said *Bacillus* host cell being from one of the following species: *Bacillus licheniformis*; *B. alkalophilus*; *B. amyloliquefaciens*; *B. circulans*; *B. clausii*; *B.*  
5 *coagulans*; *B. firmus*; *B. lautus*; *B. lentus*; *B. megaterium*; *B. pumilus* or *B. stearothermophilus*.

The term "host cell" - in relation to the present invention includes any cell that comprises either a nucleotide sequence encoding a lipid acyltransferase as defined  
10 herein or an expression vector as described above and which is used in the recombinant production of a lipid acyltransferase having the specific properties as defined herein.

Thus, a further embodiment of the present invention provides a host cell comprising  
15 (for example transformed or transfected with) a nucleotide sequence of the present invention or a nucleotide sequence that expresses a polypeptide having the specific properties as defined herein.

Suitably, in some embodiments, the host cell may be a protease deficient or protease  
20 minus strain and/or an  $\alpha$ -amylase deficient or  $\alpha$ -amylase minus strain.

#### REGULATORY SEQUENCES

In some applications, a lipid acyltransferase sequence for use in any one of the host  
25 cells, vectors, methods and/or uses of the present invention may be operably linked to a regulatory sequence which is capable of providing for the expression of the nucleotide sequence, such as by the chosen host cell (such as a *B. licheniformis* cell).

By way of example, the present invention covers a vector comprising the nucleotide  
30 sequence of the present invention operably linked to such a regulatory sequence, i.e. the vector is an expression vector.

The term "operably linked" refers to a juxtaposition wherein the components described are in a relationship permitting them to function in their intended manner. A  
35 regulatory sequence "operably linked" to a coding sequence is ligated in such a way

that expression of the coding sequence is achieved under conditions compatible with the control sequences.

5 The term "regulatory sequences" includes promoters and enhancers and other expression regulation signals.

The term "promoter" is used in the normal sense of the art, e.g. an RNA polymerase binding site.

10 Enhanced expression of the nucleotide sequence encoding the enzyme having the specific properties as defined herein may also be achieved by the selection of regulatory regions, e.g. promoter, secretion leader and terminator regions that are not regulatory regions for the nucleotide sequence encoding the enzyme in nature.

15 Suitably, the nucleotide sequence of the present invention may be operably linked to at least a promoter.

Suitably, the nucleotide sequence encoding a lipid acyltransferase may be operably linked to at a nucleotide sequence encoding a terminator sequence. Examples of  
20 suitable terminator sequences for use in any one of the vectors, host cells, methods and/or uses of the present invention include: an  $\alpha$ -amylase terminator sequence (for instance, CGGGACTTACCGAAAGAAACCATCAATGATGGTTTCTTTTTTGTTCATAAA – SEQ ID No. 64), an alkaline protease terminator sequence (for instance, CAAGACTAAAGACCGTTCGCCCGTTTTTGCAATAAGCGGGCGAATCTTACATAAAA  
25 ATA – SEQ ID No. 65), a glutamic-acid specific terminator sequence (for instance, ACGGCCGTTAGATGTGACAGCCCGTTCCAAAAGGAAGCGGGCTGTCTTCGTGTAT TATTGT – SEQ ID No. 66), a levanase terminator sequence (for instance, TCTTTTAAAGGAAAGGCTGGAATGCCCGGCATTCCAGCCACATGATCATCGTTT –  
30 GCTGACAAATAAAAAGAAGCAGGTATGGAGGAACCTGCTTCTTTTTACTATTATTG). Suitably, the nucleotide sequence encoding a lipid acyltransferase may be operably linked to an  $\alpha$ -amylase terminator, such as a *B. licheniformis*  $\alpha$ -amylase terminator.

## PROMOTER

The promoter sequence to be used in accordance with the present invention may be heterologous or homologous to the sequence encoding a lipid acyltransferase.

5

The promoter sequence may be any promoter sequence capable of directing expression of a lipid acyltransferase in the host cell of choice.

Suitably, the promoter sequence may be homologous to a *Bacillus* species, for example *B. licheniformis*. Preferably, the promoter sequence is homologous to the host cell of choice.

Suitable promoter sequences for use in the present invention include: the promoter of the *Bacillus licheniformis* alpha-amylase gene, the promoter of the *Bacillus licheniformis* subtilisin gene, the promoter of the *Bacillus subtilis* subtilisin gene, the promoter of the *Bacillus licheniformis* alkaline protease gene (subtilisin Carlsberg gene), the promoter of the *B. licheniformis* glutamic-acid specific protease gene, the promoter of *B. amyloliquefaciens* alpha-amylase gene; the promoter of *B. subtilis* levansucrase and a "consensus" promoter having the sequence TTGACA for the "-35" region and TATAAT for the "-10" region (i.e. the -35 to -10 promoter) of the alpha-amylase gene.

Other examples of promoters suitable for directing the transcription of a nucleic acid sequence in the methods of the present invention include: the promoter of the *Bacillus lentus* alkaline protease gene (aprH), ; the promoter of the *Bacillus subtilis* alpha-amylase gene (amyE); the promoter of the *Bacillus stearothermophilus* maltogenic amylase gene (amyM); the promoter of the *Bacillus licheniformis* penicillinase gene (penP); the promoters of the *Bacillus subtilis* xylA and xylB genes; and/or the promoter of the *Bacillus thuringiensis* subsp. *tenebrionis* CryIIIA gene.

30

In a preferred embodiment, the promoter sequence is an  $\alpha$ -amylase promoter (such as a *Bacillus licheniformis*  $\alpha$ -amylase promoter). Preferably, the promoter sequence comprises the -35 to -10 sequence of the *B. licheniformis*  $\alpha$ -amylase promoter – see Figures 53 and 55.

## SIGNAL PEPTIDE

The lipid acyltransferase produced by a host cell by expression of the nucleotide sequence encoding the lipid acyltransferase may be secreted or may be contained  
5 intracellularly depending on the sequence and/or the vector used.

A signal sequence may be used to direct secretion of the coding sequences through a particular cell membrane. The signal sequences may be natural or foreign to the lipid acyltransferase coding sequence. For instance, the signal peptide coding sequence  
10 may be obtained from an amylase or protease gene from a *Bacillus* species, preferably from *Bacillus licheniformis*.

Suitable signal peptide coding sequences may be obtained from one or more of the following genes: maltogenic  $\alpha$ -amylase gene, subtilisin gene, beta-lactamase gene,  
15 neutral protease gene, prsA gene, and/or acyltransferase gene.

Preferably, the signal peptide is a signal peptide of *B. licheniformis*  $\alpha$ -amylase, *Aeromonas* acyltransferase (for instance, mkkwfvcllgialtvqa - SEQ ID No. 21), *B. subtilis* subtilisin (for instance, mrskklwisllfaltliftmafsnmsaqa - SEQ ID No. 22) or *B. licheniformis* subtilisin (for instance, mmrkksfwfgmltafmlvftmefdsdsasa - SEQ ID No.  
20 23). Suitably, the signal peptide may be the signal peptide of *B. licheniformis*  $\alpha$ -amylase.

However, any signal peptide coding sequence capable of directing the expressed lipid  
25 acyltransferase into the secretory pathway of a *Bacillus host* cell (preferably a *B. licheniformis* host cell) of choice may be used.

In some embodiments of the present invention, a nucleotide sequence encoding a signal peptide may be operably linked to a nucleotide sequence encoding a lipid  
30 acyltransferase of choice.

The lipid acyltransferase of choice may be expressed in a host cell as defined herein as a fusion protein.

## EXPRESSION VECTOR

The term "expression vector" means a construct capable of *in vivo* or *in vitro* expression.

5

Preferably, the expression vector is incorporated in the genome of the organism, such as a *B. licheniformis* host. The term "incorporated" preferably covers stable incorporation into the genome.

10 The nucleotide sequence encoding a lipid acyltransferase as defined herein may be present in a vector, in which the nucleotide sequence is operably linked to regulatory sequences such that the regulatory sequences are capable of providing the expression of the nucleotide sequence by a suitable host organism (such as *B. licheniformis*), i.e. the vector is an expression vector.

15

The vectors of the present invention may be transformed into a suitable host cell as described above to provide for expression of a polypeptide having lipid acyltransferase activity as defined herein.

20 The choice of vector, e.g. plasmid, cosmid, virus or phage vector, genomic insert, will often depend on the host cell into which it is to be introduced. The present invention may cover other forms of expression vectors which serve equivalent functions and which are, or become, known in the art.

25 Once transformed into the host cell of choice, the vector may replicate and function independently of the host cell's genome, or may integrate into the genome itself.

The vectors may contain one or more selectable marker genes – such as a gene which confers antibiotic resistance e.g. ampicillin, kanamycin, chloramphenicol or  
30 tetracyclin resistance. Alternatively, the selection may be accomplished by co-transformation (as described in WO91/17243).

Vectors may be used *in vitro*, for example for the production of RNA or used to transfect or transform a host cell.

Thus, in a further embodiment, the invention provides a method of making nucleotide sequences of the present invention or nucleotide sequences encoding polypeptides having the specific properties as defined herein for use in any one of the vectors, host cells, other methods and/or uses of the present invention, by introducing a nucleotide sequence into a replicable vector, introducing the vector into a compatible host cell, and growing the host cell under conditions which bring about replication of the vector.

10 The vector may further comprise a nucleotide sequence enabling the vector to replicate in the host cell in question. Examples of such sequences are the origins of replication of plasmids pUC19, pACYC177, pUB110, pE194, pAMB1 and pIJ702.

#### LIPID ACYL TRANSFERASE

15 The nucleotide sequence encoding a lipid acyl transferase for use in any one of the methods, vectors and/or uses of the present invention may encode a natural lipid acyl transferase or a variant lipid acyl transferase.

For instance, the nucleotide sequence encoding a lipid acyl transferase for use in the present invention may be one as described in WO2004/064537, WO2004/064987, WO2005/066347, or WO2006/008508.

The term "lipid acyl transferase" as used herein preferably means an enzyme that has acyltransferase activity (generally classified as E.C. 2.3.1.x, for example 2.3.1.43), whereby the enzyme is capable of transferring an acyl group from a lipid to one or more acceptor substrates, such as one or more of the following: a sterol; a stanol; a carbohydrate; a protein; a protein subunit; a sugar alcohol, such as ascorbic acid and/or glycerol – preferably glycerol and/or a sterol, such as cholesterol.

30 Preferably, the nucleotide sequence encoding a lipid acyl transferase for use in any one of the vectors, host cells, methods and/or uses of the present invention encodes a lipid acyltransferase that is capable of transferring an acyl group from a

phospholipid (as defined herein) to a sugar alcohol, such as ascorbic acid and/or glycerol, most preferably glycerol.

For some aspects the "acyl acceptor" according to the present invention may be any compound comprising a hydroxy group (-OH), such as for example, polyvalent  
5 alcohols, including glycerol; sterols; stanols; carbohydrates; hydroxy acids including fruit acids, citric acid, tartaric acid, lactic acid and ascorbic acid; proteins or a sub-unit thereof, such as amino acids, protein hydrolysates and peptides (partly hydrolysed  
10 "acyl acceptor" according to the present invention is not water. Preferably, the "acyl acceptor" according to the present invention is a sugar alcohol, such as a polyol, most preferably glycerol. For the purpose of this invention ascorbic acid is also considered a sugar-alcohol.

15 The acyl acceptor is preferably not a monoglyceride.

The acyl acceptor is preferably not a diglyceride

In one aspect, the nucleotide sequence encoding a lipid acyltransferase for use in any  
20 one of the host cells, vectors, methods and/or uses of the present invention encodes a lipid acyltransferase that may, as well as being able to transfer an acyl group from a lipid to glycerol, additionally be able to transfer the acyl group from a lipid to one or more of the following: a carbohydrate, a protein, a protein subunit, sterol and/or a stanol, preferably it is capable of transferring to both a sugar alcohol, such as ascorbic  
25 acid and/or glycerol, most preferably a sterol such as cholesterol, and/or plant sterol/stanols.

Preferably, the lipid substrate upon which the lipid acyl acts is one or more of the following lipids: a phospholipid, such as a lecithin, e.g. phosphatidylcholine.

30

This lipid substrate may be referred to herein as the "lipid acyl donor". The term lecithin as used herein encompasses phosphatidylcholine, phosphatidylethanolamine, phosphatidylinositol, phosphatidylserine and phosphatidylglycerol.

For some aspects, preferably the nucleotide sequence encoding a lipid acyl transferase for use in any one of the host cells, vectors, methods and/or uses of the present invention encodes a lipid acyltransferase that is incapable, or substantially incapable, of acting on a triglyceride and/or a 1-monoglyceride and/or 2-monoglyceride.

For some aspects, preferably the nucleotide sequence encoding a lipid acyl transferase for use in any one of the host cells, vectors, methods and/or uses of the present invention encodes a lipid acyltransferase that does not exhibit triacylglycerol lipase activity (E.C. 3.1.1.3) or does not exhibit significant triacylglycerol lipase activity (E.C. 3.1.1.3).

The ability to hydrolyse triglyceride (E.C. 3.1.1.3 activity) may be determined by lipase activity is determined according to Food Chemical Codex (3rd Ed., 1981, pp 492-493) modified to sunflower oil and pH 5.5 instead of olive oil and pH 6.5. The lipase activity is measured as LUS (lipase units sunflower) where 1 LUS is defined as the quantity of enzyme which can release 1 [μ]mol of fatty acids per minute from sunflower oil under the above assay conditions. Alternatively the LUT assay as defined in WO9845453 may be used.

The nucleotide sequence encoding a lipid acyl transferase for use in any one of the host cells, vectors, methods and/or uses of the present invention may encode a lipid acyltransferase that which is substantially incapable of acting on a triglyceride may have a LUS/mg of less than 1000, for example less than 500, such as less than 300, preferably less than 200, more preferably less than 100, more preferably less than 50, more preferably less than 20, more preferably less than 10, such as less than 5, less than 2, more preferably less than 1 LUS/mg. Alternatively LUT/mg activity is less than 500, such as less than 300, preferably less than 200, more preferably less than 100, more preferably less than 50, more preferably less than 20, more preferably less than 10, such as less than 5, less than 2, more preferably less than 1 LUT/mg.

The nucleotide sequence encoding a lipid acyl transferase for use in any one of the host cells, vectors, methods and/or uses of the present invention may encode a lipid acyltransferase that which is substantially incapable of acting on a monoglyceride may be determined by using mono-oleate (M7765 1-Oleoyl-*rac*-glycerol 99%) in place

of the sunflower oil in the LUS assay. 1 MGHU is defined as the quantity of enzyme which can release 1 [mu]mol of fatty acids per minute from monoglyceride under the assay conditions.

- 5 The nucleotide sequence encoding a lipid acyl transferase for use in any one of the host cells, vectors, methods and/or uses of the present invention encodes a lipid acyltransferase that which is substantially incapable of acting on a triglyceride may have a MGHU/mg of less than 5000, for example less than 1000, for example less than 500, such as less than 300, preferably less than 200, more preferably less than 100, more preferably less than 50, more preferably less than 20, more preferably less than 10, such as less than 5, less than 2, more preferably less than 1 MGHU/mg.

- 15 Suitably, the nucleotide sequence encoding a lipid acyltransferase for use in any one of the host cells, vectors, methods and/or uses of the present invention encodes a lipid acyltransferase that may exhibit one or more of the following phospholipase activities: phospholipase A2 activity (E.C. 3.1.1.4) and/or phospholipase A1 activity (E.C. 3.1.1.32). The lipid acyl transferase may also have phospholipase B activity (E.C 3.1.1.5).

- 20 Suitably, for some aspects the lipid acyltransferase may be capable of transferring an acyl group from a phospholipid to a sugar alcohol, preferably glycerol and/or ascorbic acid.

- 25 For some aspects, preferably the nucleotide sequence encoding a lipid acyltransferase for use any one of the host cells, vectors, methods and/or uses of the present invention encodes a lipid acyltransferase that is capable of transferring an acyl group from a phospholipid to a sterol and/or a stanol to form at least a sterol ester and/or a stanol ester.

- 30 The lipid acyltransferase may be capable of transferring an acyl group from a lipid to a polyol such as glycerol, and/or a sterol such as cholesterol or plant sterol/stanols. Thus, in one embodiment the "acyl acceptor" according to the present invention may be glycerol and/or cholesterol or plant sterol/stanols.

Preferably, the lipid acyltransferase enzyme may be characterised using the following criteria:

5 the enzyme possesses acyl transferase activity which may be defined as ester transfer activity whereby the acyl part of an original ester bond of a lipid acyl donor is transferred to an acyl acceptor, preferably glycerol or cholesterol, to form a new ester; and

10 the enzyme comprises the amino acid sequence motif GDSX, wherein X is one or more of the following amino acid residues L, A, V, I, F, Y, H, Q, T, N, M or S.

Preferably, X of the GDSX motif is L or Y. More preferably, X of the GDSX motif is L. Thus, preferably the enzyme according to the present invention comprises the amino acid sequence motif GDSL.

15 The GDSX motif is comprised of four conserved amino acids. Preferably, the serine within the motif is a catalytic serine of the lipid acyl transferase enzyme. Suitably, the serine of the GDSX motif may be in a position corresponding to Ser-16 in *Aeromonas hydrophila* lipid acyltransferase enzyme taught in Brumlik & Buckley (Journal of Bacteriology Apr. 1996, Vol. 178, No. 7, p 2060-2064).

20 To determine if a protein has the GDSX motif according to the present invention, the sequence is preferably compared with the hidden markov model profiles (HMM profiles) of the pfam database in accordance with the procedures taught in WO2004/064537 or WO2004/064987, incorporated herein by reference.

25 Preferably the lipid acyl transferase enzyme can be aligned using the Pfam00657 consensus sequence (for a full explanation see WO2004/064537 or WO2004/064987).

30 Preferably, a positive match with the hidden markov model profile (HMM profile) of the pfam00657 domain family indicates the presence of the GDSL or GDSX domain according to the present invention.

35 Preferably when aligned with the Pfam00657 consensus sequence the lipid acyltransferase for use in the methods or uses of the invention may have at least

one, preferably more than one, preferably more than two, of the following, a GDSx block, a GANDY block, a HPT block. Suitably, the lipid acyltransferase may have a GDSx block and a GANDY block. Alternatively, the enzyme may have a GDSx block and a HPT block. Preferably the enzyme comprises at least a GDSx block. See  
5 WO2004/064537 or WO2004/064987 for further details.

Preferably, residues of the GANDY motif are selected from GANDY, GGND A, GGNDL, most preferably GANDY.

10 Preferably, when aligned with the Pfam00657 consensus sequence the enzyme for use in the methods or uses of the invention have at least one, preferably more than one, preferably more than two, preferably more than three, preferably more than four, preferably more than five, preferably more than six, preferably more than seven, preferably more than eight, preferably more than nine, preferably more than ten,  
15 preferably more than eleven, preferably more than twelve, preferably more than thirteen, preferably more than fourteen, of the following amino acid residues when compared to the reference *A. hydrophilia* polypeptide sequence, namely SEQ ID No. 1: 28hid, 29hid, 30hid, 31hid, 32gly, 33Asp, 34Ser, 35hid, 130hid, 131Gly, 132Hid, 133Asn, 134Asp, 135hid, 309His.

20

The pfam00657 GDSX domain is a unique identifier which distinguishes proteins possessing this domain from other enzymes.

The pfam00657 consensus sequence is presented in Figure 3 as SEQ ID No. 2. This  
25 is derived from the identification of the pfam family 00657, database version 6, which may also be referred to as pfam00657.6 herein.

30

The consensus sequence may be updated by using further releases of the pfam database (for example see WO2004/064537 or WO2004/064987).

In one embodiment, the nucleotide sequence encoding a lipid acyl transferase enzyme for use in any one of the host cells, vectors, methods and/or uses of the present invention encodes a lipid acyltransferase that may be characterised using the following criteria:

- 5
- (i) the enzyme possesses acyl transferase activity which may be defined as ester transfer activity whereby the acyl part of an original ester bond of a lipid acyl donor is transferred to acyl acceptor, preferably glycerol or cholesterol, to form a new ester, preferably monoglyceride or cholesterol ester respectfully;
- (ii) the enzyme comprises the amino acid sequence motif GDSX, wherein X is one or more of the following amino acid residues L, A, V, I, F, Y, H, Q, T, N, M or S.;
- 10 (iii) the enzyme comprises His-309 or comprises a histidine residue at a position corresponding to His-309 in the *Aeromonas hydrophila* lipid acyltransferase enzyme shown in Figures 2 and 4 (SEQ ID No. 1 or SEQ ID No. 3).

Preferably, the amino acid residue of the GDSX motif is L.

15

In SEQ ID No. 3 or SEQ ID No. 1 the first 18 amino acid residues form a signal sequence. His-309 of the full length sequence, that is the protein including the signal sequence, equates to His-291 of the mature part of the protein, i.e. the sequence without the signal sequence.

20

In one embodiment, the nucleotide sequence encoding a lipid acyl transferase enzyme for use any one of the host cells, vectors, methods and uses of the present invention encodes a lipid acyltransferase that comprises the following catalytic triad: Ser-34, Asp-306 and His-309 or comprises a serine residue, an aspartic acid residue and a histidine residue, respectively, at positions corresponding to Ser-34, Asp-306 and His-309 in the *Aeromonas hydrophila* lipid acyl transferase enzyme shown in Figure 4 (SEQ ID No. 3) or Figure 2 (SEQ ID No. 1). As stated above, in the sequence shown in SEQ ID No. 3 or SEQ ID No. 1 the first 18 amino acid residues form a signal sequence. Ser-34, Asp-306 and His-309 of the full length sequence, that is the protein including the signal sequence, equate to Ser-16, Asp-288 and His-291 of the mature part of the protein, i.e. the sequence without the signal sequence. In the pfam00657 consensus sequence, as given in Figure 3 (SEQ ID No. 2) the active site residues correspond to Ser-7, Asp-345 and His-348.

25

30

In one embodiment, the nucleotide sequence encoding a lipid acyl transferase enzyme for use any one of the host cells, vectors, methods and uses of the present invention encodes a lipid acyltransferase that may be characterised using the following criteria:

- 5           the enzyme possesses acyl transferase activity which may be defined as ester transfer activity whereby the acyl part of an original ester bond of a first lipid acyl donor is transferred to an acyl acceptor to form a new ester; and
- 10           the enzyme comprises at least Gly-32, Asp-33, Ser-34, Asp-134 and His-309 or comprises glycine, aspartic acid, serine, aspartic acid and histidine residues at positions corresponding to Gly-32, Asp-33, Ser-34, Asp-306 and His-309, respectively, in the *Aeromonas hydrophila* lipid acyltransferase enzyme shown in SEQ ID No. 3 or SEQ ID No. 1.
- 15   Suitably, the nucleotide sequence encoding a lipid acyltransferase enzyme for use in any one of the host cells, vectors, methods and uses of the present invention may be one of the following nucleotide sequences:
- (a) the nucleotide sequence shown as SEQ ID No. 36 (see Figure 29);
- (b) the nucleotide sequence shown as SEQ ID No. 38 (see Figure 31);
- 20   (c) the nucleotide sequence shown as SEQ ID No. 39 (see Figure 32);
- (d) the nucleotide sequence shown as SEQ ID No. 42 (see Figure 35);
- (e) the nucleotide sequence shown as SEQ ID No. 44 (see Figure 37);
- (f) the nucleotide sequence shown as SEQ ID No. 46 (see Figure 39);
- (g) the nucleotide sequence shown as SEQ ID No. 48 (see Figure 41);
- 25   (h) the nucleotide sequence shown as SEQ ID No. 49 (see Figure 57);
- (i) the nucleotide sequence shown as SEQ ID No. 50 (see Figure 58 );
- (j) the nucleotide sequence shown as SEQ ID No. 51 (see Figure 59);
- (k) the nucleotide sequence shown as SEQ ID No. 52 (see Figure 60 );
- (l) the nucleotide sequence shown as SEQ ID No. 53 (see Figure 61);
- 30   (m) the nucleotide sequence shown as SEQ ID No. 54 (see Figure 62);
- (n) the nucleotide sequence shown as SEQ ID No. 55 (see Figure 63);
- (o) the nucleotide sequence shown as SEQ ID No. 56 (see Figure 64);
- (p) the nucleotide sequence shown as SEQ ID No. 57 (see Figure 65);
- (q) the nucleotide sequence shown as SEQ ID No. 58 (see Figure 66);
- 35   (r) the nucleotide sequence shown as SEQ ID No. 59 (see Figure 67);

(s) the nucleotide sequence shown as SEQ ID No. 60 (see Figure 68);

(t) the nucleotide sequence shown as SEQ ID No. 61 (see Figure 69);

(u) the nucleotide sequence shown as SEQ ID No. 62 (see Figure 70);

(v) the nucleotide sequence shown as SEQ ID No. 63 (see Figure 71);

5 (w) or

a nucleotide sequence which has 70% or more, preferably 75% or more, identity with any one of the sequences shown as SEQ ID No. 36, SEQ ID No. 38, SEQ ID No. 39, SEQ ID No. 42, SEQ ID No. 44, SEQ ID No. 46, SEQ ID No. 48, SEQ ID No. 49, SEQ ID No. 50, SEQ ID No. 51, SEQ ID No. 52, SEQ ID No. 53, SEQ ID No. 54, SEQ ID No. 55, SEQ ID No. 56, SEQ ID No. 57, SEQ ID No. 58, SEQ ID No. 59, SEQ ID No. 60, SEQ ID No. 61, SEQ ID No. 62 or SEQ ID No. 63.

Suitably the nucleotide sequence may have 80% or more, preferably 85% or more, more preferably 90% or more and even more preferably 95% or more identity with any one of the sequences shown as SEQ ID No. 36, SEQ ID No. 38, SEQ ID No. 39, SEQ ID No. 42, SEQ ID No. 44, SEQ ID No. 46, SEQ ID No. 48, SEQ ID No. 49, SEQ ID No. 50, SEQ ID No. 51, SEQ ID No. 52, SEQ ID No. 53, SEQ ID No. 54, SEQ ID No. 55, SEQ ID No. 56, SEQ ID No. 57, SEQ ID No. 58, SEQ ID No. 59, SEQ ID No. 60, SEQ ID No. 61, SEQ ID No. 62 or SEQ ID No. 63.

20

In one embodiment, the nucleotide sequence encoding a lipid acyltransferase enzyme for use any one of the host cells, vectors, methods and uses of the present invention is a nucleotide sequence which has 70% or more, preferably 75% or more, identity with any one of the sequences shown as: SEQ ID No. 49, SEQ ID No. 50, SEQ ID No. 51, SEQ ID No. 62, and SEQ ID No. 63. Suitably the nucleotide sequence may have 80% or more, preferably 85% or more, more preferably 90% or more and even more preferably 95% or more identity with any one of the sequences shown as: SEQ ID No. 49, SEQ ID No. 50, SEQ ID No. 51, SEQ ID No. 62, and SEQ ID No. 63.

30 In one embodiment, the nucleotide sequence encoding a lipid acyltransferase enzyme for use in any one of the host cells, vectors, methods and uses of the present invention is a nucleotide sequence which has 70% or more, 75% or more, 80% or more, preferably 85% or more, more preferably 90% or more and even more preferably 95% or more identity the sequence shown as SEQ ID No. 49.

35

Suitably, the nucleotide sequence encoding a lipid acyl transferase enzyme for use any one of the host cells, vectors, methods and uses of the present invention may encode a lipid acyltransferase that comprises one or more of the following amino acid sequences:

- 5 (i) the amino acid sequence shown as SEQ ID No. 3  
(ii) the amino acid sequence shown as SEQ ID No. 4  
(iii) the amino acid sequence shown as SEQ ID No. 5  
(iv) the amino acid sequence shown as SEQ ID No. 6  
(v) the amino acid sequence shown as SEQ ID No. 7  
10 (vi) the amino acid sequence shown as SEQ ID No. 8  
(vii) the amino acid sequence shown as SEQ ID No. 9  
(viii) the amino acid sequence shown as SEQ ID No. 10  
(ix) the amino acid sequence shown as SEQ ID No. 11  
(x) the amino acid sequence shown as SEQ ID No. 12  
15 (xi) the amino acid sequence shown as SEQ ID No. 13  
(xii) the amino acid sequence shown as SEQ ID No. 14  
(xiii) the amino acid sequence shown as SEQ ID No. 1  
(xiv) the amino acid sequence shown as SEQ ID No. 15 or  
an amino acid sequence which has 75%, 80%, 85%, 90%, 95%, 98% or more identity  
20 with any one of the sequences shown as SEQ ID No. 1, SEQ ID No. 3, SEQ ID No. 4,  
SEQ ID No. 5, SEQ ID No. 6, SEQ ID No. 7, SEQ ID No. 8, SEQ ID No. 9, SEQ ID  
No. 10, SEQ ID No. 11, SEQ ID No. 12, SEQ ID No. 13, SEQ ID No. 14, or SEQ ID  
No. 15.
- 25 Suitably, nucleotide sequence encoding a lipid acyl transferase enzyme for use any  
one of the host cells, vectors, methods and uses of the present invention may encode  
a lipid acyltransferase that comprises either the amino acid sequence shown as SEQ  
ID No. 3 or as SEQ ID No. 4 or SEQ ID No. 1 or SEQ ID No. 15 or comprises an  
amino acid sequence which has 75% or more, preferably 80% or more, preferably  
30 85% or more, preferably 90% or more, preferably 95% or more, identity with the  
amino acid sequence shown as SEQ ID No. 3 or the amino acid sequence shown as  
SEQ ID No. 4 or the amino acid sequence shown as SEQ ID No. 1 or the amino acid  
sequence shown as SEQ ID No. 15.

Suitably the nucleotide sequence encoding a lipid acyl transferase enzyme for use any one of the host cells, vectors, methods and uses of the present invention may encode a lipid acyltransferase that comprises an amino acid sequence which has 80% or more, preferably 85% or more, more preferably 90% or more and even more preferably 95% or more identity with any one of the sequences shown as SEQ ID No. 3, SEQ ID No. 4, SEQ ID No. 5, SEQ ID No. 6, SEQ ID No. 7, SEQ ID No. 8, SEQ ID No. 9, SEQ ID No. 10, SEQ ID No. 11, SEQ ID No. 12, SEQ ID No. 13, SEQ ID No. 14, SEQ ID No. 1, or SEQ ID No. 15.

10 Suitably, the nucleotide sequence encoding a lipid acyl transferase enzyme for use any one of the host cells, vectors, methods and uses of the present invention may encode a lipid acyltransferase that comprises one or more of the following amino acid sequences:

(a) an amino acid sequence shown as amino acid residues 1-100 of SEQ ID No. 3 or  
15 SEQ ID No. 1;

(b) an amino acid sequence shown as amino acids residues 101-200 of SEQ ID No. 3 or SEQ ID No. 1;

(c) an amino acid sequence shown as amino acid residues 201-300 of SEQ ID No. 3 or SEQ ID No. 1; or

20 (d) an amino acid sequence which has 75% or more, preferably 85% or more, more preferably 90% or more, even more preferably 95% or more identity to any one of the amino acid sequences defined in (a)-(c) above.

Suitably, lipid acyl transferase enzyme for use in methods and uses of the present  
25 invention may comprise one or more of the following amino acid sequences:

(a) an amino acid sequence shown as amino acid residues 28-39 of SEQ ID No. 3 or  
SEQ ID No. 1;

(b) an amino acid sequence shown as amino acids residues 77-88 of SEQ ID No. 3 or SEQ ID No. 1;

30 (c) an amino acid sequence shown as amino acid residues 126-136 of SEQ ID No. 3 or SEQ ID No. 1;

(d) an amino acid sequence shown as amino acid residues 163-175 of SEQ ID No. 3 or SEQ ID No. 1;

35 (e) an amino acid sequence shown as amino acid residues 304-311 of SEQ ID No. 3 or SEQ ID No. 1; or

(f) an amino acid sequence which has 75% or more, preferably 85% or more, more preferably 90% or more, even more preferably 95% or more identity to any one of the amino acid sequences defined in (a)-(e) above.

5 In one aspect, nucleotide sequence encoding a lipid acyl transferase enzyme for use any one of the host cells, vectors, methods and uses of the present invention encodes a lipid acyltransferase that may be the lipid acyl transferase from *Candida parapsilosis* as taught in EP 1 275 711. Thus in one aspect the lipid acyl transferase for use in the method and uses of the present invention may be a lipid acyl transferase  
10 comprising one of the amino acid sequences taught in SEQ ID No. 17 or SEQ ID No. 18.

Much by preference, the nucleotide sequence encoding a lipid acyl transferase enzyme for use in any one of the host cells, vectors, methods and uses of the present  
15 invention encodes a lipid acyltransferase that may be a lipid acyl transferase (lipid acyltransferase) comprising the amino acid sequence shown as SEQ ID No. 16, or an amino acid sequence which has 75% or more, preferably 85% or more, more preferably 90% or more, even more preferably 95% or more, even more preferably 98% or more, or even more preferably 99% or more identity to SEQ ID No. 16. This  
20 enzyme could be considered a variant enzyme.

In one aspect, the nucleotide sequence encoding a lipid acyltransferase enzyme for use any one of the host cells, vectors, methods and uses of the present invention encodes a lipid acyltransferase that may be a lecithin:cholesterol acyltransferase  
25 (LCAT) or variant thereof (for example a variant made by molecular evolution)

Suitable LCATs are known in the art and may be obtainable from one or more of the following organisms for example: mammals, rat, mice, chickens, *Drosophila melanogaster*, plants, including *Arabidopsis* and *Oryza sativa*, nematodes, fungi and  
30 yeast.

In one embodiment the nucleotide sequence encoding a lipid acyltransferase enzyme for use any one of the host cells, vectors, methods and uses of the present invention encodes a lipid acyltransferase that may be the lipid acyltransferase obtainable,  
35 preferably obtained, from the E. coli strains TOP 10 harbouring pPet12aAhydro and

pPet12aASalmo deposited by Danisco A/S of Langebrogade 1, DK-1001 Copenhagen K, Denmark under the Budapest Treaty on the International Recognition of the Deposit of Microorganisms for the purposes of Patent Procedure at the National Collection of Industrial, Marine and Food Bacteria (NCIMB) 23 St. Machar Street, Aberdeen Scotland, GB on 22 December 2003 under accession numbers NCIMB 41204 and NCIMB 41205, respectively.

A nucleotide sequence encoding a lipid acyltransferase enzyme for use any one of the host cells, vectors, methods and uses of the present invention may encode a phospholipid glycerol acyl transferase. Phospholipid glycerol acyl transferases include those isolated from *Aeromonas spp.*, preferably *Aeromonas hydrophila* or *A. salmonicida*, most preferable *A. salmonicida* or variants thereof. Most preferred lipid acyl transferases for use in the present invention are encoded by SEQ ID No.s 1, 3, 4, 15 and 16. It will be recognised by the skilled person that it is preferable that the signal peptides of the acyl transferase has been cleaved during expression of the transferase. The signal peptide of SEQ ID 1, 3, 4, 15 and 16 are amino acids 1-18. Therefore the most preferred regions are amino acids 19-335 for SEQ ID No. 1 and SEQ ID No. 3 (*A. hydrophilia*) and amino acids 19-336 for SEQ ID No. 4, SEQ ID No. 15 and SEQ ID No. 16. (*A. salmonicida*). When used to determine the homology of identity of the amino acid sequences, it is preferred that the alignments as herein described use the mature sequence.

Therefore the most preferred regions for determining homology (identity) are amino acids 19-335 for SEQ ID No. 1 and 3 (*A. hydrophilia*) and amino acids 19-336 for SEQ ID No.s 4, 15 and 16. (*A. salmonicida*). SEQ ID 34 and 35 are mature protein sequences of a lipid acyl transferase from *A. hydrophilia* and *A. salmonicida* respectively.

A nucleotide sequence encoding a lipid acyltransferase enzyme for use any one of the host cells, vectors, methods and uses of the present invention encodes a lipid acyltransferase that may also be isolated from *Thermobifida*, preferably *T. fusca*, most preferably that encoded by SEQ ID No. 28.

A nucleotide sequence encoding a lipid acyltransferase enzyme for use any one of the host cells, vectors, methods and uses of the present invention encodes a lipid

acyltransferase that may also be isolated from *Streptomyces*, preferable *S. avermitis*, most preferably that encoded by SEQ ID No. 32. Other possible enzymes for use in the present invention from *Streptomyces* include those encoded by SEQ ID No.s 5, 6, 9, 10, 11, 12, 13, 14, 31, and 33.

5

An enzyme for use in the invention may also be isolated from *Corynebacterium*, preferably *C. efficiens*, most preferably that encoded by SEQ ID No. 29.

Suitably, the nucleotide sequence encoding a lipid acyltransferase enzyme for use any one of the host cells, vectors, methods and uses of the present invention may encode a lipid acyltransferase that comprises any one of the amino acid sequences shown as SEQ ID No.s 37, 38, 40, 41, 43, 45, or 47 or an amino acid sequence which has at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97% or 98% identity therewith, or encoded by any one of the nucleotide sequences shown as SEQ ID No.s 36, 39, 42, 44, 46, or 48 or a nucleotide sequence which has at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97% or 98% identity therewith.

In one embodiment, the nucleic sequence encoding a lipid acyltransferase enzyme for use any one of the host cells, vectors, methods and uses of the present invention is selected from the group consisting of:

- a) a nucleic acid comprising a nucleotide sequence shown in SEQ ID No. 36;
- b) a nucleic acid which is related to the nucleotide sequence of SEQ ID No. 36 by the degeneration of the genetic code; and
- c) a nucleic acid comprising a nucleotide sequence which has at least 70% identity with the nucleotide sequence shown in SEQ ID No. 36.

In one embodiment, a nucleotide sequence encoding a lipid acyltransferase enzyme for use any one of the host cells, vectors, methods and uses of the present invention encodes a lipid acyltransferase that comprises an amino acid sequence as shown in SEQ ID No. 37 or an amino acid sequence which has at least 60% identity thereto.

In a further embodiment the nucleotide sequence encoding a lipid acyltransferase enzyme for use any one of the host cells, vectors, methods and uses of the present invention may encode a lipid acyltransferase comprising any one of the amino acid sequences shown as SEQ ID No. 37, 38, 40, 41, 43, 45 or 47 or an amino acid

sequence which has at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97% or 98% identity therewith, or encoded by any one of the nucleotide sequences shown as SEQ ID No. 39, 42, 44, 46 or 48 or a nucleotide sequence which has at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97% or 98% identity therewith.

5

In a further embodiment the nucleotide sequence encoding a lipid acyltransferase enzyme for use any one of the host cells, vectors, methods and uses of the present invention may encode a lipid acyltransferase comprising any one of amino sequences shown as SEQ ID No. 38, 40, 41, 45 or 47 or an amino acid sequence which has at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97% or 98% identity therewith for the uses described herein.

In a further embodiment the nucleotide sequence encoding a lipid acyltransferase for use in any one of the host cells, vectors, methods and uses of the present invention may encode a lipid acyltransferase comprising any one of amino sequences shown as SEQ ID No. 38, 40, or 47 or an amino acid sequence which has at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97% or 98% identity therewith for the uses described herein.

More preferably in one embodiment the nucleotide sequence encoding a lipid acyltransferase for use in any one of the host cells, vectors, methods and uses of the present invention may encode a lipid acyltransferase comprising the amino acid sequence shown as SEQ ID No. 47 or an amino acid sequence which has at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97% or 98% identity therewith.

25

In another embodiment the nucleotide sequence encoding a lipid acyltransferase for use in any one of the host cells, vectors, methods and uses of the present invention may encode a lipid acyltransferase comprising the amino acid sequence shown as SEQ ID No. 43 or 44 or an amino acid sequence which has at least 80%, 85%, 90%, 95%, 96%, 97% or 98% identity therewith.

30

In another embodiment the nucleotide sequence encoding a lipid acyltransferase for use in any one of the host cells, vectors, methods and uses of the present invention may encode a lipid acyltransferase comprising the amino acid sequence shown as

SEQ ID No. 41 or an amino acid sequence which has at least 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97% or 98% identity therewith.

In one embodiment the nucleotide sequence encoding a lipid acyltransferase for use  
5 in any one of the host cells, vectors, methods and uses of the present invention is selected from the group consisting of:

- a) a nucleic acid comprising a nucleotide sequence shown in SEQ ID No. 36;
- b) a nucleic acid which is related to the nucleotide sequence of SEQ ID No. 36 by the degeneration of the genetic code; and
- 10 c) a nucleic acid comprising a nucleotide sequence which has at least 70% identity with the nucleotide sequence shown in SEQ ID No. 36.

In one embodiment the lipid acyltransferase according to the present invention may be a lipid acyltransferase obtainable, preferably obtained, from the *Streptomyces*  
15 strains L130 or L131 deposited by Danisco A/S of Langebrogade 1, DK-1001 Copenhagen K, Denmark under the Budapest Treaty on the International Recognition of the Deposit of Microorganisms for the purposes of Patent Procedure at the National Collection of Industrial, Marine and Food Bacteria (NCIMB) 23 St. Machar Street, Aberdeen Scotland, GB on 25 June 2004 under accession numbers NCIMB 41226  
20 and NCIMB 41227, respectively.

Suitable nucleotide sequences encoding a lipid acyltransferase for use in any one of the host cells, vectors, methods and uses of the present invention may encode a polynucleotide encoding a lipid acyltransferase (SEQ ID No. 16); or may encode an  
25 amino acid sequence of a lipid acyltransferase (SEQ ID No. 17).

A suitable nucleotide sequence encoding a lipid acyltransferase for use in any one of the host cells, vectors, methods and uses of the present invention may encode an amino acid sequence which may be identified by alignment to the L131 (SEQ ID No.  
30 37) sequence using Align X, the Clustal W pairwise alignment algorithm of VectorNTI using default settings.

An alignment of the L131 and homologues from *S. avermitilis* and *T. fusca* illustrates that the conservation of the GDSx motif (GDSY in L131 and *S. avermitilis* and *T.*  
35 *fusca*), the GANDY box, which is either GGND A or GGNDL, and the HPT block

(considered to be the conserved catalytic histidine). These three conserved blocks are highlighted in Figure 42.

When aligned to either the pfam Pfam00657 consensus sequence (as described in  
5 WO04/064987) and/ or the L131 sequence herein disclosed (SEQ ID No 37) it is possible to identify three conserved regions, the GDSx block, the GANDY block and the HTP block (see WO04/064987 for further details).

When aligned to either the pfam Pfam00657 consensus sequence (as described in  
10 WO04/064987) and/ or the L131 sequence herein disclosed (SEQ ID No 37)

i) The nucleotide sequence encoding a lipid acyltransferase for use in any one of the host cells, vectors, methods and uses of the present invention may encode a lipid acyltransferase that, has a GDSx motif, more preferably a GDSx motif selected from GDSL or GDSY motif.

15 and/or

ii) The nucleotide sequence encoding a lipid acyltransferase for use in any one of the host cells, vectors, methods and uses of the present invention may encode a lipid acyltransferase that, has a GANDY block, more preferably a GANDY block comprising amino GGNDx, more preferably  
20 GGNDA or GGNDL.

and/or

iii) The nucleotide sequence encoding a lipid acyltransferase for use in any one of the host cells, vectors, methods and uses of the present invention encodes a lipid acyltransferase that has preferably an HTP block.

25 and preferably

iv) nucleotide sequence encoding a lipid acyltransferase for use in any one of the host cells, vectors, methods and uses of the present invention may encode a lipid acyltransferase that has preferably a GDSx or GDSY motif, and a GANDY block comprising amino GGNDx, preferably GGNDA or  
30 GGNDL, and a HTP block (conserved histidine).

### Variant lipid acyl transferase

In a preferred embodiment the nucleotide sequence encoding a lipid acyltransferase for use in any one of the host cells, vectors, methods and uses of the present invention may encode a lipid acyltransferase that is a variant lipid acyl transferase.

Variants which have an increased activity on phospholipids, such as increased hydrolytic activity and/ or increased transferase activity, preferably increased transferase activity on phospholipids may be used.

Preferably the variant lipid acyltransferase is prepared by one or more amino acid modifications of the lipid acyl transferases as defined hereinabove.

Suitably, when the nucleotide sequence encoding a lipid acyltransferase for use in any one of the host cells, vectors, methods and uses of the present invention may encode a lipid acyltransferase that may be a variant lipid acyltransferase, in which case the enzyme may be characterised in that the enzyme comprises the amino acid sequence motif GDSX, wherein X is one or more of the following amino acid residues L, A, V, I, F, Y, H, Q, T, N, M or S, and wherein the variant enzyme comprises one or more amino acid modifications compared with a parent sequence at any one or more of the amino acid residues defined in set 2 or set 4 or set 6 or set 7 (as defined WO2005/066347 and hereinbelow).

For instance the variant lipid acyltransferase may be characterised in that the enzyme comprises the amino acid sequence motif GDSX, wherein X is one or more of the following amino acid residues L, A, V, I, F, Y, H, Q, T, N, M or S, and wherein the variant enzyme comprises one or more amino acid modifications compared with a parent sequence at any one or more of the amino acid residues detailed in set 2 or set 4 or set 6 or set 7 (as defined in WO2005/066347 and hereinbelow) identified by said parent sequence being structurally aligned with the structural model of P10480 defined herein, which is preferably obtained by structural alignment of P10480 crystal structure coordinates with 1IVN.PDB and/or 1DEO.PDB as defined WO2005/066347 and hereinbelow.

In a further embodiment a nucleotide sequence encoding a lipid acyltransferase for use in any one of the host cells, vectors, methods and uses of the present invention may encode a variant lipid acyltransferase that may be characterised in that the enzyme comprises the amino acid sequence motif GDSX, wherein X is one or more of the following amino acid residues L, A, V, I, F, Y, H, Q, T, N, M or S, and wherein the variant enzyme comprises one or more amino acid modifications compared with a parent sequence at any one or more of the amino acid residues taught in set 2 identified when said parent sequence is aligned to the pfam consensus sequence (SEQ ID No. 2 –Figure 3) and modified according to a structural model of P10480 to ensure best fit overlap as defined WO2005/066347 and hereinbelow.

Suitably the nucleotide sequence encoding a lipid acyltransferase for use in any one of the host cells, vectors, methods and uses of the present invention may encode a variant lipid acyltransferase enzyme that may comprise an amino acid sequence, which amino acid sequence is shown as SEQ ID No. 34, SEQ ID No. 3, SEQ ID No. 4, SEQ ID No. 5, SEQ ID No. 6, SEQ ID No. 7, SEQ ID No. 8, SEQ ID No. 19, SEQ ID No. 10, SEQ ID No. 11, SEQ ID No. 12, SEQ ID No. 13, SEQ ID No. 14, SEQ ID No. 1, SEQ ID No. 15, SEQ ID No. 25, SEQ ID No. 26, SEQ ID No. 27, SEQ ID No. 28, SEQ ID No. 29, SEQ ID No. 30, , SEQ ID No. 32, or SEQ ID No. 33 except for one or more amino acid modifications at any one or more of the amino acid residues defined in set 2 or set 4 or set 6 or set 7 (as defined WO2005/066347 and hereinbelow) identified by sequence alignment with SEQ ID No. 34.

Alternatively the nucleotide sequence encoding a lipid acyltransferase may encode a variant lipid acyltransferase enzyme comprising an amino acid sequence, which amino acid sequence is shown as SEQ ID No. 34, SEQ ID No. 3, SEQ ID No. 4, SEQ ID No. 5, SEQ ID No. 6, SEQ ID No. 7, SEQ ID No. 8, SEQ ID No. 19, SEQ ID No. 10, SEQ ID No. 11, SEQ ID No. 12, SEQ ID No. 13, SEQ ID No. 14, SEQ ID No. 1, SEQ ID No. 15, SEQ ID No. 25, SEQ ID No. 26, SEQ ID No. 27, SEQ ID No. 28, SEQ ID No. 29, SEQ ID No. 30, , SEQ ID No. 32, or SEQ ID No. 33 except for one or more amino acid modifications at any one or more of the amino acid residues defined in set 2 or set 4 or set 6 or set 7 as defined WO2005/066347 and hereinbelow, identified by said parent sequence being structurally aligned with the structural model of P10480 defined herein, which is preferably obtained by structural alignment of P10480 crystal

structure coordinates with 1IVN.PDB and/or 1DEO.PDB as taught within WO2005/066347 and hereinbelow.

Alternatively, the nucleotide sequence encoding a lipid acyltransferase may encode a  
 5 variant lipid acyltransferase enzyme comprising an amino acid sequence, which amino acid sequence is shown as SEQ ID No. 34, SEQ ID No. 3, SEQ ID No. 4, SEQ ID No. 5, SEQ ID No. 6, SEQ ID No. 7, SEQ ID No. 8, SEQ ID No. 19, SEQ ID No. 10, SEQ ID No. 11, SEQ ID No. 12, SEQ ID No. 13, SEQ ID No. 14, SEQ ID No. 1, SEQ ID No. 15, SEQ ID No. 25, SEQ ID No. 26, SEQ ID No. 27, SEQ ID No. 28, SEQ  
 10 ID No. 29, SEQ ID No. 30, , SEQ ID No. 32, or SEQ ID No. 33 except for one or more amino acid modifications at any one or more of the amino acid residues taught in set 2 identified when said parent sequence is aligned to the pfam consensus sequence (SEQ ID No. 2) and modified according to a structural model of P10480 to ensure best fit overlap as taught within WO2005/066347 and hereinbelow.

15

Preferably, the parent enzyme is an enzyme which comprises, or is homologous to, the amino acid sequence shown as SEQ ID No. 34 and/or SEQ ID No. 15 and/or SEQ ID No. 35.

20 Preferably, the nucleotide sequence encoding a lipid acyltransferase may encode a variant enzyme which comprises an amino acid sequence, which amino acid sequence is shown as SEQ ID No. 34 or SEQ ID No. 35 except for one or more amino acid modifications at any one or more of the amino acid residues defined in set 2 or set 4 or set 6 or set 7 as defined in WO2005/066347 and hereinbelow.

25

#### DEFINITION OF SETS

Amino acid set 1:

30 Amino acid set 1 (note that these are amino acids in 1IVN – Figure 53 and Figure 54)  
Gly8, Asp9, Ser10, Leu11, Ser12, Tyr15, Gly44, Asp45, Thr46, Glu69, Leu70, Gly71, Gly72, Asn73, Asp74, Gly75, Leu76, Gln106, Ile107, Arg108, Leu109, Pro110, Tyr113, Phe121, Phe139, Phe140, Met141, Tyr145, Met151, Asp154, His157, Gly155, Ile156, Pro158

35

The highly conserved motifs, such as GDSx and catalytic residues, were deselected from set 1 (residues underlined). For the avoidance of doubt, set 1 defines the amino acid residues within 10Å of the central carbon atom of a glycerol in the active site of the 1IVN model.

5

Amino acid set 2:

Amino acid set 2 (note that the numbering of the amino acids refers to the amino acids in the P10480 mature sequence)

10 Leu17, Lys22, Met23, Gly40, Asn80, Pro81, Lys82, Asn87, Asn88, Trp111, Val112, Ala114, Tyr117, Leu118, Pro156, Gly159, Gln160, Asn161, Pro162, Ser163, Ala164, Arg165, Ser166, Gln167, Lys168, Val169, Val170, Glu171, Ala172, Tyr179, His180, Asn181, Met209, Leu210, Arg211, Asn215, Lys284, Met285, Gln289 and Val290.

15 Table of selected residues in Set 1 compared with Set 2:

IVN model			P10480 Mature sequence Residue Number
IVN	A.hyd homologue		
	PFAM	Structure	
Gly8	Gly32		
Asp9	Asp33		
Ser10	Ser34		
Leu11	Leu35		Leu17
Ser12	Ser36		Ser18
			Lys22
			Met23
Tyr15	Gly58		Gly40
Gly44	Asn98		Asn80
Asp45	Pro99		Pro81
Thr46	Lys100		Lys82
			Asn87
			Asn88
Glu69	Trp129		Trp111
Leu70	Val130		Val112

Gly71	Gly131		
Gly72	Ala132		Ala114
Asn73	Asn133		
Asp74	Asp134		
Gly75	Tyr135		Tyr117
Leu76	Leu136		Leu118
Gln106		Pro174	Pro156
Ile107		Gly177	Gly159
Arg108		Gln178	Gln160
Leu109		Asn179	Asn161
Pro110		180 to 190	Pro162
Tyr113			Ser163
			Ala164
			Arg165
			Ser166
			Gln167
			Lys168
			Val169
			Val170
			Glu171
			Ala172
Phe121	His198	Tyr197	Tyr179
		His198	His180
		Asn199	Asn181
Phe139	Met227		Met209
Phe140	Leu228		Leu210
Met141	Arg229		Arg211
Tyr145	Asn233		Asn215
			Lys284
Met151	Met303		Met285

Ile156	Val308		Val290
His157	His309		

Pro158	Pro310		
--------	--------	--	--

Amino acid set 3:

- 5 Amino acid set 3 is identical to set 2 but refers to the *Aeromonas salmonicida* (SEQ ID No. 4) coding sequence, i.e. the amino acid residue numbers are 18 higher in set 3 as this reflects the difference between the amino acid numbering in the mature protein (SEQ ID No. 34) compared with the protein including a signal sequence (SEQ ID No. 25).
- 10 The mature proteins of *Aeromonas salmonicida* GDSX (SEQ ID No. 4) and *Aeromonas hydrophila* GDSX (SEQ ID No. 34) differ in five amino acids. These are Thr3Ser, Gln182Lys, Glu309Ala, Ser310Asn, and Gly318-, where the *salmonicida* residue is listed first and the *hydrophila* residue is listed last. The *hydrophila* protein is only 317 amino acids long and lacks a residue in position 318. The *Aeromonas*
- 15 *salmonicida* GDSX has considerably high activity on polar lipids such as galactolipid substrates than the *Aeromonas hydrophila* protein. Site scanning was performed on all five amino acid positions.

Amino acid set 4:

Amino acid set 4 is S3, Q182, E309, S310, and -318.

5 Amino acid set 5:

F13S, D15N, S18G, S18V, Y30F, D116N, D116E, D157 N, Y226F, D228N Y230F.

Amino acid set 6:

10

Amino acid set 6 is Ser3, Leu17, Lys22, Met23, Gly40, Asn80, Pro81, Lys82, Asn 87, Asn88, Trp111, Val112, Ala114, Tyr117, Leu118, Pro156, Gly159, Gln160, Asn161, Pro162, Ser163, Ala164, Arg165, Ser166, Gln167, Lys168, Val169, Val170, Glu171, Ala172, Tyr179, His180, Asn181, Gln182, Met209, Leu210, Arg211, Asn215, Lys284, Met285, Gln289, Val290, Glu309, Ser310, -318.

15

The numbering of the amino acids in set 6 refers to the amino acids residues in P10480 (SEQ ID No. 25) – corresponding amino acids in other sequence backbones can be determined by homology alignment and/or structural alignment to P10480 and/or 1IVN.

20

Amino acid set 7:

Amino acid set 7 is Ser3, Leu17, Lys22, Met23, Gly40, Asn80, Pro81, Lys82, Asn 87, Asn88, Trp111, Val112, Ala114, Tyr117, Leu118, Pro156, Gly159, Gln160, Asn161, Pro162, Ser163, Ala164, Arg165, Ser166, Gln167, Lys168, Val169, Val170, Glu171, Ala172, Tyr179, His180, Asn181, Gln182, Met209, Leu210, Arg211, Asn215, Lys284, Met285, Gln289, Val290, Glu309, Ser310, -318, Y30X (where X is selected from A, C, D, E, G, H, I, K, L, M, N, P, Q, R, S, T, V, or W), Y226X (where X is selected from A, C, D, E, G, H, I, K, L, M, N, P, Q, R, S, T, V, or W), Y230X (where X is selected from A, C, D, E, G, H, I, K, L, M, N, P, Q, R, S, T, V, or W), S18X (where X is selected from A, C, D, E, F, H, I, K, L, M, N, P, Q, R, T, W or Y), D157X (where X is selected from A, C, E, F, G, H, I, K, L, M, P, Q, R, S, T, V, W or Y).

30

The numbering of the amino acids in set 7 refers to the amino acids residues in P10480 (SEQ ID No. 25) – corresponding amino acids in other sequence backbones can be determined by homology alignment and/or structural alignment to P10480 and/or 1IVN).

5

Suitably, the variant enzyme comprises one or more of the following amino acid modifications compared with the parent enzyme:

S3E, A, G, K, M, Y, R, P, N, T or G

E309Q, R or A, preferably Q or R

10 -318Y, H, S or Y, preferably Y.

Preferably, X of the GDSX motif is L. Thus, preferably the parent enzyme comprises the amino acid motif GDSL.

15  
20  
Suitably, said first parent lipid acyltransferase may comprise any one of the following amino acid sequences: SEQ ID No. 34, SEQ ID No. 3, SEQ ID No. 4, SEQ ID No. 5, SEQ ID No. 6, SEQ ID No. 7, SEQ ID No. 8, SEQ ID No. 19, SEQ ID No. 10, SEQ ID No. 11, SEQ ID No. 12, SEQ ID No. 13, SEQ ID No. 14, SEQ ID No. 1, SEQ ID No. 15, SEQ ID No. 25, SEQ ID No. 26, SEQ ID No. 27, SEQ ID No. 28, SEQ ID No. 29, SEQ ID No. 30, , SEQ ID No. 32 or SEQ ID No. 33.25  
Suitably, said second related lipid acyltransferase may comprise any one of the following amino acid sequences: SEQ ID No. 3, SEQ ID No. 34, SEQ ID No. 4, SEQ ID No. 5, SEQ ID No. 6, SEQ ID No. 7, SEQ ID No. 8, SEQ ID No. 19, SEQ ID No. 10, SEQ ID No. 11, SEQ ID No. 12, SEQ ID No. 13, SEQ ID No. 14, SEQ ID No. 1, SEQ ID No. 15, SEQ ID No. 25, SEQ ID No. 26, SEQ ID No. 27, SEQ ID No. 28, SEQ ID No. 29, SEQ ID No. 30, , SEQ ID No. 32 or SEQ ID No. 33.30  
The variant enzyme must comprise at least one amino acid modification compared with the parent enzyme. In some embodiments, the variant enzyme may comprise at least 2, preferably at least 3, preferably at least 4, preferably at least 5, preferably at least 6, preferably at least 7, preferably at least 8, preferably at least 9, preferably at least 10 amino acid modifications compared with the parent enzyme.

When referring to specific amino acid residues herein the numbering is that obtained from alignment of the variant sequence with the reference sequence shown as SEQ ID No. 34 or SEQ ID No. 35.

- 5 In one aspect preferably the variant enzyme comprises one or more of the following amino acid substitutions:
- S3A, C, D, E, F, G, H, I, K, L, M, N, P, Q, R, T, V, W, or Y; and/or  
 L17A, C, D, E, F, G, H, I, K, M, N, P, Q, R, S, T, V, W, or Y; and/or  
 10 S18A, C, D, E, F, H, I, K, L, M, N, P, Q, R, T, W, or Y; and/or  
 K22A, C, D, E, F, G, H, I, L, M, N, P, Q, R, S, T, V, W, or Y; and/or  
 M23A, C, D, E, F, G, H, I, K, L, N, P, Q, R, S, T, V, W, or Y; and/or  
 Y30A, C, D, E, G, H, I, K, L, M, N, P, Q, R, S, T, V, or W; and/or  
 G40A, C, D, E, F, H, I, K, L, M, N, P, Q, R, S, T, V, W, or Y; and/or  
 15 N80A, C, D, E, F, G, H, I, K, L, M, P, Q, R, S, T, V, W, or Y; and/or  
 P81A, C, D, E, F, G, H, I, K, L, M, N, Q, R, S, T, V, W, or Y; and/or  
 K82A, C, D, E, F, G, H, I, L, M, N, P, Q, R, S, T, V, W, or Y; and/or  
 N87A, C, D, E, F, G, H, I, K, L, M, P, Q, R, S, T, V, W, or Y; and/or  
 N88A, C, D, E, F, G, H, I, K, L, M, P, Q, R, S, T, V, W, or Y; and/or  
 20 W111A, C, D, E, F, G, H, I, K, L, M, N, P, Q, R, S, T, V, W or Y; and/or  
 V112A, C, D, E, F, G, H, I, K, L, M, N, P, Q, R, S, T, W, or Y; and/or  
 A114C, D, E, F, G, H, I, K, L, M, N, P, Q, R, S, T, V, W, or Y; and/or  
 Y117A, C, D, E, F, G, H, I, K, L, M, N, P, Q, R, S, T, V, or W; and/or  
 L118A, C, D, E, F, G, H, I, K, M, N, P, Q, R, S, T, V, W, or Y; and/or  
 25 P156A, C, D, E, F, G, H, I, K, L, M, N, Q, R, S, T, V, W, or Y; and/or  
 D157A, C, E, F, G, H, I, K, L, M, P, Q, R, S, T, V, W, or Y; and/or  
 G159A, C, D, E, F, H, I, K, L, M, N, P, Q, R, S, T, V, W, or Y; and/or  
 Q160A, C, D, E, F, G, H, I, K, L, M, N, P, R, S, T, V, W, or Y; and/or  
 N161A, C, D, E, F, G, H, I, K, L, M, P, Q, R, S, T, V, W, or Y; and/or  
 30 P162A, C, D, E, F, G, H, I, K, L, M, N, Q, R, S, T, V, W, or Y; and/or  
 S163A, C, D, E, F, G, H, I, K, L, M, N, P, Q, R, T, V, W, or Y; and/or  
 A164C, D, E, F, G, H, I, K, L, M, N, P, Q, R, S, T, V, W, or Y; and/or  
 R165A, C, D, E, F, G, H, I, K, L, M, N, P, Q, S, T, V, W, or Y; and/or  
 S166A, C, D, E, F, G, H, I, K, L, M, N, P, Q, R, T, V, W, or Y; and/or  
 35 Q167A, C, D, E, F, G, H, I, K, L, M, N, P, R, S, T, V, W, or Y; and/or

K168A, C, D, E, F, G, H, I, L, M, N, P, Q, R, S, T, V, W, or Y; and/or  
 V169A, C, D, E, F, G, H, I, K, L, M, N, P, Q, R, S, T, W, or Y; and/or  
 V170A, C, D, E, F, G, H, I, K, L, M, N, P, Q, R, S, T, W, or Y; and/or  
 E171A, C, D, F, G, H, I, K, L, M, N, P, Q, R, S, T, V, W, or Y; and/or  
 5 A172C, D, E, F, G, H, I, K, L, M, N, P, Q, R, S, T, V, W, or Y; and/or  
 Y179A, C, D, E, F, G, H, I, K, L, M, N, P, Q, R, S, T, V, or W; and/or  
 H180A, C, D, E, F, G, I, K, L, M, P, Q, R, S, T, V, W, or Y; and/or  
 N181A, C, D, E, F, G, H, I, K, L, M, P, Q, R, S, T, V, W, or Y; and/or  
 Q182A, C, D, E, F, G, H, I, K, L, M, N, P, R, S, T, V, W, or Y, preferably K; and/or  
 10 M209A, C, D, E, F, G, H, I, K, L, N, P, Q, R, S, T, V, W, or Y; and/or  
 L210 A, C, D, E, F, G, H, I, K, M, N, P, Q, R, S, T, V, W, or Y; and/or  
 R211 A, C, D, E, F, G, H, I, K, L, M, N, P, Q, R, S, T, V, W, or Y; and/or  
 N215 A, C, D, E, F, G, H, I, K, L, M, N, P, Q, R, S, T, V, W, or Y; and/or  
 Y226A, C, D, E, G, H, I, K, L, M, N, P, Q, R, S, T, V, or W; and/or  
 15 Y230A, C, D, E, G, H, I, K, L, M, N, P, Q, R, S, T, V or W; and/or  
 K284A, C, D, E, F, G, H, I, L, M, N, P, Q, R, S, T, V, W, or Y; and/or  
 M285A, C, D, E, F, G, H, I, K, L, N, P, Q, R, S, T, V, W, or Y; and/or  
 Q289A, C, D, E, F, G, H, I, K, L, M, N, P, R, S, T, V, W, or Y; and/or  
 V290A, C, D, E, F, G, H, I, K, L, M, N, P, Q, R, S, T, W, or Y; and/or  
 20 E309A, C, D, F, G, H, I, K, L, M, N, P, Q, R, S, T, V, W, or Y; and/or  
 S310A, C, D, E, F, G, H, I, K, L, M, N, P, Q, R, T, V, W, or Y.

In addition or alternatively thereto there may be one or more C-terminal extensions.  
 Preferably the additional C-terminal extension is comprised of one or more aliphatic  
 25 amino acids, preferably a non-polar amino acid, more preferably of I, L, V or G. Thus,  
 the present invention further provides for a variant enzyme comprising one or more of  
 the following C-terminal extensions: 318I, 318L, 318V, 318G.

Preferred variant enzymes may have a decreased hydrolytic activity against a  
 30 phospholipid, such as phosphatidylcholine (PC), may also have an increased  
 transferase activity from a phospholipid.

Preferred variant enzymes may have an increased transferase activity from a  
 phospholipid, such as phosphatidylcholine (PC), these may also have an increased  
 35 hydrolytic activity against a phospholipid.

Modification of one or more of the following residues may result in a variant enzyme having an increased absolute transferase activity against phospholipid:

5 S3, D157, S310, E309, Y179, N215, K22, Q289, M23, H180, M209, L210, R211, P81, V112, N80, L82, N88; N87

Specific preferred modifications which may provide a variant enzyme having an improved transferase activity from a phospholipid may be selected from one or more  
10 of the following:

S3A, C, D, E, F, G, H, I, K, L, M, N, P, Q, R, T, V, W or Y; preferably N, E, K, R, A, P or M, most preferably S3A

D157A, C, E, F, G, H, I, K, L, M, N, P, Q, R, S, T, V, W or Y; preferably D157S, R, E, N, G, T, V, Q, K or C

15 S310A, C, D, E, F, G, H, I, K, L, M, N, P, Q, R, T, V, W or Y; preferably S310T  
-318 E

E309A, C, D, E, F, G, H, I, K, L, M, N, P, Q, R, T, V, W or Y; preferably E309 R, E, L, R or A

Y179A, C, D, E, F, G, H, I, K, L, M, N, P, Q, R, S, T, V or W; preferably Y179 D, T, E,  
20 R, N, V, K, Q or S, more preferably E, R, N, V, K or Q

N215A, C, D, E, F, G, H, I, K, L, M, P, Q, R, S, T, V, W or Y; preferably N215 S, L, R or Y

K22A, C, D, E, F, G, H, I, L, M, N, P, Q, R, S, T, V, W or Y; preferably K22 E, R, C or A

25 Q289A, C, D, E, F, G, H, I, K, L, M, N, P, R, S, T, V, W or Y; preferably Q289 R, E, G, P or N

M23A, C, D, E, F, G, H, I, K, L, N, P, Q, R, S, T, V, W or Y; preferably M23 K, Q, L, G, T or S

H180A, C, D, E, F, G, I, K, L, M, P, Q, R, S, T, V, W or Y; preferably H180 Q, R or K

30 M209 A, C, D, E, F, G, H, I, K, L, N, P, Q, R, S, T, V, W or Y; preferably M209 Q, S, R, A, N, Y, E, V or L

L210A, C, D, E, F, G, H, I, K, M, N, P, Q, R, S, T, V, W or Y; preferably L210 R, A, V, S, T, I, W or M

R211A, C, D, E, F, G, H, I, K, L, M, N, P, Q, S, T, V, W or Y; preferably R211T

35 P81A, C, D, E, F, G, H, I, K, L, M, N, Q, R, S, T, V, W or Y; preferably P81G

V112A, C, D, E, F, G, H, I, K, L, M, N, P, Q, R, S, T, W or Y; preferably V112C

N80A, C, D, E, F, G, H, I, K, L, M, P, Q, R, S, T, V, W or Y; preferably N80 R, G, N, D, P, T, E, V, A or G

L82A, C, D, E, F, G, H, I, M, N, P, Q, R, S, T, V, W or Y; preferably L82N, S or E

5 N88A, C, D, E, F, G, H, I, K, L, M, P, Q, R, S, T, V, W or Y; preferably N88C

N87A, C, D, E, F, G, H, I, K, L, M, P, Q, R, S, T, V, W or Y; preferably N87M or G

Preferred modification of one or more of the following residues results in a variant enzyme having an increased absolute transferase activity against phospholipid:

10

S3 N, R, A, G

M23 K, Q, L, G, T, S

H180 R

L82 G

15 Y179 E, R, N, V, K or Q

E309 R, S, L or A

One preferred modification is N80D. This is particularly the case when using the reference sequence SEQ ID No. 35 as the backbone. Thus, the reference sequence  
 20 may be SEQ ID No. 16. This modification may be in combination with one or more further modifications. Therefore in a preferred embodiment of the present invention the nucleotide sequence encoding a lipid acyltransferase for use in any one of the host cells, vectors, methods and uses of the present invention may encode a lipid acyltransferase that comprises SEQ ID No. 35 or an amino acid sequence which has  
 25 75% or more, preferably 85% or more, more preferably 90% or more, even more preferably 95% or more, even more preferably 98% or more, or even more preferably 99% or more identity to SEQ ID No. 35.

As noted above, when referring to specific amino acid residues herein the numbering  
 30 is that obtained from alignment of the variant sequence with the reference sequence shown as SEQ ID No. 34 or SEQ ID No. 35

Much by preference, the nucleotide sequence encoding a lipid acyltransferase for use in any one of the host cells, vectors, methods and uses of the present invention may  
 35 encode a lipid comprising the amino acid sequence shown as SEQ ID No. 16, or an

amino acid sequence which has 75% or more, preferably 85% or more, more preferably 90% or more, even more preferably 95% or more, even more preferably 98% or more, or even more preferably 99% or more identity to SEQ ID No. 16. This enzyme may be considered a variant enzyme.

5

For the purposes of the present invention, the degree of identity is based on the number of sequence elements which are the same. The degree of identity in accordance with the present invention for amino acid sequences may be suitably determined by means of computer programs known in the art, such as Vector NTI 10 (Invitrogen Corp.). For pairwise alignment the score used is preferably BLOSUM62 with Gap opening penalty of 10.0 and Gap extension penalty of 0.1.

Suitably, the degree of identity with regard to an amino acid sequence is determined over at least 20 contiguous amino acids, preferably over at least 30 contiguous amino acids, preferably over at least 40 contiguous amino acids, preferably over at least 50 contiguous amino acids, preferably over at least 60 contiguous amino acids.

Suitably, the degree of identity with regard to an amino acid sequence may be determined over the whole sequence.

20

Suitably, the nucleotide sequence encoding a lipid acyltransferase/ lipid acyl transferase enzyme according to the present invention may be obtainable, preferably obtained, from organisms from one or more of the following genera: *Aeromonas*, *Streptomyces*, *Saccharomyces*, *Lactococcus*, *Mycobacterium*, *Streptococcus*, *Lactobacillus*, *Desulfitobacterium*, *Bacillus*, *Campylobacter*, *Vibrionaceae*, *Xylella*, *Sulfolobus*, *Aspergillus*, *Schizosaccharomyces*, *Listeria*, *Neisseria*, *Mesorhizobium*, *Ralstonia*, *Xanthomonas*, *Candida*, *Thermobifida* and *Corynebacterium*.

Suitably, the nucleotide sequence encoding a lipid acyltransferase / lipid acyl transferase enzyme according to the present invention may be obtainable, preferably obtained, from one or more of the following organisms: *Aeromonas hydrophila*, *Aeromonas salmonicida*, *Streptomyces coelicolor*, *Streptomyces rimosus*, *Mycobacterium*, *Streptococcus pyogenes*, *Lactococcus lactis*, *Streptococcus pyogenes*, *Streptococcus thermophilus*, *Streptomyces thermosacchari*, *Streptomyces avermitilis* *Lactobacillus helveticus*, *Desulfitobacterium dehalogenans*, *Bacillus sp*,

35

*Campylobacter jejuni*, *Vibrionaceae*, *Xylella fastidiosa*, *Sulfolobus solfataricus*,  
*Saccharomyces cerevisiae*, *Aspergillus terreus*, *Schizosaccharomyces pombe*,  
*Listeria innocua*, *Listeria monocytogenes*, *Neisseria meningitidis*, *Mesorhizobium loti*,  
*Ralstonia solanacearum*, *Xanthomonas campestris*, *Xanthomonas axonopodis* ,  
5 *Candida parapsilosis* *Thermobifida fusca* and *Corynebacterium efficiens*.

In one aspect, preferably the nucleotide sequence encoding a nucleotide sequence  
encoding a lipid acyltransferase for use in any one of the host cells, vectors, methods  
and uses of the present invention encodes a lipid acyl transferase enzyme according  
10 to the present invention is obtainable, preferably obtained or derived, from one or  
more of *Aeromonas spp.*, *Aeromonas hydrophila* or *Aeromonas salmonicida*.

Enzymes which function as lipid acyltransferases in accordance with the present  
invention can be routinely identified using the assay taught in Example 12 of  
15 WO2004/064537. Using this assay, in which there is a very high water content –  
approximately 95%, lipid acyltransferases/lipid acyl transferase in accordance with the  
present invention are those which have at least 2% acyltransferase activity (relative  
transferase activity), preferably at least 5% relative transferase activity, preferably at  
least 10% relative transferase activity, preferably at least 15%, 20%, 25% 26%, 28%,  
20 30%, 40% 50%, 60% or 75% relative transferase activity.

Phospholipases may act as acyl-transferase enzymes in low water environments.  
Therefore it is considered that in place of or in addition to the phospholipid  
acyltransferase enzyme a phospholipase enzyme may be used when process for the  
25 modification of the edible oil of fat takes place in a low water environment.

The term “high water” as used herein means any substrate or foodstuff with more than  
3% water content, preferably more than 4%, more than 5%, more than 6%, more than  
7%, more than 8%, more than 9%, more than 10%, more than 20%, more than 30%,  
30 more than 40%, more than 50%, more than 60%, more than 70%, more than 80% or  
more than 90%.

The term “low water” as used herein means any substrate or foodstuff with less than  
3% water content, preferably less than 2%, less than 1% or less than 0.5%, less than  
35 0.3%, less than 0.2, less than 0.1, less than 0.05, or less than 0.01%

For avoidance of doubt milk is a high water environment where as butterfat is a low water environment.

5 Suitable phospholipases for use in the invention include phospholipase A1, phospholipase A2, or phospholipase B. Phospholipase A1, phospholipase A2, or phospholipase B may also be used in co-ordination with the lipid acyl transferase activity. Phospholipase C and /or D may also be used in co-ordination with the lipid acyl transferase activity/phospholipase A1, A2 and/or B activity in analogy with  
10 WO2005/089562. Preferred phospholipases may include phospholipase A2, such as Lecitase<sup>TM</sup> or the *Fusarium venenatum* and *Tuber albidum* phospholipase disclosed in WO2004/97012 (Novozymes/Chr. Hansen). A *Fusarium venenatum* phospholipase is sold by Novozymes as MAX YIELD<sup>TM</sup>.

#### 15 ISOLATED

In one aspect, the method of the present invention comprises the additional step of recovering/isolating the lipid acyltransferase. Thus, the lipid acyltransferase produced may be in an isolated form.

20

In another aspect, the nucleotide sequence encoding a lipid acyltransferase for use in the present invention may be in an isolated form.

The term "isolated" means that the sequence or protein is at least substantially free  
25 from at least one other component with which the sequence or protein is naturally associated in nature and as found in nature.

#### PURIFIED

30 In one aspect, the method of the present invention comprises the additional step of purifying the lipid acyltransferase.

In another aspect, the nucleotide sequence encoding a lipid acyltransferase for use in the present invention may be in a purified form.

35

The term "purified" means that the sequence is in a relatively pure state – e.g. at least about 51% pure, or at least about 75%, or at least about 80%, or at least about 90% pure, or at least about 95% pure or at least about 98% pure.

## 5 CLONING A NUCLEOTIDE SEQUENCE ENCODING A POLYPEPTIDE ACCORDING TO THE PRESENT INVENTION

10 A nucleotide sequence encoding either a polypeptide which has the specific properties as defined herein or a polypeptide which is suitable for modification may be isolated from any cell or organism producing said polypeptide. Various methods are well known within the art for the isolation of nucleotide sequences.

For example, a genomic DNA and/or cDNA library may be constructed using chromosomal DNA or messenger RNA from the organism producing the polypeptide.  
15 If the amino acid sequence of the polypeptide is known, labeled oligonucleotide probes may be synthesised and used to identify polypeptide-encoding clones from the genomic library prepared from the organism. Alternatively, a labelled oligonucleotide probe containing sequences homologous to another known polypeptide gene could be used to identify polypeptide-encoding clones. In the latter case, hybridisation and  
20 washing conditions of lower stringency are used.

Alternatively, polypeptide-encoding clones could be identified by inserting fragments of genomic DNA into an expression vector, such as a plasmid, transforming enzyme-negative bacteria with the resulting genomic DNA library, and then plating the  
25 transformed bacteria onto agar containing an enzyme inhibited by the polypeptide, thereby allowing clones expressing the polypeptide to be identified.

In a yet further alternative, the nucleotide sequence encoding the polypeptide may be prepared synthetically by established standard methods, e.g. the phosphoramidite  
30 method described by Beaucage S.L. *et al* (1981) Tetrahedron Letters 22, p 1859-1869, or the method described by Matthes *et al* (1984) EMBO J. 3, p 801-805. In the phosphoramidite method, oligonucleotides are synthesised, e.g. in an automatic DNA synthesiser, purified, annealed, ligated and cloned in appropriate vectors.

The nucleotide sequence may be of mixed genomic and synthetic origin, mixed synthetic and cDNA origin, or mixed genomic and cDNA origin, prepared by ligating fragments of synthetic, genomic or cDNA origin (as appropriate) in accordance with standard techniques. Each ligated fragment corresponds to various parts of the entire nucleotide sequence. The DNA sequence may also be prepared by polymerase chain reaction (PCR) using specific primers, for instance as described in US 4,683,202 or in Saiki R K *et al* (Science (1988) 239, pp 487-491).

#### NUCLEOTIDE SEQUENCES

10

The present invention also encompasses nucleotide sequences encoding polypeptides having the specific properties as defined herein. The term "nucleotide sequence" as used herein refers to an oligonucleotide sequence or polynucleotide sequence, and variant, homologues, fragments and derivatives thereof (such as portions thereof). The nucleotide sequence may be of genomic or synthetic or recombinant origin, which may be double-stranded or single-stranded whether representing the sense or antisense strand.

15

The term "nucleotide sequence" in relation to the present invention includes genomic DNA, cDNA, synthetic DNA, and RNA. Preferably it means DNA, more preferably cDNA for the coding sequence.

20

In a preferred embodiment, the nucleotide sequence *per se* encoding a polypeptide having the specific properties as defined herein does not cover the native nucleotide sequence in its natural environment when it is linked to its naturally associated sequence(s) that is/are also in its/their natural environment. For ease of reference, we shall call this preferred embodiment the "non-native nucleotide sequence". In this regard, the term "native nucleotide sequence" means an entire nucleotide sequence that is in its native environment and when operatively linked to an entire promoter with which it is naturally associated, which promoter is also in its native environment. Thus, the polypeptide of the present invention can be expressed by a nucleotide sequence in its native organism but wherein the nucleotide sequence is not under the control of the promoter with which it is naturally associated within that organism.

25  
30

Preferably the polypeptide is not a native polypeptide. In this regard, the term "native polypeptide" means an entire polypeptide that is in its native environment and when it has been expressed by its native nucleotide sequence.

- 5 Typically, the nucleotide sequence encoding polypeptides having the specific properties as defined herein is prepared using recombinant DNA techniques (i.e. recombinant DNA). However, in an alternative embodiment of the invention, the nucleotide sequence could be synthesised, in whole or in part, using chemical methods well known in the art (see Caruthers MH *et al* (1980) Nuc Acids Res Symp Ser 215-23 and Horn T *et al* (1980) Nuc Acids Res Symp Ser 225-232).
- 10

#### MOLECULAR EVOLUTION

- Once an enzyme-encoding nucleotide sequence has been isolated, or a putative enzyme-encoding nucleotide sequence has been identified, it may be desirable to modify the selected nucleotide sequence, for example it may be desirable to mutate the sequence in order to prepare an enzyme in accordance with the present invention.
- 15

- Mutations may be introduced using synthetic oligonucleotides. These oligonucleotides contain nucleotide sequences flanking the desired mutation sites.
- 20

- A suitable method is disclosed in Morinaga *et al* (Biotechnology (1984) 2, p646-649). Another method of introducing mutations into enzyme-encoding nucleotide sequences is described in Nelson and Long (Analytical Biochemistry (1989), 180, p 147-151).
- 25

- Instead of site directed mutagenesis, such as described above, one can introduce mutations randomly for instance using a commercial kit such as the GeneMorph PCR mutagenesis kit from Stratagene, or the Diversify PCR random mutagenesis kit from Clontech. EP 0 583 265 refers to methods of optimising PCR based mutagenesis, which can also be combined with the use of mutagenic DNA analogues such as those described in EP 0 866 796. Error prone PCR technologies are suitable for the production of variants of lipid acyl transferases with preferred characteristics. WO0206457 refers to molecular evolution of lipases.
- 30

A third method to obtain novel sequences is to fragment non-identical nucleotide sequences, either by using any number of restriction enzymes or an enzyme such as Dnase I, and reassembling full nucleotide sequences coding for functional proteins. Alternatively one can use one or multiple non-identical nucleotide sequences and  
5 introduce mutations during the reassembly of the full nucleotide sequence. DNA shuffling and family shuffling technologies are suitable for the production of variants of lipid acyl transferases with preferred characteristics. Suitable methods for performing 'shuffling' can be found in EP0 752 008, EP1 138 763, EP1 103 606. Shuffling can also be combined with other forms of DNA mutagenesis as described in US 6,180,406  
10 and WO 01/34835.

Thus, it is possible to produce numerous site directed or random mutations into a nucleotide sequence, either *in vivo* or *in vitro*, and to subsequently screen for improved functionality of the encoded polypeptide by various means. Using *in silico*  
15 and *exo* mediated recombination methods (see WO 00/58517, US 6,344,328, US 6,361,974), for example, molecular evolution can be performed where the variant produced retains very low homology to known enzymes or proteins. Such variants thereby obtained may have significant structural analogy to known transferase enzymes, but have very low amino acid sequence homology.

20

As a non-limiting example, In addition, mutations or natural variants of a polynucleotide sequence can be recombined with either the wild type or other mutations or natural variants to produce new variants. Such new variants can also be screened for improved functionality of the encoded polypeptide.

25

The application of the above-mentioned and similar molecular evolution methods allows the identification and selection of variants of the enzymes of the present invention which have preferred characteristics without any prior knowledge of protein structure or function, and allows the production of non-predictable but beneficial  
30 mutations or variants. There are numerous examples of the application of molecular evolution in the art for the optimisation or alteration of enzyme activity, such examples include, but are not limited to one or more of the following: optimised expression and/or activity in a host cell or *in vitro*, increased enzymatic activity, altered substrate and/or product specificity, increased or decreased enzymatic or structural stability,

altered enzymatic activity/specificity in preferred environmental conditions, e.g. temperature, pH, substrate

5 As will be apparent to a person skilled in the art, using molecular evolution tools an enzyme may be altered to improve the functionality of the enzyme.

10 Suitably, the nucleotide sequence encoding a lipid acyltransferase used in the invention may encode a variant lipid acyltransferase, i.e. the lipid acyltransferase may contain at least one amino acid substitution, deletion or addition, when compared to a parental enzyme. Variant enzymes retain at least 1%, 2%, 3%, 5%, 10%, 15%, 20%, 30%, 40%, 50 %, 60%, 70%, 80%, 90%, 95%, 97%, 99% homology with the parent enzyme. Suitable parent enzymes may include any enzyme with esterase or lipase activity. Preferably, the parent enzyme aligns to the pfam00657 consensus sequence.

15

In a preferable embodiment a variant lipid acyltransferase enzyme retains or incorporates at least one or more of the pfam00657 consensus sequence amino acid residues found in the GDSx, GANDY and HPT blocks.

20 Enzymes, such as lipases with no or low lipid acyltransferase activity in an aqueous environment may be mutated using molecular evolution tools to introduce or enhance the transferase activity, thereby producing a lipid acyltransferase enzyme with significant transferase activity suitable for use in the compositions and methods of the present invention.

25

Suitably, the nucleotide sequence encoding a lipid acyltransferase for use in any one of the vectors, host cells, methods and/or uses of the present invention may encode a lipid acyltransferase that may be a variant with enhanced enzyme activity on polar lipids, preferably phospholipids and/or glycolipids when compared to the parent enzyme. Preferably, such variants also have low or no activity on lyso polar lipids. The enhanced activity on polar lipids, phospholipids and/or glycolipids may be the result of hydrolysis and/or transferase activity or a combination of both.

30

35 Variant lipid acyltransferases may have decreased activity on triglycerides, and/or monoglycerides and/or diglycerides compared with the parent enzyme.

Suitably the variant enzyme may have no activity on triglycerides and/or monoglycerides and/or diglycerides.

- 5 Alternatively, the variant enzyme may have increased activity on triglycerides, and/or may also have increased activity on one or more of the following, polar lipids, phospholipids, lecithin, phosphatidylcholine, glycolipids, digalactosyl monoglyceride, monogalactosyl monoglyceride.
- 10 Variants of lipid acyltransferases are known, and one or more of such variants may be suitable for use in the methods and uses according to the present invention and/or in the enzyme compositions according to the present invention. By way of example only, variants of lipid acyltransferases are described in the following references may be used in accordance with the present invention: Hilton & Buckley J Biol. Chem.
- 15 1991 Jan 15; 266 (2): 997-1000; Robertson *et al* J. Biol. Chem. 1994 Jan 21; 269(3):2146-50; Brumlik *et al* J. Bacteriol 1996 Apr; 178 (7): 2060-4; Peelman *et al* Protein Sci. 1998 Mar; 7(3):587-99.

#### AMINO ACID SEQUENCES

20

The present invention also encompasses amino acid sequences encoded by a nucleotide sequence which encodes a lipid acyltransferase for use in any one of the vectors, host cells, methods and/or uses of the present invention.

- 25 As used herein, the term "amino acid sequence" is synonymous with the term "polypeptide" and/or the term "protein". In some instances, the term "amino acid sequence" is synonymous with the term "peptide".

- 30 The amino acid sequence may be prepared/isolated from a suitable source, or it may be made synthetically or it may be prepared by use of recombinant DNA techniques.

Suitably, the amino acid sequences may be obtained from the isolated polypeptides taught herein by standard techniques.

One suitable method for determining amino acid sequences from isolated polypeptides is as follows:

Purified polypeptide may be freeze-dried and 100 µg of the freeze-dried material may  
5 be dissolved in 50 µl of a mixture of 8 M urea and 0.4 M ammonium hydrogen  
carbonate, pH 8.4. The dissolved protein may be denatured and reduced for 15  
minutes at 50°C following overlay with nitrogen and addition of 5 µl of 45 mM  
dithiothreitol. After cooling to room temperature, 5 µl of 100 mM iodoacetamide may  
10 be added for the cysteine residues to be derivatized for 15 minutes at room  
temperature in the dark under nitrogen.

135 µl of water and 5 µg of endoproteinase Lys-C in 5 µl of water may be added to  
the above reaction mixture and the digestion may be carried out at 37°C under  
nitrogen for 24 hours.

15 The resulting peptides may be separated by reverse phase HPLC on a VYDAC C18  
column (0.46x15cm;10µm; The Separation Group, California, USA) using solvent A:  
0.1% TFA in water and solvent B: 0.1% TFA in acetonitrile. Selected peptides may be  
re-chromatographed on a Develosil C18 column using the same solvent system, prior  
20 to N-terminal sequencing. Sequencing may be done using an Applied Biosystems  
476A sequencer using pulsed liquid fast cycles according to the manufacturer's  
instructions (Applied Biosystems, California, USA).

#### SEQUENCE IDENTITY OR SEQUENCE HOMOLOGY

25 Here, the term "homologue" means an entity having a certain homology with the  
subject amino acid sequences and the subject nucleotide sequences. Here, the term  
"homology" can be equated with "identity".

30 The homologous amino acid sequence and/or nucleotide sequence should provide  
and/or encode a polypeptide which retains the functional activity and/or enhances the  
activity of the enzyme.

In the present context, a homologous sequence is taken to include an amino acid  
35 sequence which may be at least 75, 85 or 90% identical, preferably at least 95 or 98%

identical to the subject sequence. Typically, the homologues will comprise the same active sites etc. as the subject amino acid sequence. Although homology can also be considered in terms of similarity (i.e. amino acid residues having similar chemical properties/functions), in the context of the present invention it is preferred to express  
5 homology in terms of sequence identity.

In the present context, a homologous sequence is taken to include a nucleotide sequence which may be at least 75, 85 or 90% identical, preferably at least 95 or 98% identical to a nucleotide sequence encoding a polypeptide of the present invention  
10 (the subject sequence). Typically, the homologues will comprise the same sequences that code for the active sites etc. as the subject sequence. Although homology can also be considered in terms of similarity (i.e. amino acid residues having similar chemical properties/functions), in the context of the present invention it is preferred to express homology in terms of sequence identity.

15

Homology comparisons can be conducted by eye, or more usually, with the aid of readily available sequence comparison programs. These commercially available computer programs can calculate % homology between two or more sequences.

20 % homology may be calculated over contiguous sequences, i.e. one sequence is aligned with the other sequence and each amino acid in one sequence is directly compared with the corresponding amino acid in the other sequence, one residue at a time. This is called an "ungapped" alignment. Typically, such ungapped alignments are performed only over a relatively short number of residues.

25

Although this is a very simple and consistent method, it fails to take into consideration that, for example, in an otherwise identical pair of sequences, one insertion or deletion will cause the following amino acid residues to be put out of alignment, thus potentially resulting in a large reduction in % homology when a global alignment is  
30 performed. Consequently, most sequence comparison methods are designed to produce optimal alignments that take into consideration possible insertions and deletions without penalising unduly the overall homology score. This is achieved by inserting "gaps" in the sequence alignment to try to maximise local homology.

However, these more complex methods assign "gap penalties" to each gap that occurs in the alignment so that, for the same number of identical amino acids, a sequence alignment with as few gaps as possible - reflecting higher relatedness between the two compared sequences - will achieve a higher score than one with many gaps. "Affine gap costs" are typically used that charge a relatively high cost for the existence of a gap and a smaller penalty for each subsequent residue in the gap. This is the most commonly used gap scoring system. High gap penalties will of course produce optimised alignments with fewer gaps. Most alignment programs allow the gap penalties to be modified. However, it is preferred to use the default values when using such software for sequence comparisons.

Calculation of maximum % homology therefore firstly requires the production of an optimal alignment, taking into consideration gap penalties. A suitable computer program for carrying out such an alignment is the Vector NTI (Invitrogen Corp.). Examples of other software that can perform sequence comparisons include, but are not limited to, the BLAST package (see Ausubel *et al* 1999 Short Protocols in Molecular Biology, 4<sup>th</sup> Ed – Chapter 18), and FASTA (Altschul *et al* 1990 J. Mol. Biol. 403-410). Both BLAST and FASTA are available for offline and online searching (see Ausubel *et al* 1999, pages 7-58 to 7-60). However, for some applications, it is preferred to use the Vector NTI program. A new tool, called BLAST 2 Sequences is also available for comparing protein and nucleotide sequence (see FEMS Microbiol Lett 1999 174(2): 247-50; FEMS Microbiol Lett 1999 177(1): 187-8 and [tatiana@ncbi.nlm.nih.gov](mailto:tatiana@ncbi.nlm.nih.gov)).

Although the final % homology can be measured in terms of identity, the alignment process itself is typically not based on an all-or-nothing pair comparison. Instead, a scaled similarity score matrix is generally used that assigns scores to each pairwise comparison based on chemical similarity or evolutionary distance. An example of such a matrix commonly used is the BLOSUM62 matrix - the default matrix for the BLAST suite of programs. Vector NTI programs generally use either the public default values or a custom symbol comparison table if supplied (see user manual for further details). For some applications, it is preferred to use the default values for the Vector NTI package.

Alternatively, percentage homologies may be calculated using the multiple alignment feature in Vector NTI (Invitrogen Corp.), based on an algorithm, analogous to CLUSTAL (Higgins DG & Sharp PM (1988), *Gene* 73(1), 237-244).

- 5 Once the software has produced an optimal alignment, it is possible to calculate % homology, preferably % sequence identity. The software typically does this as part of the sequence comparison and generates a numerical result.

10 Should Gap Penalties be used when determining sequence identity, then preferably the following parameters are used for pairwise alignment:

FOR BLAST	
GAP OPEN	0
GAP EXTENSION	0

FOR CLUSTAL	DNA	PROTEIN	
WORD SIZE	2	1	K triple
GAP PENALTY	15	10	
GAP EXTENSION	6.66	0.1	

15 In one embodiment, preferably the sequence identity for the nucleotide sequences is determined using CLUSTAL with the gap penalty and gap extension set as defined above.

20 Suitably, the degree of identity with regard to a nucleotide sequence is determined over at least 20 contiguous nucleotides, preferably over at least 30 contiguous nucleotides, preferably over at least 40 contiguous nucleotides, preferably over at least 50 contiguous nucleotides, preferably over at least 60 contiguous nucleotides, preferably over at least 100 contiguous nucleotides.

25 Suitably, the degree of identity with regard to a nucleotide sequence may be determined over the whole sequence.

In one embodiment the degree of amino acid sequence identity in accordance with the present invention may be suitably determined by means of computer programs known in the art, such as Vector NTI 10 (Invitrogen Corp.). For pairwise alignment the matrix used is preferably BLOSUM62 with Gap opening penalty of 10.0 and Gap extension penalty of 0.1.

Suitably, the degree of identity with regard to an amino acid sequence is determined over at least 20 contiguous amino acids, preferably over at least 30 contiguous amino acids, preferably over at least 40 contiguous amino acids, preferably over at least 50 contiguous amino acids, preferably over at least 60 contiguous amino acids.

Suitably, the degree of identity with regard to an amino acid sequence may be determined over the whole sequence.

The sequences may also have deletions, insertions or substitutions of amino acid residues which produce a silent change and result in a functionally equivalent substance. Deliberate amino acid substitutions may be made on the basis of similarity in polarity, charge, solubility, hydrophobicity, hydrophilicity, and/or the amphipathic nature of the residues as long as the secondary binding activity of the substance is retained. For example, negatively charged amino acids include aspartic acid and glutamic acid; positively charged amino acids include lysine and arginine; and amino acids with uncharged polar head groups having similar hydrophilicity values include leucine, isoleucine, valine, glycine, alanine, asparagine, glutamine, serine, threonine, phenylalanine, and tyrosine.

Conservative substitutions may be made, for example according to the Table below. Amino acids in the same block in the second column and preferably in the same line in the third column may be substituted for each other:

ALIPHATIC	Non-polar	G A P
		I L V
	Polar – uncharged	C S T M
		N Q
	Polar – charged	D E
		K R
AROMATIC		H F W Y

The present invention also encompasses homologous substitution (substitution and replacement are both used herein to mean the interchange of an existing amino acid residue, with an alternative residue) that may occur i.e. like-for-like substitution such as basic for basic, acidic for acidic, polar for polar etc. Non-homologous substitution may also occur i.e. from one class of residue to another or alternatively involving the inclusion of unnatural amino acids such as ornithine (hereinafter referred to as Z), diaminobutyric acid ornithine (hereinafter referred to as B), norleucine ornithine (hereinafter referred to as O), pyrrolysine, thienylalanine, naphthylalanine and phenylglycine.

Replacements may also be made by unnatural amino acids.

Variant amino acid sequences may include suitable spacer groups that may be inserted between any two amino acid residues of the sequence including alkyl groups such as methyl, ethyl or propyl groups in addition to amino acid spacers such as glycine or  $\beta$ -alanine residues. A further form of variation, involves the presence of one or more amino acid residues in peptoid form, will be well understood by those skilled in the art. For the avoidance of doubt, "the peptoid form" is used to refer to variant amino acid residues wherein the  $\alpha$ -carbon substituent group is on the residue's nitrogen atom rather than the  $\alpha$ -carbon. Processes for preparing peptides in the peptoid form are known in the art, for example Simon RJ et al., PNAS (1992) 89(20), 9367-9371 and Horwell DC, Trends Biotechnol. (1995) 13(4), 132-134.

25

Nucleotide sequences for use in the present invention or encoding a polypeptide having the specific properties defined herein may include within them synthetic or

modified nucleotides. A number of different types of modification to oligonucleotides are known in the art. These include methylphosphonate and phosphorothioate backbones and/or the addition of acridine or polylysine chains at the 3' and/or 5' ends of the molecule. For the purposes of the present invention, it is to be understood that the nucleotide sequences described herein may be modified by any method available in the art. Such modifications may be carried out in order to enhance the *in vivo* activity or life span of nucleotide sequences.

The present invention also encompasses the use of nucleotide sequences that are complementary to the sequences discussed herein, or any derivative, fragment or derivative thereof. If the sequence is complementary to a fragment thereof then that sequence can be used as a probe to identify similar coding sequences in other organisms etc.

Polynucleotides which are not 100% homologous to the sequences of the present invention but fall within the scope of the invention can be obtained in a number of ways. Other variants of the sequences described herein may be obtained for example by probing DNA libraries made from a range of individuals, for example individuals from different populations. In addition, other viral/bacterial, or cellular homologues particularly cellular homologues found in mammalian cells (e.g. rat, mouse, bovine and primate cells), may be obtained and such homologues and fragments thereof in general will be capable of selectively hybridising to the sequences shown in the sequence listing herein. Such sequences may be obtained by probing cDNA libraries made from or genomic DNA libraries from other animal species, and probing such libraries with probes comprising all or part of any one of the sequences in the attached sequence listings under conditions of medium to high stringency. Similar considerations apply to obtaining species homologues and allelic variants of the polypeptide or nucleotide sequences of the invention.

Variants and strain/species homologues may also be obtained using degenerate PCR which will use primers designed to target sequences within the variants and homologues encoding conserved amino acid sequences within the sequences of the present invention. Conserved sequences can be predicted, for example, by aligning the amino acid sequences from several variants/homologues. Sequence alignments can be

performed using computer software known in the art. For example the GCG Wisconsin PileUp program is widely used.

5 The primers used in degenerate PCR will contain one or more degenerate positions and will be used at stringency conditions lower than those used for cloning sequences with single sequence primers against known sequences.

10 Alternatively, such polynucleotides may be obtained by site directed mutagenesis of characterised sequences. This may be useful where for example silent codon sequence changes are required to optimise codon preferences for a particular host cell in which the polynucleotide sequences are being expressed. Other sequence changes may be desired in order to introduce restriction polypeptide recognition sites, or to alter the property or function of the polypeptides encoded by the polynucleotides.

15 Polynucleotides (nucleotide sequences) of the invention may be used to produce a primer, e.g. a PCR primer, a primer for an alternative amplification reaction, a probe e.g. labelled with a revealing label by conventional means using radioactive or non-radioactive labels, or the polynucleotides may be cloned into vectors. Such primers, probes and other fragments will be at least 15, preferably at least 20, for example at  
20 least 25, 30 or 40 nucleotides in length, and are also encompassed by the term polynucleotides of the invention as used herein.

Polynucleotides such as DNA polynucleotides and probes according to the invention may be produced recombinantly, synthetically, or by any means available to those of skill  
25 in the art. They may also be cloned by standard techniques.

In general, primers will be produced by synthetic means, involving a stepwise manufacture of the desired nucleic acid sequence one nucleotide at a time. Techniques for accomplishing this using automated techniques are readily available in the art.

30 Longer polynucleotides will generally be produced using recombinant means, for example using a PCR (polymerase chain reaction) cloning techniques. This will involve making a pair of primers (e.g. of about 15 to 30 nucleotides) flanking a region of the lipid targeting sequence which it is desired to clone, bringing the primers into contact with  
35 mRNA or cDNA obtained from an animal or human cell, performing a polymerase chain

reaction under conditions which bring about amplification of the desired region, isolating the amplified fragment (e.g. by purifying the reaction mixture on an agarose gel) and recovering the amplified DNA. The primers may be designed to contain suitable restriction enzyme recognition sites so that the amplified DNA can be cloned into a suitable cloning vector.

## HYBRIDISATION

The present invention also encompasses sequences that are complementary to the sequences of the present invention or sequences that are capable of hybridising either to the sequences of the present invention or to sequences that are complementary thereto.

The term "hybridisation" as used herein shall include "the process by which a strand of nucleic acid joins with a complementary strand through base pairing" as well as the process of amplification as carried out in polymerase chain reaction (PCR) technologies.

The present invention also encompasses the use of nucleotide sequences that are capable of hybridising to the sequences that are complementary to the subject sequences discussed herein, or any derivative, fragment or derivative thereof.

The present invention also encompasses sequences that are complementary to sequences that are capable of hybridising to the nucleotide sequences discussed herein.

Hybridisation conditions are based on the melting temperature ( $T_m$ ) of the nucleotide binding complex, as taught in Berger and Kimmel (1987, Guide to Molecular Cloning Techniques, Methods in Enzymology, Vol. 152, Academic Press, San Diego CA), and confer a defined "stringency" as explained below.

Maximum stringency typically occurs at about  $T_m - 5^\circ\text{C}$  ( $5^\circ\text{C}$  below the  $T_m$  of the probe); high stringency at about  $5^\circ\text{C}$  to  $10^\circ\text{C}$  below  $T_m$ ; intermediate stringency at about  $10^\circ\text{C}$  to  $20^\circ\text{C}$  below  $T_m$ ; and low stringency at about  $20^\circ\text{C}$  to  $25^\circ\text{C}$  below  $T_m$ . As will be understood by those of skill in the art, a maximum stringency hybridisation

can be used to identify or detect identical nucleotide sequences while an intermediate (or low) stringency hybridisation can be used to identify or detect similar or related polynucleotide sequences.

- 5 Preferably, the present invention encompasses sequences that are complementary to sequences that are capable of hybridising under high stringency conditions or intermediate stringency conditions to nucleotide sequences encoding polypeptides having the specific properties as defined herein.
- 10 More preferably, the present invention encompasses sequences that are complementary to sequences that are capable of hybridising under high stringent conditions (e.g. 65°C and 0.1xSSC {1xSSC = 0.15 M NaCl, 0.015 M Na-citrate pH 7.0}) to nucleotide sequences encoding polypeptides having the specific properties as defined herein.

15

The present invention also relates to nucleotide sequences that can hybridise to the nucleotide sequences discussed herein (including complementary sequences of those discussed herein).

- 20 The present invention also relates to nucleotide sequences that are complementary to sequences that can hybridise to the nucleotide sequences discussed herein (including complementary sequences of those discussed herein).

- 25 Also included within the scope of the present invention are polynucleotide sequences that are capable of hybridising to the nucleotide sequences discussed herein under conditions of intermediate to maximal stringency.

- 30 In a preferred aspect, the present invention covers nucleotide sequences that can hybridise to the nucleotide sequences discussed herein, or the complement thereof, under stringent conditions (e.g. 50°C and 0.2xSSC).

- In a more preferred aspect, the present invention covers nucleotide sequences that can hybridise to the nucleotide sequences discussed herein, or the complement thereof, under high stringent conditions (e.g. 65°C and 0.1xSSC).

35

## EXPRESSION OF POLYPEPTIDES

A nucleotide sequence for use in the present invention or for encoding a polypeptide having the specific properties as defined herein can be incorporated into a recombinant replicable vector. The vector may be used to replicate and express the nucleotide sequence, in polypeptide form, in and/or from a compatible host cell. Expression may be controlled using control sequences which include promoters/enhancers and other expression regulation signals. Prokaryotic promoters and promoters functional in eukaryotic cells may be used. Tissue specific or stimuli specific promoters may be used. Chimeric promoters may also be used comprising sequence elements from two or more different promoters described above.

The polypeptide produced by a host recombinant cell by expression of the nucleotide sequence may be secreted or may be contained intracellularly depending on the sequence and/or the vector used. The coding sequences can be designed with signal sequences which direct secretion of the substance coding sequences through a particular prokaryotic or eukaryotic cell membrane.

## CONSTRUCTS

20

The term "construct" - which is synonymous with terms such as "conjugate", "cassette" and "hybrid" - includes a nucleotide sequence encoding a polypeptide having the specific properties as defined herein for use according to the present invention directly or indirectly attached to a promoter. An example of an indirect attachment is the provision of a suitable spacer group such as an intron sequence, such as the Sh1-intron or the ADH intron, intermediate the promoter and the nucleotide sequence of the present invention. The same is true for the term "fused" in relation to the present invention which includes direct or indirect attachment. In some cases, the terms do not cover the natural combination of the nucleotide sequence coding for the protein ordinarily associated with the wild type gene promoter and when they are both in their natural environment.

30

The construct may even contain or express a marker which allows for the selection of the genetic construct.

For some applications, preferably the construct comprises at least a nucleotide sequence of the present invention or a nucleotide sequence encoding a polypeptide having the specific properties as defined herein operably linked to a promoter.

## 5 ORGANISM

The term "organism" in relation to the present invention includes any organism that could comprise a nucleotide sequence according to the present invention or a nucleotide sequence encoding for a polypeptide having the specific properties as defined herein and/or products obtained therefrom.

The term "transgenic organism" in relation to the present invention includes any organism that comprises a nucleotide sequence coding for a polypeptide having the specific properties as defined herein and/or the products obtained therefrom, and/or wherein a promoter can allow expression of the nucleotide sequence coding for a polypeptide having the specific properties as defined herein within the organism. Preferably the nucleotide sequence is incorporated in the genome of the organism.

The term "transgenic organism" does not cover native nucleotide coding sequences in their natural environment when they are under the control of their native promoter which is also in its natural environment.

Therefore, the transgenic organism of the present invention includes an organism comprising any one of, or combinations of, a nucleotide sequence coding for a polypeptide having the specific properties as defined herein, constructs as defined herein, vectors as defined herein, plasmids as defined herein, cells as defined herein, or the products thereof. For example the transgenic organism can also comprise a nucleotide sequence coding for a polypeptide having the specific properties as defined herein under the control of a promoter not associated with a sequence encoding a lipid acyltransferase in nature.

## TRANSFORMATION OF HOST CELLS/ORGANISM

Teachings on the transformation of prokaryotic hosts are well documented in the art, for example see Sambrook *et al* (Molecular Cloning: A Laboratory Manual, 2nd edition, 1989, Cold Spring Harbor Laboratory Press). If a prokaryotic host is used then the nucleotide sequence may need to be suitably modified before transformation - such as by removal of introns.

Various methods are known for the transformation of *Bacillus* species.

10

## SECRETION

Often, it is desirable for the polypeptide to be secreted from the expression host into the culture medium from where the enzyme may be more easily recovered. According to the present invention, the secretion leader sequence may be selected on the basis of the desired expression host. Hybrid signal sequences may also be used with the context of the present invention.

Typical examples of secretion leader sequences not associated with a nucleotide sequence encoding a lipid acyltransferase in nature are those originating from the fungal amyloglucosidase (AG) gene (*glaA* - both 18 and 24 amino acid versions e.g. from *Aspergillus*), the  $\alpha$ -factor gene (yeasts e.g. *Saccharomyces*, *Kluyveromyces* and *Hansenula*) or the  $\alpha$ -amylase gene (*Bacillus*).

## DETECTION

A variety of protocols for detecting and measuring the expression of the amino acid sequence are known in the art. Examples include enzyme-linked immunosorbent assay (ELISA), radioimmunoassay (RIA) and fluorescent activated cell sorting (FACS).

A wide variety of labels and conjugation techniques are known by those skilled in the art and can be used in various nucleic and amino acid assays.

A number of companies such as Pharmacia Biotech (Piscataway, NJ), Promega (Madison, WI), and US Biochemical Corp (Cleveland, OH) supply commercial kits and protocols for these procedures.

5 Suitable reporter molecules or labels include those radionuclides, enzymes, fluorescent, chemiluminescent, or chromogenic agents as well as substrates, cofactors, inhibitors, magnetic particles and the like. Patents teaching the use of such labels include US-A-3,817,837; US-A-3,850,752; US-A-3,939,350; US-A-3,996,345; US-A-4,277,437; US-A-4,275,149 and US-A-4,366,241.

10

Also, recombinant immunoglobulins may be produced as shown in US-A-4,816,567.

#### FUSION PROTEINS

15 In the method of the present invention the lipid acyltransferase may be produced as a fusion protein, for example to aid in extraction and purification thereof. Examples of fusion protein partners include glutathione-S-transferase (GST), 6xHis, GAL4 (DNA binding and/or transcriptional activation domains) and  $\beta$ -galactosidase. It may also be convenient to include a proteolytic cleavage site between the fusion protein partner  
20 and the protein sequence of interest to allow removal of fusion protein sequences. Preferably the fusion protein will not hinder the activity of the protein sequence.

Gene fusion expression systems in *E. coli* have been reviewed in Curr. Opin. Biotechnol. (1995) 6(5):501-6.

25

In another embodiment of the invention, the amino acid sequence of a polypeptide having the specific properties as defined herein may be ligated to a non-native sequence to encode a fusion protein. For example, for screening of peptide libraries for agents capable of affecting the substance activity, it may be useful to encode a  
30 chimeric substance expressing a non-native epitope that is recognised by a commercially available antibody.

The invention will now be described, by way of example only, with reference to the following Figures and Examples.

35

Figure 1 shows the amino acid sequence of a mutant *Aeromonas salmonicida* mature lipid acyltransferase (GCAT) with a mutation of Asn80Asp (notably, amino acid 80 is in the mature sequence) (SEQ ID 16);

## EXAMPLE 1

**Expression of KLM3' in *Bacillus licheniformis***

5

A nucleotide sequence (SEQ ID No. 49) encoding a lipid acyltransferase (SEQ. ID No. 16, hereinafter KLM3') was expressed in *Bacillus licheniformis* as a fusion protein with the signal peptide of *B. licheniformis* [alpha]-amylase (LAT) (see FIGS. 53 and 54). For optimal expression in *Bacillus*, a codon optimized gene construct (no. 052907) was ordered at Geneart (Geneart AG, Regensburg, Germany).

Construct no. 052907 contains an incomplete LAT promoter (only the -10 sequence) in front of the LAT-KLM3' precursor gene and the LAT transcription (Tlat) downstream of the LAT-KLM3' precursor gene (see FIGS 53 and 55). To create a *Xho*I fragment that contains the LAT-KLM3' precursor gene flanked by the complete LAT promoter at the 5' end and the LAT terminator at the 3' end, a PCR (polymerase chain reaction) amplification was performed with the primers Plat5XhoI\_FW and EBS2XhoI\_RV and gene construct 052907 as template.

20 Plat5XhoI\_FW:

```
ccccgctcgaggctttcttttggaaagaaaatatagggaaaatggtacttgtaaataattc
ggaatattatacaatatcatatgtttcacattgaaagggg
```

EBS2XhoI\_RV: tggaatctcgaggttttatcctttacctgtctcc

25

PCR was performed on a thermocycler with Phusion High Fidelity DNA polymerase (Finnzymes OY, Espoo, Finland) according to the instructions of the manufacturer (annealing temperature of 55[deg.] C.).

30 The resulting PCR fragment was digested with restriction enzyme *Xho*I and ligated with T4 DNA ligase into *Xho*I digested pICatH according to the instructions of the supplier (Invitrogen, Carlsbad, Calif. USA).

The ligation mixture was transformed into *B. subtilis* strain SC6.1 as described in U.S. Patent Application US20020182734 (International Publication WO 02/14490). The

35

sequence of the *Xho*I insert containing the LAT-KLM3' precursor gene was confirmed by DNA sequencing (BaseClear, Leiden, The Netherlands) and one of the correct plasmid clones was designated pICatH-KLM3'(ori1) (Figure 53). pICatH-KLM3'(ori1) was transformed into *B. licheniformis* strain BML780 (a derivative of BRA7 and  
5 BML612, see WO2005111203) at the permissive temperature (37[deg.] C.).

One neomycin resistant (neoR) and chloramphenicol resistant (CmR) transformant was selected and designated BML780(pICatH-KLM3'(ori1)). The plasmid in BML780(pICatH-KLM3'(ori1)) was integrated into the catH region on the *B.*  
10 *licheniformis* genome by growing the strain at a non-permissive temperature (50[deg.] C) in medium with 5 [mu]g/ml chloramphenicol. One CmR resistant clone was selected and designated BML780-pICatH-KLM3'(ori1). BML780-pICatH- KLM3'(ori1) was grown again at the permissive temperature for several generations without antibiotics to loop-out vector sequences and then one neomycin sensitive (neoS),  
15 CmR clone was selected. In this clone, vector sequences of pICatH on the chromosome are excised (including the neomycin resistance gene) and only the catH - LATKLM3' cassette is left. Next, the catH - LATKLM3' cassette on the chromosome was amplified by growing the strain in/on media with increasing concentrations of chloramphenicol. After various rounds of amplification, one clone (resistant against 50  
20 [mu]g/ml chloramphenicol) was selected and designated BML780-KLM3'CAP50. To verify KLM3'expression, BML780-KLM3'CAP50 and BML780 (the empty host strain) were grown for 48h at 37 [deg.] C on a Heart Infusion (Bacto) agar plate with 1% tributyrin. A clearing zone, indicative for lipid acyltransferase activity, was clearly visible around the colony of BML780-KLM3'CAP50 but not around the host strain  
25 BML780 (see Figure 56). This result shows that a substantial amount of KLM3' is expressed in *B. licheniformis* strain BML780-KLM3'CAP50 and that these KLM3' molecules are functional.

#### COMPARATIVE EXAMPLE 1

30

##### Vector construct

The plasmid construct is pCS32new N80D, which is a pCCmini derivative carrying the sequence encoding the mature form of the native *Aeromonas salmonicida*  
35 Glycerophospholipid-cholesterol acyltransferase with a Asn to Asp substitution at

position 80 (KLM3'), under control of the p32 promoter and with a CGTase signal sequence.

The host strain used for the expression, is in the *bacillus subtilis* OS21 $\Delta$ AprE strain

5

The expression level is measured as transferase activity, expressed as % cholesterol esterified, calculated from the difference in free cholesterol in the reference sample and free cholesterol in the enzyme sample in reactions with PC ( $T_{PC}$ ) as donor and cholesterol as acceptor molecule.

10

#### Culture conditions

5 ml of LB broth (Casein enzymatic digest, 10 g/l; low-sodium Yeast extract, 5 g/l; Sodium Chloride, 5 g/l; Inert tableting aids, 2 g/l) supplemented with 50 mg/l  
15 kanamycin, was inoculated with a single colony and incubated at 30 °C for 6 hours at 205 rpm. 0.7 ml of this culture was used to inoculate 50 ml of SAS media ( $K_2HPO_4$ , 10 g/l; MOPS (3-morpholinopropane sulfonic acid), 40 g/l; Sodium Chloride, 5 g/l; Antifoam (Sin 260), 5 drops/l; Soy flour degreased, 20 g/l; Biospringer 106 (100 % dw YE), 20 g/l) supplemented with 50 mg/l kanamycin and a solution of high maltose  
20 starch hydrolysates (60 g/l). Incubation was continued for 40 hours at 30 °C and 180 rpm before the culture supernatant was separated by centrifugation at 19000 rpm for 30 min. The supernatant was transferred into a clean tube and directly used for transferase activity measurement.

#### 25 Preparation of substrates and enzymatic reaction

PC (Avanti Polar Lipids #441601) and cholesterol (Sigma C8503) was scaled in the ratio 9:1, dissolved in chloroform, and evaporated to dryness.

The substrate was prepared by dispersion of 3% PC:Cholesterol 9:1 in 50 mM Hepes buffer pH 7.

30 0.250 ml substrate solution was transferred into a 3 ml glass tube with screw lid. 0.025 ml culture supernatant was added and the mixture was incubated at 40 °C for 2 hours. A reference sample with water instead of enzyme was also prepared. Heating the reaction mixture in a boiling water bath for 10 minutes stopped the enzyme reaction. 2 ml of 99% ethanol was added to the reaction mixture before submitted to  
35 cholesterol assay analysis.

### Cholesterol assay

100  $\mu$ l substrate containing 1.4 U/ml Cholesterol oxidase( SERVA Electrophoresis GmbH cat. No 17109), 0.4 mg/ml ABTS (Sigma A-1888), 5 U/ml Peroxidase (Sigma 6732) in 0.1 M Tris-HCl, pH 6.6 and 0.5 % Triton X-100 (Sigma X-100) was incubated at 37°C for 5 minutes before 5  $\mu$ l enzyme reaction sample was added and mixed. The reaction mixture was incubated for further 5 minutes and OD<sub>405</sub> was measured. The content of cholesterol was calculated from the analyses of standard solutions of cholesterol containing 0.4 mg/ml, 0.3 mg/ml, 0.20 mg/ml, 0.1 mg/ml, 0.05 mg/ml, and 0 mg/ml cholesterol in 99 % EtOH.

### Results

The table shows the average of 8 separate expression cultures

Strain	T <sub>PC</sub> <sup>a</sup>
OS21AAprE[pCS32new]	74.2 $\pm$ 10.1 <sup>b</sup>

<sup>a</sup> T<sub>PC</sub> is the transferase activity, expressed as % cholesterol esterified, calculated from the difference in free cholesterol in the reference sample and free cholesterol in the enzyme sample in reactions with PC as donor molecule and cholesterol as acceptor molecule.

<sup>b</sup> Average of 8 separate expression cultures

15

Various modifications and variations of the described methods and system of the present invention will be apparent to those skilled in the art. Although the present invention has been described in connection with specific preferred embodiments, it should be understood that the invention as claimed should not be unduly limited to such specific embodiments. Indeed, various modifications of the described modes for carrying out the invention which are obvious to those skilled in biochemistry and biotechnology or related fields are intended to be within the scope of the following claims.

20

**CLAIMS:**

1. A method for the production of a lipid acyltransferase comprising the steps of:
  - (i) providing a *Bacillus licheniformis* cell,
  - (ii) transforming the *Bacillus licheniformis* cell with a heterologous nucleotide sequence encoding a lipid acyltransferase shown as SEQ ID NO. 49, and
  - (iii) expressing the lipid acyltransferase in the cell under the control of a promoter sequence.
2. The method according to claim 1, wherein the promoter sequence is not natively associated with the nucleotide sequence encoding a lipid acyltransferase.
3. The method according to claim 1 or claim 2, wherein a nucleotide sequence encoding a signal peptide is operably linked to said heterologous nucleotide sequence encoding a lipid acyltransferase.
4. The method according to any one of claims 1 to 3, wherein said method comprises the additional step of isolating the lipid acyltransferase.
5. The method according to any one of claims 1 to 4, wherein said promoter sequence is homologous to the host cell.
6. The method according to any one of claims 1 to 5, wherein said promoter sequence is selected from the group consisting of an  $\alpha$ -amylase promoter sequence, a protease promoter sequence, a subtilisin promoter sequence, a glutamic acid-specific protease promoter sequence and a levansucrase promoter sequence.
7. The method according to any one of claims 1 to 5, wherein said promoter sequence is an  $\alpha$ -amylase promoter sequence.
8. A *Bacillus licheniformis* host cell comprising a nucleotide sequence encoding a heterologous lipid acyltransferase shown as SEQ ID NO. 49.

9. Use of a *Bacillus licheniformis* host cell in the production of a heterologous lipid acyltransferase encoded by a nucleotide sequence shown as SEQ ID NO. 49.
10. The use according to claim 9, wherein there is an increased expression of the lipid acyltransferase as compared with expression of the lipid acyltransferase in a *B. subtilis* host cell.
11. An expression vector comprising a nucleotide sequence encoding a lipid acyltransferase shown as SEQ ID NO. 49 operably linked to a promoter sequence homologous to *B licheniformis*.
12. The expression vector according to claim 11, wherein the promoter is not natively associated with the nucleotide sequence encoding a lipid acyltransferase.
13. The expression vector according to claim 11 or claim 12, wherein a nucleotide sequence encoding a signal peptide is operably linked to a heterologous nucleotide sequence encoding the lipid acyltransferase.
14. The expression vector according to any one of claims 11 to 13, wherein said promoter sequence is selected from the group consisting of an  $\alpha$ -amylase promoter sequence, a protease promoter sequence, a subtilisin promoter sequence, a glutamic acid-specific protease promoter sequence and a levansucrase promoter sequence.
15. An expression vector according to any one of claims 11 to 13, wherein said promoter sequence is an  $\alpha$ -amylase promoter sequence.
16. A lipid acyltransferase obtained by the method of any one of claims 1 to 7.
