Field of Search Pkt./303

BACKGROUND OF THE INVENTION

The present Invention relates to a new and distinct cultivar of Poinsettia plant, botanically known as Euphorbia pulcherrima Willd., and hereinafter referred to by the name ‘Eckailen’.

The new Poinsettia is a product of a planned breeding program conducted by the Inventor in Encinitas, Calif. The objective of the breeding program is to create new Poinsettia cultivars having flower bracts with desirable colors, uniform plant habit and excellent post-production longevity.

The new Poinsettia is a naturally-occurring whole plant mutation of the Poinsettia cultivar Windark, disclosed in U.S. Plant patent application Ser. No. 09/087,917. The new Poinsettia was discovered and selected by the Inventor as a single flowering plant within a population of plants of the parent cultivar in a controlled environment in Encinitas, Calif., in December, 1998. The selection of this plant was based on its attractive flower bract colors and good plant form and substance.

Asexual reproduction of the new Poinsettia by terminal cuttings taken at Encinitas, Calif., since December, 1998, has shown that the unique features of this new Poinsettia are stable and reproduced true to type in successive generations of asexual reproduction.

BRIEF SUMMARY OF THE INVENTION

The following traits have been repeatedly observed and are determined to be the unique characteristics of ‘Eckailen’. These characteristics in combination distinguish ‘Eckailen’ as a new and distinct cultivar.

1. Inflorescences with recurved red and dark pink bi-colored flower bracts.
2. Dark green-colored recurved leaves with burgundy-colored petiolar.
3. Compact, uniform and upright plant habit.
4. Natural season flower maturity date is December 5 for plants grown in Encinitas, Calif.; response time, about 10 weeks.
5. Excellent post-production longevity.

Plants of the new Poinsettia differ primarily from plants of the mutation parent, the cultivar Windark, in flower bract coloration as flower bracts of plants of the cultivar Windark are solid red in color.

BRIEF DESCRIPTION OF THE PHOTOGRAPHS

The accompanying colored photographs illustrate the overall appearance of the new Poinsettia, showing the colors as true as it is reasonably possible to obtain in colored reproductions of this type. Colors in the photographs may differ slightly from the color values cited in the detailed botanical description which accurately describe the colors of the new Poinsettia.

The photograph on the first sheet comprises a side perspective view of three typical plants of ‘Eckailen’ planted in a single container.

The photograph at the top of the second sheet comprises a top perspective view of three typical plants of ‘Eckailen’ planted in a single container.

The photograph at the bottom of the second sheet is a close-up view of typical leaves and flower bracts of ‘Eckailen’ (top) and ‘Windark’ (bottom). Plants used in the photographs were about 19 weeks old.

DETAILED BOTANICAL DESCRIPTION

The new Poinsettia has not been observed under all possible environmental conditions. The phenotype may vary somewhat with variations in environment such as temperature, daylength and light intensity, without, however, any variance in genotype. The following observations and measurements describe plants grown in Encinitas, Calif., under commercial practice in a glass-covered greenhouse with day temperatures about 24° C., night temperatures about 19° C., and light levels about 4,000 foot-candles. Three plants were grown in 16.5-cm pots as single-stem plants and flowered under naturally lengthening nyctoperiods during the fall. Plants used for the description were about 19 weeks old.

In the following description, color references are made to The Royal Horticultural Society Colour Chart except where general terms of ordinary dictionary significance are used.

Botanical classification: Euphorbia pulcherrima Willd. cultivar Eckailen.

Propagation:
- **Type cutting.**—Terminal cuttings.
- **Time to initiate roots.**—About 10 days at 20 to 22°C.
- **Time to develop roots.**—About 28 days at 20 to 22°C.
- **Rooting habit.**—Thick, fibrous and freely-branching.

Plant description:
- **Plant form.**—Inverted triangle, top of plant rounded; mounding.
- **Growth habit.**—Upright, compact and uniform plant habit. Strong, thick stems. Moderate vigor to vigorous.
- **Plant height.**—About 26 cm.
- **Plant diameter or spread.**—About 33 cm.
- **Crop time.**—From unrooted cuttings to a flowering plant in a 16.5-cm container, about 19 weeks are required.

**Stem description.**—Length: About 26 cm. Diameter: About 1.4 cm. Internode length: About 1.25 cm. Stem color: 146A.

**Inflorescence description.**
- **Inflorescence type and habit.**—Inflorescences are compound corymbs of cyathia with colored flower bracts subtending the cyathia.
- **Natural flowering season.**—Autumn/winter in Norther Hemisphere. Flower initiation and development can be induced under long nychtoperiod conditions. Response time, about 10 weeks; natural season flower maturity date is December 5 for plants grown in Encinitas, Calif.
- **Post-production longevity.**—Plants of the new Poinsettia maintain good substance and bract color for about 4 to 6 weeks under interior conditions and for about 8 weeks under greenhouse conditions.
- **Quantity of inflorescences.**—Plants grown as single-stem plants, one inflorescence per plant.
- **Inflorescence size.**—Diameter: About 13 cm. Height (depth): About 6.5 cm.

Disease resistance: Resistance to pathogens common to Poinsettias has not been observed on plants grown under commercial conditions.

It is claimed:
1. A new and distinct cultivar of Poinsettia plant named 'Eckaileen', as illustrated and described.
