Title: BICYCLIC PYRIMIDIN-4-(3H)-ONES AND ANALOGUES AND DERIVATIVES THEREOF WHICH MODULATE THE FUNCTION OF THE VANILLOID-1 RECEPTOR (VR1)

Abstract: Compounds of formula (I), which are useful as therapeutic compounds, particularly in the treatment of pain and other conditions ameliorated by the modulation of the function of the vanilloid-1 receptor (VR1).
BICYCLIC PYRIMIDIN-4-(3H)-ONES AND ANALOGUES AND DERIVATIVES THEREOF WHICH MODULATE THE FUNCTION OF THE VANILLOID-1 RECEPTOR (VR1)

The present invention is concerned with 2,3-substituted fused bicyclic pyrimidin-4(3H)-ones and analogues and derivatives thereof as well as pharmaceutically acceptable salts and prodrugs thereof, which are useful as therapeutic compounds, particularly in the treatment of pain and other conditions ameliorated by the modulation of the function of the vanilloid-1 receptor (VR1).

The pharmacologically active ingredient of chilli peppers has been recognised for some time to be the phenolic amide capsaicin. The application of capsaicin to mucous membranes or when injected intradermally, causes intense burning-like pain in humans. The beneficial effects of topical administration of capsaicin as an analgesic is also well established. However, understanding of the underlying molecular pharmacology mediating these responses to capsaicin has been a more recent development.

The receptor for capsaicin, termed the vanilloid VR1 receptor, was cloned by Caterina and colleagues at UCSF in 1997 (Nature, 398:816, 1997). VR1 receptors are cation channels that are found on sensory nerves that innervate the skin, viscera, peripheral tissues and spinal cord. Activation of VR1 elicits action potentials in sensory fibres that ultimately generate the sensation of pain. Importantly the VR1 receptor is activated not only by capsaicin but also by acidic pH and by noxious heat stimuli. It is also sensitized by a number of inflammatory mediators and thus appears to be a polymodal integrator of painful stimuli.

The prototypical VR1 antagonist is capsazepine (Walpole et al., J. Med. Chem., 37:1942, 1994) – VR1 IC50 of 420nM. A novel series of sub-micromolar antagonists has also been reported recently (Lee et al, Bioorg. Med. Chem., 9:1713, 2001), but these reports provide no evidence for in vivo efficacy. A much higher affinity antagonist has been derived from the 'ultrapotent' agonist resiniferatoxin. Iodo-resiniferatoxin (Wahl et al., Mol. Pharmacol., 59:9, 2001) is a nanomolar antagonist of VR1 but does not possess properties suitable for an oral pharmaceutical. This last is also true of

WO-A-9733890 (Novartis AG) discloses structurally related compounds as pesticides.

The compounds of the present invention have advantageous properties, such as good metabolic stability.

We herein describe another novel series of VR1 modulators. These comprise predominantly VR1 antagonists but encompass VR1 partial antagonists and VR1 partial agonists. Such compounds have been shown to be efficacious in animal models of pain.

Other salts may, however, be useful in the preparation of the compounds according to the invention or of their non-toxic pharmaceutically acceptable salts. Suitable pharmaceutically acceptable salts of the compounds of this invention include acid addition salts which may, for example, be formed by mixing a solution of the compound according to the invention with a solution of a pharmaceutically acceptable acid such as hydrochloric acid, fumaric acid, p-toluenesulphonic acid, maleic acid, succinic acid, acetic acid, citric acid, tartaric acid, carbonic acid, phosphoric acid or sulphuric acid. A further salt is the acid addition salt with benzenesulphonic acid. Preferred pharmaceutically acceptable salts of the compounds of the present invention are the besylate salts. Salts of amine groups may also comprise quaternary ammonium salts in which the amino nitrogen atom carries a suitable organic group such as an alkyl, alkenyl, alkynyl or aralkyl moiety.

Furthermore, where the compounds of the invention carry an acidic moiety, suitable pharmaceutically acceptable salts thereof may include metal salts such as alkali metal salts, e.g. sodium or potassium salts; and alkaline earth metal salts, e.g. calcium or magnesium salts.
The salts may be formed by conventional means, such as by reacting the free base form of the compound of formula I with one or more equivalents of the appropriate acid in a solvent or medium in which the salt is insoluble, or in a solvent such as water which is removed in vacuo or by freeze drying or by exchanging the anions of an existing salt for another anion on a suitable ion exchange resin.

The present invention also includes within its scope N-oxides of the compounds of formula I above. In general, such N-oxides may be formed on any available nitrogen atom. The N-oxides may be formed by conventional means, such as reacting the compound of formula I with oxone in the presence of wet alumina.

The present invention includes within its scope prodrugs of the compounds of formula I above. In general, such prodrugs will be functional derivatives of the compounds of formula I which are readily convertible in vivo into the required compound of formula I. Conventional procedures for the selection and preparation of suitable prodrug derivatives are described, for example, in "Design of Prodrugs", ed. H. Bundgaard, Elsevier, 1985.

A prodrug may be a pharmacologically inactive derivative of a biologically active substance (the "parent drug" or "parent molecule") that requires transformation within the body in order to release the active drug, and that has improved delivery properties over the parent drug molecule. The transformation in vivo may be, for example, as the result of some metabolic process, such as chemical or enzymatic hydrolysis of a carboxylic, phosphoric or sulphate ester, or reduction or oxidation of a susceptible functionality.

The present invention includes within its scope solvates of the compounds of formula I and salts thereof, for example, hydrates.

The compounds according to the invention may have one or more asymmetric centres, and may accordingly exist both as enantiomers and as diastereoisomers. It is to be understood that all such isomers and mixtures thereof are encompassed within the scope of the present invention. Furthermore, the compounds of formula I may also exist in tautomeric forms and the invention includes within its scope both mixtures and separate individual tautomers.

The compounds may exist in different isomeric forms, all of which are encompassed by the present invention.
The present invention further provides pharmaceutical compositions comprising one or more compounds of formula I in association with a pharmaceutically acceptable carrier or excipient.

Preferably the compositions according to the invention are in unit dosage forms such as tablets, pills, capsules, powders, granules, sterile parenteral solutions or suspensions, metered aerosol or liquid sprays, drops, ampoules, auto-injector devices, suppositories, creams or gels; for oral, parenteral, intrathecal, intranasal, sublingual, rectal or topical administration, or for administration by inhalation or insufflation. Oral compositions such as tablets, pills, capsules or wafers are particularly preferred. For preparing solid compositions such as tablets, the principal active ingredient is mixed with a pharmaceutical carrier, e.g. conventional tablettting ingredients such as corn starch, lactose, sucrose, sorbitol, talc, stearic acid, magnesium stearate, dicalcium phosphate or gums, and other pharmaceutical diluents, e.g. water, to form a solid pre-formulation composition containing a homogeneous mixture of a compound of the present invention, or a pharmaceutically acceptable salt thereof. When referring to these pre-formulation compositions as homogeneous, it is meant that the active ingredient is dispersed evenly throughout the composition so that the composition may be readily subdivided into equally effective unit dosage forms such as tablets, pills and capsules. This solid pre-formulation composition is then subdivided into unit dosage forms of the type described above containing from 0.1 to about 500 mg of the active ingredient of the present invention. Favoured unit dosage forms contain from 1 to 500 mg, for example 1, 5, 10, 25, 50, 100, 300 or 500 mg, of the active ingredient. The tablets or pills of the novel composition can be coated or otherwise compounded to provide a dosage form affording the advantage of prolonged action. For example, the tablet or pill can comprise an inner dosage and an outer dosage component, the latter being in the form of an envelope over the former. The two components can be separated by an enteric layer that serves to resist disintegration in the stomach and permits the inner component to pass intact into the duodenum or to be delayed in release. A variety of materials can be used for such enteric layers or coatings, such materials including a number of polymeric acids and mixtures of polymeric acids with such materials as shellac, cetyl alcohol and cellulose acetate.
The liquid forms in which the novel compositions of the present invention may be incorporated for administration orally or by injection include aqueous solutions, suitably flavoured syrups, aqueous or oil suspensions, and flavoured emulsions with edible oils such as cottonseed oil, sesame oil, coconut oil or peanut oil, as well as elixirs and similar pharmaceutical vehicles. Suitable dispersing or suspending agents for aqueous suspensions include synthetic and natural gums such as tragacanth, acacia, alginate, dextran, sodium carboxymethylcellulose, methylcellulose, polyvinyl-pyrrolidone or gelatin.

In the treatment of painful conditions such as those listed below, a suitable dosage level is about 1.0 mg to 15 g per day, preferably about 5.0 mg to 1 g per day, more preferably about 5 mg to 500 mg per day, especially 10 mg to 100 mg per day. may be removed at a convenient subsequent stage using methods known from the
art.

The reaction was diluted with water (50 ml), extracted with dichloromethane (2 x 50 ml) and the combined organic fractions dried over MgSO\(_4\) and condensed. The crude product was purified by flash column chromatography, eluting with 2 % methanol in dichloromethane, to give the title compound as a white solid (100 mg, 15 %). \(^1H \text{NMR (400 MHz, CDCl}_3\) \(\delta 9.10 (1H, s), 8.65 (1H, d, J 5.2), 7.99 (1H, dd, J 5.3, 0.8), 7.52 (2H, m), 7.23 (3H, m), 7.16 (1H, d, J 7.8), 7.10 (1H, m), 6.95 (1H, m), 4.42 (2H, s). \] m/z (ES\(^+\)) 398, 400 (M+H\(^+\)).
**Example 2** 3-(4-Chlorophenyl)-2-[2-(4-chlorophenyl)-2-oxoethyl]thio]pyrido[3,2-d]pyrimidin-4(3H)-one

A suspension of Description 5 (75 mg, 0.26 mmol), potassium carbonate (75 mg, 0.54 mmol) and 2-bromo-4'-chloroacetophenone (67 mg, 0.29 mmol) in acetonitrile (4 ml) was stirred at 75 °C for 5 h. The reaction was cooled and diluted with water (ca. 7 ml) to dissolve the salts. The solid was collected by filtration, rinsed with water (3 ml) then diethyl ether (5 ml) and dried to give the title compound as an off white solid (48 mg, 44 %). $^1$H NMR (500 MHz, DMSO) $\delta$ 8.69 (1H, m), 8.10 (2H, m), 7.75-7.66 (5H, m), 7.57 (2H, m), 7.54 (1H, m), 4.77 (2H, s). M/z (ES$^+$) 442, 444 (M+H$^+$).

**Examples 3-48**

Examples 3-46 were prepared using the appropriate purinone or pyrimidinone core (Descriptions 5, 7, 8, 12, 15, 16, 19, 20, 21, 23-25, 28 and 29) and the appropriate alkyl iodide, bromide or chloride in a procedure analogous to Example 2. Alkyl iodides, bromides and chlorides are commercially available or described in Description 22 or prepared by known methods as follows: 1-(2-bromoethyl)-4-trifluoromethyl benzene, *Can. J. Chem.* 1996, 74, 453; 3-bromomethylbenzo[b]thiophene, *J. Med. Chem.* 2002, 45, 4559; 4-(2-bromoethyl)chlorobenzene, *J. Am. Chem. Soc.* 1977, 99, 3059. Where the product did not precipitate analytically pure from the reaction it was purified by recrystallisation, flash column chromatography, preparative thin layer chromatography or mass directed HPLC as appropriate.

**Example 49** 3-(4-Chlorophenyl)-2-(3-oxo-4-phenylpiperazin-1-yl)pyrdo[3,2-d]pyrimidin-4(3H)-one

A mixture of Description 6 (50 mg, 0.17 mmol), 1-phenylpiperazin-2-one (Tetrahedron Lett. 1998, 39, 7459) (37 mg, 0.21 mmol) and potassium carbonate (240 mg, 1.7 mmol) in anhydrous acetonitrile (2 ml) was refluxed for 5 h. The
reaction was cooled to room temperature and the salts removed by filtration and washed with acetonitrile (3 x 10 ml). The filtrate was evaporated in vacuo and the resulting residue purified by mass directed HPLC, then passed through a strong cation exchange (SCX) cartridge to give the title compound (8 mg, 10 %). 

$^1$H (400 MHz, DMSO) δ 8.65 (1H, dd, $J_{1.6, 4.3}$), 7.94 (1H, dd, $J_{1.6, 8.2}$), 7.77 (1H, dd, $J_{4.1, 8.4}$), 7.64-7.61 (4H, m), 7.40-7.36 (2H, m), 7.26-7.22 (3H, m), 3.86 (2H, s), 3.43 (4H, s). $M/z$ (ES$^+$) 432, 434 (M+H$^+$).

Example 50 3-4-Chlorophenyl-2-[2-4-chlorophenylethylaminolpyrido

[3,2-d]pyrimidin-4(3H)-one

A mixture of Description 6 (58 mg, 0.2 mmol) and 2-(4-chlorophenyl)ethylamine (37 mg, 0.24 mmol) and potassium carbonate (138 mg, 1 mmol) in acetonitrile (2 ml) was heated at reflux for 4 h, then cooled to room temperature. The reaction mixture was then evaporated in vacuo and the residue partitioned between dichloromethane (15 ml) and water (2 x 15 ml). The organic layer was dried over MgSO$_4$, filtered and evaporated. The crude product was purified by preparative thin layer chromatography (eluant: 5% methanol in dichloromethane) to give the title compound as a beige solid (20 mg, 24 %). $^1$H (360 MHz, DMSO) δ 8.43 (1H, dd, $J_{1.4, 4.2}$), 7.75-7.72 (1H, m), 7.64-7.59 (3H, m), 7.37 (2H, d, $J_{8.6}$), 7.33 (2H, d, $J_{8.5}$), 7.21 (2H, d, $J_{8.4}$), 6.07 (1H, t, $J_{5.8}$), 3.50-3.45 (2H, m), 2.82 (2H, t, $J_{7.0}$). $M/z$ (ES$^+$) 411, 413 (M+H$^+$).

Example 51 3-(4-Chlorophenyl)-2-[3-fluorobenzyloxy]thieno[3,2-d]pyrimidin-4(3H)-one

To 3-fluorobenzylalcohol (16 mg, 0.127 mmol) in THF (1 ml) at 0 ºC was added NaH (60 % dispersion in oil, 5 mg, 0.130 mmol) and the solution allowed to warm to room temperature for 10 min. A solution of Description 10 (25 mg, 0.084 mmol) in THF (1 ml) was added and the reaction stirred for 18 h at room temperature. The reaction was concentrated, then dissolved in water (2 ml) and dichloromethane (2 ml) and the mixture vortexed. After settling, the mixture was added to a phase separation cartridge and the dichloromethane phase was separated and concentrated. The crude mixture was dissolved in dimethylsulfoxide and purified by mass-directed HPLC to give the title compound as a white solid (10 mg, 30 %). $^1$H (400 MHz, DMSO) δ 8.20 (1H, d, $J_{4.7}$), 7.59
(2H, d, J 7.7), 7.51 (2H, d, J 7.7), 7.35 (2H, m), 7.08 (2H, m), 6.99 (1H, d, J 8.8), 5.42 (2H, s). M/z (ES\(^+\)) 387, 389 (M+H\(^+\)).

The solvent was removed and the reaction then dissolved in water (2 ml) and dichloromethane (2 ml) added and the mixture vortexed. After settling, the mixture was added to a phase separation cartridge and the dichloromethane phase was separated and concentrated. The crude mixture was dissolved in dimethylsulfoxide and purified by mass-directed HPLC to provide the title compound as a white solid (9 mg, 27%). \(^1\)H (400 MHz, DMSO) δ 7.74 (1H, d, J 5.3), 7.57 (2H, d, J 8.3), 7.29 (3H, m), 7.14 (1H, d, J 5.3), 6.95 (3H, m), 4.62 (2H, d, J 5.4), 4.47 (1H, brm). M/z (ES\(^+\)) 386, 388 (M+H\(^+\)).

Examples 55-205, as shown below, were prepared using the appropriate purine or pyrimidinone core according to procedures described above. Synthesis of these cores is described above in Descriptions 5, 7, 8, 12, 15, 16, 19-21, 23-25, 28, 29, 47-76. Alkyl iodides, bromides, chlorides and amines are commercially available, prepared by known methods or by the methods described above. Where the product did not precipitate analytically pure from the reaction mixture it was purified by recrystallisation, flash column chromatography, preparative thin layer chromatography or mass directed HPLC as appropriate.

**Example 206** 1-(4-Chlorophenyl)-2-[2-(2,4-dichlorophenyl)ethylthio]-9-[2- dimethylaminoethyl]-1,9-dihydro-6H-purin-6-one

5 A suspension of Example 143 (200 mg, 0.40 mmol) in CH₂Cl₂ (4 ml) was added to a suspension of triphenylphosphine (127 mg, 0.49 mmol), imidazole (33 mg, 0.49 mmol) and iodine (123 mg, 0.49 mmol) in CH₂Cl₂ (2 ml). The resulting yellow suspension was stirred at room temperature for 5 h. The reaction was diluted with CH₂Cl₂ (10 ml) and shaken with a 1:1 mixture of water and saturated sodium thiosulphate solution (15 ml). The aqueous layer was extracted with
CH₂Cl₂ (2 x 20 ml) and the organic layers combined, dried over MgSO₄ and condensed to give the crude iodide (0.38 g). A portion of this iodide (125 mg) was taken up in a solution of dimethylaniline (5.6 M in EtOH, 0.37 ml) and stirred at room temperature. After 3 h additional dimethylaniline (5.6 M in EtOH, 0.3 ml) was added. After a further 90 min the reaction was condensed and taken up in fresh dimethylaniline (5.6 M in EtOH, 2.0 ml) and the reaction heated at 50 °C in a sealed tube for 2 h. The reaction was condensed then loaded onto a strong cation exchange cartridge in MeOH and eluted using methanolic ammonia (2 M). The crude product was purified by preparative TLC, eluting with 7.5 % methanol in CH₂Cl₂ to give the title compound (51 mg). ¹H NMR (360 MHz, CDCl₃) δ 7.80 (1 H, s), 7.50 (2H, d, J 8.7), 7.38 (1H, d, J 2.2), 7.22-7.14 (4H, m), 4.23 (2H, t, J 6.3), 3.35 (2H, t, J 7.4), 3.11 (2H, t, J 7.6), 2.73 (2H, t, J 6.4), 2.30 (6H, s); M/z (ES⁺) 526, 524, 525 (M+H⁺).

Methyl iodide (10 μl, 0.155 mmol) was added and the reaction stirred for 3 h. The reaction was loaded onto a strong cation exchange cartridge with methanol and then the product eluted with methanolic ammonia (2 M). The crude product was purified by preparative TLC, eluting with 5 % methanol in CH₂Cl₂ to give the title compound (52 mg, 84 %). ¹H NMR (500 MHz, DMSO) δ 8.04 (1H, s), 7.62 (2H, d, J 8.6), 7.42 (3H, m), 7.24 (2H, m), 3.84 (3H, s), 3.57-3.53 (1H, m), 3.36 (2H, t, J 7.4), 3.05 (2H, t, J 7.3), 1.15-1.11 (2H, m), 1.10-1.04 (2H, m). Example 208 1-(4-Chlorophenyl)-9-ethyl-2-[methyl(3,3,3-trifluoropropyl)amino]-1,9-dihydro-6H-purin-6-one

Sodium hydride (60 % in mineral oil, 10 mg, 0.26 mmol) was added to a solution of Example 141 (mono HCl salt, 45 mg, 0.12 mmol) in N,N-dimethylformamide (anhydrous, 2 ml), at RT and stirred for 5 min, effervescence seen. Methyl iodide (10 μl, 0.14 mmol) was added and the solution stirred for a further 20 min at
room temperature. Water (2 ml) was added and the product extracted into ethyl acetate, which was dried over MgSO₄, and evaporated *in vacuo* to give an oil. The oil was dissolved in dichloromethane and loaded onto a strong cation exchange (SCX) cartridge. The cartridge was washed with dichloromethane and methanol then the material eluted with 2 M ammonia in methanol. This was concentrated *in vacuo* and purified by preparative thin layer chromatography (eluant: 2.5 % methanol in dichloromethane with 0.1 % saturated aqueous ammonia) to give the title compound as a glass (19 mg, 40 %). ^1^H NMR (400 MHz, CDCl₃) δ 7.62 (1H, s), 7.45 (2H, d, *J* 8.7), 7.23 (2H, d, *J* 8.6), 4.13 (2H, q, *J* 7.3), 3.49-3.41 (2H, m), 2.53 (3H, s), 2.33-2.21 (2H, m), 1.52 (3H, t, *J* 7.3). *M/z* (ES⁺) 400, 402 (M+H⁺).

The above exemplified compounds of the present invention have been tested in the following assay and generally possess an IC\textsubscript{50} < 300nM and, in the majority of cases, < 200 nM. Other assays, such as electrophysiology using rat VR1 expressed in HEK cells measuring activity at various pH levels, can be used.

\textbf{Biological Methodology}

\textbf{Determination of \textit{in vitro} activity}

CHO cells, stably expressing recombinant human VR1 receptors and plated into black-sided 384-well plates, were washed twice with assay buffer (Hepes-buffered saline) and then incubated with 1uM Fluo-3-AM for 60 minutes in darkness. Cells were washed twice more to remove excess dye, before being placed, along with plates containing capsaicin and test compounds in a Molecular Devices FLIPR. The FLIPR simultaneously performed automated pharmacological additions and recorded fluorescence emmission from Fluo-3. In all experiments, basal fluorescence was recorded, before addition of test compounds and subsequent addition of a previously determined concentration of capsaicin that evoked 80% of the maximum response. Inhibition of capsaicin evoked increases in intracellular [Ca\textsuperscript{2+}] were expressed relative to wells on the same plate to which capsaicin was added in the absence of test compounds. Increases in intracellular [Ca\textsuperscript{2+}] occurring after addition of test compound alone, prior to addition of capsaicin, allow determination of intrinsic agonist or partial agonist activity, if present.

INTERNATIONAL SEARCH REPORT

Box II Observations where certain claims were found unsearchable (Continuation of Item 2 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. [X] Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
   Although claims 10,11 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compounds.

2. [ ] Claims Nos.: because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:

3. [ ] Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box III Observations where unity of invention is lacking (Continuation of Item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. [ ] As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2. [ ] As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. [ ] As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:

4. [ ] No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

[ ] The additional search fees were accompanied by the applicant's protest.

[ ] No protest accompanied the payment of additional search fees.
