UNITED STATES PATENT OFFICE.

ALBERT M. DAVIS, OF BOSTON, MASSACHUSETTS.

SHAVING-STICK HOLDER.

1,186,290.

Specification of Letters Patent.

Patented June 6, 1916.

Application filed December 19, 1913. Serial No. 807,657.

To all whom it may concern:

Be it known that I, ALBERT M. DAVIS, a citizen of the United States, and a resident of Boston, in the county of Suffolk and State of Massachusetts, have invented a new and useful Improvement in Shaving-Stick Holders, of which the following is a specification.

My invention relates to shaving-stick holders and its object is to improve and simplify the construction of such devices in the manner hereinafter set forth.

My invention will be described by reference to the accompanying drawings, in which,—

Figure 1 is an elevation of a shaving-stick holder constructed in accordance with my invention. Fig. 2 is a longitudinal central section showing the container arranged at the bottom of the holder on the end of a shaving-stick. Fig. 3 is a similar section showing the container advanced from its initial position to project the end of the shaving stick from the holder as the stick becomes shortened by use. Fig. 4 is a transverse section taken on the line 4—4 of Fig. 3. Fig. 5 is an elevation of the container. Fig. 6 is a longitudinal central section taken on the line 6—6 of Fig. 5. Fig. 7 is an elevation of a modification. Fig. 8 is a longitudinal central section of the holder shown in Fig. 7. Fig. 9 is an elevation of said modification showing the cap arranged on the bottom of the holder.

In the particular drawings selected for more fully disclosing my invention, 1 represents a cylinder, preferably of metal, having a cap 2 and adapted to receive a shaving-stick 3. Two diametrically-opposite longitudinally-extending portions 4, 4 of the cylinder are flattened as shown in Fig. 4 and provided with corrugations 5. The cupped container 6, also preferably of metal, is provided with two oppositely arranged spurs 7, the container being of such diameter that it will snugly fit the cylinder 1, and the spurs being preferably slightly narrower than the circumferential length of the corrugations. The container is forced over the lower end of the shaving-stick and the stick and container then inserted into the holder, so that by the coöperation of the spurs with the corrugations, retrograde movement of the stick will be prevented as the same is advanced from time to time for use.

In the embodiment shown in Fig. 7, the cylinder or holder 1' is provided with circumferentially-extending corrugations 5' with which the spurs 7 of the container coöperate to prevent retrograde movement of the stick in the manner above set forth.

As shown in Fig. 9, the cap 2 may be placed over the lower end of the holder when the stick is in use.

In both embodiments of my invention the bottom of the cup-shaped container is substantially flush with the lower end of the cylindrical body 1, 1' before the shaving-stick has been advanced for use, and thus constitutes a closure for the holder.

It will be obvious that various modifications may be made in the devices above particularly described without departing from the spirit of my invention.

I claim:

1. A shaving-stick holder comprising a cylindrical body provided with corrugations, and a cup-shaped container snugly fitting the interior of said cylindrical body and adapted to receive the end of a shaving stick, said container being provided with two diametrically opposite spurs projecting downwardly from its sides and arranged to coöperate with said corrugations for preventing retrograde movement of said shaving-stick as the same is advanced for use.

2. A shaving-stick holder comprising a cylindrical body having two diametrically-opposite longitudinally-extending flattened portions provided with corrugations, and a cup-shaped container snugly fitting the interior of said cylindrical body and adapted to receive the end of a shaving-stick, said container being provided with spurs projecting downwardly from its sides and arranged to coöperate with said corrugations for preventing retrograde movement of said shaving-stick as the same is advanced for use.

3. A shaving-stick holder comprising a cylindrical body provided with corrugations, and a cup-shaped container snugly fitting the interior of said cylindrical body and adapted to receive the end of said shaving-stick, said container being provided with spurs projecting downwardly from its sides and arranged to coöperate with said corrugations for preventing retrograde move-

ment of said shaving-stick as the same is advanced for use and the bottom of said container being substantially flush with the lower end of said cylindrical body before
5 said shaving-stick is advanced for use and constituting a closure for said body.

In testimony whereof, I have hereunto

subscribed my name this 18th day of December, 1913.

ALBERT M. DAVIS.
