CLEANING PRODUCT

FIELD OF INVENTION

The present invention relates to a cleaning product. In particular, it relates to a cleaning product comprising a spray dispenser and a cleaning composition. The product makes the cleaning of
5 dishware easier and faster.

BACKGROUND OF THE INVENTION

Traditionally manual dishwashing has been performed by filling a sink with water, adding a dishwashing detergent to create a soapy solution, immersing the soiled articles in the solution, scrubbing the articles and rinsing to remove the remaining soils and remove the suds generated
10 from the soapy solution from the washed articles. Traditionally an entire load of soiled dishware has usually been washed in one go. Nowadays some users prefer to clean articles as soon as they have finished with them rather than wait until they have a full load. This involves washing one article or a small number of articles at the time. The washing is usually performed under running water rather than in a full sink. The cleaning should be fast and involve minimum effort from
15 the user.

Nowadays, a high number of users prefer to do the washing under the tap. This usually involves the use of a cleaning implement, such as a sponge. The user delivers detergent to the sponge. When the number of items to be cleaned is small, there is the risk of dosing more detergent than
20 required, this will require the need for more rinsing for the dishware and the cleaning implement. Another disadvantage associated to this method, is that some time is required to mix the detergent with water in the sponge, this can slow down the cleaning process.

When the cleaning of a lightly soiled article is done under running water, it is desirable that the
25 cleaning is performed quickly and with minimum effort. Ideally, the product should be applied and then immediately rinsed obviating or reducing the need for scrubbing.

Spray products are well liked by users. A sprayable composition for use in hand dishwashing should be easy to spray, deliver fast and long lasting suds, easy to rinse and at the same time should provide fast and good cleaning of a variety of soils. The composition should be such that

when sprayed onto the dishware spreading to the surrounding atmosphere should be minimised or avoided. Spreading to the surrounding atmosphere can not only give rise to waste of the product but it can also have inhalation risks associated to it.

- 5 The object of the present invention is to facilitate cleaning, especially the manual dishwashing task, in particular by reducing the time and effort needed to achieve the cleaning.

BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1 depicts a setting for testing the product of the invention. Part A displays the first container
10 (7) inside the second container (8). The second container is placed up-side-down at the centre of the first container. The first and the second container have side walls (3 and 2, respectively) defining a moat. The first container has an aperture (5) for the feeding of the oil. Part B displays the removal of the first container. Part C displays the oil island created surrounded by water.

15 SUMMARY OF THE INVENTION

According to a first aspect of the invention, there is provided a cleaning product. The product is suitable for the cleaning of any kind of surfaces but preferably the product is a hand dishwashing cleaning product. The product comprises a spray dispenser and a cleaning composition. The composition is a foaming composition and it is suitable for spraying. The composition is housed
20 in the spray dispenser. The “composition” of the cleaning product of the invention is herein sometimes referred to as “the composition of the invention”.

By “spray dispenser” is herein meant a container comprising a housing to accommodate the composition and means to spray that composition. The preferred spraying means being a trigger
25 spray. The composition foams when it is sprayed. Foaming is a property that users associate with cleaning therefore it is important that the composition of the invention foams to send the user the signal that the composition is cleaning.

The composition of the invention comprises:

- i) at least 5%, preferably from 6% to 15% by weight of the composition of a surfactant system comprising:
- ii) 60% to 90% by weight of the surfactant system of a primary surfactant selected from the group consisting of amphoteric surfactant, zwitteronic surfactant and mixtures thereof; preferably the primary surfactant is selected from the group consisting of amine oxide, betaines and mixtures thereof;
- iii) 10 to 40% by weight of the surfactant system of a co-surfactant selected from non-ionic, anionic and mixtures thereof; and
- iv) a glycol ether solvent selected from the group consisting of glycol ethers of Formula I: $R_1O(R_2O)_nR_3$, Formula II: $R_4O(R_5O)_nR_6$ and mixtures thereof

wherein

R_1 is a linear or branched C_4 , C_5 or C_6 alkyl or a substituted or unsubstituted phenyl, R_2 is ethyl or isopropyl, R_3 is hydrogen or methyl and n is 1, 2 or 3

R_4 is n-propyl or isopropyl, R_5 is isopropyl, R_6 is hydrogen or methyl and n is 1, 2 or 3

The surfactant system and the glycol ether solvent are in a weight ratio of from about 5:1 to about 1:1, preferably from about 3:1 to about 1:1. The surfactant system seems to help with the cleaning and foam generation. With the claimed level of surfactant, the specific solvent and the surfactant:solvent weight ratio flash suds and long lasting suds are generated. The suds generated when spraying the composition of the invention are strong enough to withstand the impact force when the foam contact the article to be washed but at the same time the composition is easy to rinse.

The composition of the invention provides good cleaning, in particular, good cleaning of oily soils. The composition of the invention not only provides outstanding cleaning but also very fast cleaning, requiring reduced scrubbing effort by the consumer. Thus the product of the invention is especially suitable for cleaning dishware under the tap. When the dishware is only lightly soiled the composition of the invention provides very good cleaning with reduced scrubbing or in the absence of scrubbing. The dishware can be cleaned by simply spraying the composition followed by a rinse with water, optionally aided by a low force wiping action.

In the case of heavily soiled dishware the product of the invention can facilitate the removal of the soil when the product is used to pre-treat the dishware. Pre-treatment usually involves leaving the soiled dishware with the neat product.

- 5 Compositions having the claimed level of surfactant system and the claimed weight ratio of surfactant system to glycol ether solvent when sprayed provide good coverage on the dishware with minimum over spray, thereby avoiding wasting product or the risk of inhalation.

Compositions having a surfactant:solvent weight ratio lower than 1:1 do not seem to be able to foam and/or tend to phase separate creating physical instability in the product. Compositions
10 having a surfactant:solvent weight ratio higher than 5:1 are difficult to spray and are prone to gelling when in contact with greasy soils in the presence of the low levels of water typically present when the product of the invention is used. Gel formation would inhibit the spreading of the composition negatively impairing on the cleaning.

- 15 Preferably, the composition of the invention has a pH greater than 8, more preferably from 9 to 12, most preferably from 9.5 to 11.5 as measured at 10% solution in distilled water at 20°C and a reserve alkalinity of from about 0.1 to about 1, more preferably from about 0.1 to about 0.5. Reserve alkalinity is herein expressed as grams of NaOH/100 ml of composition required to titrate product from a pH 10 to the pH of the finished composition. This pH and reserve
20 alkalinity further contribute to the cleaning of tough food soils.

Compositions having a surfactant system comprising the primary surfactant and a co-surfactant have been found to be very good from a cleaning and sudsing viewpoint. They have also been found very good from a spray pattern view point. The presence of small droplets (and therefore the risk of inhalation) is minimized when the surfactant system of the composition of the
25 invention contains anionic surfactant. By co-surfactant is herein meant a surfactant that is present in the composition in an amount lower than the main surfactant. By main surfactant is herein meant the surfactant that is present in the composition in the highest amount. Preferably the primary surfactant comprises amine oxide.

The primary surfactant is selected from the group consisting of betaine, amine oxide and mixtures thereof. Amine oxide is the preferred primary surfactant for use herein. The co-surfactant is selected from the group consisting of non-ionic surfactant, anionic surfactant and mixtures thereof. Particularly good performing products are those in which the primary surfactant and the co-surfactant are present in a weight ratio of about 10:1 to about 4:1, preferably in a weight ratio of from about 8:1 to about 3:1, most preferably in a weight ratio from about 7:1 to about 2:1. Especially preferred are compositions in which the co-surfactant comprises a non-ionic surfactant.

The composition of the invention comprises glycol ethers selected from the group consisting glycol ethers of Formula I, Formula II and mixtures thereof. It has been found that these glycol ethers help not only with the speed of cleaning of the product but also with the cleaning, especially greasy soils cleaning. This does not seem to happen with glycol ethers having a different formula to Formula I and Formula II.

Preferably, the composition of the invention further comprises a chelant, preferably an aminocarboxylate chelant, more preferably GLDA. The aminocarboxylate not only act as a chelant but also contributes to the reserve alkalinity, this seems to help with the cleaning of cooked-, baked- and burnt-on soils. Preferably, the composition of the invention comprises bicarbonate and/or monoethanol and/or carboxylate builder preferably citrate builder, that as in the case of the of the aminocarboxylate chelant also contribute to the reserve alkalinity.

The composition of the invention can be Newtonian or non-Newtonian. Preferably the composition is a shear thinning fluid. This is important to allow the composition to be easily sprayed. The viscosity of the composition of the invention should also make the fluid to stay in vertical surfaces to provide cleaning and at the same time be easy to rinse. Especially suitable have been found compositions having a starting viscosity at high shear (10,000 s⁻¹) of from about 1 to about 10 mPa s. Preferably, the composition is a shear thinning composition having a low shear (100 s⁻¹) to high shear (10,000 s⁻¹) viscosity ratio of from about 10:1 to about 1.5:1 at 20°C as measured using the method defined herein below. Preferably the compositions of the invention comprises xanthan gum.

A preferred composition preferably has a pH of from 10 to 11.5 as measured in a 10% solution in distilled water at 20°C, a reserve alkalinity of from 0.1 to 0.3, expressed as g NaOH/ 100ml of composition at a pH of 10, the composition comprising:

- 5 i) from about 4 to about 10%, preferably from about 5 to about 8% by weight of the composition of an amine oxide surfactant;
- ii) from about 1 to about 5% by weight of the composition of a non-ionic surfactant; and
- iii) from about 3% to about 8%, preferably from about 4 to about 7% by weight of the
- 10 composition of glycol ether solvent, preferably dipropylene glycol n-butyl ether.

According to the second aspect of the invention, there is provided a method of cleaning soiled dishware using the product according to any of the preceding claims comprising the steps of:

- a) optionally pre-wetting the soiled dishware
- b) spraying the cleaning composition onto the soiled dishware;
- 15 c) optionally adding water to the soiled dishware during a period of time;
- d) optionally scrubbing the dishware; and
- e) rinsing the dishware.

The method of the invention allows for faster and easier cleaning of dishware under running tap, especially when the dishware is lightly soiled. When the dishware is soiled with tough food soils
20 such as cooked-, baked- or burnt-on soils the method of the invention facilitates the cleaning when the soiled dishware is soaked with the product of the invention in neat form or diluted in water.

DETAILED DESCRIPTION OF THE INVENTION

The present invention envisages a cleaning product, preferably a hand dishwashing cleaning
25 product, the product comprises a spray dispenser and a cleaning composition. The cleaning composition comprises a surfactant system and a specific glycol ether solvent. The product of the invention simplifies the cleaning task, in particular the manual cleaning task, by making the task easier and faster. The product of the invention is particularly suitable for the manual cleaning of dishware.

For the purpose of the present invention “dishware” encompasses all the items used to either cook or used to serve and eat food.

Cleaning composition

5 The cleaning composition is preferably a hand dishwashing cleaning composition, preferably in liquid form.

Preferably the pH of the composition is greater than 8, more preferably from about 10 to about 12 and most preferably from about 9.5 to about 11.5, as measured at 20°C and 10% concentration in distilled water. Preferably, the composition has a reserve alkalinity of from
10 about 0.1 to about 1, more preferably from about 0.1 to about 0.5 measured as detailed herein below.

Reserve alkalinity is defined as the grams of NaOH per 100 g of composition required to titrate the test composition at pH 10 to come to the test composition pH. The reserve alkalinity for a solution is determined in the following manner.

15 A pH meter (for example An Orion Model 720A) with a Ag/AgCl electrode (for example an Orion sure flow Electrode model 9172BN) is calibrated using standardized pH 7 and pH 10 buffers. A 100g of a 10% solution in distilled water at 20°C of the composition to be tested is prepared. The pH of the 10% solution is measured and the 100g solution is titrated down to pH 10 using a standardized solution of 0.1 N of HCl. The volume of 0.1N HCl required is recorded
20 in ml. The reserve alkalinity is calculated as follows:

Reserve Alkalinity = ml 0.1N HCl x 0.1 (equivalent / liter) x Equivalent weight NaOH (g/equivalent) x 10

Surfactant system

25 The cleaning composition preferably comprises from about 5% to about 15%, more preferably from about 6% to about 14% and especially from about 7% to about 12% by weight thereof of a surfactant system. The surfactant system comprises a primary surfactant selected from the group consisting of amphoteric surfactant, zwitteronic surfactant and mixtures thereof, preferably the amphoteric surfactant comprises an amine oxide surfactant. The surfactant system comprises a

co-surfactant preferably selected from the group consisting of non-ionic surfactant, anionic surfactant and mixtures thereof. Preferably a non-ionic surfactant.

The preferred amphoteric surfactant for use herein comprises an amine oxide surfactant. The preferred zwitterionic surfactant for use herein comprises a betaine surfactant.

- 5 Preferably, the primary surfactant and the co-surfactant are present in the composition of the invention in a weight ratio of about 10:1 to about 4:1, preferably from 9:1 to 3:1 and more preferably from 8:1 to 3:1.

The most preferred surfactant system for the detergent composition of the present invention comprise: (1) 4% to 10%, preferably 5% to 8% by weight of the composition of the primary
10 surfactant, preferably an amine oxide surfactant; (2) 1% to 5%, preferably from 1% to 4% by weight of the composition of the co-surfactant, preferably a non-ionic surfactant. It has been found that such surfactant system in combination with the glycol ether of the invention provides excellent cleaning, in particular cleaning of oily soils and good foaming profile.

15 Primary surfactant

The primary surfactant is selected from the group consisting of amphoteric surfactant, zwitterionic surfactant and mixtures thereof

Amphoteric surfactant

Preferably the amphoteric surfactant is an amine oxide. Preferred amine oxides are alkyl
20 dimethyl amine oxide or alkyl amido propyl dimethyl amine oxide, more preferably alkyl dimethyl amine oxide and especially coco dimethyl amino oxide. Amine oxide may have a linear or mid-branched alkyl moiety. Typical linear amine oxides include water-soluble amine oxides containing one R1 C8-18 alkyl moiety and 2 R2 and R3 moieties selected from the group consisting of C1-3 alkyl groups and C1-3 hydroxyalkyl groups. Preferably amine oxide is
25 characterized by the formula $R1 - N(R2)(R3) O$ wherein R1 is a C8-18 alkyl and R2 and R3 are selected from the group consisting of methyl, ethyl, propyl, isopropyl, 2-hydroxyethyl, 2-hydroxypropyl and 3-hydroxypropyl. The linear amine oxide surfactants in particular may include linear C10-C18 alkyl dimethyl amine oxides and linear C8-C12 alkoxy ethyl dihydroxy ethyl amine oxides. Preferred amine oxides include linear C10, linear C10-C12, and linear C12-
30 C14 alkyl dimethyl amine oxides. As used herein "mid-branched" means that the amine oxide

has one alkyl moiety having n_1 carbon atoms with one alkyl branch on the alkyl moiety having n_2 carbon atoms. The alkyl branch is located on the α carbon from the nitrogen on the alkyl moiety. This type of branching for the amine oxide is also known in the art as an internal amine oxide. The total sum of n_1 and n_2 is from 10 to 24 carbon atoms, preferably from 12 to 20, and more preferably from 10 to 16. The number of carbon atoms for the one alkyl moiety (n_1) should be approximately the same number of carbon atoms as the one alkyl branch (n_2) such that the one alkyl moiety and the one alkyl branch are symmetric. As used herein "symmetric" means that $|n_1 - n_2|$ is less than or equal to 5, preferably 4, most preferably from 0 to 4 carbon atoms in at least 50 wt%, more preferably at least 75 wt% to 100 wt% of the mid-branched amine oxides for use herein.

The amine oxide further comprises two moieties, independently selected from a C1-3 alkyl, a C1-3 hydroxyalkyl group, or a polyethylene oxide group containing an average of from about 1 to about 3 ethylene oxide groups. Preferably the two moieties are selected from a C1-3 alkyl, more preferably both are selected as a C1 alkyl.

Zwitterionic surfactant

Other suitable surfactants include zwitterionic surfactants, preferably betaines, such as alkyl betaines, alkylamidobetaine, amidazoliniumbetaine, sulfobetaine (INCI Sultaines) as well as the Phosphobetaine and preferably meets formula (I):

(I)

wherein

R_1 is a saturated or unsaturated C6-22 alkyl residue, preferably C8-18 alkyl residue, in particular a saturated C10-16 alkyl residue, for example a saturated C12-14 alkyl residue;

X is NH, NR₄ with C1-4 Alkyl residue R₄, O or S,

n a number from 1 to 10, preferably 2 to 5, in particular 3,

x 0 or 1, preferably 1,

R2, R3 are independently a C1-4 alkyl residue, potentially hydroxy substituted such as a hydroxyethyl, preferably a methyl.

m a number from 1 to 4, in particular 1, 2 or 3,

y 0 or 1 and

- 5 Y is COO, SO₃, OPO(OR₅)O or P(O)(OR₅)O, whereby R₅ is a hydrogen atom H or a C1-4 alkyl residue.

Preferred betaines are the alkyl betaines of the formula (Ia), the alkyl amido propyl betaine of the formula (Ib), the Sulfo betaines of the formula (Ic) and the Amido sulfobetaine of the formula (Id);

15 R1-CO-NH-(CH₂)₃-N⁺(CH₃)₂-CH₂CH(OH)CH₂SO₃⁻ (Id) in which R₁₁ as the same meaning as in formula I. Particularly preferred betaines are the Carbobetaine [wherein Y=COO⁻], in particular the Carbobetaine of the formula (Ia) and (Ib), more preferred are the Alkylamidobetaine of the formula (Ib).

Examples of suitable betaines and sulfobetaine are the following [designated in accordance with
20 INCI]: Almondamidopropyl of betaines, Apricotamidopropyl betaines, Avocamidopropyl of betaines, Babassuamidopropyl of betaines, Behenamidopropyl betaines, Behenyl of betaines, betaines, Canolamidopropyl betaines, Capryl/Capram idopropyl betaines, Carnitine, Cetyl of betaines, Cocamidoethyl of betaines, Cocamidopropyl betaines, Cocamidopropyl Hydroxysultaine, Coco betaines, Coco Hydroxysultaine, Coco/Oleamidopropyl betaines, Coco
25 Sultaine, Decyl of betaines, Dihydroxyethyl Oleyl Glycinate, Dihydroxyethyl Soy Glycinate, Dihydroxyethyl Stearyl Glycinate, Dihydroxyethyl Tallow Glycinate, Dimethicone Propyl of PG-betaines, Erucamidopropyl Hydroxysultaine, Hydrogenated Tallow of betaines, Isostearam idopropyl betaines, Lauramidopropyl betaines, Lauryl of betaines, Lauryl Hydroxysultaine,

Lauryl Sultaine, Milkam idopropyl betaines, Minkamidopropyl of betaines, Myristam idopropyl betaines, Myristyl of betaines, Oleam idopropyl betaines, Oleam idopropyl Hydroxysultaine, Oleyl of betaines, Olivamidopropyl of betaines, Palmam idopropyl betaines, Palm itam idopropyl betaines, Palmitoyl Carnitine, Palm Kernelam idopropyl betaines, 5 Polytetrafluoroethylene Acetoxypromyl of betaines, Ricinoleam idopropyl betaines, Sesam idopropyl betaines, Soyam idopropyl betaines, Stearam idopropyl betaines, Stearyl of betaines, Tallowam idopropyl betaines, Tallowam idopropyl Hydroxysultaine, Tallow of betaines, Tallow Dihydroxyethyl of betaines, Undecylenam idopropyl betaines and Wheat Germam idopropyl betaines.

10

A preferred betaine is, for example, Cocoamidopropylbetaine.

Co-surfactant

The co-surfactant is selected from the group consisting of non-ionic surfactant, anionic surfactant and mixtures thereof

15 Non ionic surfactant

Suitable nonionic surfactants include the condensation products of aliphatic alcohols with from 1 to 25 moles of ethylene oxide. The alkyl chain of the aliphatic alcohol can either be straight or branched, primary or secondary, and generally contains from 8 to 22 carbon atoms. Particularly preferred are the condensation products of alcohols having an alkyl group containing from 10 to 18 carbon atoms, preferably from 10 to 15 carbon atoms with from 2 to 18 moles, preferably 2 to 15, more preferably 5-12 of ethylene oxide per mole of alcohol. Highly preferred nonionic surfactants are the condensation products of guerbet alcohols with from 2 to 18 moles, preferably 2 to 15, more preferably 5-12 of ethylene oxide per mole of alcohol.

25 Other suitable non-ionic surfactants for use herein include fatty alcohol polyglycol ethers, alkylpolyglucosides and fatty acid glucamides.

Anionic surfactants include, but are not limited to, those surface-active compounds that contain an organic hydrophobic group containing generally 8 to 22 carbon atoms or generally 8 to 18

carbon atoms in their molecular structure and at least one water-solubilizing group preferably selected from sulfonate, sulfate, and carboxylate so as to form a water-soluble compound. Usually, the hydrophobic group will comprise a linear or branched C8-C22 alkyl, or acyl group. Such surfactants are employed in the form of water-soluble salts and the salt-forming cation
5 usually is selected from sodium, potassium, ammonium, magnesium and mono-, di- or tri-alkanolammonium, with the sodium, cation being the usual one chosen.

The anionic surfactant is preferably a sulfate surfactant. A preferred sulfate surfactant is alkyl ethoxy sulfate, more preferably an alkyl ethoxy sulfate with an average degree of ethoxylation
10 from about 2 to about 5, most preferably about 3. Another preferred sulfate surfactant is a branched short chain alkyl sulfate, in particular 2-ethyl hexyl sulfate.

Sulfate anionic surfactant

A preferred sulfate anionic surfactant is an alkoxyate, more preferably, an alkoxyate sulfate
15 anionic surfactant having an average alkoxylation degree from about 2 to about 5, most preferably about 3. Preferably, the alkoxy group is ethoxy. When the sulfate anionic surfactant is a mixture of sulfate anionic surfactants, the average alkoxylation degree is the weight average alkoxylation degree of all the components of the mixture (weight average alkoxylation degree). In the weight average alkoxylation degree calculation the weight of sulfate anionic surfactant
20 components not having alkoxyate groups should also be included.

Weight average alkoxylation degree = $(x_1 * \text{alkoxylation degree of surfactant 1} + x_2 * \text{alkoxylation degree of surfactant 2} + \dots) / (x_1 + x_2 + \dots)$

wherein $x_1, x_2, \dots$ are the weights in grams of each sulfate anionic surfactant of the mixture and
25 alkoxylation degree is the number of alkoxy groups in each sulfate anionic surfactant.

If the surfactant is branched, the preferred branching group is an alkyl. Typically, the alkyl is selected from methyl, ethyl, propyl, butyl, pentyl, cyclic alkyl groups and mixtures thereof.

Single or multiple alkyl branches could be present on the main hydrocarbyl chain of the starting alcohol(s) used to produce the sulfate anionic surfactant used in the detergent of the invention.

The branched sulfate anionic surfactant can be a single anionic surfactant or a mixture of anionic surfactants. In the case of a single surfactant the percentage of branching refers to the weight percentage of the hydrocarbyl chains that are branched in the original alcohol from which the surfactant is derived.

In the case of a surfactant mixture the percentage of branching is the weight average and it is defined according to the following formula:

10 Weight average of branching (%) = $\frac{(x_1 * \text{wt\% branched alcohol 1 in alcohol 1} + x_2 * \text{wt\% branched alcohol 2 in alcohol 2} + \dots)}{(x_1 + x_2 + \dots)} * 100$

wherein $x_1, x_2, \dots$ are the weight in grams of each alcohol in the total alcohol mixture of the alcohols which were used as starting material for the anionic surfactant for the detergent of the invention. In the weight average branching degree calculation the weight of anionic surfactant components not having branched groups should also be included.

When the surfactant system comprises a branched anionic surfactant, the surfactant system comprises at least 50%, more preferably at least 60% and preferably at least 70% of branched anionic surfactant by weight of the surfactant system, more preferably the branched anionic surfactant comprises more than 50% by weight thereof of an alkyl ethoxylated sulfate having an average ethoxylation degree of from about 2 to about 5 and preferably a level of branching of from about 5% to about 40%.

Suitable sulfate surfactants for use herein include water-soluble salts of C8-C18 alkyl, preferably C8-C18 alkyl comprising more than 50% by weight of the C8 to C18 alkyl of C12 to C14 alkyl or hydroxyalkyl, sulfate and/or ether sulfate. Suitable counterions include alkali metal cation earth alkali metal cation, alkanolammonium or ammonium or substituted ammonium, but preferably sodium.

The sulfate surfactants may be selected from C8-C18 alkyl alkoxy sulfates (AExS) wherein preferably x is from 1-30 in which the alkoxy group could be selected from ethoxy, propoxy, butoxy or even higher alkoxy groups and mixtures thereof. Especially preferred for use herein is a C12-C14 alkyl ethoxy sulfate with an average degree of ethoxylation from about 2 to about 5,
5 preferably about 3.

Alkyl alkoxy sulfates are commercially available with a variety of chain lengths, ethoxylation and branching degrees. Commercially available sulfates include, those based on Neodol alcohols ex the Shell company, Lial – Isalchem and Safol ex the Sasol company, natural alcohols
10 ex The Procter & Gamble Chemicals company.

If the anionic surfactant is branched, it is preferred that the branched anionic surfactant comprises at least 50%, more preferably at least 60% and especially at least 70% of a sulfate surfactant by weight of the branched anionic surfactant. Preferred from a cleaning view point are
15 those branched surfactants in which the branched anionic surfactant comprises more than 50%, more preferably at least 60% and especially at least 70% by weight thereof of sulfate surfactant and the sulfate surfactant is selected from the group consisting of alkyl sulfate, alkyl ethoxy sulfates and mixtures thereof. Even more preferred are those in which the branched anionic surfactant has an average degree of ethoxylation of from about 2 to about 5, more preferably
20 about 3 and even more preferably when the anionic surfactant has an average level of branching of from about 10% to about 35%, %, more preferably from about 20% to 30%.

Linear alkyl alkoxy sulfate surfactants are preferred for use in the composition of the invention.

25 Branched short chain alkyl sulfate surfactant

This type of anionic surfactants has been found to deliver strong grease cleaning. They also present good foaming performance, when used in combination with amine oxide or betaine especially amine oxide surfactants, especially immediate foaming performance upon spraying.

By a “branched short chain alkyl sulfate” is herein meant a surfactant having a linear alkyl sulfate backbone, the backbone comprising from 4 to 8, preferably from 5 to 7 carbon atoms, substituted with one or more C1-C5 preferably C1-C3 alkyl branching groups in the C1, C2 or C3, preferably C2 position on the linear alkyl sulfate backbone. This type of anionic surfactant has been found to deliver strong grease cleaning as well as good foaming performance, especially immediate foaming performance upon spraying when the composition comprises amine oxide or betaine, preferably amine oxide as co-surfactant. Preferred branched short chain alkyl sulfate for use herein is a branched hexyl sulfate, more preferably 2-ethyl hexyl sulfate.

The branched short chain alkyl sulphate surfactants according to the current invention have a linear alkyl sulphate backbone comprising from 4 to 8 carbon atoms, substituted with one or more C1-C5 alkyl branching groups in the C1, C2 or C3 position on the linear alkyl sulphate backbone. The sulphate group within the branched short chain alkyl sulphate surfactant is bonded directly to said C4-C8 linear backbone in terminal position.

Preferably the linear alkyl sulphate backbone comprises from 5 to 7 carbon atoms. Preferably the one or more alkyl branching groups are selected from methyl, ethyl, propyl or isopropyl. Preferably the branched short chain alkyl sulphate surfactant has only one branching group substituted on its linear backbone chain. Preferably the alkyl branching group is on the C2 position in the linear alkyl sulphate backbone.

More preferably the branched short chain alkyl sulphate according to the current invention has a linear alkyl backbone comprising from 5 to 7 carbons, substituted on the C2 position in the linear alkyl sulphate backbone with one alkyl branching group selected from methyl, ethyl, propyl. Most preferably the branched short chain alkyl sulphate surfactant is 2-ethylhexylsulphate.

The composition of the present invention might further comprise a fraction of the corresponding non-sulphated branched short chain alcohol feedstock material of the formulated branched short chain alkyl sulphate surfactant.

Suitable branched short chain alkyl sulphate surfactants include 1-methylbutylsulphate, 1-ethylbutylsulphate, 1-propylbutylsulphate, 1-isopropylbutylsulphate 1-methylpentylsulphate, 1-ethylpentylsulphate, 1-propylpentylsulphate, 1-isopropylpentylsulphate 1-butylpentylsulphate, 1-

methylhexylsulphate, 1-ethylhexylsulphate, 1-propylhexylsulphate, 1-isopropylhexylsulphate 1-
 butylhexylsulphate, 1-pentylhexylsulphate, 1-methylheptylsulphate, 1-ethylheptylsulphate, 1-
 propylheptylsulphate, 1-isopropylheptylsulphate, 1-butylheptylsulphate, 1-pentylheptylsulphate,
 1-hexylheptylsulphate, 1-methyloctylsulphate, 1-ethyloctylsulphate, 1-propyloctylsulphate, 1-
 5 isopropyloctylsulphate, 1-butyloctylsulphate, 1-pentyloctylsulphate, 1-hexyloctylsulphate, 1-
 heptyloctylsulphate, 2-methylbutylsulphate, 2-ethylbutylsulphate, 2-propylbutylsulphate, 2-
 isopropylbutylsulphate 2-methylpentylsulphate, 2-ethylpentylsulphate, 2-propylpentylsulphate,
 2-isopropylpentylsulphate, 2-butyloctylsulphate, 2-methylhexylsulphate, 2-ethylhexylsulphate,
 2-propylhexylsulphate, 2-isopropylhexylsulphate, 2-butylhexylsulphate, 2-pentylhexylsulphate,
 10 2-methylheptylsulphate, 2-ethylheptylsulphate, 2-propylheptylsulphate, 2-
 isopropylheptylsulphate, 2-butylheptylsulphate, 2-pentylheptylsulphate, 2-hexylheptylsulphate,
 2-methyloctylsulphate, 2-ethyloctylsulphate, 2-propyloctylsulphate, 2-isopropyloctylsulphate, 2-
 butyloctylsulphate, 2-pentyloctylsulphate, 2-hexyloctylsulphate, 2-heptyloctylsulphate, 3-
 methylbutylsulphate, 3-ethylbutylsulphate, 3-propylbutylsulphate, 3-isopropylbutylsulphate, 3-
 15 methylpentylsulphate, 3-ethylpentylsulphate, 3-propylpentylsulphate, 3-isopropylpentylsulphate,
 3-butyloctylsulphate, 3-methylhexylsulphate, 3-ethylhexylsulphate, 3-propylhexylsulphate, 3-
 isopropylhexylsulphate, 3-butylhexylsulphate, 3-pentylhexylsulphate, 3-methylheptylsulphate, 3-
 ethylheptylsulphate, 3-propylheptylsulphate, 3-isopropylheptylsulphate, 3-butylheptylsulphate,
 3-pentylheptylsulphate, 3-hexylheptylsulphate, 3-methyloctylsulphate, 3-ethyloctylsulphate, 3-
 20 propyloctylsulphate, 3-isopropyloctylsulphate, 3-butyloctylsulphate, 3-pentyloctylsulphate, 3-
 hexyloctylsulphate, 3-heptyloctylsulphate, and mixtures thereof.

More preferably the branched short chain alkyl sulphate surfactant is selected from the list of 1-
 methylpentylsulphate, 1-ethylpentylsulphate, 1-propylpentylsulphate, 1-butyloctylsulphate, 1-
 methylhexylsulphate, 1-ethylhexylsulphate, 1-propylhexylsulphate, 1-butylhexylsulphate, 1-

 ethylhexylsulphate, 2-propylhexylsulphate, 2-butylhexylsulphate, 2-pentylhexylsulphate, 2-
 methylheptylsulphate, 2-ethylheptylsulphate, 2-propylheptylsulphate, 2-butylheptylsulphate, 2-
 30 pentylheptylsulphate, 2-hexylheptylsulphate, 3-methylpentylsulphate, 3-ethylpentylsulphate, 3-
 propylpentylsulphate, 3-butyloctylsulphate, 3-methylhexylsulphate, 3-ethylhexylsulphate, 3-
 propylhexylsulphate, 3-butylhexylsulphate, 3-pentylhexylsulphate, 3-methylheptylsulphate, 3-

ethylheptylsulphate, 3-propylheptylsulphate, 3-butylheptylsulphate, 3-pentylheptylsulphate, 3-hexylheptylsulphate, and mixtures thereof.

Even more preferably the branched short chain alkyl sulphate surfactant is selected from the list of 2-methylpentylsulphate, 2-ethylpentylsulphate, 2-propylpentylsulphate, 2-butylpentylsulphate, 5 2-methylhexylsulphate, 2-ethylhexylsulphate, 2-propylhexylsulphate, 2-butylhexylsulphate, 2-pentylhexylsulphate, 2-methylheptylsulphate, 2-ethylheptylsulphate, 2-propylheptylsulphate, 2-butylheptylsulphate, 2-pentylheptylsulphate, 2-hexylheptylsulphate, and mixtures thereof.

Even more preferably the branched short chain alkyl sulphate surfactant is selected from the list of 2-methylpentylsulphate, 2-ethylpentylsulphate, 2-propylpentylsulphate, 2-methylhexylsulphate, 2-ethylhexylsulphate, 2-propylhexylsulphate, 2-methylheptylsulphate, 2-ethylheptylsulphate, 2-propylheptylsulphate, and mixtures thereof. 10

Most preferred branched short chain alkyl sulphate surfactant is 2-ethylhexylsulphate. This compound is commercially available under the Syntapon EH tradename from Enaspol and 15 Empicol 0585U from Huntsman.

Glycol ether solvent

The composition of the invention comprises a glycol ether solvent selected from glycol ethers of Formula I or Formula II.

20 Formula I = $R_1O(R_2O)_nR_3$

wherein

R₁ is a linear or branched C₄, C₅ or C₆ alkyl, a substituted or unsubstituted phenyl, preferably n-butyl. Benzyl is one of the substituted phenyls for use herein.

R₂ is ethyl or isopropyl, preferably isopropyl

25 R₃ is hydrogen or methyl, preferably hydrogen

n is 1, 2 or 3, preferably 1 or 2

Formula II = $R_4O(R_5O)_nR_6$

wherein

R_4 is n-propyl or isopropyl, preferably n-propyl

R_5 is isopropyl

5 R_6 is hydrogen or methyl, preferably hydrogen

n is 1, 2 or 3 preferably 1 or 2

Suitable glycol ether solvents according to Formula I include ethyleneglycol n-butyl ether, diethyleneglycol n-butyl ether, triethyleneglycol n-butyl ether, propyleneglycol n-butyl ether, 10 dipropyleneglycol n-butyl ether, tripropyleneglycol n-butyl ether, ethyleneglycol n-pentyl ether, diethyleneglycol n-pentyl ether, triethyleneglycol n-pentyl ether, propyleneglycol n-pentyl ether, dipropyleneglycol n-pentyl ether, tripropyleneglycol n-pentyl ether, ethyleneglycol n-hexyl ether, diethyleneglycol n-hexyl ether, triethyleneglycol n-hexyl ether, propyleneglycol n-hexyl ether, dipropyleneglycol n-hexyl ether, tripropyleneglycol n-hexyl ether, ethyleneglycol phenyl 15 ether, diethyleneglycol phenyl ether, triethyleneglycol phenyl ether, propyleneglycol phenyl ether, dipropyleneglycol phenyl ether, tripropyleneglycol phenyl ether, ethyleneglycol benzyl ether, diethyleneglycol benzyl ether, triethyleneglycol benzyl ether, propyleneglycol benzyl ether, dipropyleneglycol benzyl ether, tripropyleneglycol benzyl ether, ethyleneglycol isobutyl ether, diethyleneglycol isobutyl ether, triethyleneglycol isobutyl ether, propyleneglycol isobutyl 20 ether, dipropyleneglycol isobutyl ether, tripropyleneglycol isobutyl ether, ethyleneglycol isopentyl ether, diethyleneglycol isopentyl ether, triethyleneglycol isopentyl ether, propyleneglycol isopentyl ether, dipropyleneglycol isopentyl ether, tripropyleneglycol isopentyl ether, ethyleneglycol isohexyl ether, diethyleneglycol isohexyl ether, triethyleneglycol isohexyl ether, propyleneglycol isohexyl ether, dipropyleneglycol isohexyl ether, tripropyleneglycol isohexyl ether, ethyleneglycol n-butyl methyl ether, diethyleneglycol n-butyl methyl ether, triethyleneglycol n-butyl methyl ether, propyleneglycol n-butyl methyl ether, dipropyleneglycol n-butyl methyl ether, tripropyleneglycol n-butyl methyl ether, ethyleneglycol n-pentyl methyl ether, diethyleneglycol n-pentyl methyl ether, triethyleneglycol n-pentyl methyl ether, propyleneglycol n-pentyl methyl ether, dipropyleneglycol n-pentyl methyl ether, tripropyleneglycol n-pentyl methyl ether, ethyleneglycol n-hexyl methyl ether, diethyleneglycol

n-hexyl methyl ether, triethyleneglycol n-hexyl methyl ether, propyleneglycol n-hexyl methyl ether, dipropyleneglycol n-hexyl methyl ether, tripropyleneglycol n-hexyl methyl ether, ethyleneglycol phenyl methyl ether, diethyleneglycol phenyl methyl ether, triethyleneglycol phenyl methyl ether, propyleneglycol phenyl methyl ether, dipropyleneglycol phenyl methyl ether, tripropyleneglycol phenyl methyl ether, ethyleneglycol benzyl methyl ether, diethyleneglycol benzyl methyl ether, triethyleneglycol benzyl methyl ether, propyleneglycol benzyl methyl ether, dipropyleneglycol benzyl methyl ether, tripropyleneglycol benzyl methyl ether, ethyleneglycol isobutyl methyl ether, diethyleneglycol isobutyl methyl ether, triethyleneglycol isobutyl methyl ether, propyleneglycol isobutyl methyl ether, dipropyleneglycol isobutyl methyl ether, tripropyleneglycol isobutyl methyl ether, ethyleneglycol isopentyl methyl ether, diethyleneglycol isopentyl methyl ether, triethyleneglycol isopentyl methyl ether, propyleneglycol isopentyl methyl ether, dipropyleneglycol isopentyl methyl ether, tripropyleneglycol isopentyl methyl ether, ethyleneglycol isohexyl methyl ether, diethyleneglycol isohexyl methyl ether, triethyleneglycol isohexyl methyl ether, propyleneglycol isohexyl methyl ether, dipropyleneglycol isohexyl methyl ether, tripropyleneglycol isohexyl methyl ether, and mixtures thereof.

Preferred glycol ether solvents according to Formula I are ethyleneglycol n-butyl ether, diethyleneglycol n-butyl ether, triethyleneglycol n-butyl ether, propyleneglycol n-butyl ether, dipropyleneglycol n-butyl ether, tripropyleneglycol n-butyl ether, and mixtures thereof.

Most preferred glycol ethers according to Formula II are propyleneglycol n-butyl ether, dipropyleneglycol n-butyl ether, and mixtures thereof.

Suitable glycol ether solvents according to Formula II include propyleneglycol n-propyl ether, dipropyleneglycol n-propyl ether, tripropyleneglycol n-propyl ether, propyleneglycol isopropyl ether, dipropyleneglycol isopropyl ether, tripropyleneglycol isopropyl ether, propyleneglycol n-propyl methyl ether, dipropyleneglycol n-propyl methyl ether, tripropyleneglycol n-propyl methyl ether, propyleneglycol isopropyl methyl ether, dipropyleneglycol isopropyl methyl ether, tripropyleneglycol isopropyl methyl ether, and mixtures thereof.

Preferred glycol ether solvents according to Formula II are propyleneglycol n-propyl ether, dipropyleneglycol n-propyl ether, and mixtures thereof.

Most preferred glycol ether solvents are propyleneglycol n-butyl ether, dipropyleneglycol n-butyl ether, and mixtures thereof, especially dipropyleneglycol n-butyl ether.

Suitable glycol ether solvents can be purchased from The Dow Chemical Company, more particularly from the E-series (ethylene glycol based) Glycol Ethers and the P-series (propylene glycol based) Glycol Ethers line-ups. Suitable glycol ether solvents include Butyl Carbitol, Hexyl Carbitol, Butyl Cellosolve, Hexyl Cellosolve, Butoxytriglycol, Dowanol Eph, Dowanol PnP, Dowanol DPnP, Dowanol PnB, Dowanol DPnB, Dowanol TPnB, Dowanol PPh, and mixtures thereof.

10 The glycol ether of the product of the invention can boost foaming.

The glycol ether solvent typically is present from about 1% to about 10%, preferably from about 2 to about 8%, most preferably from about 3% to about 7% by weight of the composition.

Chelant

15 The composition herein may optionally further comprise a chelant at a level of from 0.1% to 10%, preferably from 0.2% to 5%, more preferably from 0.2% to 3%, most preferably from 0.5% to 1.5% by weight of the composition.

Suitable chelating agents can be selected from the group consisting of amino carboxylates, amino phosphonates, polyfunctionally-substituted aromatic chelating agents and mixtures thereof.

20

Amino carboxylates include ethylenediaminetetra-acetates, N-hydroxyethylethylenediaminetriacetates, nitrilo-triacetates, ethylenediamine tetrapropionates, triethylenetetraaminehexacetates, diethylenetriaminepentaacetates, and ethanoldiglycines, alkali metal, ammonium, and substituted ammonium salts therein and mixtures therein, as well as
 25 MGDA (methyl-glycine-diacetic acid), and salts and derivatives thereof and GLDA (glutamic-N,N- diacetic acid) and salts and derivatives thereof. GLDA (salts and derivatives thereof) is especially preferred according to the invention, with the tetrasodium salt thereof being especially preferred.

Builder

The composition herein may comprise a builder, preferably a carboxylate builder. Salts of carboxylic acids useful herein include salts of C1-6 linear or at least 3 carbon containing cyclic acids. The linear or cyclic carbon-containing chain of the carboxylic acid or salt thereof may be substituted with a substituent group selected from the group consisting of hydroxyl, ester, ether, aliphatic groups having from 1 to 6, more preferably 1 to 4 carbon atoms, and mixtures thereof.

Preferred salts of carboxylic acids are those selected from the salts from the group consisting of salicylic acid, maleic acid, acetyl salicylic acid, 3 methyl salicylic acid, 4 hydroxy isophthalic acid, dihydroxyfumaric acid, 1,2, 4 benzene tricarboxylic acid, pentanoic acid, citric acid, and mixtures thereof, preferably citric acid.

- 10 Alternative carboxylate builders suitable for use in the composition of the invention includes salts of fatty acids like palm kernel derived fatty acids or coconut derived fatty acid, or salts of polycarboxylic acids.

The cation of the salt is preferably selected from alkali metal, alkaline earth metal, monoethanolamine, diethanolamine or triethanolamine and mixtures thereof, preferably sodium.

- 15 The carboxylic acid or salt thereof, when present, is preferably present at the level of from 0.1% to 5%, more preferably from 0.2% to 1% by weight of the total composition.

Shear thinning rheology modifier

- The composition according to the invention might further comprise a rheology modifying agent, providing a shear thinning rheology profile to the product. Preferably the rheology modifying agent is a non crystalline polymeric rheology modifier. This polymeric rheology modifier can be a synthetic or a naturally derived polymer.

- Examples of naturally derived polymeric structurants of use in the present invention include: hydroxyethyl cellulose, hydrophobically modified hydroxyethyl cellulose, carboxymethyl cellulose, polysaccharide derivatives and mixtures thereof. Polysaccharide derivatives include but are not limited to pectine, alginate, arabinogalactan (gum Arabic), carrageenan, gum karaya, gum tragacanth, gellan gum, xanthan gum and guar gum. Examples of synthetic polymeric structurants of use in the present invention include polymers and copolymers comprising polycarboxylates, polyacrylates, polyurethanes, polyvinylpyrrolidone, polyols and derivatives and mixtures thereof.

Preferably the composition according to the invention comprises a naturally derived rheology modifying polymer, most preferably Xanthan Gum.

Generally, the rheology modifying polymer will be comprised at a level of from 0.001% to 1% by weight, alternatively from 0.01% to 0.5% by weight, more alternatively from 0.05% to 0.25% by weight of the composition.

Further optional ingredients

The composition herein may comprise a number of optional ingredients such as rheology trimming agents selected from inorganic salts preferably sodium chloride, C2-C4 alcohols, C2-C4 polyols, poly alkylene glycols, hydrotropes, and mixtures thereof. The composition might also comprise pH trimming and/or buffering agents such as sodium hydroxyde, alkanolamines including monoethanolamine, and bicarbonate inorganic salts. The composition might comprise further minor ingredients selected from preservatives, UV stabilizers, antioxidants, perfumes, coloring agents and mixtures thereof.

Viscosity

The flow curve of products is measured with the use of a Rheometer (TA instruments – model DHR1), a Peltier concentric cylinder temperature system (TA instruments) and a double gap cup and rotor (TA instruments). The flow curve procedure comprises a conditioning step and a flow ramp step at 20°C, the conditioning step comprising a 30s pre-shear step at a shear rate of 10s-1 followed by a 120s zero shear equilibration time. The flow ramp step comprises a Logarithmical shear rate increase from 0.001 s-1 to 10000 s-1 in a time span of 300s. A data filter is set at the instrument recommended minimum torque value of 20µNm.

“Low shear viscosity” is defined as the viscosity measured at a shear rate of 100 s-1. “High shear viscosity” is measured at a shear rate of 10000 s-1.

Spray dispenser

The spray dispenser comprises a housing to accommodate the composition of the invention and spraying means. Suitable spray dispensers include hand pump (sometimes referred to as "trigger") devices, pressurized can devices, electrostatic spray devices, etc. Preferably the spray dispenser is non-pressurized and the spray means are of the trigger dispensing type. Preferably the spray dispenser is non-pressurized and the spray means are of the trigger dispensing type.

Examples

Oil cleaning of compositions inside and outside of the scope of the invention is assessed by means of measuring the time to collapse an oil disk.

- 10 The test is carried out at ambient temperature of 21°C±2°C. All used products should be acclimatized within this temperature range.

A petri dish (1) (VWR Article #391-0441 / Ø90mm) is put on a water-levelled surface, with opening (2) facing upwards. A second smaller petri dish (3) (VWR Article #391-0866 / Ø55mm) is put in the middle of the first petri dish, with opening (4) facing downwards. A hole (5) is made in the smaller petri-dish. The hole (5) should be sufficiently big to allow product dosing there through by means of a micropipette. Care should be taken to maintain the structural integrity of the side-wall (6) whilst making the hole. The sidewall should maintain its round shape. By means of a micropipette (Eppendorf Article #4986000.025 / Multipette XStream) with disposable tip (Eppendorf Article #022266.501 / Combitip Plus 10ml) 2ml of olive oil (Bertolli Olive Oil Classico) is dispensed through the hole of the small petri dish (7). By means of a micropipette (Eppendorf Article #4986000.025 / Multipette XStream) with disposable tip (Eppendorf Article #0030089.480 / Combitip Advanced 50ml) 12 ml of deionized water is dispensed in the moat of the larger petri dish that surrounds the inner petri dish (8). This creates an island of oil in the middle (9) surrounded by a moat of water (10), but physically separated by the sidewall of the inner petri dish. The inner petri dish is then carefully removed (11) to create an oil-water interface (12), as shown in Figure 1.

A micropipette (Eppendorf Article #4831000.732 / Xplorer Plus 1000µl) with disposable tip (Eppendorf Article #0030073.460 / Etips Reloads 50-1000µl) is used to dispense the cleaning composition. The dispensing speed of the Micropipette is set at highest speed. 50µl of product is then dispensed in the middle of the oil disk from a height of approximately 1cm (13). In parallel, a timer is started the moment the product is dispensed. When the oil disk breaks at the oil water

interface, the timer is stopped and time is recorded in seconds. If no end-point is detected after 180s the test is stopped. The test is repeated 4 times to allow statistical analysis, and average breaking times are reported.

Example A represents a composition according to the invention. Comparative examples A, B, C and D represent compositions outside the scope of the invention. Comparative examples A and B are single variable deviations of example formula A from which respectively the solvent according to the invention has been removed (comparative example A) or tested in isolation (comparative example B). Comparative example C represents a low active version of a traditional surfactant based hand dish formulation liquid, while comparative example D represents a detergent spray composition used as a pre-treater for automatic dishwashing

applications, commercialized under the Dreft Power Spray as sold in Belgium in 2008. From the data in the table below it is clear that a composition according to the invention has a much faster oil disk collapse time than the comparative compositions outside of the scope of the invention. The composition according to Example A provides better cleaning than the comparative compositions.

	Example A	Comparative example A	Comparative example B	Comparative example C	Comparative example D
Oil disk breaking time (s)	21	102	>180	>180	>180

CLAIMS

What is claimed is:

1. A cleaning product comprising a spray dispenser and a cleaning composition suitable for spraying, the composition housed in the spray dispenser wherein the composition comprises:
 - i) at least 5% by weight of the composition of a surfactant system comprising:
 - ii) 60% to 90% by weight of the surfactant system of a primary surfactant selected from the group consisting of amphoteric surfactant, zwitterionic surfactant and mixtures thereof;
 - iii) 10 to 40% by weight of the surfactant system of a co-surfactant selected from the group consisting of non-ionic surfactant, anionic surfactant and mixtures thereof; and
 - iv) a glycol ether solvent selected from the group consisting of glycol ethers of Formula I: $R1O(R2O)_nR3$, Formula II: $R4O(R5O)_nR6$ and mixtures thereof wherein
 $R1$ is a linear or branched $C4$, $C5$ or $C6$ alkyl or a substituted or unsubstituted phenyl, $R2$ is ethyl or isopropyl, $R3$ is hydrogen or methyl and n is 1, 2 or 3
 $R4$ is n -propyl or isopropyl, $R5$ is isopropyl, $R6$ is hydrogen or methyl and n is 1, 2 or 3
2. A product according to claim 1 wherein the primary surfactant is selected from the group consisting of amine oxide, betaines and mixtures thereof.
3. A product according to any of claims 1 or 2 wherein the primary surfactant is an amphoteric surfactant and the amphoteric surfactant comprises amine oxide.
4. A product according to any of the preceding claims wherein the co-surfactant comprises a non-ionic surfactant.
5. A product according to any of the preceding claims wherein the primary surfactant and the co-surfactant are present in a weight ratio of about 10:1 to about 2:1, preferably from about 7:1 to about 4:1.

6. A product according to any of the preceding claims wherein the composition comprises from about 1% to about 7% by weight of the composition of the glycol ether solvent.
7. A product according to any of the preceding claims wherein the glycol ether solvent is selected from the group consisting of comprises dipropylene glycol n-butyl ether, propyleneglycol n-butyl ether and mixtures thereof.
8. A product according to any of the preceding claims wherein the composition has a pH greater than 8, preferably from 9.5 to 11.5 as measured at 10% solution in distilled water at 20°C and a reserve alkalinity of from about 0.1 to about 1 expressed as g NaOH/ 100ml of composition at a pH of 10.
9. A product according to any of the preceding claims wherein the composition has a reserve alkalinity of from about 0.1 to about 0.5 expressed as g NaOH/ 100ml of composition at a pH of 10.
10. A product according the any of the preceding claims wherein the surfactant system and the solvent are in a weight ratio of from about 4:1 to about 1:1.
11. A product according to any of the preceding claims wherein the composition comprises:
 - i) 4 to 10% by weight of the composition of an amine oxide surfactant;
 - ii) 1 to 5% by weight of the composition of non-ionic surfactant; and
 - iii) 3% to 8% by weight of the composition of glycol ether solvent, preferably dipropylene glycol n-butyl ether.
12. A product according to any of the preceding claims wherein the composition further comprises a chelant, preferably an aminocarboxylate chelant, more preferably a salt of glutamic-N,N- diacetic acid.
13. A product according to any of the preceding claims wherein the composition further comprises a builder, preferably citrate.

14. A product according to any of the preceding claims wherein the composition further comprises bicarbonate.
15. A product according to any of the preceding claims wherein the composition further comprises an alkanol amine, preferably monoethanol amine.
16. A product according to any of the preceding claims wherein the composition further comprises a further solvent selected from the group consisting of C2-C4 alcohols, C2-C4 polyols, poly alkylene glycol and mixtures thereof.
17. A product according to any of the preceding claims wherein the composition has a high shear viscosity (at 10,000 s⁻¹) of from about 1 to about 20 mPa s at 20°C as measured using the method defined herein.
18. A product according to the preceding claim wherein the composition has a low shear (100 s⁻¹) to high shear viscosity ratio of from about 10:1 to about 1.5:1 at 20°C as measured using the method defined herein.
19. A product according to any of the preceding claims wherein the composition comprises a rheology modifier, preferably xanthan gum.
20. A method of cleaning soiled dishware using the product according to any of the preceding claims comprising the steps of:
 - a) optionally pre-wetting the soiled dishware;
 - b) spraying the cleaning composition onto the soiled dishware;
 - c) optionally adding water to the soiled dishware during a period of time;
 - d) optionally scrubbing the dishware; and
 - e) rinsing the dishware.

INTERNATIONAL SEARCH REPORT

International application No
PCT/US2016/040273

A. CLASSIFICATION OF SUBJECT MATTER
INV. C11D1/94 C11D3/20 C11D3/43 C11D17/04
ADD.

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)
C11D

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

EPO-Internal, WPI Data

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	DE 10 2004 063765 A1 (HENKEL KGAA) 13 July 2006 (2006-07-13) claims; examples -----	1-20
X	GB 2 279 362 A (KAO CORP) 4 January 1995 (1995-01-04) example 4 -----	1-20
X	WO 96/24654 A1 (HENKEL ECOLAB GMBH & CO OHG) 15 August 1996 (1996-08-15) page 8, last paragraph; claims; examples 3,4,6 -----	1-20
X	EP 0 839 907 A1 (PROCTER & GAMBLE) 6 May 1998 (1998-05-06) claims; examples -----	1-20

Further documents are listed in the continuation of Box C.

See patent family annex.

* Special categories of cited documents :

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier application or patent but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

"&" document member of the same patent family

Date of the actual completion of the international search

1 September 2016

Date of mailing of the international search report

20/10/2016

Name and mailing address of the ISA/

European Patent Office, P.B. 5818 Patentlaan 2
