UNITED STATES PATENT OFFICE.

JAMES S. FLETCHER, OF SOUTH BEND, INDIANA.

IMPROVEMENT IN TOILET-BRACKETS.

Specification forming part of Letters Patent No. 133,640, dated December 3, 1872.

To all whom it may concern:

Be it known that I, JAMES S. FLETCHER, of South Bend, in the county of St. Joseph and in the State of Indiana, have invented certain new and useful Improvements in Toilet-Brackets; and do hereby declare that the following is a full, clear, and exact description thereof, reference being had to the accompanying drawing and to the letters of reference marked thereon making a part of this specification.

The nature of my invention consists in the construction and arrangement of a toilet-bracket, as will be hereinafter more fully set forth.

In order to enable others skilled in the art to which my invention appertains to make and use the same, I will now proceed to describe its construction and operation, referring to the annexed drawing, in which—

Figure 1 is a perspective view of my toilet-bracket, and Fig. 2 represents the molding above the glass.

The back of my toilet-bracket is made in two equal parts, A A, which, when placed together, form a space, B, for the looking-glass. These two parts are connected by means of a rosette, C, at the top, moldings D and E at the top and bottom of the space B, respectively, and by the box G below the molding E. The box G consists of a top and a bottom, con-

nected by end pieces, and doors H H forming the front. These doors are hinged at the corners and meet in the center, as shown. The molding D over the top of the glass is intended to be made in the form shown in Fig. 2—that is, not half circle, but of the shape usual for looking-glasses. It is made by shaping it one side with the shaper and then reversing it for the other side. The usual way of forming said moldings has been with a lathe, in the form of rings, and then cut in two halves. The moldings D and E are connected by other moldings J J on the sides.

Having thus fully described my invention, what I claim as new, and desire to secure by Letters Patent, is—

The within-described toilet-bracket, consisting of two halves, A A, forming the back, the rosette C, moldings D E and J J, and box G with doors H H, all constructed and arranged substantially as and for the purposes herein set forth.

In testimony that I claim the foregoing I have hereunto set my hand this 29th day of April, 1872.

JAMES S. FLETCHER.
