2-[5-(5-CARBAMIMIDOYL-1H-HETEROARYL)]-6-HYDROXYBIPHENYL-3-YL-
DERIVATIVES AS FACTOR VIIA INHIBITORS

BACKGROUND OF THE INVENTION

5

Field of invention

The present invention relates to novel inhibitors of Factor VIIa and Factor Xa, in
particular Factor VIIa, pharmaceutical compositions comprising these inhibitors and
methods for using these inhibitors for treating or preventing thromboembolic disorders.

Processes for preparing these inhibitors are also disclosed.

State of the Art

Thrombosis results from a complex sequence of biochemical events, known as the
coagulation cascade. A triggering event in coagulation is the binding of the serine protease
Factor VIIa found in the circulation to tissue factor (TF), a receptor which is found on the
surface of blood vessels after damage or inflammation. Once bound to TF Factor VIIa
catalyzes the formation of the serine protease Factor Xa, which subsequently forms the final
protease in the cascade, thrombin.

The clinical manifestations of thrombosis range from acute myocardial infarction and
unstable angina which occur in the key blood vessels of the heart to deep vein thrombosis
(DVT) which is the formation of blood clots in lower extremities which often follows
orthopedic surgery on the hip and knee, as well as general abdominal surgery and paralysis.
Formation of DVT is a risk factor for the development of pulmonary embolism (PE) in which
part of a blood clot formed in the lower extremities, breaks off and travels to the lung where
it blocks the flow of blood. The unpredictable development of PE often leads to a fatal
outcome. Thrombosis can also be generalized systemically with microclot formation
occurring throughout the vascular system. This condition, known as disseminated
intravascular coagulation (DIC), can be a consequence of certain viral diseases such as Ebola,
certain cancers and sepsis. Severe DIC can lead to a dramatic reduction in the coagulation
factors due to the excessive activation of the clotting response which may result in multiple
organ failure, hemorrhage and death.

The formation or embolization of blood clots in the blood vessels of the brain is the
key event resulting in ischemic stroke. Triggering factors that lead to stroke are atrial
fibrillation or abnormal rhythm of the atria of the heart and atherosclerosis followed by thrombosis in the main artery leading from the heart to the brain, the carotid artery. Over 600,000 individuals suffer strokes each year in the U.S. Two-thirds of these stroke victims suffer some disability and one-third suffer permanent and severe disability. Accordingly, there is a need for antithrombotic agents for the treatment of a variety of thrombotic conditions. The present invention fulfills this and related needs.

Administration and Pharmaceutical Compositions

In general, the compounds of this invention will be administered in a therapeutically effective amount by any of the accepted modes of administration for agents that serve similar utilities. The actual amount of the compound of this invention, i.e., the active ingredient, will depend upon numerous factors such as the severity of the disease to be treated, the age and relative health of the subject, the potency of the compound used, the route and form of administration, and other factors.

Therapeutically effective amounts of compounds of Formula I may range from approximately 0.1-50 mg per kilogram body weight of the recipient per day; preferably about 0.5-20 mg/kg/day. Thus, for administration to a 70 kg person, the dosage range would most preferably be about 35 mg to 1.4 g per day.

In general, compounds of this invention will be administered as pharmaceutical compositions by any one of the following routes: oral, systemic (e.g., transdermal, intranasal or by suppository), or parenteral (e.g., intramuscular, intravenous or subcutaneous) administration. The preferred manner of administration is oral or parenteral using a convenient daily dosage regimen, which can be adjusted according to the degree of affliction. Oral compositions can take the form of tablets, pills, capsules, semisolids, powders, sustained release formulations, solutions, suspensions, elixirs, aerosols, or any other appropriate compositions.
The choice of formulation depends on various factors such as the mode of drug administration (e.g., for oral administration, formulations in the form of tablets, pills or capsules are preferred) and the bioavailability of the drug substance. Recently, pharmaceutical formulations have been developed especially for drugs that show poor bioavailability based upon the principle that bioavailability can be increased by increasing the surface area i.e., decreasing particle size. For example, U.S. Pat. No. 4,107,288 describes a pharmaceutical formulation having particles in the size range from 10 to 1,000 nm in which the active material is supported on a crosslinked matrix of macromolecules. U.S. Pat. No. 5,145,684 describes the production of a pharmaceutical formulation in which the drug substance is pulverized to nanoparticles (average particle size of 400 nm) in the presence of a surface modifier and then dispersed in a liquid medium to give a pharmaceutical formulation that exhibits remarkably high bioavailability.

The compositions are comprised of in general, a compound of Formula I in combination with at least one pharmaceutically acceptable excipient. Acceptable excipients are non-toxic, aid administration, and do not adversely affect the therapeutic benefit of the compound of Formula I. Such excipient may be any solid, liquid, semi-solid or, in the case of an aerosol composition, gaseous excipient that is generally available to one of skill in the art.

Solid pharmaceutical excipients include starch, cellulose, talc, glucose, lactose, sucrose, gelatin, malt, rice, flour, chalk, silica gel, magnesium stearate, sodium stearate, glycerol monostearate, sodium chloride, dried skim milk and the like. Liquid and semisolid excipients may be selected from glycerol, propylene glycol, water, ethanol and various oils, including those of petroleum, animal, vegetable or synthetic origin, e.g., peanut oil, soybean oil, mineral oil, sesame oil, etc. Preferred liquid carriers, particularly for injectable solutions, include water, saline, aqueous dextrose, and glycols.

Compressed gases may be used to disperse a compound of this invention in aerosol form. Inert gases suitable for this purpose are nitrogen, carbon dioxide, etc.

The amount of the compound in a formulation can vary within the full range employed by those skilled in the art. Typically, the formulation will contain, on a weight percent (wt %) basis, from about 0.01-99.99 wt % of a compound of Formula I based on the total formulation, with the balance being one or more suitable pharmaceutical excipients.
Preferably, the compound is present at a level of about 1-80 wt %. Representative pharmaceutical formulations containing a compound of Formula I are described below.

![Chemical Structure](image)

2-[5-(5-Carbamimidoyl-1H-benzoimidazol-2-yl)-5'-cyano-6,2'-dihydroxy-biphenyl-3-yl]-3-hydroxy-2-hydroxymethyl-propionic acid methyl ester (0.108 g, 0.2 mmol), prepared as in Example 4, was dissolved in aqueous hydrochloric acid (3 ml, 1N) and methanol (6 ml) and the solution was subjected to hydrogenation at 1 atm over Pd(OH\(_2\)) \(_2\) (0.03 g) for 2 hours. The mixture was filtered through celite and the filtrate was concentrated in vacuum. The
residue was trituted with ethyl ether and the solids were collected by filtration to give 2-[5'-aminomethyl-5-(5-carbamimidoyl-1H-benzoimidazol-2-yl)-6,2'-dihydroxy-biphenyl-3-yl]-3-hydroxy-2-hydroxymethyl-propionic acid methyl ester (0.1 g).

The 2-[5'-aminomethyl-5-(5-carbamimidoyl-1H-benzoimidazol-2-yl)-6,2'-dihydroxy-biphenyl-3-yl]-3-hydroxy-2-hydroxymethyl-propionic acid methyl ester was heated with aqueous hydrochloric acid (6 ml, 3N) in acetitrile (6 ml) for 6 hours. The solvents were removed in vacuum and product purified from the residue by reversed phase HPLC (acetonitrile gradient) to give 2-[5'-aminomethyl-5-(5-carbamimidoyl-1H-benzoimidazol-2-yl)-6,2'-dihydroxy-biphenyl-3-yl]-3-hydroxy-2-hydroxymethyl-propionic acid (0.09 g).

The 2-[5'-aminomethyl-5-(5-carbamimidoyl-1H-benzoimidazol-2-yl)-6,2'-dihydroxy-biphenyl-3-yl]-3-hydroxy-2-hydroxymethyl-propionic acid was dissolved in a mixture of methanol and water and then triethylamine was added to establish pH 9. Potassium cyanate (0.081 g, 1 mmol) was added and the mixture was heated for 12 hours at 45 to 55°C. The mixture was concentrated under reduced pressure and the product was purified from the residue by reversed phase HPLC (acetonitrile gradient) to give 2-[5-(5-carbamimidoyl-1H-benzoimidazol-2-yl)-6,2'-dihydroxy-5'-ureidomethyl-biphenyl-3-yl]-3-hydroxy-2-hydroxymethyl-propionic acid. MS: found (M+H') 535.1, (M-H') 533.3, calc. 534.19.

Proceeding as in Example 5, but substituting sulfamide for potassium cyanate, gave 2-[5-(5-carbamimidoyl-1H-benzoimidazol-2-yl)-6,2'-dihydroxy-5'-aminosulfonylaminomethyl-biphenyl-3-yl]-3-hydroxy-2-hydroxymethyl-propionic acid (Compound 9).

Biological Examples

EXAMPLE 6

In Vitro Factor VIIa Inhibitor Assay

Mixtures of human Factor VIIa (0.5-5 nM) and test compound (varying concentrations) in assay medium (comprising: NaCl, 150 mM (pH 7.4); CaCl₂, 5 mM; Tween-20, 0.05%; tissue factor, 25 nM; EDTA, 1.5 mM; and dimethylsulfoxide, 10%).
Human Factor VIIa (7 nM) incubated with the substrate (500 μM of CH$_3$SO$_2$-D-CHA-But-Arg-pNA) in the presence of inhibitor. Hydrolysis of the chromogenic substrate was followed spectrophotometrically at 405 nm for five minutes. Initial velocity measurements calculated from the progress curves by a kinetic analysis program (Batch Ki; Peter Kuzmic, BioKin, Ltd., Madison, WI) were used to determine the $K_{i}$ app.

Compounds of the invention tested by the above-described assay exhibited inhibition of Factor VIIa.

EXAMPLE 7

*In Vitro* Factor Xa Inhibitor Assay

Mixtures of human Factor Xa (0.5-5 nM) and test compound (varying concentrations) in assay medium (comprising: Tris, 50 mM (pH 8); NaCl, 1M; CaCl$_2$, 5 mM; polyoxyethylenesorbitan monolaurate (Tween-20), 0.05%; DMSO, 10%; zinc chloride, 150 μM) were incubated for 1 hour at room temperature and then substrate, MesOC-Norleu-Gly-Arg-pNA, was added such that the final concentration of the substrate in the assay mixture was between 0.5 and 5 mM. Hydrolysis of the substrate was followed spectrophotometrically at (405 λ) for 5 minutes. Apparent inhibition constants ($K_{i}$) were calculated from the enzyme progress curves using standard mathematical models.

Compounds of the invention tested by the above-described assay exhibited inhibition of Factor Xa.

EXAMPLE 8

Pharmacokinetic Assay

Rats with pre-implanted jugular vein catheters, filled with heparin/saline/PVP lock prior to shipment, were obtained from Charles River. Three rats were selected for each study, weighed and administered test compound by tail vein injection. Any residual test compound was retained and stored at -70 °C for later analysis.

Blood samples (0.25 mL each) were collected from the indwelling catheters at specified times over 120 hours. The catheters were flushed with physiological saline immediately after each collection and filled with heparinized saline after each 8, 24 and 48
hour collection. In the event that a catheter failed, blood samples were collected via the retro-orbital sinus under isoflurane anesthesia at the appropriate time.

Blood samples were placed in 0.5 mL Microtainer® tubes (lithium heparin), shaken gently and stored on wet ice. The samples were centrifuged for 10 minutes at 2400 rpm in a refrigerated centrifuged. Plasma samples (100 μL) from each tube were transferred to 0.5 mL Unison polypropylene vials (Sun - 500210) and stored below -70 °C for later analysis by LC/MS-MS.

EXAMPLE 9

In vitro Clotting Assays

Coagulation assays, activated partial thromboplastin time (aPTT) and prothrombin time (PT) were carried out based on the procedure described in Hougie, C. Hematology (Williams, W. J., Beutler, B., Erslev, A. J., and Lichtman, M. A., Eds.), pp. 1766-1770 (1990), McGraw-Hill, New York.

Briefly, the assays were performed using normal human citrated plasma and were performed at 37°C on a coagulometer (Electra 800) in accordance with the manufacturer’s instructions (Medical Laboratory Automation- Pleasantville, New York). The instrument was calibrated with plasma immediately prior to collecting clotting times for samples with inhibitors. The aPTT and PT doubling concentrations were calculated by fitting inhibitor dose response curves to a modified version of the Hill equation.

INTERNATIONAL SEARCH REPORT

Box I  Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. [X] Claims Nos.;
   because they relate to subject matter not required to be searched by this Authority, namely:
   Although claim 16 is directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the composition.

2.   Claims Nos.;
   because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:

3.   Claims Nos.;
   because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II  Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1.   As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2.   As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3.   As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.: 

4.   No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.: 

Remark on Protest

☐ The additional search fees were accompanied by the applicant’s protest.

☐ No protest accompanied the payment of additional search fees.
