INHIBITORS OF HISTONE DEACETYLASE

CROSS-REFERENCE TO RELATED APPLICATION

This application claims priority from U.S. provisional application serial no. 60/667,708, filed April 1, 2005, which is incorporated herein by reference in its entirety.

BACKGROUND OF THE INVENTION

Field of the Invention

[0001] This invention relates to compounds for the inhibition of histone deacetylase.

Description of Related Art

[0002] In eukaryotic cells, nuclear DNA associates with histones to form a compact complex called chromatin. The histones constitute a family of basic proteins which are generally highly conserved across eukaryotic species. The core histones, termed H2A, H2B, H3, and H4, associate to form a protein core. DNA winds around this protein core, with the basic amino acids of the histones interacting with the negatively charged phosphate groups of the DNA. Approximately 146 base pairs of DNA wrap around a histone core to make up a nucleosome particle, the repeating structural motif of chromatin.

[0003] Csordas, *Biochem. J.*, 286: 23-38 (1990) teaches that histones are subject to posttranslational acetylation of the α,ε-amino groups of *N*-terminal lysine residues, a reaction that is catalyzed by histone acetyl transferase (HAT1). Acetylation neutralizes the positive charge of the lysine side chain, and is thought to impact chromatin structure. Indeed, Taunton *et al.*, *Science,* 272: 408-411 (1996), teaches that access of transcription factors to chromatin templates is enhanced by histone hyperacetylation. Taunton *et al.* further teaches that an enrichment in underacetylated histone H4 has been found in transcriptionally silent regions of the genome.

[0004] Histone acetylation is a reversible modification, with deacetylation being catalyzed by a family of enzymes termed histone deacetylases (HDACs). The molecular cloning of gene sequences encoding proteins with HDAC activity has established the existence of a set of discrete HDAC enzyme isoforms. Grozinger *et al.*, *Proc. Natl. Acad. Sci. USA*, 96:4868-4873 (1999), teaches that HDACs may be divided into two classes, the first represented by yeast Rpd3-like proteins, and the second represented by yeast Hd1-like proteins. Grozinger *et al.* also teaches that the human HDAC-1, HDAC-2, and HDAC-3 proteins are members of the first class of HDACs, and discloses new proteins, named HDAC-4, HDAC-5, and HDAC-6, which are members of the second class of HDACs. Kao *et al.*, *Gene & Development* 14:55-66 (2000), discloses an additional member of this second class, called HDAC-7. More recently, Hu, E. *et al. J. Bio. Chem.* 275:15254-13264 (2000) disclosed another member of the first class of histone deacetylases, HDAC-8. Zhou *et al.*,

Proc. Natl. Acad. Sci. U.S.A., 98: 10572-10577 (2001) teaches the cloning and characterization of a new histone deacetylase, HDAC-9. Kao *et al., J. Biol. Chem.*, 277:187-93 (2002) teaches the isolation and characterization of mammalian HDAC10, a novel histone deacetylase. Gao *et al, J. Biol. Chem.* (In press) teaches the cloning and functional characterization of HDAC11, a novel member of the human histone deacetylase family. Shore, *Proc. Natl. Acad. Sci. U.S.A.* 97: 14030-2 (2000) discloses a third class of deacetylase activity, the Sir2 protein family. It has been unclear what roles these individual HDAC enzymes play.

[0005] Studies utilizing known HDAC inhibitors have established a link between acetylation and gene expression. Numerous studies have examined the relationship between HDAC and gene expression. Taunton *et al., Science* 272:408-411 (1996), discloses a human HDAC that is related to a yeast transcriptional regulator. Cress *et al., J. Cell. Phys.* 184:1-16 (2000), discloses that, in the context of human cancer, the role of HDAC is as a corepressor of transcription. Ng *et al., TIBS* 25: March (2000), discloses HDAC as a pervasive feature of transcriptional repressor systems. Magnaghi-Jaulin *et al., Prog. Cell Cycle Res.* 4:41-47 (2000), discloses HDAC as a transcriptional co-regulator important for cell cycle progression.

[0006] Richon *et al., Proc. Natl. Acad. Sci. USA*, **95**: 3003-3007 (1998), discloses that HDAC activity is inhibited by trichostatin A (TSA), a natural product isolated from *Streptomyces hygroscopicus*, which has been shown to inhibit histone deacetylase activity and arrest cell cycle progression in cells in the G1 and G2 phases (Yoshida *et al., J. Biol. Chem.* 265: 17174-17179, 1990; Yoshida *et al., Exp. Cell Res.* 177: 122-131, 1988), and by a synthetic compound, suberoylanilide hydroxamic acid (SAHA). Yoshida and Beppu, *Exper. Cell Res.*, 177: 122-131 (1988), teaches that TSA causes arrest of rat fibroblasts at the G_1 and G_2 phases of the cell cycle, implicating HDAC in cell cycle regulation. Indeed, Finnin *et al., Nature,* 401: 188-193 (1999), teaches that TSA and SAHA inhibit cell growth, induce terminal differentiation, and prevent the formation of tumors in mice. Suzuki *et al.,* U.S. Pat. No. 6,174,905, EP 0847992, JP 258863/96, and Japanese Application No. 10138957, disclose benzamide derivatives that induce cell differentiation and inhibit HDAC. Delorme *et al.*, WO 01/38322 and PCT/IB01/00683, disclose additional compounds that serve as HDAC inhibitors. Other inhibitors of histone deacetylase activity, including trapoxin, depudecin, FR901228 (Fujisawa Pharmaceuticals), and butyrate, have been found to similarly inhibit cell cycle progression in cells (Taunton *et al., Science* 272: 408-411, 1996; Kijima *et al., J. Biol. Chem.* 268(30):22429-22435, 1993; Kwon *et al., Proc. Natl. Acad. Sci. USA* 95(7):3356-61, 1998).

[0007] These findings suggest that inhibition of HDAC activity represents a novel approach for intervening in cell cycle regulation and that HDAC inhibitors have great

therapeutic potential in the treatment of cell proliferative diseases or conditions. To date, few inhibitors of histone deacetylase are known in the art.It would be highly desirable to have inhibiters of histone deacetylase.

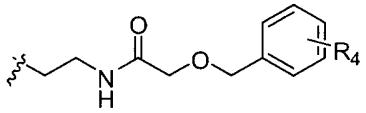
is the structure



[0075] In the second aspect, the invention provides a composition comprising a compound according to the first aspect and Embodiments A to GGG and a pharmaceutically acceptable carrier.

[0076] In the third aspect, the invention provides a method of inhibiting histone deacetylase. In still another embodiment, the method of inhibiting histone deacetylase in a cell comprising contacting the cell with an inhibiting effective amount of a composition according to the second aspect.

[0077] For purposes of the present invention, the following definitions will be used (unless expressly stated otherwise).

[0078] As used herein, the terms "histone deacetylase" and "HDAC" are intended to refer to any one of a family of enzymes that remove acetyl groups from the ω-amino groups of lysine residues at the *N*-terminus of a histone. Unless otherwise indicated by context, the term "histone" is meant to refer to any histone protein, including H1, H2A, H2B, H3, H4, and H5, from any species. Preferred histone deacetylases include class I and class II enzymes. Other preferred histone deacetylases include class III enzymes. Preferably the histone deacetylase is a human HDAC, including, but not limited to, HDAC-1, HDAC-2, HDAC-3, HDAC-4, HDAC-5, HDAC-6, HDAC-7, HDAC-8, HDAC-9, HDAC-10, HDAC-11, SirT1, SirT2, SirT3, SirT4, SirT5, SirT6 and SirT7. In some other preferred embodiments, the histone deacetylase is derived from a protozoal or fungal source.

[0079] The terms "histone deacetylase inhibitor" and "inhibitor of histone deacetylase" are intended to mean a compound having a structure as defined herein, which is capable of interacting with a histone deacetylase and inhibiting its enzymatic activity.

[0080] The term "inhibiting histone deacetylase enzymatic activity" is intended to mean reducing the ability of a histone deacetylase to remove an acetyl group from a histone. The concentration of inhibitor which reduces the activity of a histone deacetylase to 50% of that of the uninhibited enzyme is determined as the IC_{50} value.

[0081] Preferably, such inhibition is specific, *i.e.*, the histone deacetylase inhibitor reduces the ability of a histone deacetylase to remove an acetyl group from a histone at a concentration that is lower than the concentration of the inhibitor that is required to produce another, unrelated biological effect. Preferably, the concentration of the inhibitor required for

histone deacetylase inhibitory activity is at least 2-fold lower, more preferably at least 5-fold lower, even more preferably at least 10-fold lower, and most preferably at least 20-fold lower than the concentration required to produce an unrelated biological effect.

[0082] For simplicity, chemical moieties are defined and referred to throughout primarily as univalent chemical moieties (*e.g.*, alkyl, aryl, etc.). Nevertheless, such terms are also used to convey corresponding multivalent moieties under the appropriate structural circumstances clear to those skilled in the art. For example, while an "alkyl" moiety generally refers to a monovalent radical (*e.g.* CH_3-CH_2-), in certain circumstances a bivalent linking moiety can be "alkyl," in which case those skilled in the art will understand the alkyl to be a divalent radical (*e.g.*, -CH_2-CH_2-), which is equivalent to the term "alkylene." (Similarly, in circumstances in which a divalent moiety is required and is stated as being "aryl," those skilled in the art will understand that the term "aryl" refers to the corresponding divalent moiety, arylene). All atoms are understood to have their normal number of valences for bond formation (*i.e.*, 4 for carbon, 3 for N, 2 for O, and 2, 4, or 6 for S, depending on the oxidation state of the S). On occasion a moiety may be defined, for example, as $(A)_a$-B-, wherein a is 0 or 1. In such instances, when a is 0 the moiety is B- and when a is 1 the moiety is A-B-.

[0083] For simplicity, reference to a "C_n-C_m" heterocyclyl or "C_n-C_m" heteroaryl means a heterocyclyl or heteroaryl having from "n" to "m" annular atoms, where "n" and "m" are integers. Thus, for example, a C_5-C_6-heterocyclyl is a 5- or 6- membered ring having at least one heteroatom, and includes pyrrolidinyl (C_5) and piperidinyl (C_6); C_6-hetoaryl includes, for example, pyridyl and pyrimidyl.

[0084] The term "hydrocarbyl" refers to a straight, branched, or cyclic alkyl, alkenyl, or alkynyl, each as defined herein. A "C_0" hydrocarbyl is used to refer to a covalent bond. Thus, "C_0-C_3-hydrocarbyl" includes a covalent bond, methyl, ethyl, ethenyl, ethynyl, propyl, propenyl, propynyl, and cyclopropyl.

[0085] The term "alkyl" is intended to a mean straight and branched chain aliphatic group having from 1 to 12 carbon atoms, preferably 1-8 carbon atoms, and more preferably 1-6 carbon atoms, which is optionally substituted with one, two or three substituents. Other preferred alkyl groups have from 2 to 12 carbon atoms, preferably 2-8 carbon atoms and more preferably 2-6 carbon atoms. Preferably, the aralkyl group is (C_1-C_6)alk(C_6-C_{10})aryl, including, without limitation, benzyl, phenethyl, and naphthylmethyl. For simplicity, when written as "arylalkyl" this term, and terms related thereto, is intended to indicate the order of groups in a compound as "aryl – alkyl". Similarly, "alkyl-aryl" is intended to indicate the order of the groups in a compound as "alkyl-aryl".

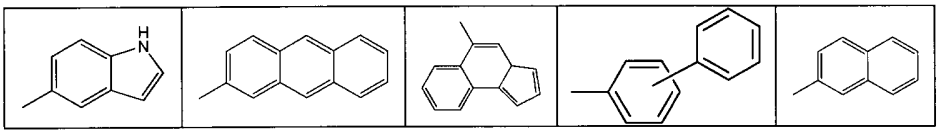
[0105] The term "radical" is intended to mean a chemical moiety comprising one or more unpaired electrons.

[0106] A moiety that is substituted is one in which one or more hydrogens have been independently replaced with another chemical substituent. As a non-limiting example, substituted phenyls include 2-flurophenyl, 3,4-dichlorophenyl, 3-chloro-4-fluoro-phenyl, 2-fluoro-3-propylphenyl. As another non-limiting example, substituted *N*-octyls include 2,4-dimethyl-5-ethyl-octyl and 3-cyclopentyl-octyl. Included within this definition are methylenes (-CH_2-) substituted with oxygen to form carbonyl -CO-).

[0107] Where optional substituents are chosen from "one or more" groups it is to be understood that this definition includes all substituents being chosen from one of the specified groups or the substituents being chosen from two or more of the specified groups.

[0108] In addition, substituents on cyclic moieties (i.e., cycloalkyl, heterocyclyl, aryl, heteroaryl) include 5-6 membered mono- and 9-14 membered bi-cyclic moieties fused to the parent cyclic moiety to form a bi- or tri-cyclic fused ring system. Substituents on cyclic moieties also include 5-6 membered mono- and 9-14 membered bi-cyclic moieties attached to the parent cyclic moiety by a covalent bond to form a bi- or tri-cyclic bi-ring system. For example, an optionally substituted phenyl includes, but is not limited to, the following:



[0109] An "unsubstituted" moiety as defined above (*e.g.*, unsubstituted cycloalkyl, unsubstituted heteroaryl, etc.) means that moiety as defined above that does not have any of the optional substituents for which the definition of the moiety (above) otherwise provides. Thus, for example, while an "aryl" includes phenyl and phenyl substituted with a halo, "unsubstituted aryl" does not include phenyl substituted with a halo.

[0110] The term "protecting group" is intended to mean a group used in synthesis to temporarily mask the characteristic chemistry of a functional group because it interferes with

another reaction. A good protecting group should be easy to put on, easy to remove and in high yielding reactions, and inert to the conditions of the reaction required. A protecting group or protective group is introduced into a molecule by chemical modification of a functional group in order to obtain chemoselectivity in a subsequent chemical reaction. One skilled in the art will recognize that during any of the processes for preparation of the compounds in the present invention, it may be necessary and/or desirable to protect sensitive or reactive groups on any of the molecules concerned. This may be achieved by means of conventional protecting groups, such as but not limited to Bn- (or $-CH_2Ph$), $-CHPh_2$, alloc (or $CH_2=CH-CH_2-O-C(O)-$), BOC-, -Cbz (or Z-), -F-moc, $-C(O)-CF_3$, N-Phthalimide,1-Adoc-, TBDMS-, TBDPS-, TMS-, TIPS-, IPDMS-, $-SiR_3$, SEM-, t-Bu-, Tr-, THP- and Allyl-. These protecting groups may be removed at a convenient stage using methods known from the art.

[0111] Some compounds of the invention may have chiral centers and/or geometric isomeric centers (E- and Z- isomers), and it is to be understood that the invention encompasses all such optical, diastereoisomers and geometric isomers. The invention also comprises all tautomeric forms of the compounds disclosed herein.

[0112] The compounds of the invention may be administered as is or in the form of an *in vivo* hydrolyzable ester or *in vivo* hydrolyzable amide. An *in vivo* hydrolyzable ester of a compound of the invention containing carboxy or hydroxy group is, for example, a pharmaceutically acceptable ester which is hydrolyzed in the human or animal body to produce the parent acid or alcohol. Suitable pharmaceutically acceptable esters for carboxy include C_{1-6}-alkoxymethyl esters (*e.g.*, methoxymethyl), C_{1-6}-alkanoyloxymethyl esters (*e.g.*, for example pivaloyloxymethyl), phthalidyl esters, C_{3-8}-cycloalkoxycarbonyloxyC_{1-6}-alkyl esters (*e.g.*, 1-cyclohexylcarbonyloxyethyl); 1,3-dioxolen-2-onylmethyl esters (*e.g.*, 5-methyl-1,3-dioxolen-2-onylmethyl; and C_{1-6}-alkoxycarbonyloxyethyl esters (*e.g.*, 1-methoxycarbonyloxyethyl) and may be formed at any carboxy group in the compounds of this invention.

[0113] An *in vivo* hydrolyzable ester of a compound of the invention containing a hydroxy group includes inorganic esters such as phosphate esters and a-acyloxyalkyl ethers and related compounds which as a result of the in vivo hydrolysis of the ester breakdown to give the parent hydroxy group. Examples of α-acyloxyalkyl ethers include acetoxymethoxy and 2,2-dimethylpropionyloxy-methoxy. A selection of *in vivo* hydrolyzable ester forming groups for hydroxy include alkanoyl, benzoyl, phenylacetyl and substituted benzoyl and phenylacetyl, alkoxycarbonyl (to give alkyl carbonate esters), dialkylcarbamoyl and *N*-(*N,N*-dialkylaminoethyl)-*N*-alkylcarbamoyl (to give carbamates), *N,N*-dialkylaminoacetyl and carboxyacetyl. Examples of substituents on benzoyl include morpholino and piperazino linked from a ring nitrogen atom via a methylene group to the 3- or 4- position of the benzoyl

ring. A suitable value for an *in vivo* hydrolyzable amide of a compound of the invention containing a carboxy group is, for example, a *N*-C_{1-6}-alkyl or N,N-di-C_{1-6}-alkyl amide such as *N*-methyl, *N*-ethyl, *N*-propyl, *N,N*-dimethyl, *N*-ethyl-*N*-methyl or *N,N*-diethyl amide.

[0114] The foregoing merely summarizes the one aspect and embodiments of the invention and is not intended to be limiting in nature. These aspects and embodiments are described more fully below.

Example 37

N-(biphenyl-3-yl)-6-(2-(4-(methylthio)benzyloxy)acetamido)hexanamide) (44)

Step 1: methyl 2-(4-(methylthio)benzyloxy)acetate (**42**)

[0133] To a stirred solution of (4-(methylthio)phenyl)methanol (500 mg, 3.24 mmol) in THF (10 mL) at 0 °C was added sodium hydride (143 mg, 3.56 mmol). Bromomethyl acetate (3.24 mmol, 0.31 mL) was then added *via* a syringe and the reaction was allowed to warm to room temperature with stirring over 15 hours. The reaction mixture was quenched with water and extracted with ethyl acetate. The organic extract was dried (Na_2SO_4), filtered, and evaporated. The residue was purified by silica gel column chromatography with gradient of EtOAc (20-25%) in hexane to afford **42** (240 mg, 33%) as a clear oil.

^{1}H NMR: ($CDCl_3$) δ (ppm): 7.21 (d, J=8.6 Hz, 2H), 7.16 (d, J=8.4 Hz, 2H), 4.51 (s, 2H), 4.03 (s, 2H), 3.69 (s, 3H), 2.41 (s, 3H).

Step 2: 2-(4-(methylthio)benzyloxy)acetic acid (**43**)

[0134] Following the same procedure as described for compound **5** (step 5, scheme 1, example 1) but substituting **42** for methyl ester **4**, to afford **43** (160 mg, 60 %) as a white solid. ^{1}H NMR: ($CDCl_3$) δ (ppm): 9.84 (br s, 1H), 7.45 – 7.32 (m, 4H), 4.73 (s, 2H), 4.27 (s, 2H), 2.63 (s, 3H).

Step 3: *N*-(biphenyl-3-yl)-6-(2-(4-(methylthio)benzyloxy)acetamido)hexanamide) (**44**)

[0135] Following the same procedure as described for compound **1** (scheme 1, example 1) but substituting acid **43** for *N*-Boc-caproic acid, to afford **44** (160 mg, 15% from step 1-3)

as a white solid. (DMSO-*d*6) δ (ppm) ^{1}H: 9.95 (s, 1H), 7.90 (t, J=1.8 Hz, 1H), 7.78 (t, J=5.8 Hz, 1H), 7.59 - 7.54 (m, 3H), 7.47 - 7.43 (m, 2H), 7.37 - 7.33 (m, 2H), 7.30 - 7.27 (m, 3H), 7.23 - 7.20 (m, 2H), 4.46 (s, 2H), 3.83 (s, 2H), 3.10 (q, J=7.0 Hz, 2H), 2.46 (s, 3H), 2.33 (t, J=7.5 Hz, 2H), 1.63 - 1.59 (m, 2H), 1.48 - 1.42 (m, 2H), 1.33 - 1.27 (m, 2H). Example 38-43

[0136] Example 38-43 describe the preparation of compound **45-50** using the same procedures as described for compound **44** in Example 37, scheme 2. Characterization data are presented in a Table 2.

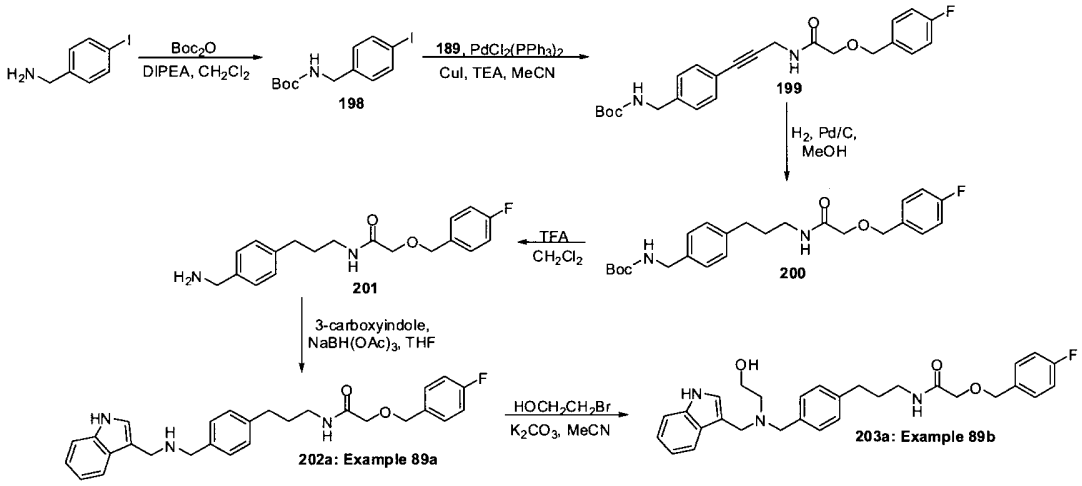
Scheme 28



Example 89a

N-(3-(4-(((1*H*-indol-3-yl)methylamino)methyl)phenyl)propyl)-2-(4-fluorobenzyloxy)acetamide (**202a**)

Step 1: *tert*-butyl 4-iodobenzylcarbamate (**198**)

[0304] To a stirred solution of (4-iodophenyl)methanamine hydrochloride (941 mg, 3.49 mmol) in dichloromethane (10 mL) at room temperature was added diisopropylethylamine (0.73 mL, 4.19 mmol) and di-*tert*-butyl dicarbonate (914 mg, 4.19 mmol). The resulting solution was stirred for 2 hours prior to dilution with brine, adjustment to pH = 1 with HCl, and extraction with ethyl acetate. The combined organic extracts were dried (Na_2SO_4), filtered, and concentrated. The residue was the taken up in ethyl acetate, and triturated with hexanes to afford **198** (600 mg, 52%) as a white solid. LRMS (ESI): (calc) 333.2; (found) 334.2 $(MH)^+$.

Step 2: *tert*-butyl 4-(3-(2-(4-fluorobenzyloxy)acetamido)prop-1-ynyl)benzylcarbamate (**199**)

[0305] Following the same procedure as described for compound **182a** (scheme 25, example 84a) but substituting **198** for **181** and **189** for methyl 3-(2-oxo-2-(prop-2-ynylamino)ethylthio)propanoate to afford **199** (553 mg, 82%) as a light yellow solid. LRMS (ESI): (calc) 426.5; (found) 427.2 $(MH)^+$.

Step 3: *tert*-butyl 4-(3-(2-(4-fluorobenzyloxy)acetamido)propyl)benzylcarbamate (**200**)

[0306] Following the same procedure as described for compound **74** (scheme 5, example 55) but substituting **199** for **73** to afford **200** (505 mg, 90%) as a white solid. LRMS (ESI): (calc) 430.5; (found) 431.0 $(MH)^+$.

Step 4: *N*-(3-(4-(aminomethyl)phenyl)propyl)-2-(4-fluorobenzyloxy)acetamide (**201**)

[0307] Following the same procedure as described for compound **2** (step2, scheme 1, example 1) but substituting **200** for **1** to afford **201** (378 mg, 97%) as light white solid. LRMS (ESI): (calc) 330.4; (found) 331.2 $(MH)^+$.

Example 91

N-(biphenyl-3-yl)-6-(2,2-difluoro-2-(4-fluorophenylthio)acetamido)hexanamide (**210**)

Step 1: 2,2-difluoro-2-(4-fluorophenylthio)acetic acid (**209**).

[0311] 4-Fluorothiophenol (1.64 mL, 15.3 mmol) and 2-chloro-2,2-difluoroacetic acid (1.47 mL, 15.3 mmol) were dissolved in dioxane, cooled to 0°C, and sodium hydride (60%, 1.28g, 32.1 mmol) was added. The mixture was then raised to room temperature and, when bubbling had ceased, was heated at 100 °C for 3 hours. The mixture was then cooled to room temperature, 5 mL of ethanol was added, and the suspension poured into a mixture of ice in 1N HCl. The mixture was then extracted with ethyl acetate and the organic layer washed with water, then brine and dried ($MgSO_4$). The residue was triturated with hexanes; the solvent was removed to afford **209** as a beige solid (3.05g, 90%). LRMS (ESI): (calc) 222.0; (found) 220.9 $(M)^-$.

Step 2 : *N*-(biphenyl-3-yl)-6-(2,2-difluoro-2-(4-fluorophenylthio)acetamido)-hexanamide (**210**).

[0312] Amide **2** (50 mg, 0.177 mmol) and acid **209** (39 mg, 0.177 mmol) were dissolved in pyridine (2 mL) and cooled to 0 °C. Phosphoryl trichoride (19 µL, 0.212 mmol) was then added dropwise and the mixture left to return to room temperature overnight. The solution

was then poured into ice water, extracted with ethyl acetate, and the combined organic layers were washed with water, brine and dried ($MgSO_4$). The residue was purified by column chromatography (25% to 75% ethyl acetate in hexanes) to obtain compound **210** (67 mg, 78%) as a colorless oil. (CD_3OD) δ (ppm) ^1H: 7.85 (s, 1H), 7.60 (m, 4H), 7.51 (d, J = 7.6 Hz, 1H), 7.32-7.42 (m, 5H), 7.16 (t, J = 8.4 Hz, 2H), 3.18 (t, J = 6.8 Hz, 2H), 2.4 (t, J = 7.2 Hz, 2H), 1.71 (quin, J = 8.0 Hz, 2H), 1.50 (quin, J = 7.2 Hz, 2H), 1.34 (m, 2H). LRMS (ESI): (calc) 486.1; (found), 509.1 $(M+Na)^+$.

The mixture was stirred at room temperature overnight and quenched with saturated sodium bicarbonate solution. The reaction mixture was extracted with dichloromethane and the combined organic layers washed with water and brine. The organic extract was dried ($MgSO_4$) filtered, and concentrated to afford **211** as a yellow solid in quantitative yield. LRMS (ESI): (calc) 281.1; (found), 304.1 $(M+Na)^+$.

Potassium carbonate (248 mg, 1.8 mmol) was then added and the mixture heated at 90 °C for 14 hours. The mixture was cooled and partitioned between water and ethyl acetate and the organic layer was washed with water, then once

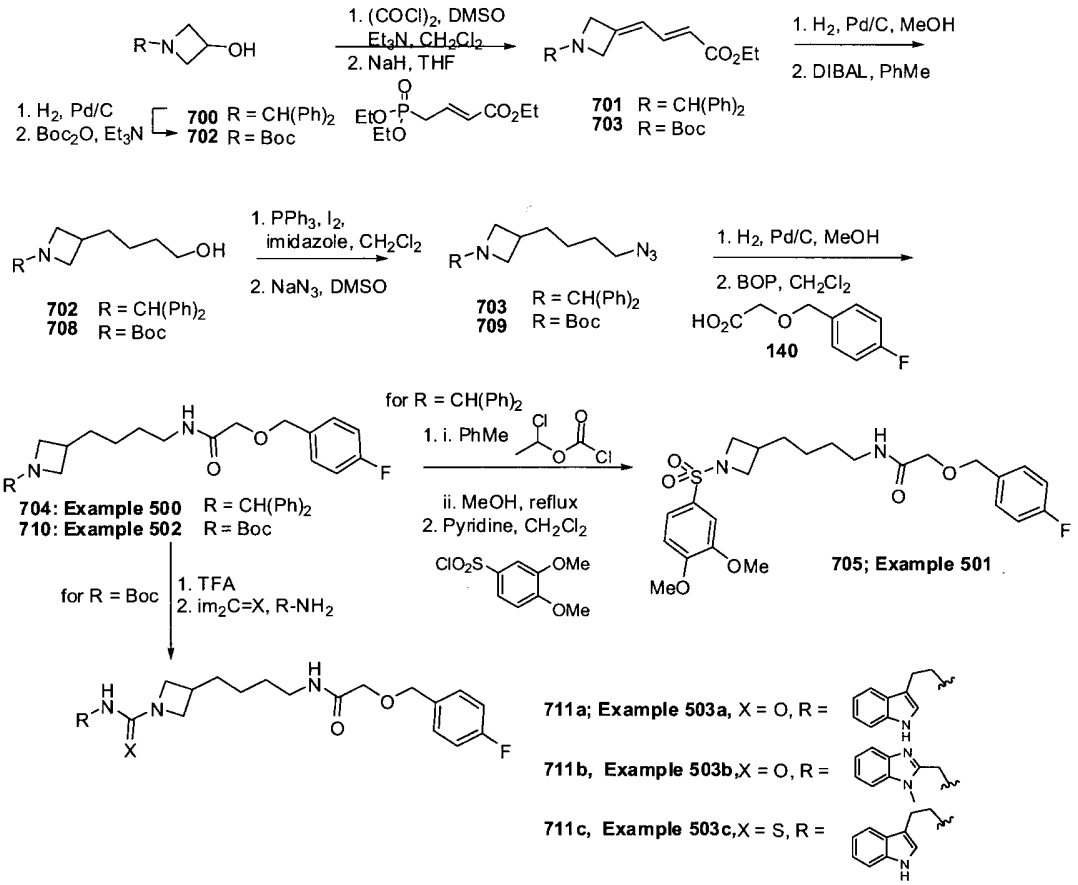
Scheme 300



Example 500

N-(4-(1-benzhydrylazetidin-3-yl)butyl)-2-(4-fluorobenzyloxy)acetamide **(704)**

Step 1: (E)-ethyl 4-(1-benzhydrylazetidin-3-ylidene)but-2-enoate (**701**)

[0451] To a stirred solution of oxalyl chloride (0.91 mL, 10.46 mmol) in CH_2Cl_2 (20 mL) at -78 °C was added DMSO (0.74 mL, 10.46 mmol). After 20 min, a solution of 1-benzhydrylazetidin-3-ol **700** (1.0 g, 4.18 mmol) in CH_2Cl_2 (5 mL) was added. The solution was stirred at -78 °C for another 20 min and Et_3N (2.91 mL, 20.92 mmol) was added. The solution was slowly warmed to 0 °C over 1h. A mixture of 1:1 EtOAc/hexane was added and the salt was filtered through a pad of Celite-Silica gel. The solution was evaporated to dryness and the crude ketone in THF (20 mL) was cooled in an ice bath. (E)-ethyl 4-(diethoxyphosphoryl)but-2-enoate (1.11 mL, 5.02 mmol) and NaH (218 mg, 5.44 mmol) were added and the resulting mixture was slowly warmed to room temperature and stirred for 1h. H_2O was added and the mixture was extracted with EtOAc. The organic phase was dried (Na_2SO_4) and evaporated. The residue was purified by silica gel column chromatography with EtOAc (20%) in hexane to afford **701** (1.27 g, 99%) as a mixture of cis and trans isomers.

N-(3-(1-(3,4-dimethoxyphenylsulfonyl)pyrrolidin-3-yl)propyl)-2-(4-fluorobenzyloxy)acetamide (**723**)

Step 1: 1-(3,4-dimethoxyphenylsulfonyl)-1H-pyrrole-3-carbaldehyde (**720**)

[0487] 3,4-dimethoxybenzene-1-sulfonyl chloride (755mg,3.2 mmol, 1.1 eq.) in DCM (3.8 ml) was added to an ice cold mixture of 50% NaOH (3 ml), Bu_4NHSO_4 (17 mg), DCM (3.4 ml) and 1H-pyrrole-3-carbaldehyde (276 mg, 2.9 mmol, prepared according to the method of Brian L. Bray et al, JOC, 1990, 55, 6317-6328; Brian L. Bray et al, JOC, 1988, 53, 6115-8). The reaction was allowed to warm-up to room temperature over 2h and was stirred at room temperature for 16h. Saturated $NaHCO_3$ was added and the organic layer was separated and the aqueous layer extracted with DCM (X2). The organic extracts were washed with sat'd $NaHCO_3$, dried ($MgSO_4$), filtered and concentrated leaving a beige solid which was triturated from ether to give **720** (85% yield).

($CDCl_3$) δ (ppm) ^1H: 9.81 (s, 1H0, 7.76 (m, 1H), 7.58 (dxd, J= 2.3, 8.6 Hz, 1H), 7.31 (d, J= 2.3 Hz, 1H), 7.17 (m, 1H), 6.95 (d, J= 8.6 Hz, 1H), 6.7 (m, 1H), 3.94 (s, 3H), 3.93 (s, 3H).

Step 2: 3-(1-(3,4-dimethoxyphenylsulfonyl)-1H-pyrrol-3-yl)acrylonitrile (**721**)

[0488] A mixture of diethyl cyanomethylphosphonate (330 mg/ 302 uL,1.83 mmol, 1.2 eq.) and K_2CO_3 (211 mg, 1.53 mmol) in THF (6 ml) was stirred at room temperature for 10 min, then at 70°C for 20 min after which aldehyde **720** (450 mg, 1.52 mmol) was added and the mixture was stirred at 70°C for 16h. The material was taken to dryness and the residue

was purified by silica gel column chromatography with EtOAc (30-40%) in Hexane to afford **721** (298 mg, 61.6% yield, as a mixture of 4:1 trans: cis isomers)

LRMS (ESI): (calc.) 318.4; (found) 319.0 $(MH)^+$

Step 3: 3-(1-(3,4-dimethoxyphenylsulfonyl)pyrrolidin-3-yl)propan-1-amine (**722**)

The material was not fully soluble. After 16h a sample checked by MS indicated the presence of the ring reduced amine **722**. The catalyst was filtered through Celite, and the filtrate was concentrated and triturated from ether, leaving **722** as white solid (119 mg, 38.5% yield, ~ 85% pure by HPLC).

LRMS (ESI): (calc.) 328.4; (found) 329.0 $(MH)^+$

Step 4: N-(3-(1-(3,4-dimethoxyphenylsulfonyl)pyrrolidin-3-yl)propyl)-2-(4-fluorobenzyloxy)acetamide (**723**)

[0490] Amine **722** (100mg, 0.30 mmol) was added to acid chloride **289** (0.4 mmol) in THF (3 ml) followed by TEA (0.101 g/ 139.4 uL, 1 mmol). After 16h at room temperature, EtOAc and sat'd $NaHCO_3$ were added and the organic layer was separated, washed with H_2O, 0.5 N HCl, brine, dried ($MgSO_4$), filtered and concentrated leaving a white solid. Trituration from ether, then from EtOAc/hexanes gave **723** as white solid (77 mg, 52% yield).

Step 1: tert-butyl 4-(3-amino-3-oxopropyl)piperidine-1-carboxylate (**735**)

[0508] Ammonium hydroxide (3 mL of 28% in H_2O) was added to a stirred solution of tert-butyl 4-(3-methoxy-3-oxopropyl)piperidine-1-carboxylate **734** (646 mg, 2.38 mmol, prepared from N-boc-4-piperidinemethanol by oxidation followed by the sequence desribed by Klein, Scott I. et al.; J. Med. Chem. 1998, 41; 14; 2492-2502) in methanol (3 mL). The mixture was stirred for 45 min at room temperature, and then for 16h at 50°C. The solvent was evaporated. The residue was purified by silica gel column chromatography with gradient of methanol (0-10%) in DCM to give **735** (490 mg, 80%).

[0520] A solution of compound **742r**, scheme **310**, example **517r**, (800 mg, 1.77 mmol) in THF (2 mL) was added to a solution of $LiAlH_4$ (131 mg, 3.55 mmol) in THF (2 mL) at room temperature. The reaction was stirred for 10 min., and then it was cooled to 0°C and slowly quenched with H_2O until the grey mixture turned white. The reaction was diluted with 10% HCl in water. The aqueous mixture was extracted with ethyl acetate. The organic extract was dried (Na_2SO_4), filtered, and evaporated. The alcohol, **743** was used without further purification (615 mg, 95%, clear oil).

[0521] Pyridinium dichromate (1.26 g, 3.36 mmol) was added to a solution of **743** (615 mg, 1.60 mmol) in dichloromethane (1 ml). The reaction stirred at room temperature for 5 h. The mixture was filtered over a pad of silica, washing with ethyl acetate. The reaction was diluted with 10% NaOH in water and the aqueous mixture was extracted with ethyl acetate and the organic layer was dried (Na_2SO_4), filtered, and evaporated. The residue was first purified by prep-hplc with gradient of methanol (20%-95%) in water, and the product was re-purified by prep-TLC plate, eluting with methanol (4%) in DCM to give **745** (6 mg, 4%) as a yellow film.

2-(4-fluorobenzyloxy)-N-(5-(3-(4-fluorophenyl)-1,2,4-oxadiazol-5-yl)pentyl)acetamide (**760**)

Step 1: 4-fluoro-N-hydroxybenzimidamide (**759**)

[0548] Hydroxylamine (0.35 ml, 50% solution in H_2O, 5.7 mmol) was added to a solution of 4-fluorobenzonitrile (0.59 g, 4.87 mmol) in THF (5 ml) and EtOH (1 ml) and the mixture was stirred at room temperature for 1h. The reaction mixture was concentrated and triturated from hexanes leaving **759** as a white solid (0.598 g, 79.6% yield). (DMSO-$d6_3$) δ (ppm) ^{1}H: 9.63 (s, 1H), 7.68 (m, 2H), 7.19 (m, 2H), 5.84 (bs, 2H). LRMS (ESI): (calc.) 154.1; (found) 155.1 $(MH)^+$.

Step 2: 2-(4-fluorobenzyloxy)-N-(5-(3-(4-fluorophenyl)-1,2,4-oxadiazol-5-yl)pentyl)acetamide (**760**)

[0549] 1-chloro-N,N,2-trimethylprop-1-en-1-amine (133.6 mg/ 140 uL, 1 mmol) was added to a solution of 6-(2-(4-fluorobenzyloxy)acetamido)hexanoic acid (230 g, 0.77 mmol) in DCM (2 ml) at room temperature under N_2. After 3 h, amidine **759** (118.7 mg, 0.77 mmol), pyridine (1 ml) and dioxane (10 ml) were addded and the mixture was refluxed for 16h. The mixture was cooled to room temperature and H_2O was added (20 ml) and the oil that formed was extracted with EtOAc and the organic layer was separated, dried ($MgSO_4$), filtered, concentrated and purified by silica gel column chromatography with gradient of EtOAc (30-100%) in Hexanes. Compound **760** was obtained as a clear semi-crystalline solid (78% yield).

($CDCl_3$) δ (ppm) ^{1}H: 8.06 (m, 2H), 7.28 (m, 2H), 7.16(m, 2H), 7.05 (m, 2H), 6.57 (bs, 1H), 4.51 (s, 2H), 3.96 (s, 2H), 3.31 (q, J= 6.8 Hz, 2H), 2.94 (t, J= 7.5, 2H), 1.90 (m, 2H), 1.61 (m, 2H), 1.46 (m, 2H). LRMS (ESI): (calc.) 415.4; (found) 416.1 $(MH)^+$.

[0550] Following the procedure in **scheme 313, example 528,** step 1 the following intermediates: 4-fluoro-N-hydroxy-3-methoxybenzimidamide **759a**, N-hydroxy-3,4,5-trimethoxybenzimidamide **759b**, benzyl 2-(hydroxyamino)-2-iminoethylcarbamate **759c**, and

4-(dimethylamino)-N-hydroxybenzimidamide **759d**, were obtained in 78%, 73%, 94% and 29% respectively, replacing 4-fluorobenzonitrile with 4-fluoro-3-methoxybenzonitrile, 3,4,5-trimethoxybenzonitrile, benzyl cyanomethylcarbamate, and 4-(dimethylamino)benzonitrile in the order indicated.

[0551] Examples **528a-d** describe the preparation of compound **760a-d** using the same procedure as described for Example **528**. Characterization data are presented in Table **37**.

Step 1: *N*-(3-(6-aminopyridin-3-yl)prop-2-ynyl)-2-(4-fluoro-benzyloxy)acetamide (**761b**)

[0552] A solution of alkyne **189** (100mg, 0.452mmol), 2-amino-5-iodopyridine (99.5mg, 0.452mmol), $Pd(PPh_3)_2Cl_2$ (16mg, 0.023mmol), and copper iodide (9mg, 0.45mmol) in diethylamine (0.23mL, 2.3mmol) and THF (2mL) was stirred at room temperature under nitrogen for 1 hour. The crude material was purified by silica gel flash chromatography using a stepwise gradient of EtOAc (50-80%) in hexanes to afford **761c** as orange oil (2.0g, 71%). LRMS (ESI): (calc.) 313.3; (found) 314.0 $(MH)^+$, 336.0 (MNa^+).

Step 2: 2-(4-fluorobenzyloxy)-N-(3-(4-hydroxyphenyl)propyl)acetamide (**765c**)

[0560] Palladium on charcoal (5% wt, 400mg) was added to a solution of **761c** (2.0g, 6.4mmol) in methanol (20mL) and the reaction was carried out as described for **765a**, Example **530e**, step 2. The crude material was purified by silica gel flash chromatography using a stepwise gradient of EtOAc (50-80%) in hexanes to obtain **765c** as a white solid (1.72g, 85%). LRMS (ESI): (calc.) 317.4; (found) 318.1 $(MH)^+$, 340.0 (MNa^+).

Step 3: (R)-tert-butyl 3-(4-(3-(2-(4-fluorobenzyloxy)acetamido)propyl)phenoxy)-pyrrolidine-1-carboxylate (**767a**)

[0561] To a flask containing a suspension of PS-PPh_2 (1.54g, 3.32mmol) in THF (20mL) under nitrogen was added compound **765c** (0.700g, 2.21mmol). The suspension was stirred for 15 minutes before the addition of DEAD (1.15g of 40% solution in toluene, 2.65mmol). After 45 minutes, (S)-(-)-*N*-BOC-3-pyrrolidinol (0.413g, 2.21mmol) was added as a solid. The suspension was stirred for 20 hours and then filtered, and the resin was washed with

DCM and the filtrate was concentrated and purified by silica gel chromatography using a stepwise gradient of EtOAc (50-100%) in hexanes to obtain **767a** as clear oil (0.302g, 28%).

Step 1: 4-(2-aminothiazol-4-yl)phenol (**784**)

[0586] Thiourea (2.16g, 28.3mmol), 4-hydroxyacephenone (1.93g, 14.2mmol) and iodine (3.60g, 14.2mmol) were heated to 100°C in ethanol (15mL) inj a pressure tube for 24 hours. The dark colored reaction mixture was cooled and concentrated. The residue was taken up in EtOAc (100mL) and washed with saturated $NaHCO_3$(aq) (2×50mL) and water, dried (Na_2SO_4) and concentrated. The crude material was purified by silica gel flash chromatography using a stepwise gradient of EtOAc (50-70%) in hexanes to afford

The reaction was stirred at room temperature for 20 hours and was concentrated. The residue was diluted with EtOAc and washed with water and then 1N HCl(aq). The acidic wash was basified to pH 8 with by the addition of solid $NaHCO_3$ to give a cloudy suspension which was extracted into EtOAc and the extracts were dried (Na_2SO_4), concentrated and purified by silica gel flash chromatography using a Biotage 12M column and a gradient of MeOH (5-10%) in DCM to give compound **785** as white solid (0.197g, 62%). The white precipitate that formed was filtered off and the filtrate was diluted with EtOAc, and the organic phase was washed with 1N HCl(aq) and extracted with saturated $NaHCO_3$(aq). The $NaHCO_3$ extracts were acidified to pH 2 with concentrated HCl (aq) and the aqueous layer was extracted with EtOAc, and the organic extracts were dried (Na_2SO_4), filtered and concentrated to give acid **786** as semi-crystalline white solid (0.485g, 89%). Compositions

[0647] In a second aspect, the invention provides compositions comprising an inhibitor of histone deacetylase according to the invention and a pharmaceutically acceptable carrier, excipient, or diluent. Compounds of the invention may be formulated by any method well known in the art and may be prepared for administration by any route, including, without limitation, parenteral, oral, sublingual, transdermal, topical, intranasal, intratracheal, or intrarectal. In certain preferred embodiments, compounds of the invention are administered intravenously in a hospital setting. In certain other preferred embodiments, administration may preferably be by the oral route. The compositions may be in the form of liquid solutions or suspensions; for oral administration, formulations may be in the form of tablets or capsules; and for intranasal formulations, in the form of powders, nasal dropsa or aerosols. The compositions of the invention may be administered systemically or locally.

[0648] The characteristics of the carrier will depend on the route of administration. As used herein, the term "pharmaceutically acceptable" means a non-toxic material that is compatible with a biological system such as a cell, cell culture, tissue, or organism, and that does not interfere with the effectiveness of the biological activity of the active ingredient(s). Thus, compositions according to the invention may contain, in addition to the inhibitor, diluents, fillers, salts, buffers, stabilizers, solubilizers, and other materials well known in the art. The preparation of pharmaceutically acceptable formulations is described in, e.g., Remington's Pharmaceutical Sciences, 18th Edition, ed. A. Gennaro, Mack Publishing Co., Easton, PA, 1990.

[0649] As used herein, the term "pharmaceutically acceptable salts" is intended to mean salts that retain the desired biological activity of the above-identified compounds and exhibit minimal or no undesired toxicological effects. Examples of such salts include, but are not limited to acid addition salts formed with inorganic acids (for Example, hydrochloric acid, hydrobromic acid, sulfuric acid, phosphoric acid, nitric acid, and the like), and salts formed with organic acids such as acetic acid, oxalic acid, tartaric acid, succinic acid, malic acid, ascorbic acid, benzoic acid, tannic acid, pamoic acid, alginic acid, polyglutamic acid, naphthalenesulfonic acid, naphthalenedisulfonic acid, and polygalacturonic acid. The compounds can also be administered as pharmaceutically acceptable quaternary salts known by those skilled in the art, which specifically include the quaternary ammonium salt of the formula -NR + Z-, wherein R is hydrogen, alkyl, or benzyl, and Z is a counterion, including chloride, bromide, iodide, -O-alkyl, toluenesulfonate, methylsulfonate, sulfonate, phosphate, or carboxylate (such as benzoate, succinate, acetate, glycolate, maleate, malate, citrate, tartrate, ascorbate, benzoate, cinnamoate, mandeloate, benzyloate, and diphenylacetate). As used herein, the term "salt" is also meant to encompass complexes, such as with an alkaline metal or an alkaline earth metal.

[0650] The active compound is included in the pharmaceutically acceptable carrier or diluent in an amount sufficient to deliver an inhibition effective amount without causing serious toxic effects. A preferred dose of the active compound for all of the above-mentioned conditions is in the range from about 0.01 to 300 mg/kg, preferably 0.1 to 100 mg/kg per day, more generally 0.5 to about 25 mg per kilogram body weight of the recipient per day. A typical topical dosage will range from 0.01–3% wt/wt in a suitable carrier. The effective dosage range of the pharmaceutically acceptable derivatives can be calculated based on the weight of the parent compound to be delivered. If the derivative exhibits activity in itself, the effective dosage can be estimated as above using the weight of the derivative, or by other means known to those skilled in the art.

[0651] In certain preferred embodiments of the second aspect of the invention, the composition further comprises an antisense oligonucleotide that inhibits the expression of a

histone deacetylase gene. The combined use of a nucleic acid level inhibitor (e.g., antisense oligonucleotide) and a protein level inhibitor (i.e., inhibitor of histone deacetylase enzyme activity) results in an improved inhibitory effect, thereby reducing the amounts of the inhibitors required to obtain a given inhibitory effect as compared to the amounts necessary when either is used individually. The antisense oligonucleotides according to this aspect of the invention are complementary to regions of RNA or double-stranded DNA that encode HDAC-1, HDAC-2, HDAC-3, HDAC-4, HDAC-5, HDAC-6, HDAC-7, HDAC-8, HDAC-9, HDAC-10, HDAC-11, SirT1, SirT2, SirT3, SirT4, SirT5, SirT6 and SirT7 (see e.g., GenBank Accession Number U50079 for HDAC-1, GenBank Accession Number U31814 for HDAC-2, and GenBank Accession Number U75697 for HDAC-3).

Inhibition of Histone Deacetylase

[0652] In a third aspect, the present invention provides a method of inhibiting histone deacetylase, comprising contacting the histone deacetylase with an inhibition effective amount of an inhibitor of histone deacetylase of the present invention.

[0653] In another embodiment of the third aspect, the invention provides a method of inhibiting histone deacetylase in a cell, comprising contacting the cell in which inhibition of histone deacetylase is desired with an inhibition effective amount of an inhibitor of histone deacetylase, or composition thereof, according to the present invention.

[0654] Because compounds of the invention inhibit histone deacetylase, they are useful research tools for *in vitro* study histone deacetylases and their role in biological processes.

[0655] Measurement of the enzymatic activity of a histone deacetylase can be achieved using known methodologies. For Example, Yoshida *et al.*, *J. Biol. Chem.*, 265: 17174-17179 (1990), describes the assessment of histone deacetylase enzymatic activity by the detection of acetylated histones in trichostatin A treated cells. Taunton *et al., Science*, 272: 408-411 (1996), similarly describes methods to measure histone deacetylase enzymatic activity using endogenous and recombinant HDAC-1.

[0656] In some preferred embodiments, the histone deacetylase inhibitor interacts with and reduces the activity of all histone deacetylases in a cell. In some other preferred embodiments according to this aspect of the invention, the histone deacetylase inhibitor interacts with and reduces the activity of fewer than all histone deacetylases in the cell. In certain preferred embodiments, the inhibitor interacts with and reduces the activity of one histone deacetylase (e.g., HDAC-1), but does not interact with or reduce the activities of other histone deacetylases (e.g., HDAC-2, HDAC-3, HDAC-4, HDAC-5, HDAC-6, HDAC-7, HDAC-8, HDAC-9, HDAC-10, HDAC-11, SirT1, SirT2, SirT3, SirT4, SirT5, SirT6 and SirT7).

[0657] The term "inhibition effective amount" is meant to denote a dosage sufficient to cause inhibition of histone deacetylase activity in a cell, which cell can be in a multicellular

organism. The multicellular organism can be a plant or an animal, preferably a mammal. If in a multicellular organism, the method according to this aspect of the invention comprises administering to the organism a compound or composition according to the present invention. Administration may be by any route, including, without limitation, parenteral, oral, sublingual, transdermal, topical, intranasal, intratracheal, or intrarectal. In certain particularly preferred embodiments, compounds of the invention are administered intravenously in a hospital setting. In certain other preferred embodiments, administration may preferably be by the oral route.

[0658] In certain preferred embodiments of the thirdaspects of the invention, the method further comprises contacting a histone deacetylase enzyme or a cell expressing histone deacetylase activity with an antisense oligonucleotide that inhibits the expression of a histone deacetylase gene. The combined use of a nucleic acid level inhibitor (e.g., antisense oligonucleotide) and a protein level inhibitor (i.e., inhibitor of histone deacetylase enzyme activity) results in an improved inhibitory effect, thereby reducing the amounts of the inhibitors required to obtain a given inhibitory effect as compared to the amounts necessary when either is used individually. The antisense oligonucleotides according to this aspect of the invention are complementary to regions of RNA or double-stranded DNA that encode HDAC-1, HDAC-2, HDAC-3, HDAC-4, HDAC-5, HDAC-6, HDAC-7, HDAC-8, SirT1, SirT2, SirT3, SirT4, SirT5, SirT6 and SirT7 (see e.g., GenBank Accession Number U50079 for HDAC-1, GenBank Accession Number U31814 for HDAC-2, and GenBank Accession Number U75697 for HDAC-3).

[0659] For purposes of the invention, the term "oligonucleotide" includes polymers of two or more deoxyribonucleosides, ribonucleosides, or 2'-substituted ribonucleoside residues, or any combination thereof. Preferably, such oligonucleotides have from about 6 to about 100 nucleoside residues, more preferably from about 8 to about 50 nucleoside residues, and most preferably from about 12 to about 30 nucleoside residues. The nucleoside residues may be coupled to each other by any of the numerous known internucleoside linkages. Such internucleoside linkages include without limitation phosphorothioate, phosphorodithioate, alkylphosphonate, alkylphosphonothioate, phosphotriester, phosphoramidate, siloxane, carbonate, carboxymethylester, acetamidate, carbamate, thioether, bridged phosphoramidate, bridged methylene phosphonate, bridged phosphorothioate and sulfone internucleoside linkages. In certain preferred embodiments, these internucleoside linkages may be phosphodiester, phosphotriester, phosphorothioate, or phosphoramidate linkages, or combinations thereof. The term oligonucleotide also encompasses such polymers having chemically modified bases or sugars and/ or having additional substituents, including without limitation lipophilic groups, intercalating agents, diamines and adamantane.

[0660] For purposes of the invention the term "2'-substituted ribonucleoside" includes ribonucleosides in which the hydroxyl group at the 2' position of the pentose moiety is substituted to produce a 2'-O-substituted ribonucleoside. Preferably, such substitution is with a lower alkyl group containing 1-6 saturated or unsaturated carbon atoms, or with an aryl or allyl group having 2-6 carbon atoms, wherein such alkyl, aryl or allyl group may be unsubstituted or may be substituted, e.g., with halo, hydroxy, trifluoromethyl, cyano, nitro, acyl, acyloxy, alkoxy, carboxyl, carbalkoxyl, or amino groups. The term "2'-substituted ribonucleoside" also includes ribonucleosides in which the 2'-hydroxyl group is replaced with an amino group or with a halo group, preferably fluoro.

[0661] Particularly preferred antisense oligonucleotides utilized in this aspect of the invention include chimeric oligonucleotides and hybrid oligonucleotides.

[0662] For purposes of the invention, a "chimeric oligonucleotide" refers to an oligonucleotide having more than one type of internucleoside linkage. One preferred example of such a chimeric oligonucleotide is a chimeric oligonucleotide comprising a phosphorothioate, phosphodiester or phosphorodithioate region, preferably comprising from about 2 to about 12 nucleotides, and an alkylphosphonate or alkylphosphonothioate region (see e.g., Pederson et al. U.S. Patent Nos. 5,635,377 and 5,366,878). Preferably, such chimeric oligonucleotides contain at least three consecutive internucleoside linkages selected from phosphodiester and phosphorothioate linkages, or combinations thereof.

[0663] For purposes of the invention, a "hybrid oligonucleotide" refers to an oligonucleotide having more than one type of nucleoside. One preferred example of such a hybrid oligonucleotide comprises a ribonucleotide or 2'-substituted ribonucleotide region, preferably comprising from about 2 to about 12 2'-substituted nucleotides, and a deoxyribonucleotide region. Preferably, such a hybrid oligonucleotide contains at least three consecutive deoxyribonucleosides and also contains ribonucleosides, 2'-substituted ribonucleosides, preferably 2'-O-substituted ribonucleosides, or combinations thereof (see e.g., Metelev and Agrawal, U.S. Patent No. 5,652,355).

[0664] The exact nucleotide sequence and chemical structure of an antisense oligonucleotide utilized in the invention can be varied, so long as the oligonucleotide retains its ability to inhibit expression of the gene of interest. This is readily determined by testing whether the particular antisense oligonucleotide is active. Useful assays for this purpose include quantitating the mRNA encoding a product of the gene, a Western blotting analysis assay for the product of the gene, an activity assay for an enzymatically active gene product, or a soft agar growth assay, or a reporter gene construct assay, or an in vivo tumor growth assay, all of which are described in detail in this specification or in Ramchandani *et al.* (1997) *Proc. Natl. Acad. Sci. USA* 94: 684-689.

[0665] Antisense oligonucleotides utilized in the invention may conveniently be synthesized on a suitable solid support using well known chemical approaches, including H-phosphonate chemistry, phosphoramidite chemistry, or a combination of H-phosphonate chemistry and phosphoramidite chemistry (i.e., H-phosphonate chemistry for some cycles and phosphoramidite chemistry for other cycles). Suitable solid supports include any of the standard solid supports used for solid phase oligonucleotide synthesis, such as controlled-pore glass (CPG) (see, e.g., Pon, R.T. (1993) *Methods in Molec. Biol.* 20: 465-496).

[0666] Particularly preferred oligonucleotides have nucleotide sequences of from about 13 to about 35 nucleotides which include the nucleotide sequences shown in Table 44. Yet additional particularly preferred oligonucleotides have nucleotide sequences of from about 15 to about 26 nucleotides which include the nucleotide sequences shown in Table 44.

The mammal may receive one or more dosages of antisense oligonucleotide prior to receiving one or more dosages of the HDAC inhibitor of the present invention.

[0668] In another embodiment, the HDAC inhibitor of the present invention may be administered to the mammal prior to administration of the antisense oligonucleotide. The mammal may receive one or more dosages of the HDAC inhibitor of the present invention prior to receiving one or more dosages of antisense oligonucleotide.

[0669] In certain preferred embodiments of the present invention, the HDAC inhibitor of the present invention may be administered together with other HDAC inhibitors known in the art or which will be discovered. Administration of such HDAC inhibitors may be done sequentially or concurrently. In certain preferred embodiments of the present invention thecompositions comprise an HDAC inhibitor of the present invention and/or an antisense oligonucleotide and/or another HDAC inhibitor known in the art or which will be discovered. The active ingredients of such compositions may act synergistically to produce a therapeutic effect.

[0670] In certain embodiments, the known HDAC inhibitor is selected from the group consisting of trichostatin A, depudecin, trapoxin, suberoylanilide hydroxamic acid, FR901228, MS-27-275, CI-994 sodim butyrate, and those compounds found in WO 2003/024448, WO 2001/038322, US 6,541,661, WO 01/70675, and PCT/US04/31591.

[0671] The following Examples are intended to further illustrate certain preferred embodiments of the invention, and are not intended to limit the scope of the invention.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/CA2006/000483

Box No. II Observations where certain claims were found unsearchable (Continuation of item 2 of the first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons :

1. [ ] Claim Nos. :
because they relate to subject matter not required to be searched by this Authority, namely :

2. [X] Claim Nos. : 1-42 and 69-73
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically :

see Extra Sheet

3. [ ] Claim Nos. :
because they are dependant claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box No. III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows :

See Extra Sheet

1. [ ] As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. [ ] As all searchable claims could be searched without effort justifying additional fees, this Authority did not invite payment of additional fees.

3. [X] As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claim Nos. :

43-48, 51, 54, 55, 58 and 60-68 (see Extra Sheet)

4. [ ] No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claim Nos. :

Remark on Protest
[ ] The additional search fees were accompanied by the applicant's protest and, where applicable, the payment of a protest fee.
[ ] The additional search fees were accompanied by the applicant's protest but the applicable protest fee was not paid within the time limit specified in the invitation.
[X] No protest accompanied the payment of additional search fees.

Continuation of **Box No. II**

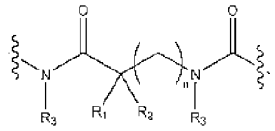
Claims 1-42 are directed to a vast number of different compounds and are thus so broad as to preclude any meaningful search being performed across their full scope. Claims 69-73 are directed to compositions and medical methods employing a compound of claim 1 and are thus also too broad to be searched under Article 17(2)(a) PCT.

--

Continuation of **Box No. III**

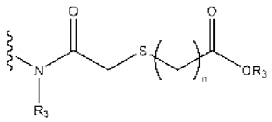
Claims 1-42 and 69-73 were excluded from the search due to the breadth of these claims precluding any reasonable search being performed. The remaining claims, claims 43-68 are directed to four separate alleged inventions. This was determined by considering the common structural elements of each of the compounds in light of the fact that the compounds of each invention must share a *significant* structural element.

Group A — comprises compounds defined in claims 43-48, 51, 54, 55 and 68 (partially) containing the structural element:



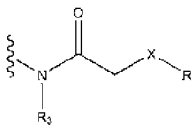
Specifically, where there is an amide group spaced apart from a second one by a hydrocarbon chain. This *bis*-amide is considered one significant structural element because any fragment smaller that this is little more than a single functional group, which is insufficient to unify the various structures.

Group B — comprises compounds defined in claims 49, 50, 52 (partially), 53 (partially), 56, 57 and 68 (partially) containing the structural element:



Specifically, where there is an amide group linked to a carboxylate group (acid or ester) via a hydrocarbon chain interrupted by a sulphur atom at the position β to the amide carbonyl. The difference between this group and Group A is that there is the presence of the Lewis basic sulphur atom and the amide has been changed to a carboxylic acid or ester. Considering the relatively small size of the structural element in these compounds, these differences are considered substantial.

Group C — comprises compounds defined in claims 58 and 60 (both partially), 61-67 and 68 (partially) containing the structural element:



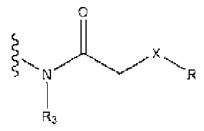
Wherein X=O, S, SO or SO_2

Specifically, where the 'R' is a hydrocarbon, alkyl-aryl etc. group such that the result is a hydrophobic carbon chain. Because 'heteroaryl' can encompass systems with a basic nitrogen group (see the exemplified compounds), these are excluded from this group. Even when X is a sulphur atom, it is clear that the 'R' would be significantly different from the $COOR_3$ group defined in **Group B**, both structurally and electronically. The common amide-β-sulphur moiety (not actually required in all the compounds of this group) is not sufficiently significant to unite these two structures, especially in light of the possible overall size of the compounds when all the variables are considered.

(Continued on Extra Sheet)

Continuation of Extra Sheet

Group D — comprises compounds defined in claims 52, 53 and 58 (each partially), 59 and 60 and 68 (both partially) containing the structural element:

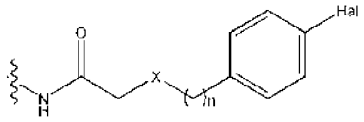


Wherein X=O, S, SO or SO_2

Specifically, where the structure is substantially the same as **Group C**, except that instead of a hydrocarbon 'R' group, there is a basic group and/or an available lone pair on a particular atom (i.e. this includes the heteroaryl, the aryl-NH_2 and the alkyl-CN groups). This difference from **Group C** and **Group D** is considered substantial because of the great electronic differences expected by changing this group.

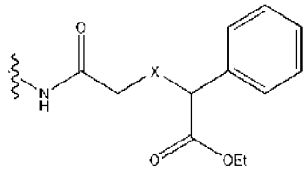
As used herein, reference to claims 58 and 60 applies only to embodiments in these claims which fall within **Group C**, and claim 68, inasmuch as it falls within **Group A** or **Group C**, since these were the groups for which an international search was established. References to claim 68 were made on the assumption that the numerous listed compounds fall within the scope of the prior art relating to the broader claims. Therefore, the *International Search Report* was based on claims 43-48, 51, 54, 55, 58 and 60-68, with the conditions discussed elsewhere being applied.

In regard to **Group C**, the claims of this group (58 and 60-68) encompass a wide range of compounds, the complete scope of which would be impossible to search across. In particular, the description indicates that the various terms in the claims (alkyl, aryl etc.) can be optionally substituted, but the scope of said substitution is very broad, with no restrictions and an extensive list of preferred substituents. Further, R_3 is not restricted in these claims, but is the broad definition provided in claim 1, and the 'left side' of the molecules of claim 67 rely on the definition of Y–L–Z in excluded claim 1. The end result is that the range of compounds encompassed by these claims is so broad that no exhaustive search could be done for these claims. Consequently, the search of the prior art was performed based on a structural feature present in the examples given in the description. In particular, the structure:



Wherein X=S or O

appears in the majority of the compounds exemplified in the description. The moiety:



Wherein X=S or SO

also appears in a few of the compounds; however, there were too many examples provided for each to be individually searched.

Because these structural motifs appear in all of the compounds exemplified, the search of claims 58 and 60-67 was restricted to compounds in which these moieties appear. The 'left side' of each molecule was tailored to be within the definition of structure Y–L–Z, as defined in claims 60-66, but not claim 58 or 67, since these claims were deemed too broad to properly search, although many of the compounds in claims 60-66 fall within their scope. Claim 68 is only relevant insofar as it defines compounds which were included in the search of the other claims included in the search of **Group A** and **Group C**.

A further restriction placed on the search was necessitated by the limitations of the structure searching software and the breadth of the claims. For claim 64, when the 'right side' of the molecule is the *para*-halogen moiety defined above and n=0, too many hits were produced, making proper citation unreasonable. Claim 65 was not able to be searched at all because of software limitations and claim breadth. Therefore, only the compounds of this claim that fall within the scope of other of the searched claims were included in the search.
