## HETEROCYCLIC COMPOUNDS AS RET KINASE INHIBITORS

This application is a divisional application of Australian Application No. 2017250448, filed on 18 April 2017. The subject matter of this application is related to the applicant's International Patent Application No. PCT/GB2017/051076, filed on 9 October 2018, and claims priority to and the benefit of GB1619277.7, filed 14 November 2016, and GB1606631.8, filed 15 April 2016, the contents of each of which are hereby incorporated by reference in its entirety.

### ***INTRODUCTION***

**[0001]** The present invention relates to certain compounds that function as inhibitors of RET (rearranged during transfection) kinase enzyme activity. The present invention also relates to processes for the preparation of these compounds, to pharmaceutical compositions comprising them, and to their use in the treatment of proliferative disorders, such as cancer, as well as other diseases or conditions in which RET kinase activity is implicated.

### ***BACKGROUND OF THE INVENTION***

**[0002]** Cancer is caused by uncontrolled and unregulated cellular proliferation. Precisely what causes a cell to become malignant and proliferate in an uncontrolled and unregulated manner has been the focus of intense research over recent decades. This research has led to the identification of a number of molecular targets associated with key metabolic pathways that are known to be associated with malignancy.

**[0003]** RET (REarranged during Transfection) is a receptor tyrosine kinase (RTK) that forms part of a macromolecular receptor complex containing dimerized RET receptor, two co-receptors and a bound ligand. The glial derived neurotrophic factor (GDNF) family of ligands bind RET in association with one of four glycosyl phosphatidylinositol (GPI) anchored GDNF family  $\alpha$ -receptors (GFR $\alpha$ ). Ligand binding to the corresponding GFR $\alpha$  co-receptor triggers RET dimerization followed by trans-phosphorylation of intracellular signalling cascades. These downstream signalling networks play a key role in regulating cell survival, differentiation, proliferation, migration and chemotaxis.

**[0004]** Activating mutations in RET have been identified in familial and sporadic forms of medullary thyroid carcinomas (MTC) (Santoro & Carlomagno 2006; Schulmberger *et al.* 2008; Wells & Santoro 2009) and these correlate with aggressive disease progression (Elisei *et al.* 2008). Clinical benefit has been observed in MTC patients using the small molecule VEGFR2/EGFR inhibitor vandetanib (Wells *et al.* 2011) which has recently been approved by the FDA & EMEA. RET inhibition is a secondary pharmacology of this agent, which also targets VEGFR2 (Vascular endothelial growth factor receptor, also known as KDR - kinase insert domain receptor) and EGFR (epidermal growth factor receptor). The clinical benefit in

al., 2012; Wang et al., 2012; Chao et al., 2012) describe various RET fusion translocations (e.g. *KIF5B-RET* and *CCDC6-RET*) present in approximately 1% of NSCLC (non-small cell lung carcinoma) patient samples, which may offer an important alternative disease segment in which a specific RET inhibitor would offer clinical benefit.

**[0006]** Mutation at the RET gatekeeper residue (V804) is predicted to confer resistance to first line therapies such as vandetanib and cabozantinib. Although not yet confirmed in this patient population, ~5% of familial MTC patients do harbour the RET<sup>V804M</sup> mutation rendering them intrinsically resistant to the current therapies

**[0007]** Therefore, there is a requirement for the development of more selective inhibitors of RET and mutant forms thereof (e.g. RET<sup>V804M</sup>), in particular inhibitors that show less inhibition of KDR. It is anticipated that these more selective inhibitors will produce the desired therapeutic benefits associated with RET inhibition without the side effects associated with significant KDR inhibition. Such inhibitors will offer the potential of better therapy for cancers such as MTC and NSCLC and will widen the scope for the clinical use of RET inhibitors in earlier disease settings.

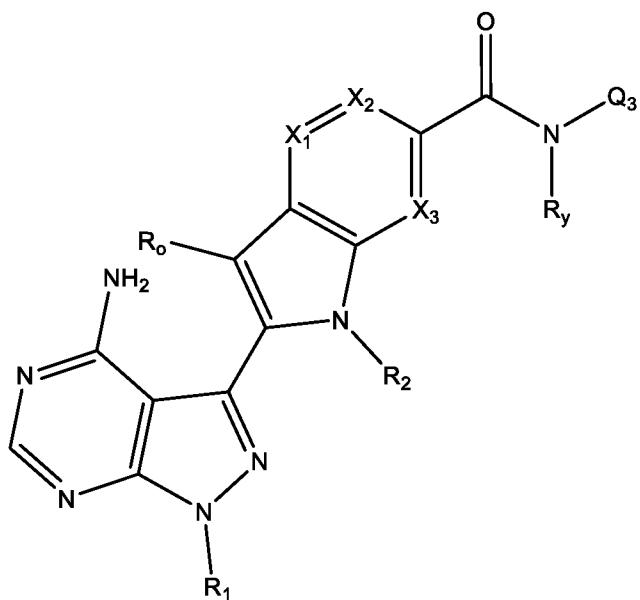

**[0008]** Some embodiments of the present invention provide further inhibitors of RET kinase enzyme activity and mutants thereof (e.g. RET<sup>V804M</sup>).

**[0009]** Some embodiments of the present invention provide inhibitors of RET kinase enzyme activity that show a greater selectivity for the inhibition of RET kinase relative to the inhibition of KDR.

***DETAILED DESCRIPTION OF THE INVENTION***

**Definitions**

**[0035]** Unless otherwise stated, the following terms used in the specification and claims have the following meanings set out below.

**[0036]** It is to be appreciated that references to "treating" or "treatment" include prophylaxis as well as the alleviation of established symptoms of a condition. "Treating" or "treatment" of a state, disorder or condition therefore includes: (1) preventing or delaying the appearance of clinical symptoms of the state, disorder or condition developing in a human that may be afflicted with or predisposed to the state, disorder or condition but does not yet experience or display clinical or subclinical symptoms of the state, disorder or condition, (2) inhibiting the state, disorder or condition, i.e., arresting, reducing or delaying the development of the disease or a relapse thereof (in case of maintenance treatment) or at least one clinical or subclinical symptom thereof, or (3) relieving or attenuating the disease, i.e., causing regression of the state, disorder or condition or at least one of its clinical or subclinical symptoms.

**[0037]** A "therapeutically effective amount" means the amount of a compound that, when administered to a mammal for treating a disease, is sufficient to effect such treatment for the disease. The "therapeutically effective amount" will vary depending on the compound, the disease and its severity and the age, weight, etc., of the mammal to be treated.

**[0038]** In this specification the term "alkyl" includes both straight and branched chain alkyl groups. References to individual alkyl groups such as "propyl" are specific for the straight chain version only and references to individual branched chain alkyl groups such as "isopropyl" are specific for the branched chain version only. For example, "(1-6C)alkyl" includes (1-4C)alkyl, (1-3C)alkyl, propyl, isopropyl and *t*-butyl. A similar convention applies to other radicals, for example "phenyl(1-6C)alkyl" includes phenyl(1-4C)alkyl, benzyl, 1-phenylethyl and 2-phenylethyl.

**[0039]** The term "(m-nC)" or "(m-nC) group" used alone or as a prefix, refers to any group having m to n carbon atoms.

**[0040]** An "alkylene," "alkenylene," or "alkynylene" group is an alkyl, alkenyl, or alkynyl group that is positioned between and serves to connect two other chemical groups. Thus, "(1-6C)alkylene" means a linear saturated divalent hydrocarbon radical of one to six carbon atoms

18 Aug 2020  
2020220079

or a branched saturated divalent hydrocarbon radical of three to six carbon atoms, for example, methylene, ethylene, propylene, 2-methylpropylene, pentylene, and the like.

**[0041]** “(2-6C)alkenylene” means a linear divalent hydrocarbon radical of two to six carbon atoms or a branched divalent hydrocarbon radical of three to six carbon atoms, containing at least one double bond, for example, as in ethenylene, 2,4-pentadienylene, and the like.

**[0042]** “(2-6C)alkynylene” means a linear divalent hydrocarbon radical of two to six carbon atoms or a branched divalent hydrocarbon radical of three to six carbon atoms, containing at least one triple bond, for example, as in ethynylene, propynylene, and butynylene and the like.

**[0043]** “(3-8C)cycloalkyl” means a hydrocarbon ring containing from 3 to 8 carbon atoms, for example, cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl or bicyclo[2.2.1]heptyl.

**[0044]** “(3-8C)cycloalkenyl” means a hydrocarbon ring containing from 3 to 8 carbon atoms and at least one double bond, for example, cyclobutenyl, cyclopentenyl, cyclohexenyl or cycloheptenyl, such as 3-cyclohexen-1-yl, or cyclooctenyl.

**[0045]** “(3-8C)cycloalkyl-(1-6C)alkylene” means a (3-8C)cycloalkyl group covalently attached to a (1-6C)alkylene group, both of which are defined herein.

**[0046]** The term “halo” or “halogeno” refers to fluoro, chloro, bromo and iodo.

**[0047]** The term “heterocycl”, “heterocyclic” or “heterocycle” means a non-aromatic saturated or partially saturated monocyclic, fused, bridged, or spiro bicyclic heterocyclic ring system(s). Monocyclic heterocyclic rings contain from about 3 to 12 (suitably from 3 to 7) ring atoms, with from 1 to 5 (suitably 1, 2 or 3) heteroatoms selected from nitrogen, oxygen or sulfur in the ring. Bicyclic heterocycles contain from 7 to 17 member atoms, suitably 7 to 12 member atoms, in the ring. Bicyclic heterocyclic(s) rings may be fused, spiro, or bridged ring systems. Examples of heterocyclic groups include cyclic ethers such as oxiranyl, oxetanyl, tetrahydrofuranyl, dioxanyl, and substituted cyclic ethers. Heterocycles containing nitrogen include, for example, azetidinyl, pyrrolidinyl, piperidinyl, piperazinyl, tetrahydrotriazinyl, tetrahydropyrazolyl, and the like. Typical sulfur containing heterocycles include tetrahydrothienyl, dihydro-1,3-dithiol, tetrahydro-2*H*-thiopyran, and hexahydrothiepine. Other heterocycles include dihydro-oxathiolyl, tetrahydro-oxazolyl, tetrahydro-oxadiazolyl, tetrahydrodioxazolyl, tetrahydro-oxathiazolyl, hexahydrotriazinyl, tetrahydro-oxazinyl, morpholinyl, thiomorpholinyl, tetrahydropyrimidinyl, dioxolinyl, octahydrobenzofuranyl, octahydrobenzimidazolyl, and octahydrobenzothiazolyl. For heterocycles containing sulfur, the oxidized sulfur heterocycles containing SO or SO<sub>2</sub> groups are also included. Examples include the sulfoxide and sulfone forms of tetrahydrothienyl and thiomorpholinyl such as tetrahydrothiophene 1,1-dioxide and thiomorpholinyl 1,1-dioxide. A suitable value for a

2020220079 18 Aug 2020

heterocyclyl group which bears 1 or 2 oxo (=O) or thioxo (=S) substituents is, for example, 2-oxopyrrolidinyl, 2-thioxopyrrolidinyl, 2-oxoimidazolidinyl, 2-thioxoimidazolidinyl, 2-oxopiperidinyl, 2,5-dioxopyrrolidinyl, 2,5-dioxoimidazolidinyl or 2,6-dioxopiperidinyl. Particular heterocyclyl groups are saturated monocyclic 3 to 7 membered heterocyclyls containing 1, 2 or 3 heteroatoms selected from nitrogen, oxygen or sulfur, for example azetidinyl, tetrahydrofuranyl, tetrahydropyranyl, pyrrolidinyl, morpholinyl, tetrahydrothienyl, tetrahydrothienyl 1,1-dioxide, thiomorpholinyl, thiomorpholinyl 1,1-dioxide, piperidinyl, homopiperidinyl, piperazinyl or homopiperazinyl. As the skilled person would appreciate, any heterocycle may be linked to another group via any suitable atom, such as via a carbon or nitrogen atom. However, reference herein to piperidino or morpholino refers to a piperidin-1-yl or morpholin-4-yl ring that is linked via the ring nitrogen.

**[0048]** By “bridged ring systems” is meant ring systems in which two rings share more than two atoms, see for example *Advanced Organic Chemistry*, by Jerry March, 4<sup>th</sup> Edition, Wiley Interscience, pages 131-133, 1992. Examples of bridged heterocyclyl ring systems include, aza-bicyclo[2.2.1]heptane, 2-oxa-5-azabicyclo[2.2.1]heptane, aza-bicyclo[2.2.2]octane, aza-bicyclo[3.2.1]octane and quinuclidine.

**[0049]** By “spiro bi-cyclic ring systems” we mean that the two ring systems share one common spiro carbon atom, i.e. the heterocyclic ring is linked to a further carbocyclic or heterocyclic ring through a single common spiro carbon atom. Examples of spiro ring systems include 6-azaspiro[3.4]octane, 2-oxa-6-azaspiro[3.4]octane, 2-azaspiro[3.3]heptanes, 2-oxa-6-azaspiro[3.3]heptanes, 7-oxa-2-azaspiro[3.5]nonane, 6-oxa-2-azaspiro[3.4]octane, 2-oxa-7-azaspiro[3.5]nonane and 2-oxa-6-azaspiro[3.5]nonane.

**[0050]** “Heterocyclyl(1-6C)alkyl” means a heterocyclyl group covalently attached to a (1-6C)alkylene group, both of which are defined herein.

**[0051]** The term “heteroaryl” or “heteroaromatic” means an aromatic mono-, bi-, or polycyclic ring incorporating one or more (for example 1-4, particularly 1, 2 or 3) heteroatoms selected from nitrogen, oxygen or sulfur. The term heteroaryl includes both monovalent species and divalent species. Examples of heteroaryl groups are monocyclic and bicyclic groups containing from five to twelve ring members, and more usually from five to ten ring members. The heteroaryl group can be, for example, a 5- or 6-membered monocyclic ring or a 9- or 10-membered bicyclic ring, for example a bicyclic structure formed from fused five and six membered rings or two fused six membered rings. Each ring may contain up to about four heteroatoms typically selected from nitrogen, sulfur and oxygen. Typically the heteroaryl ring will contain up to 3 heteroatoms, more usually up to 2, for example a single heteroatom. In one embodiment, the heteroaryl ring contains at least one ring nitrogen atom. The nitrogen

atoms in the heteroaryl rings can be basic, as in the case of an imidazole or pyridine, or essentially non-basic as in the case of an indole or pyrrole nitrogen. In general the number of basic nitrogen atoms present in the heteroaryl group, including any amino group substituents of the ring, will be less than five.

**[0052]** Examples of heteroaryl include furyl, pyrrolyl, thienyl, oxazolyl, isoxazolyl, imidazolyl, pyrazolyl, thiazolyl, isothiazolyl, oxadiazolyl, thiadiazolyl, triazolyl, tetrazolyl, pyridyl, pyridazinyl, pyrimidinyl, pyrazinyl, 1,3,5-triazenyl, benzofuranyl, indolyl, isoindolyl, benzothienyl, benzoxazolyl, benzimidazolyl, benzothiazolyl, benzothiazolyl, indazolyl, purinyl, benzofurazanyl, quinolyl, isoquinolyl, quinazolinyl, quinoxalinyl, cinnolinyl, pteridinyl, naphthyridinyl, carbazolyl, phenazinyl, benzisoquinolinyl, pyridopyrazinyl, thieno[2,3-*b*]furanyl, 2H-furo[3,2-*b*]-pyranyl, 5H-pyrido[2,3-*d*]-*o*-oxazinyl, 1*H*-pyrazolo[4,3-*d*]-oxazolyl, 4*H*-imidazo[4,5-*d*]thiazolyl, pyrazino[2,3-*d*]pyridazinyl, imidazo[2,1-*b*]thiazolyl, imidazo[1,2-*b*][1,2,4]triazinyl. "Heteroaryl" also covers partially aromatic bi- or polycyclic ring systems wherein at least one ring is an aromatic ring and one or more of the other ring(s) is a non-aromatic, saturated or partially saturated ring, provided at least one ring contains one or more heteroatoms selected from nitrogen, oxygen or sulfur. Examples of partially aromatic heteroaryl groups include for example, tetrahydroisoquinolinyl, tetrahydroquinolinyl, 2-oxo-1,2,3,4-tetrahydroquinolinyl, dihydrobenzthienyl, dihydrobenzfuranyl, 2,3-dihydrobenzo[1,4]dioxinyl, benzo[1,3]dioxolyl, 2,2-dioxo-1,3-dihydro-2-benzothienyl, 4,5,6,7-tetrahydrobenzofuranyl, indolinyl, 1,2,3,4-tetrahydro-1,8-naphthyridinyl, 1,2,3,4-tetrahydropyrido[2,3-*b*]pyrazinyl and 3,4-dihydro-2*H*-pyrido[3,2-*b*][1,4]oxazinyl.

**[0053]** Examples of five membered heteroaryl groups include but are not limited to pyrrolyl, furanyl, thienyl, imidazolyl, furazanyl, oxazolyl, oxadiazolyl, oxatriazolyl, isoxazolyl, thiazolyl, isothiazolyl, pyrazolyl, triazolyl and tetrazolyl groups.

**[0054]** Examples of six membered heteroaryl groups include but are not limited to pyridyl, pyrazinyl, pyridazinyl, pyrimidinyl and triazinyl.

**[0055]** A bicyclic heteroaryl group may be, for example, a group selected from:

a benzene ring fused to a 5- or 6-membered ring containing 1, 2 or 3 ring heteroatoms;  
a pyridine ring fused to a 5- or 6-membered ring containing 1, 2 or 3 ring heteroatoms;

**[00110]** The various functional groups and substituents making up the compounds of the Formula (I), and sub-formulae 1a to 1g, are typically chosen such that the molecular weight of the compound of the Formula (I) does not exceed 1000. More usually, the molecular weight of the compound will be less than 900, for example less than 800, or less than 750, or less than 700, or less than 650. More preferably, the molecular weight is less than 600 and, for example, is 550 or less.

**[00111]** A suitable pharmaceutically acceptable salt of a compound of the invention is, for example, an acid-addition salt of a compound of the invention which is sufficiently basic, for example, an acid-addition salt with, for example, an inorganic or organic acid, for example hydrochloric, hydrobromic, sulfuric, phosphoric, trifluoroacetic, formic, citric methane sulfonate or maleic acid. In addition, a suitable pharmaceutically acceptable salt of a compound of the invention which is sufficiently acidic is an alkali metal salt, for example a sodium or potassium salt, an alkaline earth metal salt, for example a calcium or magnesium salt, an ammonium salt or a salt with an organic base which affords a pharmaceutically acceptable cation, for example a salt with methylamine, dimethylamine, trimethylamine, piperidine, morpholine or tris-(2-hydroxyethyl)amine.

**[00112]** Compounds that have the same molecular formula but differ in the nature or sequence of bonding of their atoms or the arrangement of their atoms in space are termed “isomers”. Isomers that differ in the arrangement of their atoms in space are termed “stereoisomers”. Stereoisomers that are not mirror images of one another are termed “diastereomers” and those that are non-superimposable mirror images of each other are termed “enantiomers”. When a compound has an asymmetric center, for example, it is bonded to four different groups, a pair of enantiomers is possible. An enantiomer can be characterized by the absolute configuration of its asymmetric center and is described by the R- and S-sequencing rules of Cahn and Prelog, or by the manner in which the molecule rotates the plane of polarized light and designated as dextrorotatory or levorotatory (i.e., as (+) or (-)-isomers respectively). A chiral compound can exist as either individual enantiomer or as a mixture thereof. A mixture containing equal proportions of the enantiomers is called a “racemic mixture”.

**[00113]** The compounds of this invention may possess one or more asymmetric centers; such compounds can therefore be produced as individual (R)- or (S)-stereoisomers or as mixtures thereof. Unless indicated otherwise, the description or naming of a particular compound in the specification and claims is intended to include both individual enantiomers and mixtures, racemic or otherwise, thereof. The methods for the determination of stereochemistry and the

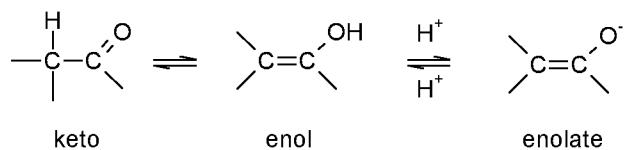

separation of stereoisomers are well-known in the art (see discussion in Chapter 4 of "Advanced Organic Chemistry", 4th edition J. March, John Wiley and Sons, New York, 2001), for example by synthesis from optically active starting materials or by resolution of a racemic form. Some of the compounds of the invention may have geometric isomeric centres (E- and Z- isomers). It is to be understood that the present invention encompasses all optical, diastereoisomers and geometric isomers and mixtures thereof that possess antiproliferative activity.

[00114] The present invention also encompasses compounds of the invention as defined herein which comprise one or more isotopic substitutions. For example, H may be in any isotopic form, including <sup>1</sup>H, <sup>2</sup>H(D), and <sup>3</sup>H (T); C may be in any isotopic form, including <sup>12</sup>C, <sup>13</sup>C, and <sup>14</sup>C; and O may be in any isotopic form, including <sup>16</sup>O and <sup>18</sup>O; and the like.

[00115] It is also to be understood that certain compounds of the Formula (I), or sub-formulae Ia to Ig, may exist in solvated as well as unsolvated forms such as, for example, hydrated forms. It is to be understood that the invention encompasses all such solvated forms that possess antiproliferative activity.

[00116] It is also to be understood that certain compounds of the Formula I, or sub-formulae Ia to Ig, may exhibit polymorphism, and that the invention encompasses all such forms that possess antiproliferative activity.

[00117] Compounds of the Formula I, and sub-formulae Ia to Ig, may exist in a number of different tautomeric forms and references to compounds of the Formula I, and sub-formulae Ia to Ig, include all such forms. For the avoidance of doubt, where a compound can exist in one of several tautomeric forms, and only one is specifically described or shown, all others are nevertheless embraced by Formula I, and sub-formulae Ia to Ig. Examples of tautomeric forms include keto-, enol-, and enolate-forms, as in, for example, the following tautomeric pairs: keto/enol (illustrated below), imine/enamine, amide/imino alcohol, amidine/amidine, nitroso/oxime, thioketone/enethiol, and nitro/aci-nitro.

[00118] Compounds of the Formula I, and sub-formulae Ia to Ig, containing an amine function may also form N-oxides. A reference herein to a compound of the Formula I, or sub-formulae Ia to Ig, that contains an amine function also includes the N-oxide. Where a compound contains several amine functions, one or more than one nitrogen atom may be oxidised to form an N-oxide. Particular examples of N-oxides are the N-oxides of a *tertiary* amine or a

nitrogen atom of a nitrogen-containing heterocycle. N-Oxides can be formed by treatment of the corresponding amine with an oxidizing agent such as hydrogen peroxide or a per-acid (e.g. a peroxycarboxylic acid), see for example Advanced Organic Chemistry, by Jerry March, 4th Edition, Wiley Interscience, pages. More particularly, N-oxides can be made by the procedure of L. W. Deady (Syn. Comm. 1977, 7, 509-514) in which the amine compound is reacted with m-chloroperoxybenzoic acid (mCPBA), for example, in an inert solvent such as dichloromethane.

**[00128]** Though the present invention may relate to any compound or particular group of compounds defined herein by way of optional, preferred or suitable features or otherwise in terms of particular embodiments, the present invention may also relate to any compound or particular group of compounds that specifically excludes said optional, preferred or suitable features or particular embodiments.

**[00129]** Suitably, the present invention excludes any individual compounds not possessing the biological activity defined herein.

## Synthesis

**[00130]** The compounds of the present invention can be prepared by any suitable technique known in the art. Particular processes for the preparation of these compounds are described further in the accompanying examples.

**[00131]** In the description of the synthetic methods described herein and in any referenced synthetic methods that are used to prepare the starting materials, it is to be understood that all proposed reaction conditions, including choice of solvent, reaction atmosphere, reaction temperature, duration of the experiment and workup procedures, can be selected by a person skilled in the art.

**[00132]** It is understood by one skilled in the art of organic synthesis that the functionality present on various portions of the molecule must be compatible with the reagents and reaction conditions utilised.

**[00133]** It will be appreciated that during the synthesis of the compounds of the invention in the processes defined herein, or during the synthesis of certain starting materials, it may be desirable to protect certain substituent groups to prevent their undesired reaction. The skilled chemist will appreciate when such protection is required, and how such protecting groups may be put in place, and later removed.

**[00134]** For examples of protecting groups see one of the many general texts on the subject, for example, 'Protective Groups in Organic Synthesis' by Theodora Green (publisher: John Wiley & Sons). Protecting groups may be removed by any convenient method described in the literature or known to the skilled chemist as appropriate for the removal of the protecting group in question, such methods being chosen so as to effect removal of the protecting group with the minimum disturbance of groups elsewhere in the molecule.

**[00135]** Thus, if reactants include, for example, groups such as amino, carboxy or hydroxy it may be desirable to protect the group in some of the reactions mentioned herein.

**[00136]** By way of example, a suitable protecting group for an amino or alkylamino group is, for example, an acyl group, for example an alkanoyl group such as acetyl, an alkoxy carbonyl group, for example a methoxycarbonyl, ethoxycarbonyl or *t*-butoxycarbonyl group, an arylmethoxycarbonyl group, for example benzyloxycarbonyl, or an aroyl group, for example benzoyl. The deprotection conditions for the above protecting groups necessarily vary with the choice of protecting group. Thus, for example, an acyl group such as an alkanoyl or alkoxy carbonyl group or an aroyl group may be removed by, for example, hydrolysis with a suitable base such as an alkali metal hydroxide, for example lithium or sodium hydroxide. Alternatively an acyl group such as a *tert*-butoxycarbonyl group may be removed, for example, by treatment with a suitable acid as hydrochloric, sulfuric or phosphoric acid or trifluoroacetic

acid and an arylmethoxycarbonyl group such as a benzyloxycarbonyl group may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon, or by treatment with a Lewis acid for example boron tris(trifluoroacetate). A suitable alternative protecting group for a primary amino group is, for example, a phthaloyl group which may be removed by treatment with an alkylamine, for example dimethylaminopropylamine, or with hydrazine.

**[00137]** A suitable protecting group for a hydroxy group is, for example, an acyl group, for example an alkanoyl group such as acetyl, an aroyl group, for example benzoyl, or an arylmethyl group, for example benzyl. The deprotection conditions for the above protecting groups will necessarily vary with the choice of protecting group. Thus, for example, an acyl group such as an alkanoyl or an aroyl group may be removed, for example, by hydrolysis with a suitable base such as an alkali metal hydroxide, for example lithium, sodium hydroxide or ammonia. Alternatively an arylmethyl group such as a benzyl group may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon.

**[00138]** A suitable protecting group for a carboxy group is, for example, an esterifying group, for example a methyl or an ethyl group which may be removed, for example, by hydrolysis with a base such as sodium hydroxide, or for example a t-butyl group which may be removed, for example, by treatment with an acid, for example an organic acid such as trifluoroacetic acid, or for example a benzyl group which may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon.

**[00139]** Resins may also be used as a protecting group.

**[00140]** The methodology employed to synthesise a compound of Formula (I) will vary depending on the nature of HET, R<sub>1</sub>, R<sub>1a</sub>, R<sub>1b</sub>, W, X<sub>1</sub>, X<sub>2</sub>, X<sub>3</sub>, X<sub>4</sub>, R<sub>2</sub> and R<sub>3</sub> and any substituent groups associated therewith. Suitable processes for their preparation are described further in the accompanying Examples.

**[00141]** Once a compound of Formula (I) has been synthesised by any one of the processes defined herein, the processes may then further comprise the additional steps of:

- (i) removing any protecting groups present;
- (ii) converting the compound Formula (I) into another compound of formula (I);
- (iii) forming a pharmaceutically acceptable salt, hydrate or solvate thereof; and/or
- (iv) forming a prodrug thereof.

**[00142]** An example of (ii) above is when a compound of formula (I) is synthesised and then one or more of the groups of HET, R<sub>1</sub>, R<sub>1a</sub>, R<sub>1b</sub>, W, X<sub>1</sub>, X<sub>2</sub>, X<sub>3</sub>, X<sub>4</sub>, R<sub>2</sub> and R<sub>3</sub>, may be further reacted to change the nature of the group and provide an alternative compound of formula (I).

2020220079

For example, the compound can be reacted to convert any R group into a substituent group other than hydrogen.

**[00143]** The resultant compounds of formula (I) can be isolated and purified using techniques well known in the art.

### **Biological Activity**

**[00146]** In general, the compounds of the invention demonstrate an  $IC_{50}$  of 1  $\mu$ M or less in the RET assay described in the Examples section, with preferred compounds of the invention demonstrating an  $IC_{50}$  of 200 nM or less and the most preferred compounds of the invention demonstrating an  $IC_{50}$  of 50 nM or less.

### **Pharmaceutical Compositions**

**[00152]** According to a further aspect of the invention there is provided a pharmaceutical composition which comprises a compound of the invention as defined hereinbefore, or a pharmaceutically acceptable salt, hydrate or solvate thereof, in association with a pharmaceutically acceptable diluent or carrier.

**[00153]** The compositions of the invention may be in a form suitable for oral use (for example as tablets, lozenges, hard or soft capsules, aqueous or oily suspensions, emulsions, dispersible powders or granules, syrups or elixirs), for topical use (for example as creams, ointments, gels, or aqueous or oily solutions or suspensions), for administration by inhalation (for example as a finely divided powder or a liquid aerosol), for administration by insufflation (for example as a finely divided powder) or for parenteral administration (for example as a sterile aqueous or oily solution for intravenous, subcutaneous, intramuscular, intraperitoneal or intramuscular dosing or as a suppository for rectal dosing).

**[00154]** The compositions of the invention may be obtained by conventional procedures using conventional pharmaceutical excipients, well known in the art. Thus, compositions intended for oral use may contain, for example, one or more colouring, sweetening, flavouring and/or preservative agents.

**[00155]** An effective amount of a compound of the present invention for use in therapy is an amount sufficient to treat or prevent a proliferative condition referred to herein, slow its progression and/or reduce the symptoms associated with the condition.

**[00156]** The amount of active ingredient that is combined with one or more excipients to produce a single dosage form will necessarily vary depending upon the individual treated and the particular route of administration. For example, a formulation intended for oral administration to humans will generally contain, for example, from 0.5 mg to 0.5 g of active agent (more suitably from 0.5 to 100 mg, for example from 1 to 30 mg) compounded with an appropriate and convenient amount of excipients which may vary from about 5 to about 98 percent by weight of the total composition.

**[00157]** The size of the dose for therapeutic or prophylactic purposes of a compound of the Formula I will naturally vary according to the nature and severity of the conditions, the age and sex of the animal or patient and the route of administration, according to well-known principles of medicine.

2020220079 18 Aug 2020

**[00158]** In using a compound of the invention for therapeutic or prophylactic purposes it will generally be administered so that a daily dose in the range, for example, 0.1 mg/kg to 75 mg/kg body weight is received, given if required in divided doses. In general lower doses will be administered when a parenteral route is employed. Thus, for example, for intravenous or intraperitoneal administration, a dose in the range, for example, 0.1 mg/kg to 30 mg/kg body weight will generally be used. Similarly, for administration by inhalation, a dose in the range, for example, 0.05 mg/kg to 25 mg/kg body weight will be used. Oral administration may also be suitable, particularly in tablet form. Typically, unit dosage forms will contain about 0.5 mg to 0.5 g of a compound of this invention.

## METHODS

### General Experimental

**[00191]** Flash column chromatography refers to automated chromatography using pre-packed silica cartridges.

**[00192]** Generally, in the experimental procedures described hereinbelow, flash chromatography was performed using pre-packed silica gel cartridge and thin layer chromatography was conducted with 5 × 10 cm plates coated with Merck Type 60 F<sub>254</sub> silica gel to a thickness of 0.25 mm. Typically, reagents obtained from commercial sources were used without further purification unless stated otherwise. Anhydrous solvents were commonly obtained from the Sigma-Aldrich Chemical Company Ltd. or Fisher Chemicals Ltd., and used without further drying. HPLC grade solvents were predominately obtained from Fisher Chemicals Ltd.

**[00193]** <sup>1</sup>H NMR spectroscopy was carried out using various spectrometers in the stated solvent at room temperature unless stated otherwise. In all cases, NMR data were consistent with the proposed structure. Characteristic chemical shifts (δ) are given in parts-per-million using conventional abbreviations for designation of major peaks e.g. s, singlet; d, doublet; t, triplet; q, quartet; dd, doublet of doublets; br, broad. LCMS was run using various spectrometers to generate low resolution mass spectra under electron spray ionisation (ESI) conditions.

18 Aug 2020

2020220079

**[00194]** Generally, in the experimental procedures described hereinbelow, proton (<sup>1</sup>H) NMR spectra were recorded on a 300 MHz or 400 MHz Bruker spectrometer. Solutions were typically prepared in either deuteriochloroform (CDCl<sub>3</sub>) or deuterated dimethylsulfoxide (DMSO-d<sub>6</sub>) with chemical shifts referenced to tetramethylsilane (TMS) or deuterated solvent as an internal standard. Furthermore, deuterated solvents were typically obtained from the Sigma-Aldrich Chemical Company, Goss or Fluorochem.

LCMS Methods

*Analytical LC-MS*

**[00195]** It will be appreciated that various LC-MS conditions may be used in the analysis of the compounds of the present invention. Examples of some non-limiting LC-MS conditions are provided below.

*Illustrative LC-MS conditions*

**[00196]** LC-MS analyses may be performed on, for example, a Waters Acquity UPLC system fitted with BEH C18 1.7 µM columns (2.1 × 50 mm or 2.1 × 100 mm), with UV diode array detection (210–400 nm). Positive and negative mass ion detection may also be performed using, for example, a Waters SQD detector. Analyses may then be performed with either buffered acidic or basic solvents, using gradients such as those detailed below.

*Examples of suitable solvent gradients*

Low pH:

Solvent A – Water + 10mM ammonium formate + 0.1% formic acid

Solvent B – Acetonitrile + 5% water + 0.1% formic acid

High pH:

Solvent A – Water + 10mM ammonium hydrogen carbonate + 0.1% ammonia solution

Solvent B – Acetonitrile + 0.1% ammonia solution

An Example of a Standard LC-MS Solvent Gradient:

### Preparative HPLC

**[00197]** Preparative HPLC refers to mass-directed reverse-phase chromatography using various water:MeCN eluent gradients. It will be appreciated that various preparative HPLC machines and/or conditions may be used to purify the compounds of the present invention, and the person skilled in the art will be well versed in selecting appropriate conditions for each respective compound. Nonetheless, details of some non-limiting examples of suitable HPLC conditions are provided below.

#### *Illustrative preparative HPLC conditions*

**[00198]** Compounds may be purified by preparative HPLC on, for example, a Waters FractionLynx MS autopurification system, with a column such as a Waters XBridge 5 µm C18, 100 mm × 19 mm i.d. column, running at a typical flow rate of 20 mL/min with UV diode array detection (210–400 nm) and mass-directed collection using both positive and negative mass ion detection.

**[00199]** Purifications may also be performed using buffered acidic or basic solvent systems, as appropriate. Compound retention times on such systems may then be assessed using a 30-50 µL test injection and a standard gradient, and then purified using an appropriately chosen focussed gradient as detailed below, based upon observed retention time.

**[00200]** Some typically examples of suitable solvent gradients include:

Low pH:

Solvent A – Water + 10mM ammonium formate + 0.1% formic acid

Solvent B – Acetonitrile + 5% water +0.1% formic acid

High pH:

Solvent A – Water + 10mM ammonium formate + 0.1% ammonia solution

Solvent B – Acetonitrile + 5% water + 0.1% ammonia solution

### Synthetic methods

**[00201]** Several methods for the chemical synthesis of the compounds of the present invention are described herein. These and/or other well-known methods may be modified and/or adapted in known ways in order to facilitate the synthesis of additional compounds within the scope of the present invention.

**[00202]** Where the preparation of starting materials is not described, these are commercially available, known in the literature, or readily obtained by those skilled in the art using standard procedures. Where it is stated that compounds were prepared analogously to earlier examples or intermediates, using General Methods, it will be appreciated by the skilled person that the reaction time, number of equivalents of reagents and temperature can be modified for each specific reaction and that it may be desirable or necessary to employ different reagents, catalysts, work-up or purification techniques.

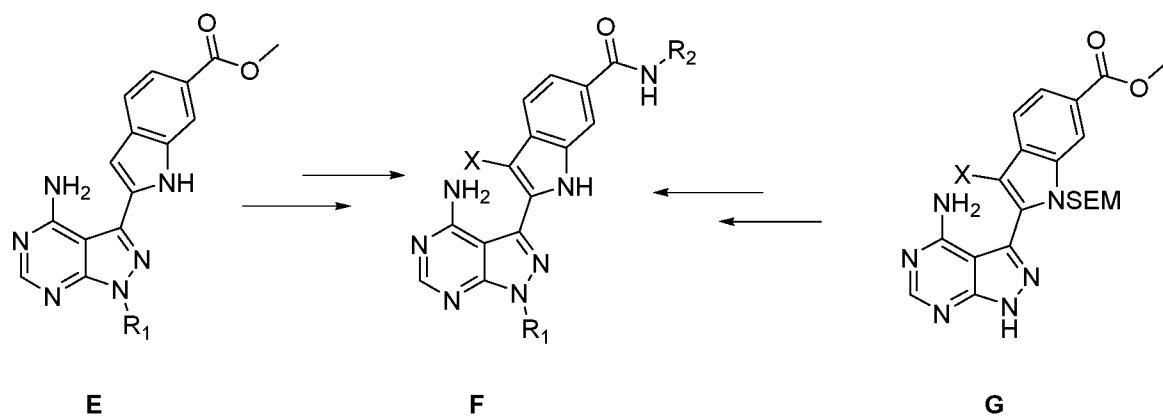

## General Synthetic Schemes

**Scheme 1 – Preparation of Indolyl Pyrazolopyrimidines D**

**[00203]** Substituted pyrazolopyrimidines C were prepared either via the known 3-step procedure from an appropriately substituted hydrazine A (General Method 1) or via elaboration of the unsubstituted pyrazolopyrimidine B (General Method 2). X is usually Br or I. Suzuki coupling of intermediate C with either 2-halo indole derivatives (General Method 3) or indolyl boronic acid derivatives (General Method 4) returned product D. Where necessary, further elaboration was conducted.

*Scheme 2 – Elaboration of Indolyl Pyrazolopyrimidines*

**[00204]** Elaboration of esters E to amides F (where X = H, Cl, Br etc) was achieved by a number of routes. These include hydrolysis (General Method 5), amide formation (General Method 6), direct amidation (General Method 7) and, in cases where X = Cl, by halogenation

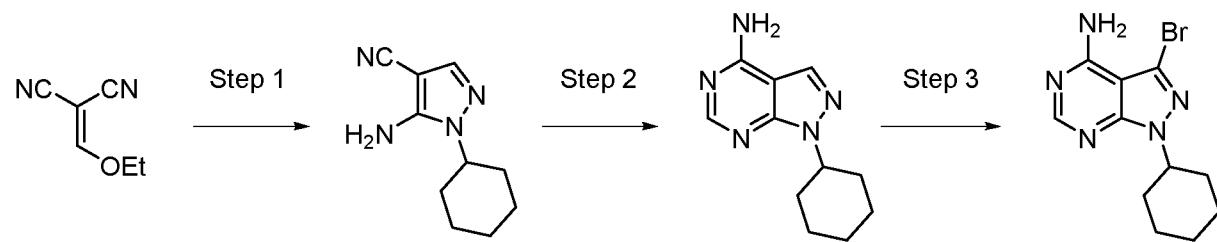

with NCS (General Method 8). The order of these transformations varied. Alternatively, ester G could be alkylated, deprotected and converted to the amide (General Method 9).

### General Methods for Intermediates and Examples

**[00205]** Representative procedures are provided to all General Methods although it will be appreciated that modifications to the procedures, work-up and isolation will be employed in individual preparations. In particular, in cases where Boc-protected intermediates are employed in Suzuki couplings, an additional treatment with HCl or TFA was included if deprotection did not occur thermally under the reaction conditions.

The residue was triturated with DCM to return the title compound (204 mg, 64%) as an off-white solid. LCMS [M+H]<sup>+</sup> 253.0 and 255.0; <sup>1</sup>H NMR (300 MHz, DMSO-d<sub>6</sub>) δ 12.13 (s, 1H), 8.36 (br d, *J* = 4.14 Hz, 1H), 7.83 (s, 1H), 7.49-7.53 (m, 2H), 6.59 (s, 1H), 2.79 (d, *J* = 4.52 Hz, 3H).

**[00219]** To a suspension of methyl 2-(4-amino-1-isopropyl-pyrazolo[3,4-d]pyrimidin-3-yl)-3-chloro-1*H*-indole-6-carboxylate (380 mg, 1.0 mmol) in THF (4 mL) was added methylamine (2.0 M in THF, 3.95 mL, 7.9 mmol) followed by AlMe<sub>3</sub> (1.0 M solution in heptane, 3.95 mL, 3.95 mmol) dropwise. The resulting suspension was stirred at room temperature for 1 h then heated at 60 °C for 1 h whereby a solution formed. The reaction was cooled to 0 °C and quenched by the dropwise addition of a 20% (w/v) solution of Rochelle's salt in water (30 mL). The mixture was stirred for 30 mins and extracted with EtOAc (2 × 30 mL). The combined extracts were washed sequentially with water (30 mL) and brine (30 mL), and concentrated *in vacuo*. The crude product was purified by fcc (0 to 10% MeOH in DCM) to return the title compound (170 mg, 45%) as a white solid. LCMS [M+H]<sup>+</sup> 384.2; <sup>1</sup>H NMR (300 MHz, DMSO-d<sub>6</sub>) δ 12.16 (s, 1H), 8.45-8.52 (m, 1H), 8.27 (s, 1H), 8.00 (s, 1H), 7.69 (dd, *J* = 2.35, 8.57 Hz, 1H), 7.61 (d, *J* = 8.57 Hz, 1H), 5.12 (sept, *J* = 6.64 Hz, 1H), 2.82 (d, *J* = 4.52 Hz, 3H), 1.53 (d, *J* = 6.69 Hz, 6H). #### General Method 8 – representative procedure

*Methyl 2-(4-amino-1-isopropyl-1*H*-pyrazolo[3,4-*d*]pyrimidin-3-yl)-3-chloro-1*H*-indole-6-carboxylate (Intermediate 28)*

**[00220]** To a solution of methyl 2-(4-amino-1-isopropyl-pyrazolo[3,4-*d*]pyrimidin-3-yl)-1*H*-indole-6-carboxylate (0.4 g, 1.14 mmol) in DMF (10 mL) was added NCS (0.15 g, 1.14 mmol) at room temperature. The orange solution was stirred at room temperature for 1 hour whereupon a suspension formed. The reaction mixture was diluted with water (150 mL) and stirred at room temperature for 30 mins. The solid was isolated by filtration, washed with water and dried *in vacuo* at 50 °C to return the title compound (3.8 g, 86%) as a sandy coloured solid. LCMS [M+H]<sup>+</sup> 385.2; <sup>1</sup>H NMR (300 MHz, DMSO-d<sub>6</sub>) δ 12.29 (s, 1H), 8.27 (s, 1H), 8.12 (s, 1H), 7.79 (dd, *J* = 1.79, 8.58 Hz, 1H), 7.68 (d, *J* = 8.16 Hz, 1H), 5.12 (quin, *J* = 6.73 Hz, 1H), 3.89 (s, 3H), 1.53 (d, *J* = 6.69 Hz, 6H).

**[00221]** Typically, treatment of substrates with 1 eq NCS resulted in varying proportions of unreacted starting material, desired product and a bischlorinated impurity. A variety of purifications techniques were employed, dependent on the ratio of product. Precipitation and/or fcc and/or preparative HPLC were variously used. On occasion, DIPEA was added to the reaction mixture and heated or the crude product was treated with NaBH<sub>4</sub> in MeOH as this was sometimes beneficial in removing the bischlorinated impurity.

A 2:1 mixture of unreacted starting material and product was observed by HPLC. The solvent was concentrated *in vacuo* and the resulting residue partitioned between EtOAc (50 mL) and water (15 mL). The organic layer was separated and retained and the aq phase was extracted with further EtOAc (2 × 50 mL). The combined organic extracts were washed with brine (50 mL), dried and concentrated

*in vacuo*. The crude product was purified by fcc (0-100% EtOAc in isohexane) to return the title compound (3.7 mg, 10%) as a white solid.

### Biological data

#### *RET, RET<sup>V804M</sup> and KDR Enzyme Assays*

**[00267]** Kinase activity was detected using CisBio HTRF kinEASE kit based on time-resolved fluorescence transfer (FRET). The assay was performed in 384-well white plates (Corning #3574) in a reaction volume of 10  $\mu$ L containing 1X CisBio enzymatic buffer supplemented with a final concentration of 5 mM MgCl<sub>2</sub>, 1 mM DTT, 10 nM SEB and 0.01% Triton X100 for RET. The same buffer conditions were used for KDR with the addition of 2 mM MnCl<sub>2</sub>. RET<sup>V804M</sup> buffer used 1X CisBio enzymatic buffer supplemented with a final concentration of 2 mM MgCl<sub>2</sub>, 1mM DTT, 20 nM SEB and 0.01% Triton X100.

**[00268]** Inhibitors were pre-incubated in the plate for 15 mins with 5  $\mu$ L kinase and assay buffer at the following concentrations; 13 pM RET (Carna Biosciences; 08-159), 30 pM RET<sup>V804M</sup> (Millipore; 14-760) and 150 pM KDR (Millipore; 14-630). The reaction was initiated by the addition of 5  $\mu$ L ATP and substrate at 2X final reaction concentrations. For RET, this was 18  $\mu$ M and 2  $\mu$ M; for RET<sup>V804M</sup>, this was 4  $\mu$ M and 1.5  $\mu$ M and for KDR, this was 16  $\mu$ M and 1  $\mu$ M, respectively. Reactions were performed at ATP K<sub>m</sub> for each target. The assay was allowed to proceed at room temperature for 30 mins before terminating with the addition of 10  $\mu$ L HTRF detection buffer containing EDTA supplemented with TK-antibody labelled with Eu<sup>3+</sup>-Cryptate (1:100 dilution) and streptavidin-XL665 (128 nM). Following incubation at room temperature for 1 hour, FRET signal was measured using the Pherastar FS Microplate Reader.

**[00269]** Activity data (IC<sub>50</sub>) for the compounds of the present invention against RET, KDR and RET<sup>V804M</sup> enzymes is shown in Table 1 below.

*BaF3 Cell Assay*

**[00270]** The system originally developed by Daley and Baltimore<sup>16</sup> was used, whereby IL3-dependent BaF3 cells are modified to express an activated recombinant kinase. Following removal of IL3, the modified cells are dependent on the activity of the recombinant kinase for survival and proliferation. The BaF3 cell lines, expressing KIF5B-RET (gift from Pasi Janne<sup>7</sup>), KDR and RET<sup>V804M</sup> (Advanced Cellular Dynamics, San Diego) were maintained in RPMI-1640 media containing 10% FBS and appropriate antibiotics. Non-modified BaF3 cells (WT) were maintained in RPMI-1640 media containing 10% FBS and supplemented with 10 ng/mL recombinant mouse IL3 (R&D systems). For assessment of compound IC<sub>50</sub>, cells were plated into 384-well plates at 1500 or 3000 cells per well in 30 µL culture medium and compounds dispensed using an acoustic liquid handling platform (LABCYTE). Following incubation of the cells for 48 hours at 37 °C in a humidified 5% CO<sub>2</sub> atmosphere, viability was determined by addition of 10 µL CellTiter-Glo reagent (Promega) and measurement of luminescence.
