(54) Title: INDOLEACETIC ACID AND INDENACETIC ACID DERIVATIVES AS THERAPEUTIC AGENTS WITH REDUCED GASTROINTESTINAL TOXICITY

WO 2005/112921 A2

(57) Abstract: The presently disclosed subject matter provides derivatives of nonsteroidal anti-inflammatory drugs (NSAIDs) that are characterized by substantially reduced cyclooxygenase inhibiting activity, yet retain the ability to interact with and modulate the activities of other polypeptides such as the class of peroxisome proliferators-activated receptors (PPARs) and γ -secretase. Also provided are methods of using the derivatives to treat pathological disorders.

(84) Designated States (unless otherwise indicated, for every kind of regional protection available): ARIPO (BW, GH, GM, KE, LS, MW, MZ, NA, SD, SL, SZ, TZ, UG, ZM, ZW), Eurasian (AM, AZ, BY, KG, KZ, MD, RU, TJ, TM), European (AT, BE, BG, CH, CY, CZ, DE, DK, EE, ES, FI, FR, GB, GR, HU, IE, IS, IT, LT, LU, MC, NL, PL, PT, RO, SE, SI, SK, TR), OAPI (BF, BJ, CF, CG, CI, CM, GA, GN, GQ, GW, ML, MR, NE, SN, TD, TG).

GRANT STATEMENT

This work was supported by grant number CA89450 from the U.S. National Institutes of Health. Thus, the U.S. government has certain rights in the presently disclosed subject matter.

15

TECHNICAL FIELD

The presently disclosed subject matter generally relates to derivatives of non-steroidal anti-inflammatory drugs (NSAIDs) that have been modified to decrease their ability to inhibit cyclooxygenase enzymes. Also provided are methods for altering the specificity of a cyclooxygenase-inhibiting compound and methods of using the altered compounds to modulate various biological activities.

Table of Abbreviations

25	15d-PGJ ₂	-	15-deoxy- $\Delta^{12,14}$ -prostaglandin J ₂
	AA	-	arachidonic acid
	AD	-	Alzheimer's disease
	APP	-	amyloid precursor protein
	ATCC	-	American Type Culture Collection
30	CCDB	-	Cambridge Crystallographic Data Bank
	CNS	-	central nervous system
	COX	-	cyclooxygenase
	COX-1	-	cyclooxygenase-1

	COX-2	-	cyclooxygenase-2
	DMAP	-	dimethylaminopyridine
	DMEM	-	Dulbecco's modified Eagle's medium
	DM-INDO	-	2-Des-methylindomethacin
5	DMSO	-	dimethyl sulfoxide
	DTT	-	dithiothreitol
	EBA	-	ethyl bromoacetate
	ED ₅₀	-	the concentration of an compound that reduces cell viability by 50%
10	EDCI	-	<i>N</i> -(3-dimethylaminopropyl)- <i>N'</i> -ethyl carbodiimide
	EDTA	-	ethylenediamine tetraacetic acid
	ESI-MS	-	electrospray ionization
	Et ₂ O	-	diethyl ether
15	EtOAc	-	ethyl acetate
	FBS	-	fetal bovine serum
	GI	-	gastrointestinal
	HOAc	-	acetic acid
	IC ₅₀	-	the concentration of an inhibitor that reduces enzyme or cellular activity by 50%
20	INDO	-	indomethacin
	mCOX-2	-	murine COX-2
	MODY	-	maturity onset diabetes of the young
25	NSAIDs	-	non-steroidal anti-inflammatory drugs
	oCOX-1	-	ovine COX-1
	PG	-	prostaglandin
	PMA	-	phosphomolybdic acid
	PMTBA	-	<i>p</i> -methylthiobenzaldehyde
30	PPA	-	polyphosphoric acid
	PPARs	-	peroxisome proliferator[s]-activated receptors
	ppm	-	parts per million

	PTSA	-	<i>p</i> -toluene sulfonic acid•H ₂ O
	SDS	-	sodium dodecyl sulfate
	SDS-PAGE	-	sodium dodecyl sulfate -polyacrylamide gel electrophoresis
5	S.E.	-	standard error
	TMS	-	tetramethylsilane

BACKGROUND

Non-steroidal anti-inflammatory drugs (NSAIDs) are a class of therapeutic agents that are widely used for their anti-inflammatory and anti-pyretic properties to treat human distress and disease. Exemplary NSAIDs include aspirin, ibuprofen, acetaminophen, indomethacin, naproxen, and others.

The anti-inflammatory and anti-pyretic activities of NSAIDs derive from the ability of these compounds to bind to and inhibit the actions of the cyclooxygenase (COX) enzymes. COX activity originates from two distinct and independently regulated enzymes, termed cyclooxygenase-1 (COX-1) and cyclooxygenase-2 (COX-2; see DeWitt & Smith, 1988; Yokoyama & Tanabe, 1989; Hla & Neilson, 1992). COX-1 is a constitutive isoform and is mainly responsible for the synthesis of cytoprotective prostaglandin in the gastrointestinal (GI) tract and for the synthesis of thromboxane, which triggers aggregation of blood platelets (Allison *et al.*, 1992). On the other hand, COX-2 is inducible and short-lived. Its expression is stimulated in response to endotoxins, cytokines, and mitogens (Kujubu *et al.*, 1991; Lee *et al.*, 1992; O'Sullivan *et al.*, 1993). NSAIDs exhibit varying selectivity for COX-1 and COX-2 but, in general, most display inhibitory activity towards both enzymes (Meade *et al.*, 1993).

Inflammation and inflammatory responses have been associated with various diseases and disorders. For example, the brains of subjects with Alzheimer's disease (AD) are characterized by the accumulation of amyloid plaques accompanied by cellular and molecular markers of inflammatory responses. AD is the most common cause of dementia in the elderly, resulting in enormous costs to individuals and to society, both in terms of

medical care and non-economic losses. As the population ages, it is undeniable that AD and related neurological disorders will become an ever-increasing medical and societal burden. What is needed, then, are new and better therapeutics that can be used to prevent and treat age-related 5 neurological disorders.

Interestingly, epidemiological studies have suggested that long-term treatment with NSAIDs might provide a protective effect against the development of AD. Initially, it was believed that the protective effect derived from the anti-inflammatory actions of NSAIDs, but this hypothesis has 10 recently been questioned. Several recent reports suggest instead that the protective effects are independent of the ability of NSAIDs to inhibit cyclooxygenases. Thus, treatment with NSAIDs might be useful to decrease the incidence and/or the severity of AD and related disorders.

Long-term use of NSAIDs is not without risks, however. In particular, 15 most NSAIDs, particularly those that are inhibitors of COX-1, are associated with significant GI toxicities. As such, the long-term use of these drugs must be approached with caution. This requires a careful balance between the use of NSAIDs for their potential benefits vis-à-vis neurological disorders and the GI toxicity associated with their use. A more favorable approach would 20 be to find or create new derivatives of NSAIDs that retain their protective effects but do not cause debilitating and potentially fatal toxicities.

One potential approach would be to employ NSAIDs that are specific 25 for COX-2. Several such NSAIDs have been produced, including celecoxib, valdecoxib (CELEBREX™ and BEXTRA™, respectively; Pfizer Inc., New York, New York, United States of America), rofecoxib, etoricoxib (VIOXX™ and ARCOXIA™, respectively; Merck and Co., Inc., Whitehouse Station, New Jersey, United States of America), and lumiracoxib (PREXIGE®; Novartis Pharmaceuticals Corporation, East Hanover, New Jersey, United States of America). Unfortunately, recent evidence indicates that these 30 COX-2-specific inhibitors do not provide any protective effect against the development of AD. In both *in vivo* and *in vitro* assays, neither celecoxib nor rofecoxib appeared capable of inhibiting the production of the A β 42 protein, the cleavage product of the amyloid precursor protein (APP) believed to be

responsible for the formation of amyloid plaques. Accordingly, it appears that simply using COX-2-specific NSAIDs is unlikely to provide the protective effects currently seen with other non-specific NSAIDs.

Additional evidence seems to suggest that the protective effects afforded by certain NSAIDs, such as ibuprofen, sulindac sulfide, and indomethacin (all non-specific NSAIDs), might not be related to their COX-inhibition activities, and thus might be related to the abilities of these NSAIDs to interact with other polypeptides present in the central nervous system (CNS). Two such polypeptides are the class of peroxisome proliferators-activated receptors (PPARs) and γ -secretase. For example, PPARs, particularly PPAR γ , have been implicated in mediating differentiation of adipocytes and regulating fat metabolism. Additionally, PPAR γ has been associated with various pathological conditions related to atherosclerosis, inflammation, obesity, diabetes, cancer, the immune response, and ageing.

See Kersten *et al.*, 2000; Celi & Shuldiner, 2002. γ -secretase, on the other hand, appears to be the main enzyme responsible for the production of A β 42 from APP, and thus has a critical role in the pathogenesis of AD.

What are needed, then, are new derivatives of NSAIDs that are less toxic than the parent NSAIDs, yet retain the abilities of the parents to modulate the activities of, for example, PPARs and/or γ -secretase. This and other needs are addressed by the compositions and methods of the presently disclosed subject matter.

SUMMARY

This Summary lists several embodiments of the presently disclosed subject matter, and in many cases lists variations and permutations of these embodiments. This Summary is merely exemplary of the numerous and varied embodiments. Mention of one or more representative features of a given embodiment is likewise exemplary. Such an embodiment can typically exist with or without the feature(s) mentioned; likewise, those features can be applied to other embodiments of the presently disclosed subject matter, whether listed in this Summary or not. To avoid excessive repetition, this Summary does not list or suggest all possible combinations of such features.

The presently disclosed subject matter provides a method for inhibiting growth of a cell. In some embodiments, the method comprises contacting the cell with a derivative of a compound, wherein the compound comprises a cyclooxygenase inhibitor comprising an indoleacetic acid or indenacetic acid functional group having a 2' methyl group and the derivative substantially lacks cyclooxygenase inhibitory activity as a result of modifying the 2' methyl group to a moiety selected from the group consisting of 5 hydrogen; halo; halomethyl, wherein at least one hydrogen of the methyl group is substituted with a halogen; C₂ to C₆ alkyl; C₂ to C₆ branched alkyl; and C₂ to C₆ substituted alkyl. In some embodiments, the cyclooxygenase inhibitor comprises an indenacetic acid functional group and the moiety is selected from the group consisting of hydrogen and fluorine. In some 10 embodiments, the cell is present in a subject. In some embodiments, the subject is a mammal. In some embodiments, the mammal is a human.

15 In some embodiments, the compound is a non-steroidal anti-inflammatory drug. In some embodiments, the non-steroidal anti-inflammatory drug is selected from the group consisting of indomethacin and sulindac, and pharmaceutically acceptable salts thereof, and combinations thereof. In some embodiments, the derivative of the compound is an amide 20 or ester derivative.

The presently disclosed subject matter also provides a method for treating a disease in a subject selected from the group consisting of a cancer, a neurodegenerative disease, and diabetes. In some embodiments, the method comprises administering to the subject a treatment effective 25 amount of a derivative of a compound, wherein the compound comprises a cyclooxygenase inhibitor comprising an indoleacetic acid or indenacetic acid functional group having a 2' methyl group and the derivative substantially lacks cyclooxygenase inhibitory activity as a result of modifying the 2' methyl group to a moiety selected from the group consisting of hydrogen; halo; halomethyl, wherein at least one hydrogen of the methyl group is substituted 30 with a halogen; C₂ to C₆ alkyl; C₂ to C₆ branched alkyl; and C₂ to C₆ substituted alkyl. In some embodiments, the cyclooxygenase inhibitor comprises an indenacetic acid functional group and the moiety is selected

from the group consisting of hydrogen and fluorine. In some embodiments, the subject is a mammal. In some embodiments, the mammal is a human.

In some embodiments, the compound is a non-steroidal anti-inflammatory drug. In some embodiments, the non-steroidal anti-inflammatory drug is selected from the group consisting of indomethacin and sulindac, and pharmaceutically acceptable salts thereof, and combinations thereof. In some embodiments, the derivative of the compound is an amide or ester derivative.

The presently disclosed subject matter also provides a method for 10 suppressing tumor growth in a subject. In some embodiments, the method comprises administering to a subject bearing a tumor a derivative of a compound, wherein the compound comprises a cyclooxygenase inhibitor comprising an indoleacetic acid or indenacetic acid functional group having a 2' methyl group and the derivative substantially lacks cyclooxygenase 15 inhibitory activity as a result of modifying the 2' methyl group to a moiety selected from the group consisting of hydrogen; halo; halomethyl, wherein at least one hydrogen of the methyl group is substituted with a halogen; C₂ to C₆ alkyl; C₂ to C₆ branched alkyl; and C₂ to C₆ substituted alkyl. In some 20 embodiments, the cyclooxygenase inhibitor comprises an indenacetic acid functional group and the moiety is selected from the group consisting of hydrogen and fluorine. In some embodiments, the subject is a mammal. In some embodiments, the mammal is a human.

In some embodiments, the compound is a non-steroidal anti-inflammatory drug. In some embodiments, the non-steroidal anti-inflammatory drug is selected from the group consisting of indomethacin and sulindac, and pharmaceutically acceptable salts thereof, and combinations thereof. In some embodiments, the derivative of the compound is an amide or ester derivative.

The presently disclosed subject matter also provides a method for 30 inducing apoptosis in a cell. In some embodiments, the method comprises contacting the cell with a derivative of a compound, wherein the compound comprises a cyclooxygenase inhibitor comprising an indoleacetic acid or indenacetic acid functional group having a 2' methyl group and the derivative

substantially lacks cyclooxygenase inhibitory activity as a result of modifying the 2' methyl group to a moiety selected from the group consisting of hydrogen; halo; halomethyl, wherein at least one hydrogen of the methyl group is substituted with a halogen; C₂ to C₆ alkyl; C₂ to C₆ branched alkyl; and C₂ to C₆ substituted alkyl. In some embodiments, the cyclooxygenase inhibitor comprises an indenacetic acid functional group and the moiety is selected from the group consisting of hydrogen and fluorine. In some embodiments, the cell is a cell in culture. In some embodiments, the cell is a cancer cell. In still some embodiments, the cell is present within a subject. 10 In some embodiments, the subject is a mammal. In some embodiments, the mammal is a human.

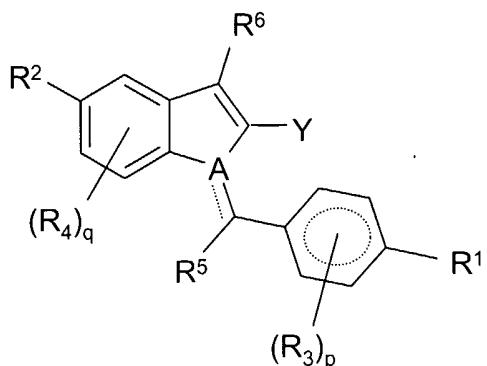

In some embodiments, the compound is a non-steroidal anti-inflammatory drug. In some embodiments, the non-steroidal anti-inflammatory drug is selected from the group consisting of indomethacin and 15 sulindac, and pharmaceutically acceptable salts thereof, and combinations thereof. In some embodiments, the derivative of the compound is an amide or ester derivative.

The presently disclosed subject matter also provides a method for modulating the activity of a peroxisome proliferators-activated receptor 20 (PPAR) isoform. In some embodiments, the method comprises contacting the PPAR isoform with a derivative of a compound, wherein the compound comprises a cyclooxygenase inhibitor comprising an indoleacetic acid or indenacetic acid functional group having a 2' methyl group and the derivative substantially lacks cyclooxygenase inhibitory activity as a result of modifying 25 the 2' methyl group to a moiety selected from the group consisting of hydrogen; halo; halomethyl, wherein at least one hydrogen of the methyl group is substituted with a halogen; C₂ to C₆ alkyl; C₂ to C₆ branched alkyl; and C₂ to C₆ substituted alkyl. In some embodiments, the cyclooxygenase inhibitor comprises an indenacetic acid functional group and the moiety is 30 selected from the group consisting of hydrogen and fluorine. In some embodiments, the PPAR isoform is PPAR γ . In some embodiments, the PPAR isoform is present within a subject. In some embodiments, the subject is a mammal. In some embodiments, the mammal is a human.

In some embodiments, the compound is a non-steroidal anti-inflammatory drug. In some embodiments, the non-steroidal anti-inflammatory drug is selected from the group consisting of indomethacin and sulindac, and pharmaceutically acceptable salts thereof, and combinations thereof. In some embodiments, the derivative of the compound is an amide or ester derivative.

The presently disclosed subject matter also provides a method for altering specificity of a cyclooxygenase-inhibiting compound. In some embodiments, the method comprises (a) providing a compound having cyclooxygenase inhibitory activity, the compound comprising an indoleacetic acid or indenacetic acid functional group having a 2' methyl group; and (b) replacing the 2' methyl group with a moiety selected from the group consisting of hydrogen; halo; halomethyl, wherein at least one hydrogen of the methyl group is substituted with a halogen; C₂ to C₆ alkyl; C₂ to C₆ branched alkyl; and C₂ to C₆ substituted alkyl to create a derivative, wherein the derivative substantially lacks cyclooxygenase inhibitory activity. In some embodiments, the compound is a non-steroidal anti-inflammatory drug. In some embodiments, the non-steroidal anti-inflammatory drug is selected from the group consisting of indomethacin and sulindac, and pharmaceutically acceptable salts thereof, and combinations thereof. In some embodiments, the derivative is selected from the group consisting of 2-Des-methylindomethacin and eindenic acid sulfide, eindenic acid sulfoxide, and eindenic acid sulfone. In some embodiments, the derivative is eindenic acid sulfide. In some embodiments, the present method further comprises derivatizing a carboxylic acid moiety present on the compound to an ester or an amide.

The presently disclosed subject matter also provides compositions that can be used in conjunction with any or all of the disclosed methods. In some embodiments, the presently disclosed subject matter provides a compound of the following formula:

Formula I

wherein

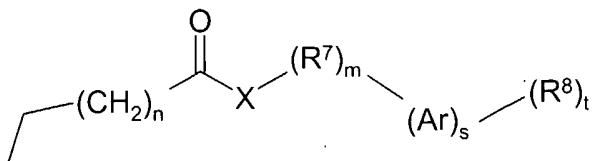

5 R^1 is selected from the group consisting of hydrogen, halo, CF_3 ;
 SCH_3 ; $SOCH_3$; SO_2CH_3 ; SO_2NH_2 ; C_1 to C_6 alkyl, branched alkyl,
 10 or substituted alkyl; C_1 to C_6 alkoxy, branched alkoxy, or
 substituted alkoxy; C_1 to C_6 alkylcarboxylic acid, branched
 alkylcarboxylic acid, or substituted alkylcarboxylic acid; and
 CH_2N_3 ;

10 R^2 is selected from the group consisting of hydrogen, halo, CF_3 ;
 SCH_3 ; $SOCH_3$; SO_2CH_3 ; SO_2NH_2 ; $CONH_2$; C_1 to C_6 alkyl,
 branched alkyl, or substituted alkyl; C_1 to C_6 alkoxy, branched
 alkoxy, or substituted alkoxy; benzyloxy; C_1 to C_6 alkylcarboxylic
 acid, branched alkylcarboxylic acid, or substituted alkylcarboxylic
 acid; and CH_2N_3 ;

15 R^3 and R^4 are each independently selected from the group consisting
 of hydrogen; halo; CF_3 ; C_1 to C_6 alkyl, branched alkyl, or
 substituted alkyl; C_1 to C_6 alkoxy, branched alkoxy, or substituted
 alkoxy; aryl; substituted aryl; benzyloxy; SCH_3 ; $SOCH_3$; SO_2CH_3 ;
 20 and SO_2NH_2 ;

20 R^5 is selected from the group consisting of hydrogen, C_1 to C_6 alkyl,
 branched alkyl, or substituted alkyl, and $=O$;

25 R^6 is selected from the group consisting of hydrogen; C_1 to C_6 alkyl,
 branched alkyl, or substituted alkyl; C_1 to C_6 alkoxy, branched
 alkoxy, or substituted alkoxy; benzyloxy; C_1 to C_6 alkylcarboxylic
 acid, branched alkylcarboxylic acid, or substituted alkylcarboxylic
 acid; and the following structure:

wherein

Ar is cyclohexyl or phenyl;

5 R⁷ is hydrogen; C₁ to C₆ alkyl, branched alkyl, or substituted alkyl;

10 R⁸ is hydrogen, halo, C₁ to C₆ alkyl, branched alkyl, and substituted alkyl; C₁ to C₆ alkoxy, branched alkoxy, and substituted alkoxy; C₁ to C₆ alkylcarboxylic acid, branched alkylcarboxylic acid, or substituted alkylcarboxylic acid; amino; nitro; CF₃; bromoacetamidyl; benzoyl; or 2-phenyl-oxiranyl;

X is O or NR⁹, wherein R⁹ is hydrogen or alkyl; and m, n, s, and t are each individually 0, 1, 2, 3, 4, or 5;

15 Y is selected from the group consisting of hydrogen, halo, CF₃, and C₂ to C₆ alkyl or branched alkyl;

A is selected from the group consisting of carbon and nitrogen;

p and q are both individually 0, 1, 2, 3, or 4;

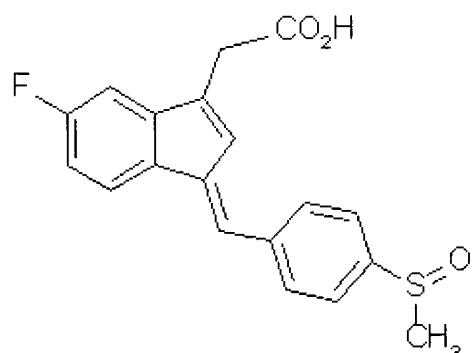

the bond between the carbon bound to R⁵ and the indene ring and is 20 a single bond or a double bond; and

the six-membered ring to which R¹ is bound is cyclohexyl or phenyl.

In some embodiments, R¹ is selected from the group consisting of halo, C₁ to C₆ alkyl or branched alkyl, SCH₃, SOCH₃, SO₂CH₃, and SO₂NH₂; R² is selected from the group consisting of hydrogen; halo; C₁ to C₆ alkyl or 25 branched alkyl; C₁ to C₆ alkoxy or branched alkoxy; benzyloxy; SCH₃; SOCH₃; SO₂CH₃; SO₂NH₂; and CONH₂; R³ and R⁴ are each independently selected from the group consisting of hydrogen, C₁ to C₆ alkyl or branched alkyl, and halo; R⁵ is selected from the group consisting of hydrogen, C₁ to C₆ alkyl or branched alkyl, and carbonyl; R⁶ is selected from the group 30 consisting of C₁ to C₆ alkylcarboxylic acid and branched C₁ to C₆

alkylcarboxylic acid; Y is selected from the group consisting of hydrogen, halo, and C₂ to C₆ alkyl or branched alkyl; A is selected from the group consisting of carbon and nitrogen; and the bond between the carbon bound to R⁵ and the indene ring is a single bond or a double bond. In some 5 embodiments, the derivative is selected from the group consisting of 2-Desmethylindomethacin and eindenic acid sulfide, eindenic acid sulfoxide, and eindenic acid sulfone. In still some embodiments, the derivative is eindenic acid sulfide.

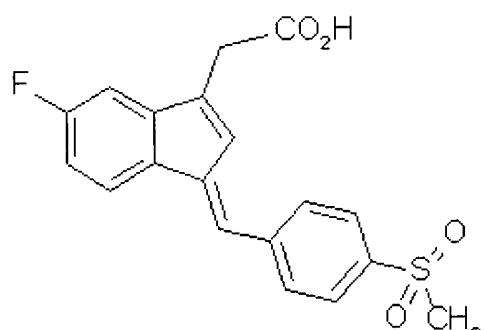

In some embodiments, the compound has the following formula:

10

Eindenic acid sulfoxide

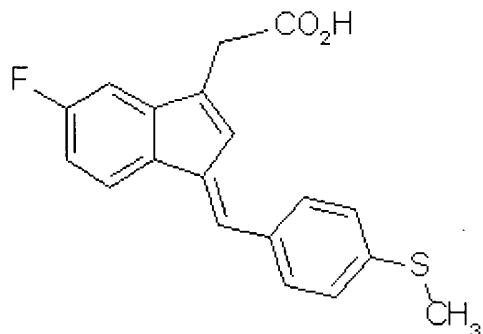

In some embodiments, the compound has the following formula:

15

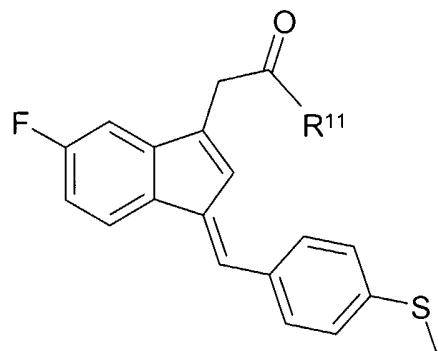

Eindenic acid sulfone

In some embodiments, the compound has the following formula:

Eindenic acid sulfide

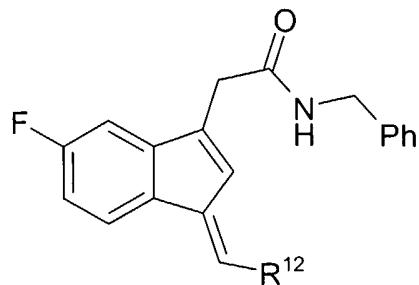

In some embodiments, the method further comprises derivatizing a carboxylic acid moiety present on the compound to an amide. In some 5 embodiments, the amide derivative has the following general formula:

Formula II

In some embodiments, R¹¹ is selected from the group consisting of C₁ to C₆ alkyl, branched alkyl, and cyclic alkyl. In some embodiments, R¹¹ is selected from the group consisting of C₁ to C₆ alkylcarboxylic acid, branched alkylcarboxylic acid, and cyclic alkylcarboxylic acid. In some embodiments, R¹¹ is selected from the group consisting of C₁ to C₆ aryl and C₁ to C₆ substituted aryl. In some embodiments of the substituted aryl, the 10 substitution is at at least one position, and each substitution is selected from the group consisting of a halogen, NH₂, OCH₃, CF₃, OH, C₁ to C₄ alkyl or branched alkyl, NO₂, benzoyl, 2-phenyl-oxirane, and NH-CO-CH₂Br. In some 15 embodiments, R¹¹ is selected from the group consisting of C₁ to C₆ alkyl, branched alkyl, and cyclic alkyl.

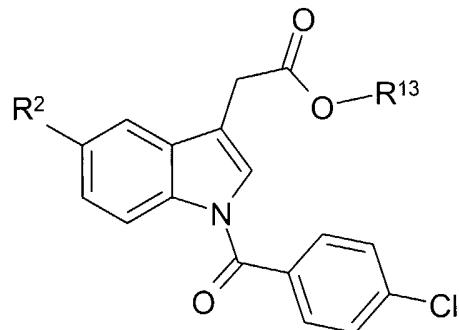

In some embodiments, the amide derivative has the following general formula:

Formula III

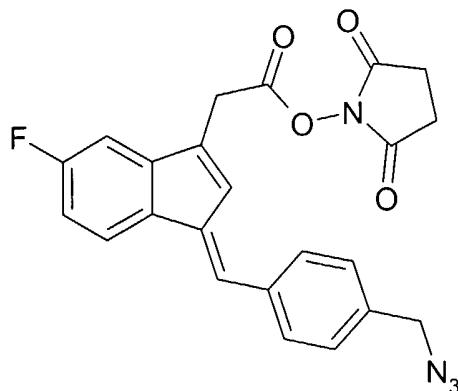

5 wherein R¹² is selected from the group consisting of phenyl-SOCH₃, phenyl-SO₂CH₃, phenyl, phenyl methyl ester, phenyl-COOH, phenyl-halo, and C₃ to C₆ cycloalkyl. Representative amide derivatives are presented in Tables 1 and 2.

10 In some embodiments, the method further comprises derivatizing a carboxylic acid moiety present on the compound to an ester. In some embodiments, the ester derivative has the following general formula:

Formula IV

15 wherein R² is defined as above, R¹³ is selected from the group consisting of C₁ to C₆ alkyl, C₁ to C₆ branched alkyl, and C₁ to C₆ substituted alkyl. In some embodiments, the ester derivative has the following formula:

Accordingly, it is an object of the presently disclosed subject matter to provide new therapeutic agents for use in treating and/or preventing disease. This object is achieved in whole or in part by the presently disclosed subject matter.

An object of the presently disclosed subject matter having been stated hereinabove, other objects will be evident as the description proceeds and as best described hereinbelow.

10

BRIEF DESCRIPTION OF THE DRAWINGS

Figures 1A-1C depict a crystal structure of indomethacin (INDO) bound in the COX-2 active site.

15

Figures 1A and 1B depict stereo views of INDO co-crystallized with COX-2 (Protein Data Bank code 4COX; Kurumbail *et al.*, 1996). In Figure 1A, key active site residues for catalysis and the binding of ligands are shown. Figure 1B is a space-filling model of the 2' methyl substituent of INDO (green) inserted into the hydrophobic pocket formed by Val-349, Ala-527, Ser-530, and Leu-531.

20

Figure 1C depicts the chemical structures of INDO and DM-INDO.

25

Figures 2A-2D depict the kinetics of the time-dependent inhibition of COX-2 mutants by INDO. Assays were performed with various concentrations of either INDO or DM-INDO as described in Example 7.

25

Figures 2A and 2C depict representative data expressed as percent activity of the uninhibited control with non-linear regression curves. The curves drawn as secondary plots for Figure 2B and Figure 2D were

generated by fitting the data presented in Figures 2A and 2C, respectively, to equation (2), disclosed hereinbelow.

Figures 3A and 3B depict the effects of the three Val-349 mutations on the reversibility of COX-2 inhibition by INDO and DM-INDO. Assays were 5 performed with 10 μ M of either INDO or DM-INDO as described in Example 7. Representative data are expressed as percent activity of the uninhibited control.

Figures 4A and 4B depict the kinetics of the time-dependent inhibition 10 of COX-2 mutants by DM-INDO. Assays were performed as described in Example 7. Representative data are expressed as percent activity of the uninhibited control with non-linear regression curves.

Figures 5A-5D depict fluorescence quenching of apo-COX-2 by INDO compared to DM-INDO, and competition by arachidonic acid (AMINO ACID). Assays were performed under conditions described in Example 9. Apo- 15 protein at 0.2 μ M was mixed with DMSO (black), INDO (gray with circles), or DM-INDO (gray), for 240 seconds (Figures 5A-5C) or 360 seconds (Figure 5D), followed by the addition of 50 μ M AA (arrow), and monitored for another 240 seconds (Figures 5A-5C) or 360 seconds (Figure 5D). Traces are the average of 3 determinations.

Figure 5A depicts the results obtained with an mCOX-2^{V349A} polypeptide. Figure 5B depicts the results obtained with a wild type mCOX-2 polypeptide. Figure 5C depicts the results obtained with an mCOX-2^{V349I} polypeptide. Figure 5D depicts the results obtained with an mCOX-2^{V349L} polypeptide. The final concentrations of INDO and DM-INDO employed 20 were 1 μ M (Figure 5A), 2 μ M (Figure 5B), 3 μ M (Figure 5C), and 5 μ M (Figure 5D).

Figure 6 depicts a scheme for synthesizing 2-Des-methylindomethacin (DM-INDO).

Figure 7 depicts a scheme for synthesizing eindenic acid sulfide 30 (Compound I) and a derivative of eindenic acid sulfide, *N*-Benzyl-2-[6-fluoro-3-(4-methylsulfanyl-benzylidene)-3*H*-inden-1-yl]-acetamide (Compound J).

Figure 8 depicts the results of cell viability assays of RKO cells exposed to various concentrations of *N*-Benzyl-2-[6-fluoro-3-(4-methylsulfanyl-benzylidene)-3*H*-inden-1-yl]-acetamide (Compound J).

5 Figure 9 depicts the results of increased caspase-3 activity in three different cell lines exposed to various concentrations of *N*-Benzyl-2-[6-fluoro-3-(4-methylsulfanyl-benzylidene)-3*H*-inden-1-yl]-acetamide (Compound J).

10 Figure 10 depicts the Western blot analyses of results of PPAR γ reporter assays of HEK293 cells exposed to various concentrations of sulindac sulfide (SS), eindenic acid sulfide (Compound I), or *N*-Benzyl-2-[6-fluoro-3-(4-methylsulfanyl-benzylidene)-3*H*-inden-1-yl]-acetamide (Compound J).

DETAILED DESCRIPTION

15 The present subject matter will be now be described more fully hereinafter with reference to the accompanying Examples, in which representative embodiments of the presently disclosed subject matter are shown. The presently disclosed subject matter can, however, be embodied in different forms and should not be construed as limited to the embodiments set forth herein. Rather, these embodiments are provided so that this disclosure will be thorough and complete, and will fully convey the scope of 20 the presently disclosed subject matter to those skilled in the art.

All publications, patent applications, patents, and other references mentioned herein are incorporated by reference in their entirety.

25 Throughout the specification and claims, a given chemical formula or name shall encompass all optical isomers and stereoisomers as well as racemic mixtures where such isomers and mixtures exist.

I. General Considerations

30 Non-steroidal anti-inflammatory drugs (NSAIDs) exert a range of biological activities including inhibition of inflammation, inhibition of pain, lowering of fever, inhibition of tumor growth, inhibition of Alzheimer's disease, and improvement of cognitive function in neurodegenerative diseases, *inter alia*. Some of these effects are mediated by inhibition of

cyclooxygenase enzymes (COX-1 and COX-2) whereas others are mediated by modulation of other molecular targets. The latter include, but are not limited to activation of peroxisome proliferators-activated receptors (PPARs), modulation of γ -secretase, inhibition of c-GMP phosphodiesterase subtypes, 5 and inhibition of Rho activation. Two compounds that exhibit activities in both cyclooxygenase-related and non-cyclooxygenase-related responses are indomethacin and sulindac sulfide. Indomethacin is directly active following administration to humans whereas sulindac sulfide is administered as the inactive prodrug sulindac. Sulindac is converted to the active drug, 10 sulindac sulfide, by reduction in the gastrointestinal tract.

Indomethacin and sulindac sulfide are structurally related molecules that contain substituted indoleacetic acid and indeneacetic acid functional groups, respectively. Both molecules contain a methyl group at the 2-position of the indole or indene ring. Molecular modeling suggests that this 15 2' methyl group is an important determinant of the ability of indomethacin and sulindac sulfide to bind tightly to COX enzymes and, thereby, inhibit their function. This hypothesis has been verified by site-directed mutagenesis of the COX-2 enzyme and by synthesis of indomethacin and sulindac sulfide derivatives that lack the 2' methyl group (2-Des-methyl derivatives) as 20 described herein. These derivatives are poor inhibitors of both COX enzymes compared to the parent drugs.

The inability of 2-Des-methyl derivatives of indole acetic acids and indene acetic acids to inhibit COX enzymes provides a strategy to develop drugs that display COX-independent effects but minimally inhibit COX 25 enzymes and, therefore, have a higher safety margin by virtue of reduced gastrointestinal toxicity. This enables higher doses of these drugs to be given, which should increase their efficacy at non-COX targets. These compounds would be expected to exhibit the ability to prevent, treat, or inhibit cancer, neurodegenerative diseases, and diabetes *inter alia*.

II. Definitions

While the following terms are believed to be well understood by one of ordinary skill in the art, the following definitions are set forth to facilitate explanation of the presently disclosed subject matter.

5 Unless defined otherwise, all technical and scientific terms used herein have the same meaning as commonly understood to one of ordinary skill in the art to which the presently disclosed subject matter belongs. Although any methods, devices, and materials similar or equivalent to those described herein can be used in the practice or testing of the presently 10 disclosed subject matter, representative methods, devices, and materials are now described.

Unless otherwise indicated, all numbers expressing quantities of ingredients, reaction conditions, and so forth used in the specification and claims are to be understood as being modified in all instances by the term 15 "about". Accordingly, unless indicated to the contrary, the numerical parameters set forth in this specification and attached claims are approximations that can vary depending upon the desired properties sought to be obtained by the presently disclosed subject matter.

Following long-standing patent law convention, the terms "a", "an", 20 and "the" refer to "one or more" when used in this application, including the claims. Thus, for example, reference to "a vector" includes a plurality of such vectors, and so forth.

As used herein, the term "about," when referring to a value or to an amount of mass, weight, time, volume, concentration or percentage is meant 25 to encompass variations of $\pm 20\%$ or $\pm 10\%$, in another example $\pm 5\%$, in another example $\pm 1\%$, in another example $\pm 0.5\%$, and in still another example $\pm 0.1\%$ from the specified amount, as such variations are appropriate to perform the disclosed method.

As used herein, the terms "amino acid" and "amino acid residue" are 30 used interchangeably and mean any of the twenty naturally occurring amino acids. An amino acid is formed upon chemical digestion (hydrolysis) of a polypeptide at its peptide linkages. The amino acid residues described herein are in some embodiments in the "L" isomeric form. However,

residues in the "D" isomeric form can be substituted for any L-amino acid residue, as long as the desired functional property is retained by the polypeptide. NH₂ refers to the free amino group present at the amino terminus of a polypeptide. COOH refers to the free carboxy group present at the carboxy terminus of a polypeptide. In keeping with standard polypeptide nomenclature abbreviations for amino acid residues are shown in tabular form presented hereinabove.

It is noted that all amino acid residue sequences represented herein by formulae have a left-to-right orientation in the conventional direction of amino terminus to carboxy terminus. In addition, the phrases "amino acid" and "amino acid residue" are broadly defined to include modified and unusual amino acids.

Furthermore, it is noted that a dash at the beginning or end of an amino acid residue sequence indicates a peptide bond to a further sequence of one or more amino acid residues or a covalent bond to an amino-terminal group such as NH₂ or acetyl or to a carboxy-terminal group such as COOH.

In certain instances herein, amino acids are indicated by a one- or three-letter code followed by a number (for example, Val-349). As used herein, this numbering system refer to the positions of corresponding amino acids in ovine COX-1, the amino acid sequence of which can be found at GENBANK® Accession No. P05979. As a result of this convention, a given amino acid and number combination might not be found in a given polypeptide, depending on the particular COX enzyme and species. For example, "Val-349" refers to the valine residue that forms part of the binding pocket for the 2'-methyl group of indomethacin or sulindac. Looking at GENBANK® Accession No. P05979, one can find a valine at position 349. However, when looking at GENBANK® Accession No. Q05769, which is the mouse COX-2 amino acid sequence, one finds that the corresponding valine is not at amino acid 349, but rather at amino acid 335. Similarly, Ala-527, Ser-530, and Leu-531 refer not only to amino acids at positions 527, 530, and 531 of ovine COX-1, respectively, but also to alanine, serine, and leucine residues found in mouse COX-2 at positions 513, 516, and 517, respectively. The human COX-2 amino acid sequence can be found at

GENBANK® Accession No. P35354, and in human COX-2, Val-349, Ala-527, Ser-530, and Leu-531 also refer to the valine, alanine, serine, and leucine amino acids that are present at amino acids 335, 513, 516, and 517, respectively.

5 As used herein, the term "cell" refers not only to the particular subject cell (e.g., a living biological cell), but also to the progeny or potential progeny of such a cell. Because certain modifications can occur in succeeding generations due to either mutation or environmental influences, such progeny might not, in fact, be identical to the parent cell, but are still included
10 within the scope of the term as used herein.

As used herein, the term "enzyme activity" refers to the ability of an enzyme to catalyze the conversion of a substrate into a product. A substrate for the enzyme can comprise the natural substrate of the enzyme but also can comprise analogues of the natural substrate, which can also be converted by the enzyme into a product or into an analogue of a product.
15 The activity of the enzyme is measured for example by determining the amount of product in the reaction after a certain period of time, or by determining the amount of substrate remaining in the reaction mixture after a certain period of time. The activity of the enzyme can also be measured by
20 determining the amount of an unused co-factor of the reaction remaining in the reaction mixture after a certain period of time or by determining the amount of used co-factor in the reaction mixture after a certain period of time. The activity of the enzyme can also be measured by determining the amount of a donor of free energy or energy-rich molecule (e.g., ATP,
25 phosphoenolpyruvate, acetyl phosphate, or phosphocreatine) remaining in the reaction mixture after a certain period of time or by determining the amount of a used donor of free energy or energy-rich molecule (e.g., ADP, pyruvate, acetate, or creatine) in the reaction mixture after a certain period of time.

30 As used herein, the term "inhibitor" refers to a chemical substance that inactivates or decreases the biological activity of a polypeptide such as a biosynthetic and catalytic activity, receptor, signal transduction polypeptide, structural gene product, or transport polypeptide.

As used herein, the term "interact" includes "binding" interactions and "associations" between molecules. Interactions can be, for example, protein-protein, protein-small molecule, protein-nucleic acid, and nucleic acid-nucleic acid in nature.

5 As used herein, the term "modulate" refers to an increase, decrease, or other alteration of any, or all, chemical and biological activities or properties of a biochemical entity, e.g., a wild type or mutant polypeptide. As such, the term "modulate" can refer to a change in the expression level of a gene (or a level of RNA molecule or equivalent RNA molecules encoding 10 one or more proteins or protein subunits), or of an activity of one or more proteins or protein subunits, such that expression, level, or activity is greater than or less than that observed in the absence of the modulator. For example, the term "modulate" can mean "inhibit" or "suppress", but the use of the word "modulate" is not limited to this definition.

15 The term "modulation" as used herein refers to both upregulation (*i.e.*, activation or stimulation) and downregulation (*i.e.*, inhibition or suppression) of a response. Thus, the term "modulation", when used in reference to a functional property or biological activity or process (e.g., enzyme activity or receptor binding), refers to the capacity to upregulate (e.g., activate or 20 stimulate), downregulate (e.g., inhibit or suppress), or otherwise change a quality of such property, activity, or process. In certain instances, such regulation can be contingent on the occurrence of a specific event, such as activation of a signal transduction pathway, and/or can be manifest only in particular cell types.

25 The term "modulator" refers to a polypeptide, nucleic acid, macromolecule, complex, molecule, small molecule, compound, species, or the like (naturally occurring or non-naturally occurring) that can be capable of causing modulation. Modulators can be evaluated for potential activity as inhibitors or activators (directly or indirectly) of a functional property, 30 biological activity or process, or a combination thereof, (e.g., agonist, partial antagonist, partial agonist, inverse agonist, antagonist, anti-microbial agents, inhibitors of microbial infection or proliferation, and the like) by inclusion in

assays. In such assays, many modulators can be screened at one time. The activity of a modulator can be known, unknown, or partially known.

Modulators can be either selective or non-selective. As used herein, the term "selective" when used in the context of a modulator (e.g., an inhibitor) refers to a measurable or otherwise biologically relevant difference in the way the modulator interacts with one molecule (e.g., an enzyme or receptor) versus another similar but not identical molecule (e.g., a member of the same enzyme or receptor family).

It must be understood that it is not required that the degree to which the interactions differ be completely opposite. Put another way, the term selective modulator encompasses not only those molecules that only bind to a given polypeptide and not to related family members. The term is also intended to include modulators that are characterized by interactions with polypeptides of interest and from related family members that differ to a lesser degree. For example, selective modulators include modulators for which conditions can be found (such as the nature of the substituents present on the modulator) that would allow a biologically relevant difference in the binding of the modulator to the polypeptide of interest versus polypeptides derived from different family members.

When a selective modulator is identified, the modulator will bind to one molecule (for example a polypeptide of interest) in a manner that is different (for example, stronger) than it binds to another molecule (for example, a polypeptide related to the polypeptide of interest). As used herein, the modulator is said to display "selective binding" or "preferential binding" to the molecule to which it binds more strongly.

As used herein, the term "mutation" carries its traditional connotation and means a change, inherited, naturally occurring or introduced, in a nucleic acid or polypeptide sequence, and is used in its sense as generally known to those of skill in the art.

As used herein, the terms "nucleic acid" and "nucleic acid molecule" mean any of deoxyribonucleic acid (DNA), ribonucleic acid (RNA), oligonucleotides, fragments generated by the polymerase chain reaction (PCR), and fragments generated by any of ligation, scission, endonuclease

action, and exonuclease action. Nucleic acids can be composed of monomers that are naturally occurring nucleotides (such as deoxyribonucleotides and ribonucleotides), or analogs of naturally occurring nucleotides (e.g., α -enantiomeric forms of naturally-occurring nucleotides), or a combination of both. Nucleic acids can be either single stranded or double stranded.

As used herein, the term "polypeptide" means any polymer comprising any of the 20 protein amino acids, or amino acid analogs, regardless of its size or function. Although "protein" is often used in reference to relatively large polypeptides, and "peptide" is often used in reference to small polypeptides, usage of these terms in the art overlaps and varies. The term "polypeptide" as used herein refers to peptides, polypeptides and proteins, unless otherwise noted. As used herein, the terms "protein", "polypeptide" and "peptide" are used interchangeably. The term "polypeptide" encompasses proteins of all functions, including enzymes.

As used herein, the terms "polypeptides of interest" and "target polypeptide" are used interchangeably to refer to a polypeptide the activity of which the compositions and methods of the presently disclosed subject matter are intended to modulate. For example, polypeptides of interest include, but are not limited to cyclooxygenase enzymes, PPARs (e.g., PPAR γ), and secretases (e.g., γ -secretase). The compositions disclosed herein are intended to differentially modulate these enzymes relative to one or more of the others. For example, the NSAID derivatives disclosed herein are intended to have reduced cyclooxygenase-binding activities, while their binding activities to other polypeptides might or might not be affected by the derivitization. While not wishing to be limited to any particular theory of operation, the reduction in COX-binding activity might enhance the bioavailability of these derivatives to other, non-COX polypeptides of interest because the derivatives either do not bind to COX enzymes or bind to COX enzymes to a lesser degree than do the non-derivatized NSAIDs upon which they are based.

As used herein, "significance" or "significant" relates to a statistical analysis of the probability that there is a non-random association between two or more entities. To determine whether or not a relationship is "significant" or has "significance", statistical manipulations of the data can be 5 performed to calculate a probability, expressed as a "p-value". Those p-values that fall below a user-defined cutoff point are regarded as significant. In one example, a p-value less than or equal to 0.05, in another example less than 0.01, in another example less than 0.005, and in yet another example less than 0.001, are regarded as significant.

10 As used herein, the term "significant increase" refers to an increase in activity (for example, enzymatic activity) that is larger than the margin of error inherent in the measurement technique, in some embodiments an increase by about 2 fold or greater over a baseline activity (for example, the activity of the wild type enzyme in the presence of the inhibitor), in some 15 embodiments an increase by about 5 fold or greater, and in still some embodiments an increase by about 10 fold or greater.

With respect to the binding of one or more molecules (for example, a modulator) to one or more polypeptides (for example, a PPAR, a COX, or a secretase), a significant increase can also refer to: (a) a biologically relevant 20 difference in binding of two or more related compounds to the same polypeptide; and/or (b) a biologically relevant difference in binding of the same compound to two different polypeptides. In this aspect, "significant" is to be thought of in its ordinary meaning: namely, a difference between two occurrences that is important (*i.e.*, biologically or medically relevant). By 25 way of example, a significant increase can also refer to an increase in the amount of a derivative of an NSAID (for example, a 2-Des-methyl derivative of the presently disclosed subject matter) that interacts with a non-COX polypeptide (for example, a PPAR γ or a γ -secretase) per unit dose of the derivative administered as compared to the amount of the non-derivatized 30 NSAID that interacts with the same non-COX polypeptide per unit dose of the non-derivatized NSAID. In this example, because the derivative binds to COX enzymes less strongly than the parent NSAID, on a mole-for-mole

basis, more of the derivative should be available to interact with non-COX polypeptides than would the parent NSAID.

As used herein, the terms "significantly less" and "significantly reduced" refer to a result (for example, an amount of a product of an enzymatic reaction) that is reduced by more than the margin of error inherent in the measurement technique, in some embodiments a decrease by about 2 fold or greater with respect to a baseline activity (for example, the activity of the wild type enzyme in the absence of the inhibitor), in some embodiments, a decrease by about 5 fold or greater, and in still some embodiments a decrease by about 10 fold or greater.

As used herein, the phrases "treatment effective amount", "therapeutically effective amount", and "treatment amount" are used interchangeably and refer to an amount of a therapeutic composition sufficient to produce a measurable response (e.g., a biologically or clinically relevant response in a subject being treated). Actual dosage levels of active ingredients in the pharmaceutical compositions of the presently disclosed subject matter can be varied so as to administer an amount of the active compound(s) that is effective to achieve the desired therapeutic response for a particular subject. The selected dosage level will depend upon the activity of the therapeutic composition, the route of administration, combination with other drugs or treatments, the severity of the condition being treated, and the condition and prior medical history of the subject being treated. However, it is within the skill of the art to start doses of the compound at levels lower than required to achieve the desired therapeutic effect and to gradually increase the dosage until the desired effect is achieved.

The potency of a therapeutic composition can vary, and therefore a "therapeutically effective amount" can vary. However, one skilled in the art can readily assess the potency and efficacy of a candidate modulator of the presently disclosed subject matter and adjust the therapeutic regimen accordingly.

After review of the disclosure herein of the presently disclosed subject matter, one of ordinary skill in the art can tailor the dosages to an individual subject, taking into account the particular formulation, method of

administration to be used with the composition, and other factors. Further calculations of dose can consider subject height and weight, severity and stage of symptoms, and the presence of additional deleterious physical conditions. Such adjustments or variations, as well as evaluation of when 5 and how to make such adjustments or variations, are well known to those of ordinary skill in the art of medicine.

III. Derivatization of NSAIDs

III.A. General Considerations

10 Cyclooxygenases (COXs) are the therapeutic targets of non-steroidal anti-inflammatory drugs. Indomethacin (INDO) was one of the first non-steroidal anti-inflammatory drugs to be characterized as a functionally irreversible, time-dependent inhibitor, but the molecular basis underlying this phenomenon is uncertain. In the crystal structure of INDO bound to COX-2, 15 a small hydrophobic pocket was identified that surrounds the 2' methyl group of INDO. The pocket is formed by the residues Ala-527, Val-349, Ser-530, and Leu-531. The contribution of this pocket to inhibition was evaluated by altering its volume by mutagenesis of Val-349. The V349A mutation expanded the pocket and increased the potency of INDO, whereas the 20 V349L mutation reduced the size of the pocket and decreased the potency of INDO. Particularly striking was the reversibility of INDO inhibition of the V349L mutant.

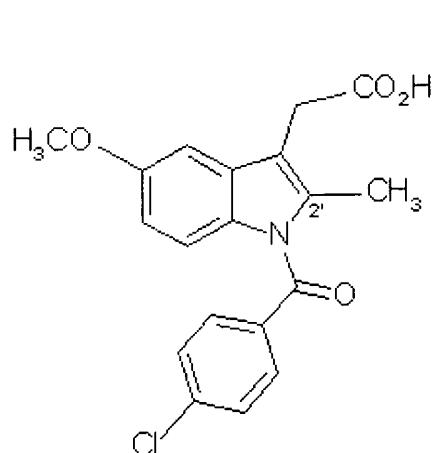

NSAIDs have been found to have various activities, including the ability to modulate the activities of cyclooxygenases (e.g., COX-1 and/or 25 COX-2), PPARs (e.g., PPAR γ), and secretases (e.g., γ -secretase). The ability to create different derivatives of NSAIDs can be exploited to differentially modulate the activities of these polypeptides, which can be used to treat different diseases and disorders.

30 The use of an NSAID to modulate a PPAR and/or a secretase *in vivo* is compromised by the presence of significant gastrointestinal toxicities induced by high dosage administration of the NSAID. This effect appears to be due to the inhibition of COX-1, resulting in a reduction in the production and release of cytoprotective prostaglandins in the gastrointestinal (GI) tract.

One approach to reducing GI toxicity is to reduce the ability of the NSAID to bind to COX-1 and/or COX-2, yet maintain the ability to modulate other target polypeptides.

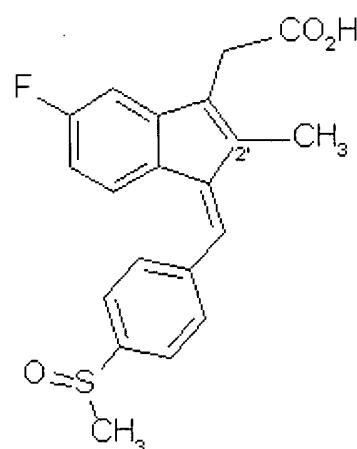

Thus, in some embodiments, the presently disclosed subject matter provides a method for altering the specificity of a cyclooxygenase-inhibiting compound. In some embodiments, the method comprises (a) providing a compound having cyclooxygenase inhibitory activity, the compound comprising an indoleacetic acid or indenacetic acid functional group having a 2' methyl group; and (b) replacing the 2' methyl group with a moiety selected from the group consisting of hydrogen; halo; halomethyl, wherein at least one hydrogen of the methyl group is substituted with a halogen; C₂ to C₆ alkyl; C₂ to C₆ branched alkyl; and C₂ to C₆ substituted alkyl to create a derivative, wherein the derivative substantially lacks cyclooxygenase inhibitory activity. In some embodiments of this method, the compound is a non-steroidal anti-inflammatory drug. Thus, in some embodiments, the derivative is a derivative of an NSAID, and comprises an indoleacetic acid or indeneacetic acid functional group having a hydrogen or a fluorine substituent at the 2' position. Representative NSAIDs comprising an indoleacetic acid or indenacetic acid functional group include, but are not limited to indomethacin and sulindac, as well as pharmaceutically acceptable salts thereof and combinations thereof.

The structures of indomethacin and sulindac are presented below.

25

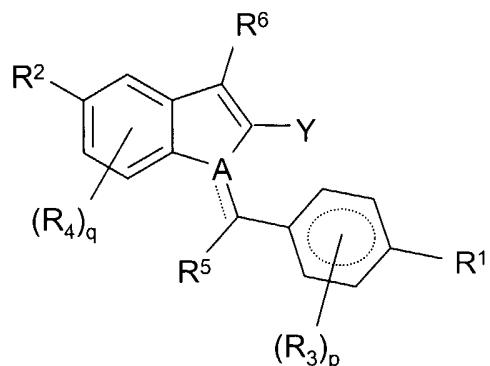

Indomethacin

Sulindac

The 2' methyl groups are shown attached to the indoleacetic acid and indenacetic acid functional groups, respectively. These 2' methyl groups play an important role in binding of these NSAIDs to COX enzymes, and thus removal of the 2' methyl groups to form 2-Des-methyl derivatives can 5 be used to reduce the ability of the 2-Des-methyl derivatives to bind to COX enzymes without negatively affecting the ability of the derivatives to bind to and/or interact with PPARs, secretases, and other target polypeptides. Accordingly, in some embodiments, the derivative is selected from the group 10 consisting of 2-Des-methylindomethacin, eindenic acid sulfide, eindenic acid sulfoxide, and eindenic acid sulfone. In some embodiments, the derivative is eindenic acid sulfide.

15 Additionally, all positions corresponding to positions where hydrogen is present in the parent compounds can also be derivatized, and should be viewed as R groups (e.g., R¹, R², R³, etc.). As such, in some embodiments a generic structure for the presently disclosed derivatives is presented as 20 Formula I:

Formula I

wherein

20 R¹ is selected from the group consisting of hydrogen, halo, CF₃; SCH₃; SOCH₃; SO₂CH₃; SO₂NH₂; C₁ to C₆ alkyl, branched alkyl, or substituted alkyl; C₁ to C₆ alkoxy, branched alkoxy, or substituted alkoxy; C₁ to C₆ alkylcarboxylic acid, branched alkylcarboxylic acid, or substituted alkylcarboxylic acid; and 25 CH₂N₃;

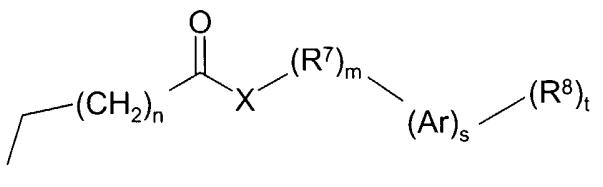

R² is selected from the group consisting of hydrogen, halo, CF₃; SCH₃; SOCH₃; SO₂CH₃; SO₂NH₂; CONH₂; C₁ to C₆ alkyl,

branched alkyl, or substituted alkyl; C₁ to C₆ alkoxy, branched alkoxy, or substituted alkoxy; benzyloxy; C₁ to C₆ alkylcarboxylic acid, branched alkylcarboxylic acid, or substituted alkylcarboxylic acid; and CH₂N₃;

5 R³ and R⁴ are each independently selected from the group consisting of hydrogen; halo; CF₃; C₁ to C₆ alkyl, branched alkyl, or substituted alkyl; C₁ to C₆ alkoxy, branched alkoxy, or substituted alkoxy; aryl; substituted aryl; benzyloxy; SCH₃; SOCH₃; SO₂CH₃; and SO₂NH₂;

10 R⁵ is selected from the group consisting of hydrogen, C₁ to C₆ alkyl, branched alkyl, or substituted alkyl, and =O;

R⁶ is selected from the group consisting of hydrogen; C₁ to C₆ alkyl, branched alkyl, or substituted alkyl; C₁ to C₆ alkoxy, branched alkoxy, or substituted alkoxy; benzyloxy; C₁ to C₆ alkylcarboxylic acid, branched alkylcarboxylic acid, or substituted alkylcarboxylic acid; and the following structure:

wherein

Ar is cyclohexyl or phenyl;

20 R⁷ is hydrogen; C₁ to C₆ alkyl, branched alkyl, or substituted alkyl;

R⁸ is hydrogen, halo, C₁ to C₆ alkyl, branched alkyl, and substituted alkyl; C₁ to C₆ alkoxy, branched alkoxy, and substituted alkoxy; C₁ to C₆ alkylcarboxylic acid, branched alkylcarboxylic acid, or substituted alkylcarboxylic acid; amino; nitro; CF₃; bromoacetamidyl; benzoyl; or 2-phenyl-oxiranyl;

25 X is O or NR⁹, wherein R⁹ is hydrogen or alkyl; and
 30 m, n, s, and t are each individually 0, 1, 2, 3, 4, or 5;

Y is selected from the group consisting of hydrogen, halo, CF₃, and C₂ to C₆ alkyl, branched alkyl, or substituted alkyl;

A is selected from the group consisting of carbon and nitrogen;

p and q are both individually 0, 1, 2, 3, or 4;

5 the bond between the carbon bound to R⁵ and the indene ring and is a single bond or a double bond; and

the six-membered ring to which R¹ is bound is cyclohexyl or phenyl.

Continuing with reference to Formula I, in some embodiments, R¹ is selected from the group consisting of halo, C₁ to C₆ alkyl or branched alkyl, 10 SCH₃, SOCH₃, SO₂CH₃, and SO₂NH₂; R² is selected from the group consisting of hydrogen; halo; C₁ to C₆ alkyl or branched alkyl; C₁ to C₆ alkoxy or branched alkoxy; benzyloxy; SCH₃; SOCH₃; SO₂CH₃; SO₂NH₂; and CONH₂; R³ and R⁴ are each independently selected from the group consisting of hydrogen, C₁ to C₆ alkyl or branched alkyl, and halo; R⁵ is 15 selected from the group consisting of hydrogen, C₁ to C₆ alkyl or branched alkyl, and carbonyl; R⁶ is selected from the group consisting of C₁ to C₆ alkylcarboxylic acid and branched C₁ to C₆ alkylcarboxylic acid; Y is selected from the group consisting of hydrogen, halo, and C₂ to C₆ alkyl or branched alkyl; A is selected from the group consisting of carbon and nitrogen; and the 20 bond between the carbon bound to R⁵ and the indene ring is a single bond or a double bond. In some embodiments, the derivative is selected from the group consisting of 2-Des-methylindomethacin, eindenic acid sulfide, eindenic acid sulfoxide, and eindenic acid sulfone. In some embodiments, the derivative is eindenic acid sulfide.

25 In derivatizing the R groups, each R group can be independently selected, such that any number of R groups (i.e., from zero R groups to all R groups present in a structure) can be derivatized. The term "independently selected" is used herein to indicate that the R groups, e.g., R¹, R², R³, etc. can be identical or different (e.g., R¹, R² and R³ can all be substituted alkyls, 30 or R¹ and R⁴ can be a substituted alkyl and R³ can be an aryl, etc.). Moreover, "independently selected" means that in a multiplicity of R groups with the same name, each group can be identical to or different from each other (e.g., one R³ can be an alkyl, while another R³ group in the same

compound can be aryl; one R⁴ group can be H, while another R⁴ group in the same compound can be alkyl, etc.).

A named R group will generally have the structure that is recognized in the art as corresponding to R groups having that name. For the purposes of illustration, representative R groups as enumerated above are defined herein. These definitions are intended to supplement and illustrate, not preclude, the definitions known to those of skill in the art.

As used herein, the term "alkyl" means C₁₋₁₀ inclusive (i.e., carbon chains comprising 1, 2, 3, 4, 5, 6, 7, 8, 9, or 10 carbon atoms; also, in some embodiments, C₁₋₆ inclusive) linear, branched, or cyclic, saturated or unsaturated (i.e., alkenyl and alkynyl) hydrocarbon chains, including for example, methyl, ethyl, propyl, isopropyl, butyl, isobutyl, *tert*-butyl, pentyl, hexyl, ethenyl, propenyl, butenyl, pentenyl, hexenyl, butadienyl, propynyl, butynyl, pentynyl, hexynyl, and allenyl groups.

The alkyl group can be optionally substituted with one or more alkyl group substituents which can be the same or different, where "alkyl group substituent" includes alkyl, halo, aryl, arylamino, acyl, hydroxy, aryloxy, alkoxy, alkylthio, arylthio, aralkyloxy, aralkylthio, carboxy, alkoxycarbonyl, oxo and cycloalkyl. In this case, the alkyl can be referred to as a "substituted alkyl". Representative substituted alkyls include, for example, benzyl, trifluoromethyl, and the like. There can be optionally inserted along the alkyl chain one or more oxygen, sulfur or substituted or unsubstituted nitrogen atoms, wherein the nitrogen substituent is hydrogen, alkyl (also referred to herein as "alkylaminoalkyl"), or aryl. Thus, the term "alkyl" can also include esters and amides. "Branched" refers to an alkyl group in which an alkyl group, such as methyl, ethyl, or propyl, is attached to a linear alkyl chain.

The term "aryl" is used herein to refer to an aromatic substituent, which can be a single aromatic ring or multiple aromatic rings that are fused together, linked covalently, or linked to a common group such as a methylene or ethylene moiety. The common linking group can also be a carbonyl as in benzophenone or oxygen as in diphenylether or nitrogen in diphenylamine. The aromatic ring(s) can include phenyl, naphthyl, biphenyl, diphenylether, diphenylamine, and benzophenone among others. In

particular embodiments, the term "aryl" means a cyclic aromatic comprising about 5 to about 10 carbon atoms, including 5 and 6-membered hydrocarbon and heterocyclic aromatic rings. As used herein, the term "aryl" also encompasses "heteroaryl" (i.e., aryl groups containing ring atoms other than carbon). Also, the term "aryl" can also include esters and amides related to the underlying aryl group.

An aryl group can be optionally substituted with one or more aryl group substituents which can be the same or different, where "aryl group substituent" includes alkyl, aryl, aralkyl, hydroxy, alkoxy, aryloxy, aralkoxy, carboxy, acyl, halo, nitro, alkoxycarbonyl, aryloxycarbonyl, aralkoxycarbonyl, acyloxy, acylamino, aroylamino, carbamoyl, alkylcarbamoyl, dialkylcarbamoyl, arylthio, alkylthio, alkylene and $-NR'R''$, where R' and R'' can be each independently hydrogen, alkyl, aryl and aralkyl. In this case, the aryl can be referred to as a "substituted aryl".

Specific examples of aryl groups include but are not limited to cyclopentadienyl, phenyl, furan, thiophene, pyrrole, pyran, pyridine, imidazole, isothiazole, isoxazole, pyrazole, pyrazine, pyrimidine, and the like.

The term "alkoxy" is used herein to refer to the $-OZ^1$ radical, where Z^1 is selected from the group consisting of alkyl, substituted alkyl, cycloalkyl, substituted cycloalkyl, heterocycloalkyl, substituted heterocycloalkyl, silyl groups and combinations thereof as described herein. Suitable alkoxy radicals include, for example, methoxy, ethoxy, benzyloxy, *t*-butoxy, etc. A related term is "aryloxy" where Z^1 is selected from the group consisting of aryl, substituted aryl, heteroaryl, substituted heteroaryl, and combinations thereof. Examples of suitable aryloxy radicals include phenoxy, substituted phenoxy, 2-pyridinoxy, 8-quinalinoxy, and the like.

The term "amino" is used herein to refer to the group $-NZ^1Z^2$, where each of Z^1 and Z^2 is independently selected from the group consisting of hydrogen, alkyl, substituted alkyl, cycloalkyl, substituted cycloalkyl, heterocycloalkyl, substituted heterocycloalkyl, aryl, substituted aryl, heteroaryl, substituted heteroaryl, alkoxy, aryloxy, silyl and combinations thereof. Additionally, the amino group can be represented as $-N^+ Z^1 Z^2 Z^3$, with the previous definitions applying and Z^3 being either H or alkyl.

As used herein, the term "acyl" refers to an organic acid group wherein the -OH of the carboxyl group has been replaced with another substituent (i.e., as represented by RCO—, wherein R is an alkyl or an aryl group as defined herein). As such, the term "acyl" specifically includes 5 arylacyl groups, such as an acetyl furan and a phenacyl group. Specific examples of acyl groups include acetyl and benzoyl.

"Aroyl" means an aryl-CO-- group wherein aryl is as previously described. Exemplary aroyl groups include benzoyl and 1- and 2-naphthoyl.

"Cyclic" and "cycloalkyl" refer to a non-aromatic mono- or multicyclic 10 ring system of about 3 to about 10 carbon atoms, e.g., 3, 4, 5, 6, 7, 8, 9, or 10 carbon atoms. The cycloalkyl group can be optionally partially unsaturated. The cycloalkyl group also can be optionally substituted with an alkyl group substituent as defined herein, oxo, and/or alkylene. There can be optionally inserted along the cyclic alkyl chain one or more oxygen, sulfur, 15 or substituted or unsubstituted nitrogen atoms, wherein the nitrogen substituent is hydrogen, lower alkyl, or aryl, thus providing a heterocyclic group. Representative monocyclic cycloalkyl rings include cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, and cycloheptyl. Multicyclic cycloalkyl rings include adamantlyl, octahydronaphthyl, decalin, camphor, camphane, 20 and noradamantlyl.

"Aralkyl" refers to an aryl-alkyl- group wherein aryl and alkyl are as previously described. Exemplary aralkyl groups include benzyl, phenylethyl, and naphthylmethyl. Similarly, the term "alkylaryl" refers to an alkyl-aryl- group, wherein aryl and alkyl are as previously described. As such, the 25 terms "aralkyl" and "alkylaryl" can be used interchangeably, although in some instances the use of one term versus the other is intended to express the order of a group in a chemical structure when read from left-to-right. By way of example, an "ethylphenyl" substituent might be distinguished from a "phenylethyl" substituent in that in the former case, the ethyl moiety is bound to the main body of the molecule while in the latter it would be the phenyl moiety that is bound to the main body of the molecule.

"Aralkyloxy" refers to an aralkyl-O- group wherein the aralkyl group is as previously described. An exemplary aralkyloxy group is benzyloxy.

"Dialkylamino" refers to an $-NRR'$ group wherein each of R and R' is independently an alkyl group as previously described. Exemplary alkylamino groups include ethylmethylamino, dimethylamino, and diethylamino.

5 "Alkoxycarbonyl" refers to an alkyl-O-CO- group. Exemplary alkoxycarbonyl groups include methoxycarbonyl, ethoxycarbonyl, butyloxycarbonyl, and t-butyloxycarbonyl.

"Aryloxycarbonyl" refers to an aryl-O-CO- group. Exemplary aryloxycarbonyl groups include phenoxy- and naphthoxy-carbonyl.

10 "Aralkoxycarbonyl" refers to an aralkyl-O-CO- group. An exemplary aralkoxycarbonyl group is benzyloxycarbonyl.

"Carbamoyl" refers to an H_2N-CO- group.

"Alkylcarbamoyl" refers to a $R'RN-CO-$ group wherein one of R and R' is hydrogen and the other of R and R' is alkyl as previously described.

15 "Dialkylcarbamoyl" refers to a $R'RN-CO-$ group wherein each of R and R' is independently alkyl as previously described.

"Acyloxy" refers to an acyl-O- group wherein acyl is as previously described.

"Acylamino" refers to an acyl-NH- group wherein acyl is as previously described.

20 "Aroylamino" refers to an aroyl-NH- group wherein aroyl is as previously described.

The term "amino" refers to the $-NH_2$ group.

The term "carbonyl" refers to the $-(C=O)-$ group.

The term "carboxyl" refers to the $-COOH$ group.

25 The terms "halo", "halide", or "halogen" as used herein refer to fluoro, chloro, bromo, and iodo groups.

The term "halomethyl" refers to a methyl group wherein at least one hydrogen has been substituted with a halogen.

The term "hydroxyl" refers to the $-OH$ group.

30 The term "hydroxyalkyl" refers to an alkyl group substituted with an $-OH$ group.

The term "mercapto" refers to the $-SH$ group.

The term "nitro" refers to the $-NO_2$ group.

The term "oxo" refers to a compound described previously herein wherein a carbon atom is replaced by an oxygen atom.

The term "thio" refers to a compound described previously herein wherein a carbon or oxygen atom is replaced by a sulfur atom.

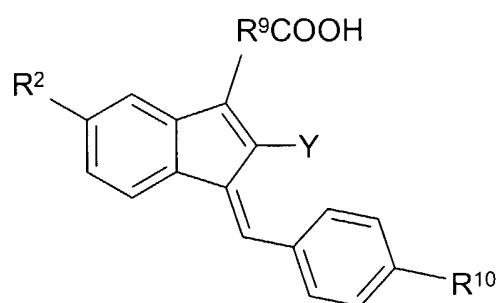

5 The term "sulfate" refers to the $-\text{SO}_4$ group.

A "heteroatom", as used herein, is an atom other than carbon. Exemplary heteroatoms are heteroatoms selected from the group consisting of N, O, P, S, Si, B, Ge, Sn, and Se. In some embodiments, a heteroatom is N. In some embodiments a heteroatom is O. In some embodiments, a 10 heteroatom is S.

As shown in Formula I, "A" depicts a carbon or a nitrogen.

A dashed line representing a bond in a structure indicates that the bond can either be present or absent in the structure. Thus, the dashed bond in Formula I that links the A atom to the carbon atom to which R^5 binds 15 indicates that this bond can be a single bond or a double bond. The same is true for the dashed bond depicted inside the six-membered ring to which R^1 is bound in Formula I. For the six-membered ring, the individual bonds can all be single, double, or a mixture of the two (e.g., the six-membered ring could be a cyclohexane ring, a benzene ring, or a ring with any combination 20 of single and/or double bonds).

As used herein, the term "eindenic acid" refers to the following structure:

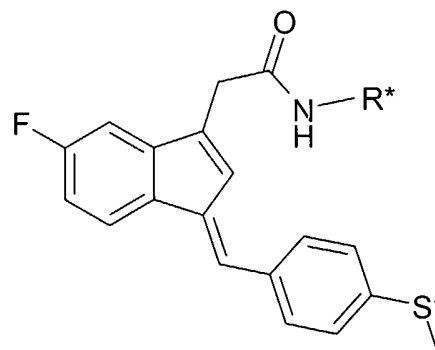

Formula V

25 Compounds having the general structure of eindenic acid as depicted in Formula V can be generated by 2'-desmethylation of sulindac, sulindac sulfide, etc. While the present co-inventors do not wish to be restricted to any particular theory of operation, they have observed that the double bond

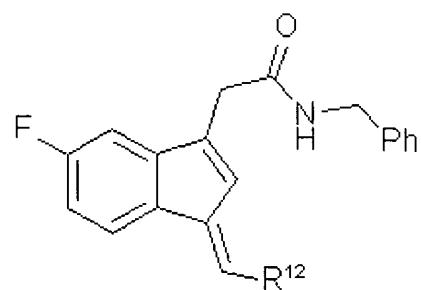

of the *p*-substituted benzylidene moiety, which is in a Z-orientation in sulindac, can adopt an E-orientation when the 2'-methyl group of sulindac is modified to a hydrogen or a fluorine. Thus, the term "eindenic acid" refers to an "E form indenacetic acid" to reflect the fact that in some embodiments this 5 double bond is in the E-orientation. However and as indicated hereinabove, each chemical formula or name disclosed herein encompasses all optical isomers and stereoisomers, as well as racemic mixtures where such isomers and mixtures exist. Thus, eindenic acids can adopt either the E-orientation or the Z-orientation. In some embodiments, R² and Y are defined as before 10 and R⁹ and R¹⁰ are each independently selected from the group consisting of C₁ to C₆ alkyl, C₁ to C₆ branched alkyl, and substituted (for example, halogen-substituted) or unsubstituted aryl.

In addition to modification of the 2' methyl position, several NSAIDs have carboxylic acid groups that can be modified. In some embodiments, 15 the carboxylic acid moiety of indomethacin or sulindac is derivatized to an amide. In some embodiments, an amide derivative has the following general formula:

Formula II

20 In some embodiments, R* is selected from the group consisting of aryl, alkylaryl, branched alkylaryl, and substituted aryl, wherein the substituted aryl comprises one or more substituents selected from the group consisting of halo, amino, nitro, alkoxy, hydroxyl, CF₃, haloacetamidyl (e.g. bromoacetamidyl), benzoyl, and 2-phenyl-oxiranyl. In some embodiments, 25 the amide derivative has the following general formula:

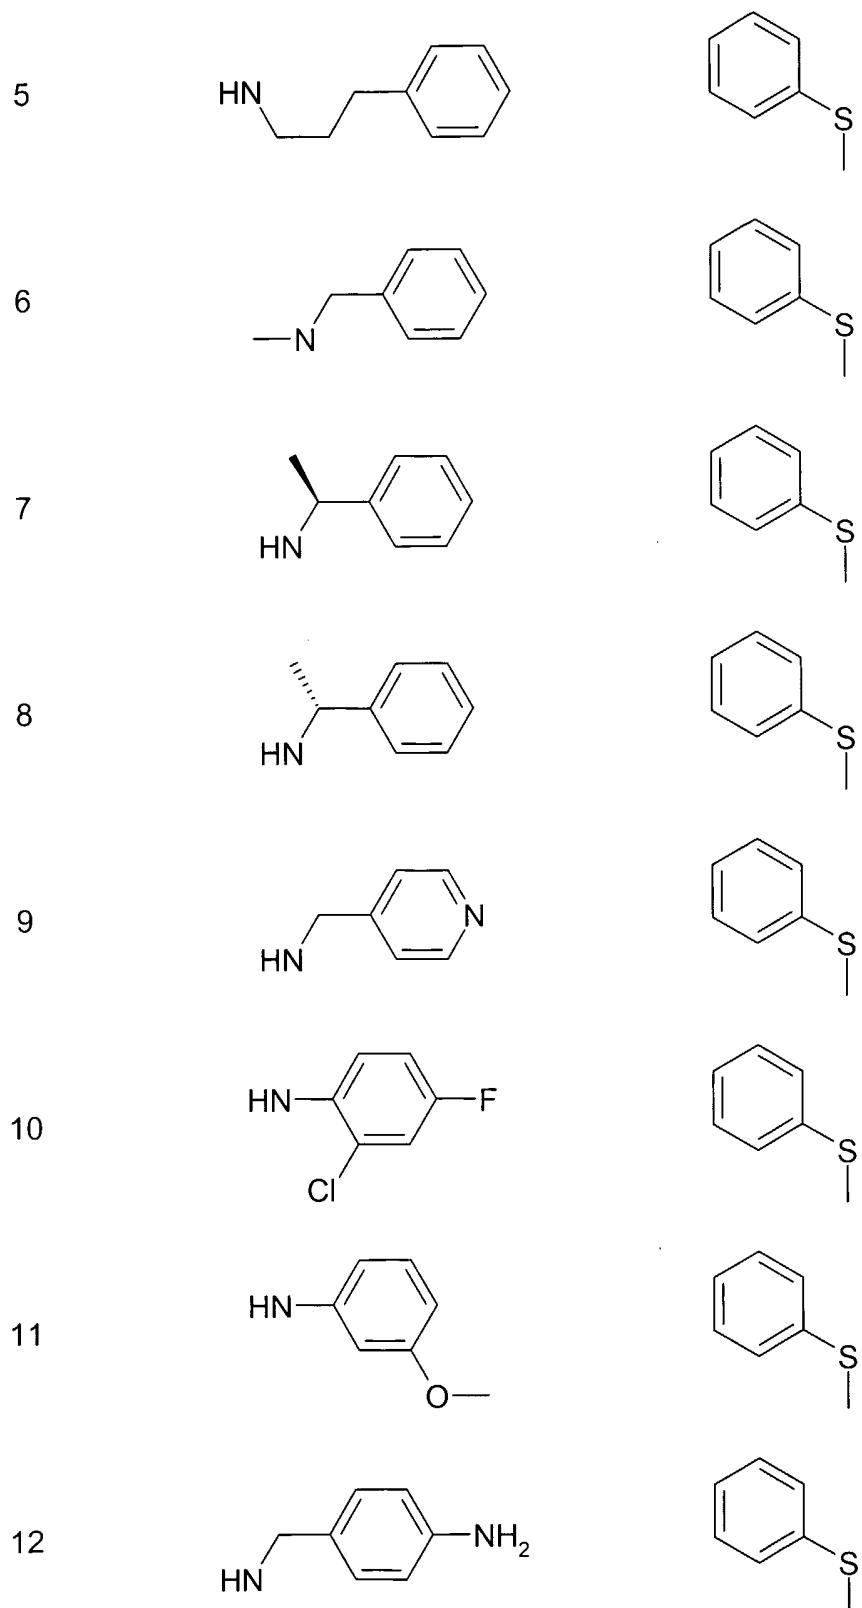

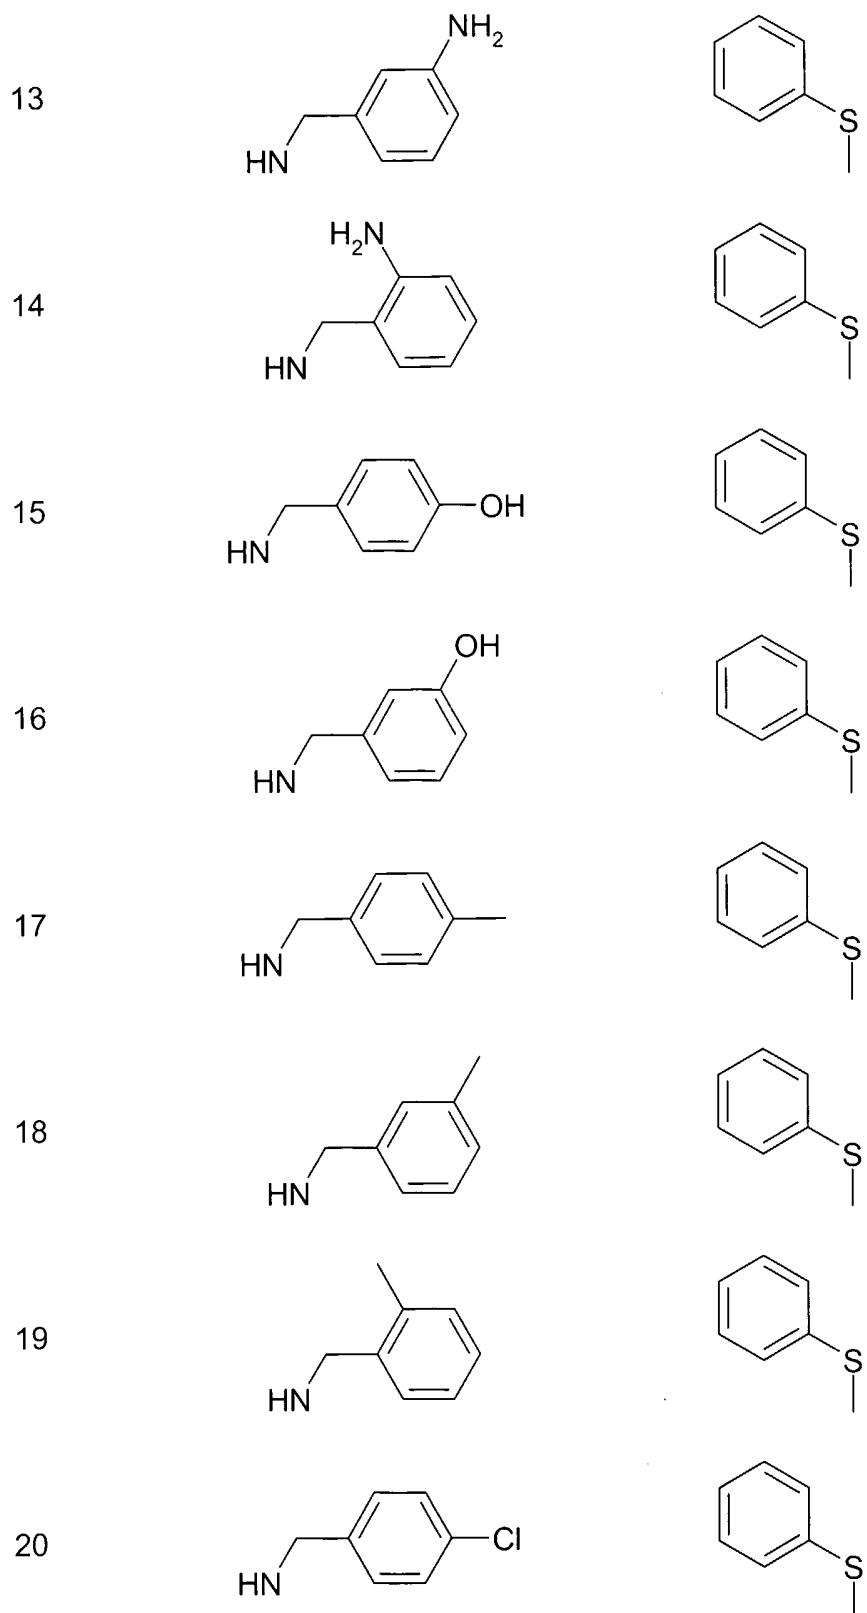

Formula III

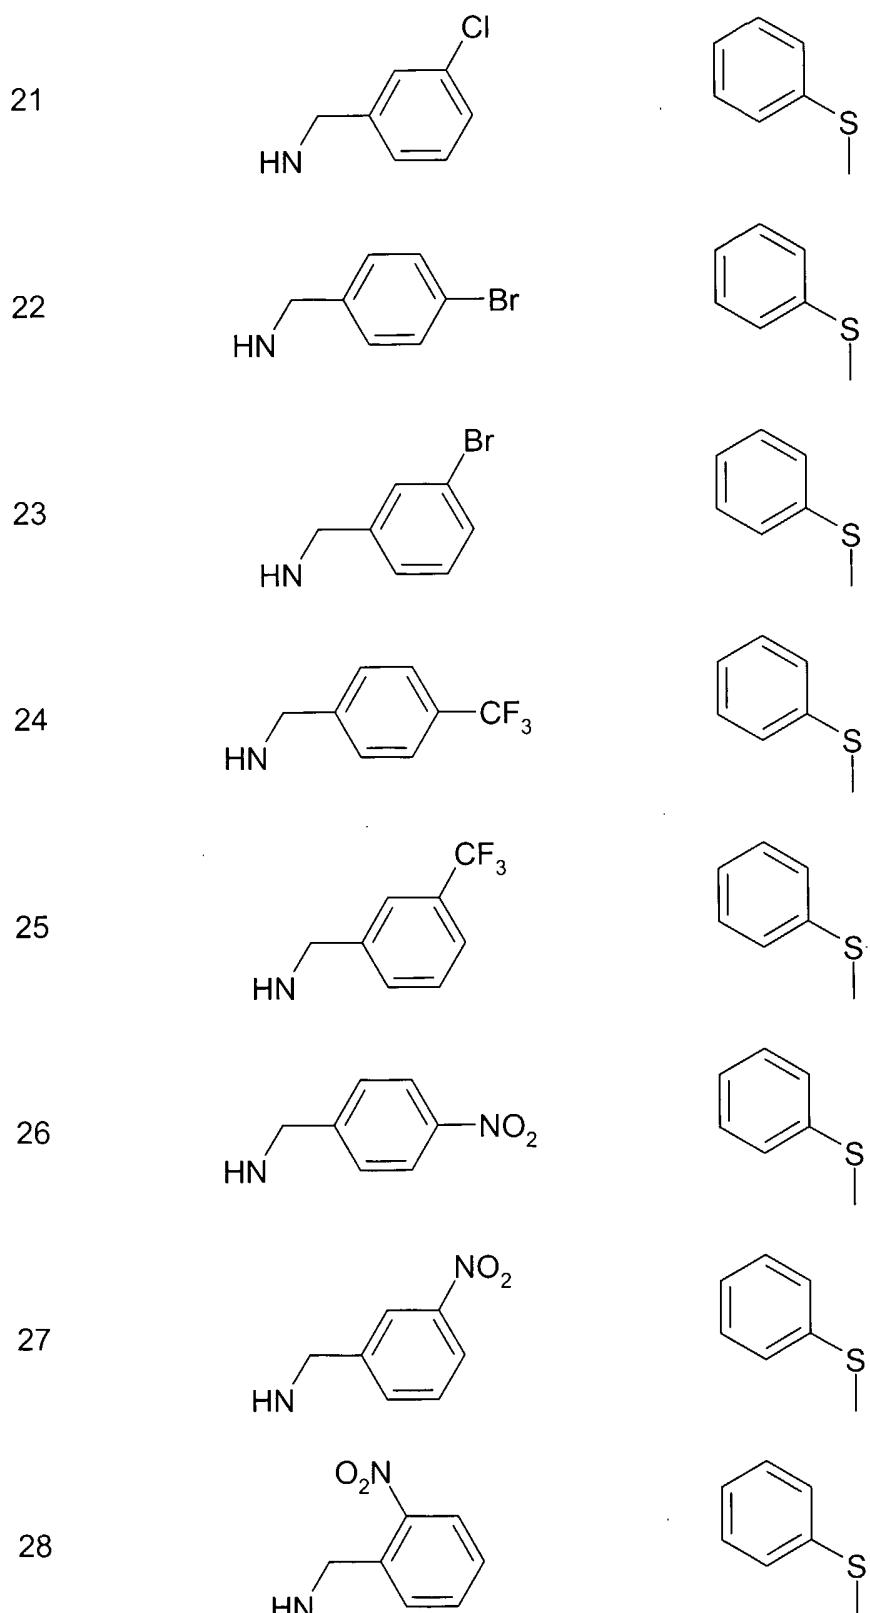

wherein R¹² is selected from the group consisting of phenyl-SOCH₃, phenyl-SO₂CH₃, phenyl, phenyl methyl ester, phenyl-COOH, phenyl-halo, and C₃ to C₆ cycloalkyl. Representative amide derivatives are presented in Table 1.

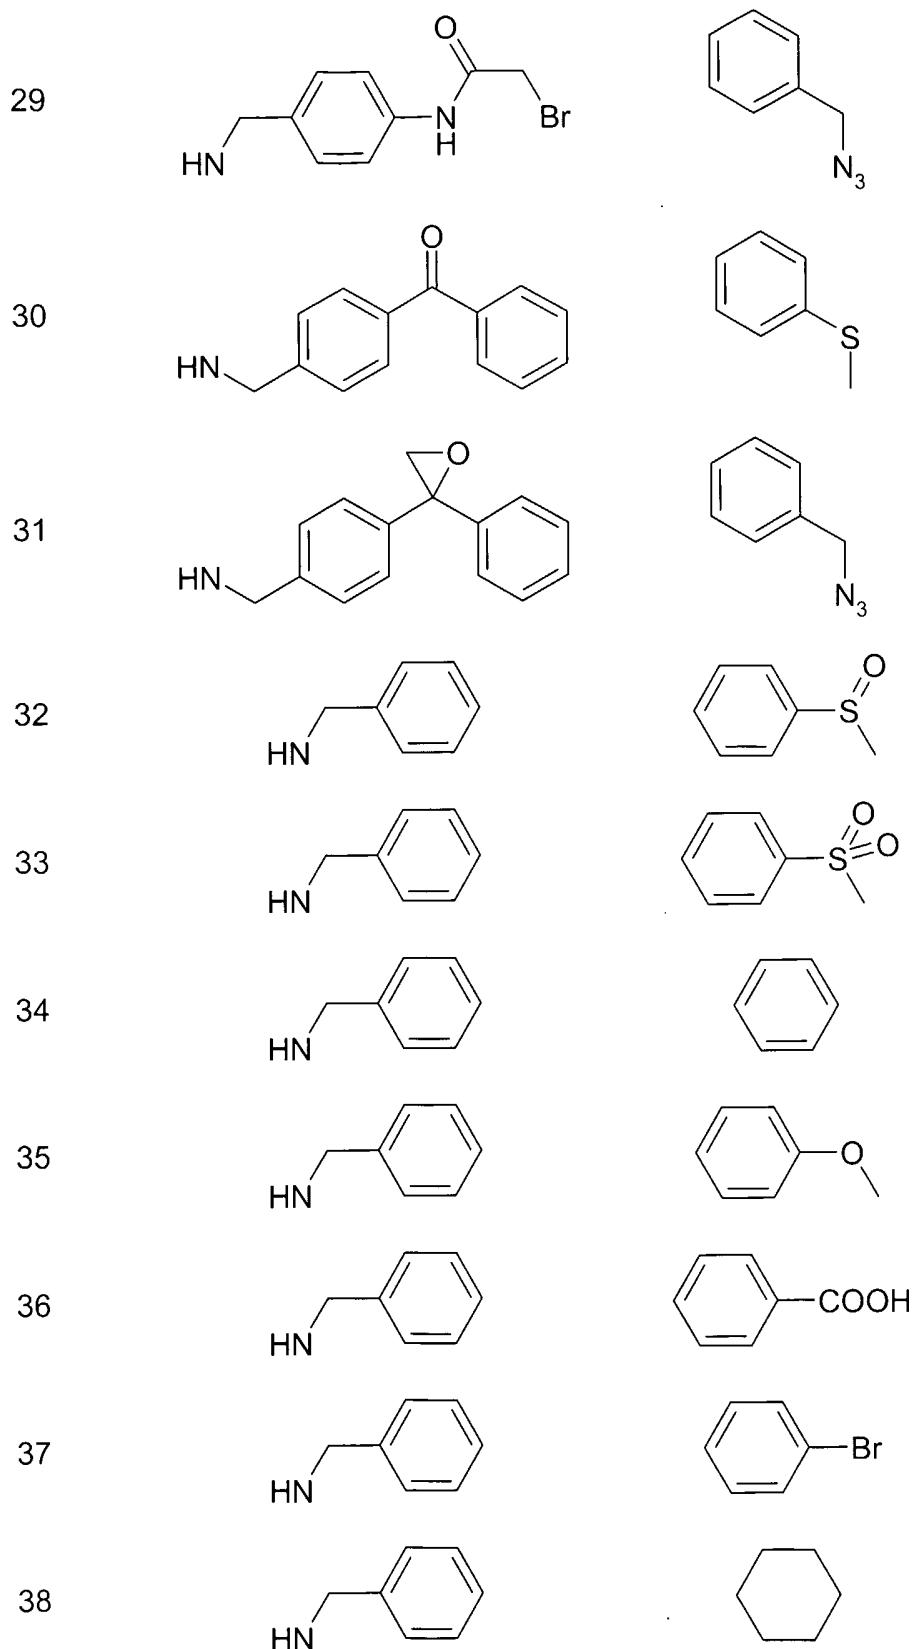

Table 1
Representative Amide Derivatives

Compound	R ¹¹	R ¹²
2	HN—	
3	HN—	
4	HN—	

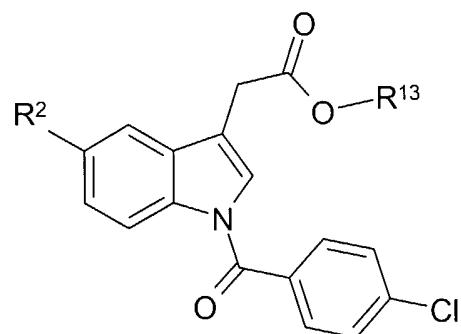

In some embodiments, a carboxylic acid moiety present on the compound is derivatized to an ester. In some embodiments, the ester derivative has the following general formula:

5

Formula IV

wherein R² is defined as above and R¹³ is defined as in Table 2. In some embodiments, the ester derivative has the following formula:

10

III.B. Modulation of PPARs

Diabetes mellitus is a condition in which the glucose homeostasis of a subject becomes unbalanced and leads to a hyperglycemic systemic condition. There are two forms of the diabetic condition, Type I and Type II. Type I diabetes usually occurs in individuals under approximately 20 years of age, is insulin-dependent, is commonly accompanied by ketoacidosis and represents about 10% of the diabetic population. Type II diabetes affects approximately 5 percent of the adult American population and represents about 90% of the diabetic population. Type II diabetes is commonly associated with obesity, usually occurs in individuals over approximately 40 years of age and is non-insulin dependent. A subset of type II diabetes can occur in younger individuals and is referred to as maturity onset diabetes of the young (MODY).

PPARs, particularly PPAR γ , have been implicated in mediating differentiation of adipocytes and regulating fat metabolism. Additionally,

PPAR γ has been associated with various pathological conditions related to atherosclerosis, inflammation, obesity, diabetes, the immune response, and ageing. See Kersten *et al.*, 2000; Celi & Shuldiner, 2002.

5 In some embodiments, the presently disclosed subject matter provides a method of modulating the activity of a PPAR (e.g., PPAR γ). In this embodiment, a treatment effective amount of a derivative of the presently disclosed subject matter is administered to a subject having a PPAR, whereby the activity of the PPAR is modulated.

III.C. Modulation of Cell Growth

10 Peroxisome proliferators-activated receptors (PPARs) have been associated with various pathological conditions related to atherosclerosis, inflammation, obesity, diabetes, the immune response, and ageing. Activation of one particular member of this family of receptors, PPAR γ , by cyclopentenone prostaglandins (PGs) such as 15-deoxy- $\Delta^{12,14}$ -prostaglandin 15 J₂ (15d-PGJ₂), causes anti-proliferation, apoptosis, differentiation, and anti-inflammatory responses in certain types of cancer cells.

20 In some embodiments, the presently disclosed subject matter provides a method of modulating the activity of a PPAR (e.g., PPAR γ). In this embodiment, a treatment effective amount of a derivative of the presently disclosed subject matter is administered to a subject having a PPAR, whereby the activity of the PPAR is modulated.

III.D. Modulation of Secretases

25 As discussed in more detail hereinabove, secretases are involved in the processing of A β peptide, including the generation of A β 42, the purported etiologic agent in Alzheimer's disease. In some embodiments, the presently disclosed subject matter provides a method of modulating the activity of a secretase (e.g., γ -secretase). In this embodiment, a treatment effective amount of a derivative of the presently disclosed subject matter is administered to a subject having a secretase, whereby the activity of the 30 secretase is modulated.

IV. Treatment MethodsIV.A. Subjects

The presently disclosed subject matter also provides a method for
5 treating a disease in a subject, wherein the disease is selected from the group consisting of a cancer, a neurodegenerative disease, and diabetes, the method comprising administering to the subject a treatment effective amount of a derivative of a compound, wherein the compound comprises a cyclooxygenase inhibitor comprising an indoleacetic acid or indenacetic acid
10 functional group having a 2' methyl group and the derivative substantially lacks cyclooxygenase inhibitory activity as a result of modifying the 2' methyl group to a moiety selected from the group consisting of hydrogen, halo, and C₂ to C₆ alkyl or branched alkyl.

As used herein, the phrase "treating a disease in a subject" refers to
15 both intervention designed to ameliorate the symptoms of causes of the disease in a subject (e.g., after initiation of the disease process) as well as to interventions that are designed to prevent the disease from occurring in the subject. Stated another way, the terms "treating" and grammatical variants thereof are intended to be interpreted broadly to encompass meanings that
20 refer to reducing the severity of and/or to curing a disease, as well as meanings that refer to prophylaxis. In this latter respect, "treating" refers to "preventing" or otherwise enhancing the ability of the subject to resist the disease process.

The subjects treated in the presently disclosed subject matter in its
25 many embodiments is desirably a human subject, although it is to be understood that the principles of the presently disclosed subject matter indicate that the presently disclosed subject matter is effective with respect to invertebrate and to all vertebrate animals, including mammals, which are intended to be included in the term "subject". Moreover, a mammal is
30 understood to include any mammalian species in which treatment or prevention of a disease is desirable, particularly agricultural and domestic mammalian species. For example, the presently disclosed subject matter is applicable to the treatment of livestock.

The methods of the presently disclosed subject matter are particularly useful in the treatment of warm-blooded vertebrates. Thus, the presently disclosed subject matter concerns mammals and birds.

More particularly provided is the treatment of mammals such as 5 humans, as well as those mammals of importance due to being endangered (such as Siberian tigers), of economic importance (animals raised on farms for consumption by humans) and/or social importance (animals kept as pets or in zoos) to humans, for instance, carnivores other than humans (such as cats and dogs), swine (pigs, hogs, and wild boars), ruminants (such as 10 cattle, oxen, sheep, giraffes, deer, goats, bison, and camels), and horses. Also provided is the treatment of birds, including the treatment of those kinds 15 of birds that are endangered, kept in zoos, as well as fowl, and more particularly domesticated fowl, *i.e.*, poultry, such as turkeys, chickens, ducks, geese, guinea fowl, and the like, as they are also of economic importance to humans. Thus, contemplated is the treatment of livestock, including, but not limited to, domesticated swine (pigs and hogs), ruminants, horses, poultry, and the like.

IV.B. Formulation

The compositions of the presently disclosed subject matter comprise 20 in some embodiments a composition that includes a carrier, particularly a pharmaceutically acceptable carrier. Any suitable pharmaceutical formulation can be used to prepare the compositions for administration to a subject.

For example, suitable formulations can include aqueous and non- 25 aqueous sterile injection solutions that can contain anti-oxidants, buffers, bacteriostatics, bactericidal antibiotics and solutes which render the formulation isotonic with the bodily fluids of the intended recipient; and aqueous and non-aqueous sterile suspensions which can include suspending agents and thickening agents. The formulations can be 30 presented in unit-dose or multi-dose containers, for example sealed ampoules and vials, and can be stored in a frozen or freeze-dried (lyophilized) condition requiring only the addition of sterile liquid carrier, for example water for injections, immediately prior to use. Some exemplary

ingredients are SDS, in one example in the range of 0.1 to 10 mg/ml, in another example about 2.0 mg/ml; and/or mannitol or another sugar, for example in the range of 10 to 100 mg/ml, in another example about 30 mg/ml; and/or phosphate-buffered saline (PBS).

5 It should be understood that in addition to the ingredients particularly mentioned above the formulations of the presently disclosed subject matter can include other agents conventional in the art with regard to the type of formulation in question. For example, sterile pyrogen-free aqueous and non-aqueous solutions can be used.

10 The therapeutic regimens and compositions of the presently disclosed subject matter can be used with additional adjuvants or biological response modifiers including, but not limited to, cytokines and other immunomodulating compounds.

IV.C. Administration

15 Administration of the compositions of the presently disclosed subject matter can be by any method known to one of ordinary skill in the art, including, but not limited to intravenous administration, intrasynovial administration, transdermal administration, intramuscular administration, subcutaneous administration, topical administration, rectal administration, 20 intravaginal administration, intratumoral administration, oral administration, buccal administration, nasal administration, parenteral administration, inhalation, and insufflation. In some embodiments, suitable methods for administration of a composition of the presently disclosed subject matter include but are not limited to intravenous injection. The particular mode of 25 administering a composition of the presently disclosed subject matter depends on various factors, including the distribution and abundance of cells to be treated, the compound employed, additional tissue- or cell-targeting features of the compound, and mechanisms for metabolism or removal of the compound from its site of administration.

IV.D. Dose

30 An effective dose of a composition of the presently disclosed subject matter is administered to a subject in need thereof. A "treatment effective amount" or a "therapeutic amount" is an amount of a therapeutic composition

sufficient to produce a measurable response (e.g., a biologically or clinically relevant response in a subject being treated). In some embodiments, an activity that inhibits amyloid aggregate formation is measured. Actual dosage levels of active ingredients in the compositions of the presently disclosed subject matter can be varied so as to administer an amount of the active compound(s) that is effective to achieve the desired therapeutic response for a particular subject. The selected dosage level will depend upon the activity of the therapeutic composition, the route of administration, combination with other drugs or treatments, the severity of the condition being treated, and the condition and prior medical history of the subject being treated. However, it is within the skill of the art to start doses of the compound at levels lower than required to achieve the desired therapeutic effect and to gradually increase the dosage until the desired effect is achieved. The potency of a composition can vary, and therefore a "treatment effective amount" can vary. However, using the assay methods described herein, one skilled in the art can readily assess the potency and efficacy of a candidate compound of the presently disclosed subject matter and adjust the therapeutic regimen accordingly.

After review of the disclosure of the presently disclosed subject matter presented herein, one of ordinary skill in the art can tailor the dosages to an individual subject, taking into account the particular formulation, method of administration to be used with the composition, and particular disease treated. Further calculations of dose can consider subject height and weight, severity and stage of symptoms, and the presence of additional deleterious physical conditions. Such adjustments or variations, as well as evaluation of when and how to make such adjustments or variations, are well known to those of ordinary skill in the art of medicine.

EXAMPLES

The following Examples provide illustrative embodiments. Certain aspects of the following Examples are described in terms of techniques and procedures found or contemplated by the present inventors to work well in the practice of the embodiments. In light of the present disclosure and the

general level of skill in the art, those of skill will appreciate that the following Examples are intended to be exemplary only and that numerous changes, modifications, and alterations can be employed without departing from the scope of the presently disclosed subject matter.

5

EXAMPLE 1

Mutagenesis and Purification of mCOX-2

Site-directed mutagenesis, expression, and purification of murine COX-2 (mCOX-2) nucleic acids and polypeptides were performed as 10 described in Rowlinson *et al.*, 1999. Briefly, PCR-mediated site-directed mutagenesis was performed on a mCOX-2 coding sequence present in a BLUESCRIPT® vector (Stratagene, La Jolla, California, United States of America) using the QUIKCHANGE® Site-Directed Mutagenesis Kit (Stratagene). The GTG codon encoding a valine at position 335 in wild type 15 mCOX-2 (referred to herein as Val-349 based on the numbering convention discussed hereinabove) was changed to encode an alanine, a leucine, or an isoleucine, creating three mutant nucleic acids encoding mCOX-2 polypeptides referred to herein as mCOX-2^{V349A} or V349A, mCOX-2^{V349L} or 20 V339L, and mCOX-2^{V349I} or V349I, respectively.

25 In order to express the mutant polypeptides, sequences containing the mutagenized codons were removed from the mCOX-2-containing BLUESCRIPT® vector and subcloned into a pVL1393 baculovirus expression vector (BD Biosciences PharMingen, San Diego, California, United States of America) encoding mCOX-2 using the BamHI restriction site present in both the mCOX-2-containing BLUESCRIPT® and pVL1393 vectors. The subcloned region was fully sequenced to ensure that no additional mutations 30 were incorporated into the expression vectors.

Wild type and mutant protein was then expressed by homologous recombination of the mCOX-2z/pVL1393 vector with the BACULOGOLD™ vector (BD Biosciences PharMingen) in Sf9 cells (EMD Biosciences, Inc. - Novagen, Madison, Wisconsin, United States of America). After virus amplification, 4 liters of Sf9 cells (95–100% viable) were grown in TNM-FH medium supplemented with 10% fetal bovine serum (FBS; HyClone, Logan,

Utah, United States of America), 1% L-glutamine, and 0.1% (v/v) pluronic F68 and then infected with fresh viral stock. Upon reaching 65–70% viability, the 4-liter total volume was harvested by centrifugation at 2500 rpm in a Sorvall RC-3B centrifuge, and the pellet was washed in ice-cold phosphate-buffered saline and re-centrifuged. The final cell pellet was stored at -80°C.

Purification of wild type and mutant mCOX-2 polypeptides was performed at 4°C in a manner similar to that described in Gierse *et al.*, 1996. Briefly, frozen cells were resuspended to 30×10^6 cells/ml in 80 mM Tris-HCl, 2 mM EDTA, 0.5 mM phenylmethylsulfonyl fluoride, and 0.1 mM diethyldithiocarbamic acid, pH 7.2. After centrifugation at 100,000g for 45 minutes, the pellet was resuspended using a Dounce homogenizer to a final volume of 72 ml. Solubilization of the COX protein from the membrane was initiated by the dropwise addition of 8 ml of 11% (w/v) CHAPS. After stirring for 1 hour, the sample was re-centrifuged as described above and the supernatant removed and then diluted 4-fold by the addition of 20 mM Tris-HCl, 0.4% CHAPS, 0.1 mM EDTA, and 0.1 mM diethyldithiocarbamic acid, pH 8.0 (Buffer B). The diluted sample was then loaded onto a 25 ml Macro-prep High-Q ion exchange column equilibrated with Buffer B. COX enzyme was eluted with a linear gradient (500 ml) of increasing KCl to 0.3 M. An analytical 7.5% SDS-polyacrylamide gel electrophoresis was run of candidate COX-containing fractions to determine the fractions to pool for the gel filtration procedure. Appropriate tubes were concentrated in an Amicon concentrator (Amicon, Beverly, Massachusetts, United States of America) to a final volume of 1.5 ml. The sample was then loaded onto a 90 ml Sephadryl-200 column that was pre-equilibrated with 20 mM Tris-HCl, 0.4% CHAPS, 0.15 M NaCl, pH 8.0. Fractions containing COX enzyme, as determined from SDS-polyacrylamide gel electrophoresis analysis, were concentrated to approximately 2 mg/ml and stored at -80°C. The purity of wild type and mutant COX-2 proteins was evaluated by analysis of a Coomassie-stained 7.5% SDS-polyacrylamide gel using an E-C Apparatus Model EC910 scanning densitometer (E-C Apparatus Corp., Holbrook, New York, United States of America). All proteins were over 80% pure.

EXAMPLE 2

Reagents and Solvents

Unlabeled arachidonic acid (AA) was purchased from Nu Chek Prep (Elysian, Minnesota, United States of America), and [1-¹⁴C]-AA was purchased from PerkinElmer Life Sciences Inc. (Boston, Massachusetts, United States of America). Ram seminal vesicles were purchased from Oxford Biomedical Research (Oxford, Michigan, United States of America). Oligonucleotides were purchased from Qiagen, Inc. (Valencia, California, United States of America) and all molecular biology enzymes were obtained from New England Biolabs (Beverly, Massachusetts, United States of America). Baculovirus reagents were purchased from BD Biosciences Pharmingen (San Diego, California, United States of America). Unless otherwise stated, all other chemicals were obtained from Sigma/Aldrich (St. Louis, Missouri, United States of America). HPLC grade solvents used for column chromatography were obtained from Fischer Scientific (Pittsburgh, Pennsylvania, United States of America). *N,N*-Dimethylformamide was distilled from calcium hydride. All other chemicals were used without further purification. Thin layer chromatography was performed on silica plates obtained from Analtech (Newark, Delaware, United States of America; Silica Gel 60 F₂₅₄ precoated). The plates were read by UV fluorescence (254 nm) or by staining with phosphomolybdic acid (PMA) followed by heating. Column chromatography was performed using silica gel 200-300 mesh (Fisher Scientific).

25

EXAMPLE 3

Instrumental Analysis

Mass spectra were obtained by electrospray ionization (ESI-MS) on a Finnigan TSQ 7000 triple-quadrupole spectrometer (Thermo Electron Corp., Waltham, Massachusetts, United States of America). ¹H-NMR were obtained on a Bruker AC 300 NMR spectrometer (Bruker BioSpin Corporation, Billerica, Massachusetts, United States of America) using CDCl₃ or DMSO-d₆ as the solvent and tetramethylsilane (TMS) as an

internal standard. All chemical shifts are reported in parts per million (ppm) downfield from TMS and coupling constants are reported in hertz.

EXAMPLE 4

5

Synthesis of 2-Des-methylindomethacin

2-Des-methylindomethacin was synthesized according to the steps outlined in Figure 6. These steps are presented in more detail as follows:

10 N-Ethylidene-N'-(4-methoxy-phenyl)-hydrazone (Compound A in Figure 6). 4-Methoxyphenylhydrazine (10.34 g, 0.075 mol) was dissolved in toluene (76 mL) in a flame dried round-bottomed flask. The flask was purged with argon and cooled to 0°C. Acetaldehyde (8.4 mL, 0.15 mol) in toluene (17 mL) was added dropwise and stirring at room temperature was continued for 30 minutes. The solution was decanted through filter paper into a round-bottomed flask and concentrated *in vacuo* to give 11.2 g of the 15 crude hydrazone (Compound A in Figure 6).

20 4-Chloro-benzoic acid N'-ethylidene-N-(4-methoxy-phenyl)-hydrazide (Compound B in Figure 6). To a solution of the crude hydrazone (Compound A in Figure 6; 0.424 g, 2.58 mmol) in pyridine (2.2 mL) under argon at 0°C was added 4-chlorobenzoyl chloride (0.904 g, 5.17 mmol) in one portion. The reaction mixture was stirred at room temperature for 3 hours. Water (25 mL) was added and the solution extracted with CH₂Cl₂ (3 x 20 mL). The combined organic phases were dried (MgSO₄), filtered, and concentrated *in vacuo*. Purification by flash chromatography (hexane/ethyl acetate 3:1) afforded the title compound (Compound B in Figure 6) as an 25 orange solid (0.266 g). ¹H NMR (CDCl₃) δ 7.70 (d, *J* = 7.2 Hz, 2H), 7.36 (d, *J* = 8.2 Hz, 2H), 7.11 (d, *J* = 8.7 Hz, 2H), 7.01 (d, *J* = 8.5 Hz, 2H), 6.82 (d, *J* = 5.0 Hz, 1H), 3.84 (s, 3H), 1.89 (d, *J* = 5.0 Hz, 3H); ESI-CID 325, 327 (M-
20 Na⁺[^{35/37}Cl]).

30 4-Chloro-benzoic acid N-(4-methoxy-phenyl)-hydrazide hydrochloride (Compound C in Figure 6). The hydrazide (Compound B in Figure 6; 0.166 g, 0.55 mmol) was dissolved in toluene (6.6 mL) and methanol (0.33 mL) in a 2 neck flask equipped with a condensor. The mixture was cooled to 0°C and HCl gas was bubbled through for 1.5 hours. The excess gas and solvent

were removed *in vacuo*. The solid was swirled with toluene and filtered to give a white solid. The solid was washed with ethyl acetate to give the hydrochloride salt (Compound **C** in Figure 6) without further purification (0.131 g, 76%). ^1H NMR (DMSO- d_6) δ 7.41 (m, 4H), 7.33 (d, J = 8.4 Hz, 2H), 6.92 (d, J = 8.9 Hz), 3.74 (s, 3H).

5 2-Des-methylindomethacin (Compound **D** in Figure 6). The hydrochloride salt (Compound **C** in Figure 6; 0.111 g, 0.35 mmol) and succinic semialdehyde (0.047 g, 0.46 mmol) were dissolved in acetic acid (AcOH; 2 mL) and heated to reflux for 4 hours. The reaction was allowed to 10 cool to room temperature overnight. Water (5 mL) and CH_2Cl_2 (5 mL) were added and the organic phase was removed. The aqueous phase was extracted with an additional portion of CH_2Cl_2 and the combined organics were washed with water and extracted with a saturated solution of NaHCO_3 (2 x 20 mL). The combined aqueous extracts were acidified with 15% HCl 15 and the resulting mixture was extracted with CH_2Cl_2 (3 x 20 mL). The combined organics were dried (MgSO_4), filtered, and concentrated *in vacuo*. Recrystallization of the crude product (isopropanol) afforded the title compound (*i.e.*, [1-(4-Chloro-benzoyl)-5-methoxy-1*H*-indol-3-yl]-acetic acid; Compound **D** in Figure 6) as a gray solid (0.058 g, 48%). ^1H NMR (DMSO- d_6) δ 8.24 (d, J = 8.9 Hz, 1H), 7.82 (d, J = 8.5 Hz, 2H), 7.73 (d, J = 8.4 Hz, 2H), 7.39 (s, 1H), 7.19 (d, J = 2.3 Hz, 1H), 7.06 (dd, J = 2.4, 8.9 Hz, 1H), 3.87 (s, 3H), 3.73 (s, 2H); ESI-CID 342, 344 ($\text{M}-\text{H}^+[^{35/37}\text{Cl}]$). Anal. Calcd for 20 $\text{C}_{18}\text{H}_{14}\text{ClNO}_4$: C, 62.89; H, 4.10; N, 4.07; Cl 10.31. Found: C, 62.80; H, 4.11; N, 4.06; Cl, 10.12.

25

EXAMPLE 5

Synthesis of Eindenic Acid Sulfide

Eindenic acid sulfide was synthesized according to the steps outlined in Figure 7. These steps are presented in more detail as follows:

30 6-Fluoro-indan-1-one (Compound **F** in Figure 7). 3-(4-Fluoro-phenyl)-propionic acid (5 g, 29.7 mmol; Compound **E** in Figure 7) was added to polyphosphoric acid (PPA; 65.4 g, 0.654 mol) at 50°C. The viscous mixture was heated at 90°C for 2 hours. The syrup was poured into ice water and

stirred for 30 minutes. The aqueous mixture was extracted with ether (3 x 50 mL) and the combined organics were washed with H₂O (2 x 50 mL) and NaHCO₃ until neutralized. The resulting organic phase was washed with H₂O (50 mL), dried (MgSO₄), filtered, and concentrated *in vacuo*.
5 Purification using flash chromatography (7:1 hexane/ethyl acetate (EtOAc)) afforded the indanone (Compound F in Figure 7) as a yellow solid (2.06 g, 46%). ¹H NMR (CDCl₃) δ 7.45 (ddd, *J* = 0.5, 4.5, 8.4 Hz, 1H), 7.39 (ddd, *J* = 0.3, 2.6, 7.8 Hz, 1H), 7.30 (td, *J* = 2.6, 8.6 Hz, 1H), 3.12 (t, *J* = 5.7 Hz, 2H), 2.75 (m, 2H); ESI-CID 151 (M-H⁺).

10 (6-Fluoro-1-hydroxy-indan-1-yl)-acetic acid ethyl ester (Compound G in Figure 7). A solution of the indanone (Compound F in Figure 7; 2.06 g, 13.7 mmol) and ethyl bromoacetate (EBA; 3.44 g, 20.6 mmol) in benzene (10 mL) was added over a 5 minute period to activated zinc (3.77 g, 57.7 mmol) in benzene (21 mL) and ether (10 mL). A few crystals of iodine were
15 added to initiate the reaction and the mixture was held at reflux. At 3 hour intervals, 2 batches of zinc (1.8 g, 27.5 mmol) and ethyl bromoacetate (EBA; 1.8 g, 10.8 mmol) were added and the mixture was refluxed overnight. The solution was cooled to room temperature and ethanol (5 mL) and acetic acid (23 mL) were added. The solution was poured into 1:1 aqueous acetic acid
20 (100 mL) and the organic layer was separated. The aqueous phase was extracted with diethyl ether (Et₂O; 2 x 25 mL) and the combined organics were washed with water, NaHCO₃, water, dried (MgSO₄), filtered, and concentrated *in vacuo* to give the crude product (Compound G in Figure 7; 3.55 g).

25 (6-Fluoro-3H-inden-1-yl)-acetic acid ethyl ester (Compound H in Figure 7). The crude (6-Fluoro-1-hydroxy-indan-1-yl)-acetic acid ethyl ester (Compound G in Figure 7; 3.55 g), *p*-toluene sulfonic acid•H₂O (PTSA; 5.67 g, 29.8 mmol), and CaCl₂ (4.13 g, 37.2 mmol) in toluene (66 mL) were refluxed overnight. The solution was filtered and the solid residue washed
30 with benzene. The combined organics were washed with water, NaHCO₃, water, dried (MgSO₄), filtered, and concentrated *in vacuo*. Purification using flash chromatography (13:1 hexane/EtOAc) afforded the title compound (Compound H in Figure 7) as an orange solid (0.703 g). ¹H NMR (CDCl₃) δ

7.25 (m, 2H), 7.06 (m, 1H), 6.25 (d, J = 2.3 Hz, 1H), 4.24 (q, J = 7.0 Hz, 2H), 3.32 (s, 2H), 3.03 (s, 2H), 1.33 (t, J = 7.1 Hz, 3H); ESI-CID 221 (M-H⁺).

Eindenic acid sulfide (Compound I in Figure 7). To a solution of the (6-Fluoro-3H-inden-1-yl)-acetic acid ethyl ester (Compound H in Figure 7; 5 0.668 g, 3.0 mmol) and *p*-methylthiobenzaldehyde (PMTBA; 0.508 g, 3.3 mmol) in MeOH (18 mL) was added 1N NaOH (9 mL). The mixture was stirred at reflux for 2 hours. The solution was cooled, diluted with water, and extracted with ether (3x). Residual ether was blown off the aqueous phase with nitrogen and the aqueous solution acidified with 50% acetic acid. The 10 precipitated product was filtered and washed with H₂O. Recrystallization from methanol afforded the title compound (*i.e.*, [6-Fluoro-3-(4-methylsulfanyl-benzylidene)-3H-inden-1-yl]-acetic acid (*i.e.*, eindenic acid sulfide; Compound I in Figure 7) as an orange solid (0.163 g, 17%) ¹H NMR (DMSO-d₆) δ 7.83 (dd, J = 5.2, 8.4 Hz, 1H), 7.64 (d, J = 8.4 Hz, 2H), 7.59 (s, 1H), 7.36 (d, J = 8.4 Hz, 2H), 7.16 (dd, J = 2.4, 9.6 Hz, 1H), 7.13 (s, 1H), 15 7.06 (td, J = 2.4, 9.6 Hz, 1H), 3.68 (s, 2H), 2.54 (s, 3H); ESI-CID 325 (M-H⁺).

EXAMPLE 6

Synthesis of a Derivative of Eindenic Acid Sulfide

20 To a solution of [6-Fluoro-3-(4-methylsulfanyl-benzylidene)-3H-inden-1-yl]-acetic acid (Compound I in Figure 7; 0.02 g, 0.06 mmol) in dry CH₂Cl₂ (1.5 mL) was added *N*-(3-dimethylaminopropyl)-*N'*-ethyl carbodiimide (EDCI; 0.014 g, 0.07 mmol), dimethylaminopyridine (DMAP; 0.75 mg, 0.006 mmol) and benzylamine (7.9 mg, 0.07 mmol). The reaction was stirred at room 25 temperature overnight. The mixture was diluted with water and extracted with CH₂Cl₂ (2x). The combined organics were washed with H₂O, dried (MgSO₄), filtered, and concentrated *in vacuo*. Purification using flash chromatography (5:2 hexane/EtOAc) afforded the title compound (*N*-Benzyl-2-[6-fluoro-3-(4-methylsulfanyl-benzylidene)-3H-inden-1-yl]-acetamide; 30 Compound J in Figure 7) as an orange solid. (0.02 g, 79%).

EXAMPLE 7

Cyclooxygenase Preparation and AssayCOX Inhibition Screening Assay

5 PCR based site-directed mutagenesis of murine COX-2 changed the valine at position 349 (ovine COX-1 numbering) to alanine, isoleucine, or leucine as outlined in Example 1. These mutated genes were used to assemble baculoviral constructs for large-scale expression in Sf9 cells. Purification of the expressed COX-2 protein was performed through 10 traditional cellular fractionation and classical column chromatography. Activity or inhibition assays were performed in 100 mM Tris-HCl buffer containing 500 μ M phenol, with hematin-reconstituted protein. Quantification of cyclooxygenase activity was performed by monitoring substrate (arachidonate or oxygen) consumption in a thermostatted cuvette at 37°C 15 using a polarographic electrode with a 5300 oxygen monitor (Yellow Springs Instrument Co. Inc., Yellow Springs, Ohio, United States of America). All inhibitors and substrates were solubilized in dimethyl sulfoxide (DMSO). Activity or inhibition assays were performed in 100 mM Tris-HCl buffer containing 500 μ M phenol, with hematin-reconstituted protein. Maximal 20 reaction velocity data were obtained from the linear portion of the oxygen uptake curves, and the data were analyzed by nonlinear regression with Prism 4.0 (GraphPad Software, San Diego, California, United States of America).

25 Reactions were run with reconstituted protein at final concentrations adjusted to give approximately 40% substrate consumption (ovine COX-1 (oCOX-1) = 35 nM, wild type mCOX-2 = 55 nM, V349A = 250 nM, V349I = 250 nM, and V349L = 100 nM). Time-dependent inhibition reactions were performed by pre-incubating the inhibitor and enzyme for 17 minutes at 25°C, followed by 3 minutes at 37°C prior to the addition of 50 μ M [1-¹⁴C]-AA 30 for 30 seconds at 37°C. Assays were terminated and analyzed for substrate consumption by thin layer chromatography as previously described (Kalgutkar *et al.*, 2000a). All inhibitor concentrations for 50% enzyme activity

(IC_{50}) were determined graphically and were the average of at least two independent determinations.

Competitive inhibition assays were performed in a similar manner, except substrate and inhibitor were added prior the initiation of the reaction 5 by addition of protein. The peroxidase activity of purified proteins was measured by the guaiacol method as described in Markey *et al.*, 1987. The K_m 's and V_{max} 's for COX activity and the relative peroxidase activity of COX-2 mutants are shown in Table 4.

10

Table 4
Characterization of Val-349 mutant COXs.^a

Enzyme	Peroxidase		K_m (μM)	Cyclooxygenase V_{max}^b ($\mu M \text{ of AA} \cdot \text{min}^{-1} \cdot \text{mg}^{-1}$)
	Activity (% wild type)	<i>m</i> COX-2)		
wild type	100		4.2 ± 1.5	16.3 ± 1.5
mCOX-2				
V349A	51		13.0 ± 4.2	1.2 ± 0.1
V349I	65		9.0 ± 2.8	1.9 ± 0.2
V349L	88		15.2 ± 7.3	6.0 ± 1.0

^aPeroxidase activity was analyzed with the guaiacol peroxidase assay, and cyclooxygenase kinetic parameters were determined using at least 7 concentrations of substrate.

15

^b The cyclooxygenase V_{max} was normalized to protein concentration and represented as specific activity. The values are the average of three determinations \pm standard error (S.E.).

20

Maximal reaction velocity data were obtained from the linear portion of the oxygen uptake curves, and the data were analyzed by nonlinear regression. Instantaneous inhibition assays were performed with substrate and inhibitor added prior the initiation of the reaction by addition of protein. Time-dependent screening assays were performed by pre-incubating the inhibitor and enzyme for 17 minutes at 25°C, followed by 3 minutes at 37°C

prior to the addition of 50 μ M [1- 14 C]-arachidonic acid (AA) for 30 seconds at 37°C.

Assays were terminated and analyzed for substrate consumption by thin layer chromatography. All inhibitor concentrations for 50% enzyme activity (IC₅₀) were the average of at least two independent determinations. Time-dependent COX inhibition reactions were pre-incubated at 37°C for varying lengths of time (0-30 minutes) with various concentrations of inhibitor. All reactions were performed with [1- 14 C]-AA for 30 seconds at 37°C; reactions were terminated and analyzed as described above.

10

EXAMPLE 8

Time-Dependent COX Inhibition Assays

As described in Example 1, to investigate the interactions of the 2' methyl group with the methyl-binding pocket, a series of mutations were made at position 349 in mCOX-2 to increase or decrease the volume of the pocket (Val → Ala, Ile, Leu) and the kinetics of inhibition of these enzymes by INDO were determined. Initially, a time-dependent IC₅₀ assay was used, in which the enzymes were pre-incubated with inhibitor for 20 minutes before the addition of 50 μ M AA. The COX reaction was allowed to proceed for 30 seconds before termination. The IC₅₀ values indicated that the potency of INDO increased when the volume of the pocket increased (V349A) and decreased when the volume of the pocket decreased (V349I, V349L; Table 5).

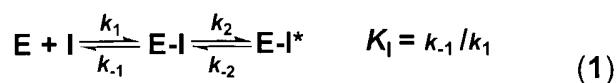

25

Time-dependent IC₅₀ determinations of INDO and DM-INDO.^a

Enzyme	INDO (μ M)	DM-INDO (μ M)
V349A	0.08	>16
wild type mCOX-2	0.25	4
V349I	0.45	3
V349L	4	>16
wild type oCOX-1	0.04	>16

^aValues are the average of two independent determinations

The time-dependence of inhibition of wild type and mutant COXs by INDO was determined by adding AA (50 μ M) to the various enzyme preparations following preincubation with INDO for different times. To 5 ensure that pseudo-first-order conditions were maintained, the enzymatic oxygenation reactions were terminated after 30 seconds to prevent extensive consumption of substrate. The decline of substrate conversion at different INDO concentrations was plotted against the pre-incubation times and fit to a single exponential decay with a plateau to determine k_{obs} (Figure 10 2). The time-dependent inhibition curves for wild type mCOX-2 approached 0% remaining activity. The graphs for V349A and V349I also approached 0% remaining activity, although V349A displayed a faster rate of inhibition. Interestingly, V349L approached a non-zero asymptote of nearly 20% 15 remaining activity, which suggested that the second step of binding was reversible (Figure 2C). The dependence of k_{obs} on the INDO concentration for the two-step, time-dependent mechanism shown in equation (1) is represented by equation (2) (see also Timofeevski *et al.*, 2002).

$$20 \quad k_{obs} = \frac{k_2 \cdot [I]}{(K_I + [I])} + k_{-2} \quad (2)$$

The rate constant k_2 represents the limiting forward rate constant for functionally irreversible inhibition, and K_I corresponds to the inhibitor concentration that yields a rate equal to half of the limiting rate. The reverse 25 rate constant of the second step k_{-2} is equal to the y -intercept, and is equal to zero for compounds that display functionally irreversible inhibition. For wild type mCOX-2, V349A, and V349I enzymes, the y -intercept was effectively zero, indicating that the inhibition was functionally irreversible (Figure 2B). In contrast, the secondary plot of data for V349L exhibited a 30 non-zero y -intercept, which was equal to k_{-2} .

Kinetic parameters for wild type mCOX-2 (Table 6) were in good agreement with previously reported values of K_I (5 μ M) and k_2 (0.045 s^{-1} ;

Gierse *et al.*, 1999). The values for oCOX-1 indicate that INDO displayed higher affinity ($K_i = 1.7 \mu\text{M}$) and a faster rate of inactivation ($k_2 = 0.25 \text{ s}^{-1}$; Kulmacz & Lands, 1985). These observations are further supported by the higher potency of INDO towards oCOX-1 compared to mCOX-2 (Table 5).

5 The K_i of V349A for INDO decreased almost four-fold, which suggested a higher affinity of binding. This mutation also slightly increased k_2 , which corresponded to the three-fold reduction in the IC_{50} value for INDO against the V349A enzyme (Table 5). As noted in Table 5, the V349I mutation had little effect on the kinetic parameters of INDO. V349L demonstrated the 10 greatest impact on inhibition, increasing K_i threefold and introducing a measurable k_2 . The slight rise in k_2 suggested a faster rate to equilibrium, which was attributed to the emergence of k_2 (Figure 2C).

15 **Table 6**
Kinetic parameters of time-dependent inhibition by INDO.^a

Enzyme	K_i (μM)	k_2 (s^{-1})	k_{-2} (s^{-1})	k_{-2}^b (s^{-1})
wild type	7.9 ± 2.2	$0.052 \pm$ 0.005	ND	ND
V349A	1.9 ± 0.4	$0.074 \pm$ 0.005	ND ^c	ND
V349I	5.3 ± 1.8	$0.045 \pm$ 0.004	ND	ND

^aKinetic parameters \pm S.E. were determined from inhibition assays.

^bRate constant determined by reversible inhibition.

^cValues were not detectable (ND).

EXAMPLE 9

Time-dependent COX inhibition by DM-INDO

The experiments described in Examples 7 and 8 suggested that insertion of the 2' methyl group of INDO into the hydrophobic pocket is an important contributor to the time-dependence of inhibition. To further test this, DM-INDO (Figure 1C) was synthesized according to the scheme depicted in Figure 6. In the time-dependent IC_{50} assay, DM-INDO weakly inhibited wild type mCOX-2 and V349I but exhibited less than 20% inhibition of V349A, V349L, and wild type oCOX-1 (Table 5). The time- and concentration-dependence of inhibition of wild type enzyme and the V349L mutant exhibited a plateau of about 30% remaining activity for both enzymes, consistent with an appreciable k_2 (Figure 4). Importantly, V349L required nearly 10-fold higher concentrations of DM-INDO to achieve similar levels of inhibition of wild type mCOX-2. Analysis of the data for inhibition of wild type enzyme by DM-INDO yielded values for K_I , k_2 , and k_{-2} of $26 \pm 7 \mu\text{M}$, $0.80 \pm 0.03 \text{ s}^{-1}$, and $0.05 \pm 0.02 \text{ s}^{-1}$, respectively. Thus, the on-rate constant (k_2) is 14-fold faster for DM-INDO than INDO and the off-rate constant (k_{-2}) is only 14-fold slower than the on-rate.

The kinetics of V349L inhibition by DM-INDO were not amendable to analysis using equation (2), because the graph did not plateau. Linear regression analysis yielded a y -intercept value for k_{-2} of $0.0025 \pm 0.0003 \text{ s}^{-1}$ (Copeland, 2000). The K_I of DM-INDO for V349L must have been much greater than the equilibrium constant for the second step. Therefore, the first step in equation (1) was not saturated to allow for the time-dependent isomerization of E-I to E-I⁺ (Copeland, 2000).

EXAMPLE 10

Reversibility of Cox InhibitionReversibility of COX inhibition by INDO

The reversibility of the second step in equation (1) could be directly evaluated by the amount of enzyme activity recovered after a prolonged incubation time with substrate. To test the reversibility of INDO inhibition, wild type mCOX-2 and the three Val-349 mutants were exposed to the same

conditions used for the time-dependent IC₅₀ assay. The enzymes were pre-incubated for 20 minutes with DMSO or 10 μ M INDO, prior to the addition of 50 μ M AA. After addition of AA, the oxygenation reactions were allowed to proceed for varying lengths of time. As the reaction time increased, the extent of inhibition decreased if INDO binding was reversible. The time course for recovery of AA oxygenation was fit to a single exponential (Figure 3A). As anticipated, significant reversibility of INDO inhibition was observed for the V349L mutant but not for wild type, V349A, or V349I enzymes. The value of k_2 calculated from the activity recovery assay (0.01 s^{-1}) corresponded closely to the k_2 value calculated from the time-dependent inhibition assay for INDO (0.008 s^{-1} ; Table 6). This relationship suggested that the reversibility of the second step in the time-dependent mechanism is the principle determinant of inhibition by INDO in the presence of 50 μ M AA.

Reversibility of COX inhibition by DM-INDO

The reversibility of DM-INDO inhibition was evaluated similarly to INDO using the activity recovery assay (Figure 3). The experiments and analysis were performed as described above. DM-INDO displayed reversibility of inhibition for wild type mCOX-2 and V349I, with the k_2 values of $0.023 \pm 0.001 s^{-1}$ and $0.015 \pm 0.005 s^{-1}$, respectively (Figure 3B). The small amount of activity lost for V349A and V349L by pre-incubation with 10 μ M DM-INDO, was quickly recovered upon addition of 50 μ M AA (Figure 3B).

EXAMPLE 11

25 Steady-State Quenching of COX Intrinsic Fluorescence

Fluorescence quenching experiments with INDO and DM-INDO were performed with a Spex Fluorolog-3 spectrofluorometer (Jobin Yvon Inc., Edison, New Jersey, United States of America) as described in Houtzager *et al.*, 1996. The excitation (280 nm) and emission (327 nm) bandwidths were 4 nm and 6 nm respectively. Steady-state measurements were performed at 37°C in a 3.5 ml fluorescence cuvette with continuous stirring. All apo-proteins were diluted to 200 nM, and displayed less than 2% activity of an equivalent amount of holoenzyme. Data were collected over 240 or 360

seconds with 2-second integration times. The reversibility of quenching was analyzed in the same manner, with subsequent addition of 50 μ M AA as competitor. The ligands were dissolved in DMSO before further dilution into buffer. The organic component in the buffer was below 0.4%.

5

Discussion of Example 11

Quenching of COX Intrinsic Fluorescence by INDO and DM-INDO

Houtzager *et al.* monitored inhibitor binding to COX-2 by fluorescence quenching of the apo-protein and demonstrated that the binding kinetics closely resembled the inhibition kinetics (Houtzager *et al.*, 1996). This assay 10 provided a method to directly monitor the binding of INDO and DM-INDO to COXs. Various concentrations of INDO and DM-INDO were added to apo-proteins and the rate of fluorescence decrease was monitored over time. After the mixture reached equilibrium, 50 μ M of AA was added as competitor 15 to monitor the reversibility of binding. The kinetic data for quenching were analyzed in the same manner as those for inhibition. For clarity, the equilibrium constant for the first step of fluorescence quenching is referred to as K_d , and k_2 and k_{-2} from the second step of quenching are represented by k'_2 and k'_{-2} , respectively.

As expected, INDO bound in a time-dependent fashion and was 20 functionally irreversible for all enzymes except V349L; the latter displayed reversible, time-dependent binding (Figure 4). In agreement with the kinetics of inhibition, INDO quenched the V349A mutant more quickly than wild type mCOX-2. INDO bound similarly to wild type mCOX-2 and V349I. Addition of 25 AA could only compete INDO off V349L (Figure 5D). The kinetic parameters derived from INDO quenching correspond to those measured for INDO inhibition (Tables 6, 7).

DM-INDO displayed reversible, time-dependent binding with all four enzymes in the quenching assay. The V349A mutation increased the rate of binding of DM-INDO, and also increased the apparent affinity (K_d ; Table 8). 30 Strikingly, the value k'_{-2} for V349A was the highest observed for DM-INDO, almost sevenfold higher than the k'_{-2} of wild type mCOX-2 (Table 8). The magnitude of this rate constant helps to explain why little or no inhibition was observed despite the fact that DM-INDO binds to this enzyme. DM-INDO

displayed a slightly smaller off-rate constant (k'_{-2}) for V349I than wild type mCOX-2, which corresponded to the slight difference in the activity recovery assay observed between these two enzymes (Table 8, Figure 3B). As with INDO, DM-INDO bound reversibly to the V349L enzyme (Figure 5). For 5 each enzyme and inhibitor examined, the values of k'_{-2} measured by fluorescence decay and calculated from the equation (2), were equal to the k'_{-2} values measured by fluorescence recovery upon incubation with AA (Tables 7 and 8). Overall, the fluorescence quenching kinetics agreed well with the kinetics of inhibition.

50 μ M AA.

A hallmark of INDO inhibition of COX enzymes is that it appears to be functionally irreversible. Removal of the 2' methyl group from INDO significantly reduces its potency as an inhibitor of COX-2 and COX-1 and eliminates its ability to serve as a functionally irreversible inhibitor. In fact, ovine COX-1 does not appear to be inhibited at all by DM-INDO at concentrations up to 16 μ M. Although the 2' methyl group appears to be a key contributor to time-dependent COX inhibition, it is not the sole determinant of binding. Previous studies have demonstrated that the carboxyl group of the indole-3-acetic acid moiety and the halogen atom of the *p*-chlorobenzoyl group also contribute to COX inhibition by INDO. See Rome & Lands, 1975. Esterification or amidation of the carboxyl group transforms the molecule into a weak, reversible inhibitor of COX-1 but does not eliminate time-dependent inhibition of COX-2 (Rome & Lands, 1975; Kalgutkar *et al.*, 2000a). However, the mode of binding of INDO esters and amides appears to be different from that of the parent acid. Inhibition of COX-2 by INDO is eliminated by mutations of Arg-120 or Tyr-355 whereas inhibition by INDO esters and amides is eliminated by mutations of Tyr-355 or Glu-524 but not Arg-120 (Kalgutkar *et al.*, 2000a). The absence of a strong ionic interaction can account for the slow reversibility of inhibition observed for certain INDO amides containing bulky substituents in the amide

functional group, and for the inability of 2-des-methyl derivatives of INDO esters and amides to exhibit any inhibition of COX-2 (Kalgutkar *et al.*, 2000b; Timofeevski *et al.*, 2002).

The presently disclosed subject matter demonstrates the importance 5 of Val-349 in the interaction of COX enzymes with substrates and inhibitors. Previous studies have revealed that mutations of Val-349 affect the affinities of COX-1 or COX-2 for substrates, the rates of substrate oxygenation, and the regiochemistry and stereochemistry of product formation (Thuresson *et al.*, 2001; Schneider *et al.*, 2002). The decreases in specific activity 10 observed with the various mutants in the presently disclosed subject matter are consistent with previous reports. The reduced activities of the mutants necessitated the adjustment of protein concentration in the inhibition assays to amounts that yielded similar rates of substrate turnover. However, a constant protein concentration was used in the fluorescence quenching 15 assays because differences in specific activities were irrelevant due to the use of apo-enzyme. Despite the differences in protein concentrations and other aspects in the design of the inhibition and fluorescence quenching assays, the values determined for the kinetic parameters of INDO and DM-INDO binding and inhibition were remarkably consistent with the exception of 20 the rate-constants for dissociation where differences of less than sevenfold were observed.

Pharmacological activities of INDO such as its anti-inflammatory activity, analgesic activity, and gastrointestinal toxicity are believed to derive 25 from the ability of INDO to inhibit COX-2 and COX-1. However, INDO has been reported to exert additional biochemical activities in cellular systems and it has been proposed that these non-COX activities might contribute to its *in vivo* pharmacology (Weggen *et al.*, 2001). The presently disclosed 30 observation that a subtle chemical modification – modifying the 2' methyl group to a moiety selected from the group consisting of hydrogen, halo, and C₂ to C₆ alkyl or branched alkyl – greatly reduces COX inhibitory activity provides a strategy for optimizing pharmacological effects at COX-independent targets while minimizing undesirable side effects due to COX inhibition.

EXAMPLE 12

Inhibition of COX Enzymes by 2-Des-Methyl Derivatives

The 2-Des-methyl analog of INDO (DM-INDO) was synthesized as discussed in Example 4, and tested against wild-type COX-1 and COX-2 as 5 well as the Val-349 mutants as described in Example 7. DM-INDO bound to all enzymes tested, but only displayed inhibitory potency against wild type mCOX-2 and the V349I enzyme. Without the 2' methyl group anchoring DM-INDO in the active site, the compound was readily competed off of the 10 enzyme by arachidonic acid (AA). The kinetics of inhibition were comparable to the kinetics of binding as evaluated by fluorescence quenching. These results implicate the importance of the contacts between the 2' methyl group of INDO and the "methyl-binding pocket", in its time-dependent binding and inhibition of COXs.

15

EXAMPLE 13

Cell Viability Assay

RKO and HCT-116 cells (human colorectal cancer cell lines) were cultured in microtiter plates (tissue culture grade, 96-well flat) in a final volume of 100 μ l culture medium containing 5-8 \times 10⁴ cells and the final 20 concentrations of chemicals (1-500 μ M). Cells were incubated in a humidified atmosphere for 8-24 hours. To the cultures, 10 μ l of cell proliferation reagent, WST-1 (Roche Applied Science, Indianapolis, Indiana, United States of America) was added, and reincubated for 1-2 hours. The 25 absorbance of the samples was determined using a microtiter plate reader at a wavelength of 405-450 nm against background control. Reference wavelength was 620 nm. The tetrazolium salt, WST-1 (4-[3-(4-iodophenyl)-2-(4-nitrophenyl)-2H-5-tetrazolio]-1,3-benzene disulfonate) was metabolized to formazan by the "succinate-tetrazolium reductase" system, which exists in mitochondria and is active only in viable cells. Thus, the formation of 30 formazan (dark yellow color) is proportional to the viable cell numbers. The results of this experiment are presented in Figure 8.

EXAMPLE 14

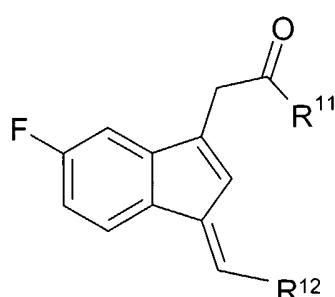

Determination of ED₅₀ Values for Derivatives

The cell viability assay described in Example 13 was employed with each derivative listed in Table 9. The generated data points were used to 5 calculate ED₅₀ values by creating a sigmoidal dose-response curve using non-linear regression. ED₅₀ values were calculated using the statistical analysis program PRISM® (GraphPad Software, Inc., San Diego, California, United States of America).

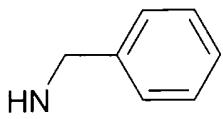

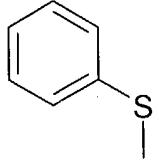

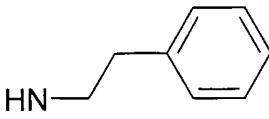

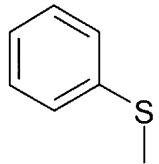

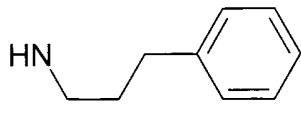

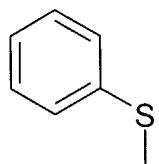

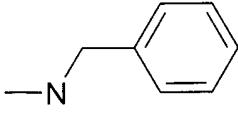

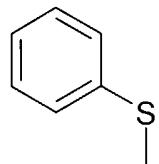

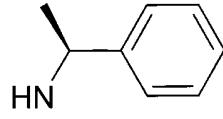

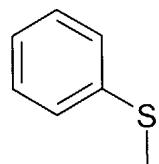

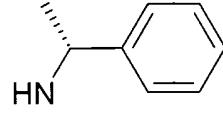

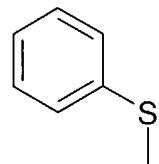

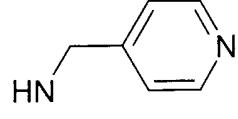

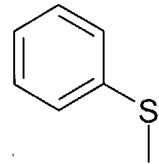

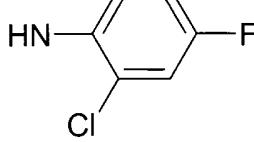

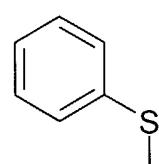

The ED₅₀ values for the derivatives are presented in Table 9. ED₅₀ 10 values were also calculated for indomethacin and sulindac sulfide using the above referenced cell viability assay. Sulindac sulfide had an ED₅₀ value of 98.2 ± 1.4 μM in RKO cells, and 109.4 ± 10.0 μM in HCT-116 cells. Indomethacin had an ED₅₀ value of 162.2 ± 11.0 μM in RKO cells, and 448.7 ± 97.6 μM in HCT-116 cells.

EXAMPLE 15

Caspase-3 Colorimetric Assay

5 RKO, HCT-116 (another human colorectal cancer cell line), and H1299 (a human non-small cell cancer line) cells that had been treated with test compounds for various times were washed twice with ice-cold PBS and lysed in a lysis buffer (BioVision) on ice for 10 minutes, followed by centrifugation at 15,000 x g for 10 minutes. Caspase-3 activity, which is a 10 measure if the initiation of apoptotic cell death, was determined in the supernatant by a colorimetric assay kit (BioVision Inc., Palo Alto, California, United States of America) using the p-nitroanilide-labeled peptide, DEVD-pNA, as substrate. Caspase-3 activity was monitored by the release of p-nitroanilide from the substrate at 405 nm. The fold increase in caspase-3 15 activity is shown in Figure 9, and was calculated by comparing the absorbance of p-nitroanilide from vehicle treated controls and those treated with sulindac sulfide and its analogs.

EXAMPLE 16

Preparation of Protein Lysates and Western Blotting Analysis

20 Cells that had been treated with test compounds for various times were washed twice with ice-cold phosphate buffered saline (PBS) and lysed in kinase lysis buffer [50 mM Tris buffer (pH 7.5) 150 mM NaCl, 0.1% Triton X-100, 0.1% Nonidet P-40, 4 mM ethylenediamine tetraacetic acid (EDTA), 25 50 mM NaF, 0.1 mM sodium orthovanadate, 1 mM dithiothreitol (DTT) and

protease inhibitors: antipain, leupeptin, pepstatin A, and chymostatin (5 µg/mL), phenylmethylsulfonyl fluoride (50 µg/mL) and 4-(2-aminoethyl)-benzenesulfonylfluoride (100 µg/mL)] for 30 minutes at 4°C. Cell lysates were cleared by centrifugation at 15,000g for 15 minutes, and the resulting supernatant was collected. Cellular protein (30-50 µg) was mixed with an equal volume of 2X Laemmli sample buffer [125 mM Tris (pH 6.8), 10% β -mercaptoethanol, 20% glycerol, 4% sodium dodecyl sulfate (SDS), and 0.05% bromophenol blue] and boiled for 5 minutes. The proteins were resolved by sodium dodecyl sulfate-polyacrylamide gel electrophoresis (SDS-PAGE) and electrophoretically transferred onto polyvinylidene difluoride membranes (Millipore Corp., Bedford, Massachusetts, United States of America). The membranes were blocked with 5% non-fat milk in Tris-buffered saline (50 mM Tris pH 7.5, 150 mM NaCl) containing 0.1% Tween 20, then incubated with anti-poly(ADP-ribose) polymerase (PharMingen, San Diego, California, United States of America) for 1-2 hours. The primary antibody was then stained with either donkey anti-rabbit or goat anti-mouse horseradish peroxidase-conjugate secondary antibodies. Enhanced chemiluminescence was performed (ECL Western blotting detection system: Amersham Biosciences, Piscataway, New Jersey, United States of America) and protein bands detected by autoradiography. The detection of a band corresponding to cleaved poly(ADP-ribose) polymerase indicated the initiation of apoptotic cell death.

EXAMPLE 17

25

PPAR γ Reporter Assays

Human embryonic kidney cells (HEK293 cells) were purchased from American Type Culture Collection (ATCC) and maintained in Dulbecco's modified Eagle's medium (DMEM) with GIBCO™ GLUTAMAX™ (Invitrogen Corp., Carlsbad, California, United States of America) and 10% heat-inactivated FBS (Atlas Biological, Fort Collins, Colorado, United States of America) or 10% charcoal-stripped FBS (HyClone, Logan, Utah, United States of America) in a 5% CO₂ constant humidity 37°C incubator. 9 x 10⁵ HEK293 cells were plated in DMEM supplemented with 10% charcoal-

stripped FBS. 18-24 hours after plating, cells were transfected with a control *Renilla* luciferase expressing plasmid (0.2 µg pCMV-*renilla* luciferase from Promega Corp., Madison, Wisconsin, United States of America), 0.4 µg PPAR γ -GAL4, and 0.4 µg UAS-tk-luc using a lipid ratio of 8 µL Effectene Transfection Reagent (Qiagen Inc., Valencia, California, United States of America) per 1 µg DNA in 3 mL of DMEM + 10% charcoal-stripped FBS. Cells remained in the transfection mixture overnight until the transfection media was replaced with DMEM + 10% charcoal-stripped serum containing ligands of interest or vehicle (0.1% DMSO)

10 Transfected HEK293 cells were treated with various concentrations of eindenic acid sulfide or the *N*-benzyl amide derivative of eindenic acid sulfide, *N*-Benzyl-2-[6-fluoro-3-(4-methylsulfanyl-benzylidene)-3H-inden-1-yl]-acetamide, dissolved in DMSO or vehicle alone (0.1% DMSO) for 4 hours. Cells were lysed in Passive Lysis Buffer (Promega Corp.) and lysates 15 were assayed for firefly luciferase and *Renilla* luciferase activity using the DUAL-LUCIFERASE[®] Reporter (DLR[™]) Assay system (Promega Corp., Catalog #E1910) according to the manufacturer's instructions. The results of this experiment are presented in Figure 10.

Discussion of Example 17

20 2-Des-methylindomethacin and eindenic acid sulfide and a series of structural analogs were tested for their ability to induce apoptosis of cultured cancer cells and for their ability to activate PPAR γ -mediated transcription in transfected cells in culture. Both compounds were demonstrated to be as active or more active than the parent drug. In fact, eindenic acid sulfide is 25 considerably more active than sulindac sulfide in both assays. Similar results were obtained with analogs of eindenic acid sulfide. While the co-inventors do not wish to be limited to any particular theory of operation, the enhanced biological activity of 2-Des-methyl analogs might be due to the alteration in conformation that results from deletion of the 2' methyl group.

30

EXAMPLE 18

Toxicity of 2-Des-methylindomethacin *In Vivo*

The toxicity of indomethacin and 2-Des-methylindomethacin were compared in C57/BL6 mice, which are very sensitive to gastrointestinal toxicity by indomethacin. Daily injections of a series of concentrations of indomethacin and 2-Des-methylindomethacin demonstrated that 2-Des-methylindomethacin is at least 25-fold less toxic than indomethacin, verifying that much higher concentrations of 2-Des-methyl analogs can be administered. Thus, 2-Des-methyl analogs of indomethacin and sulindac sulfide, as well as any prodrug forms (e.g., eindenic acid sulfoxide), appear to be attractive candidates for drugs targeting a range of diseases.

20

CLAIMS

What is claimed is:

1. A method for inhibiting growth of a cell, the method comprising contacting the cell with a derivative of a compound, wherein the compound comprises a cyclooxygenase inhibitor comprising an indoleacetic acid or indenacetic acid functional group having a 2' methyl group and the derivative substantially lacks cyclooxygenase inhibitory activity as a result of modifying the 2' methyl group to a moiety selected from the group consisting of hydrogen; halo; halomethyl, wherein at least one hydrogen of the methyl group is substituted with a halogen; C₂ to C₆ alkyl; C₂ to C₆ branched alkyl; and C₂ to C₆ substituted alkyl.
2. The method of claim 1, wherein the cyclooxygenase inhibitor comprises an indenacetic acid functional group and the moiety is selected from the group consisting of hydrogen and fluorine.
3. The method of claim 1, wherein the cell is present in a subject.
4. The method of claim 3, wherein the cell is a tumor cell.
5. The method of claim 4, wherein the subject is a mammal.
6. The method of claim 5, wherein the mammal is a human.
7. The method of claim 1, wherein the compound is a non-steroidal anti-inflammatory drug.
8. The method of claim 6, wherein the non-steroidal anti-inflammatory drug is selected from the group consisting of indomethacin, sulindac, and pharmaceutically acceptable salts thereof.
9. A method for treating a disease in a subject, wherein the disease is selected from the group consisting of a cancer, a neurodegenerative disease, and diabetes, the method comprising administering to the subject a treatment effective amount of a derivative of a compound, wherein the compound comprises a cyclooxygenase inhibitor comprising an indoleacetic acid or indenacetic acid functional group having a 2' methyl group and the derivative substantially lacks cyclooxygenase inhibitory activity as a result of modifying the 2' methyl group to a moiety selected from the group consisting of hydrogen; halo; halomethyl, wherein at

least one hydrogen of the methyl group is substituted with a halogen; C₂ to C₆ alkyl; C₂ to C₆ branched alkyl; and C₂ to C₆ substituted alkyl.

10. The method of claim 9, wherein the cyclooxygenase inhibitor comprises an indenacetic acid functional group and the moiety is selected
5 from the group consisting of hydrogen and fluorine.

11. The method of claim 9, wherein the subject is a mammal.

12. The method of claim 11, wherein the mammal is a human.

13. The method of claim 9, wherein the neurodegenerative disease
is Alzheimer's disease.

10 14. The method of claim 9, wherein the compound is a non-steroidal anti-inflammatory drug.

15. The method of claim 14, wherein the non-steroidal anti-inflammatory drug is selected from the group consisting of indomethacin and sulindac, pharmaceutically acceptable salts thereof, and combinations
15 thereof.

16. The method of claim 9, wherein the derivative causes substantially less gastrointestinal toxicity than does the compound.

17. A method for suppressing tumor growth in a subject, the method comprising administering to a subject bearing a tumor a derivative of
20 a compound, wherein the compound comprises a cyclooxygenase inhibitor comprising an indoleacetic acid or indenacetic acid functional group having a 2' methyl group and the derivative substantially lacks cyclooxygenase inhibitory activity as a result of modifying the 2' methyl group to a moiety selected from the group consisting of hydrogen; halo; halomethyl, wherein at
25 least one hydrogen of the methyl group is substituted with a halogen; C₂ to C₆ alkyl; C₂ to C₆ branched alkyl; and C₂ to C₆ substituted alkyl.

18. The method of claim 17, wherein the cyclooxygenase inhibitor comprises an indenacetic acid functional group and the moiety is selected from the group consisting of hydrogen and fluorine.

30 19. The method of claim 17, wherein the subject is a mammal.

20. The method of claim 19, wherein the mammal is a human.

21. The method of claim 17, wherein the compound is a non-steroidal anti-inflammatory drug.

22. The method of claim 17, wherein the non-steroidal anti-inflammatory drug is selected from the group consisting of indomethacin and sulindac, pharmaceutically acceptable salts thereof, and combinations thereof.

5 23. The method of claim 17, wherein the derivative causes substantially less gastrointestinal toxicity than does the compound.

24. A method for inducing apoptosis in a cell, the method comprising contacting the cell with a derivative of a compound, wherein the compound comprises a cyclooxygenase inhibitor comprising an indoleacetic acid or indenacetic acid functional group having a 2' methyl group and the derivative substantially lacks cyclooxygenase inhibitory activity as a result of modifying the 2' methyl group to a moiety selected from the group consisting of hydrogen; halo; halomethyl, wherein at least one hydrogen of the methyl group is substituted with a halogen; C₂ to C₆ alkyl; C₂ to C₆ branched alkyl; 10 and C₂ to C₆ substituted alkyl; 15

25. The method of claim 24, wherein the cyclooxygenase inhibitor comprises an indenacetic acid functional group and the moiety is selected from the group consisting of hydrogen and fluorine.

26. The method of claim 24, wherein the cell is a cell in culture.

27. The method of claim 24, wherein the cell is a cancer cell.

28. The method of claim 24, wherein the cell is present within a subject.

29. The method of claim 28, wherein the subject is a mammal.

30. The method of claim 29, wherein the mammal is a human.

25 31. The method of claim 24, wherein the compound is a non-steroidal anti-inflammatory drug.

32. The method of claim 31, wherein the non-steroidal anti-inflammatory drug is selected from the group consisting of indomethacin and sulindac, pharmaceutically acceptable salts thereof, and combinations thereof.

33. A method for modulating the activity of a peroxisome proliferators activated receptor (PPAR) isoform, the method comprising contacting the PPAR isoform with a derivative of a compound, wherein the

compound comprises a cyclooxygenase inhibitor comprising an indoleacetic acid or indenacetic acid functional group having a 2' methyl group and the derivative substantially lacks cyclooxygenase inhibitory activity as a result of modifying the 2' methyl group to a moiety selected from the group consisting of hydrogen; halo; halomethyl, wherein at least one hydrogen of the methyl group is substituted with a halogen; C₂ to C₆ alkyl; C₂ to C₆ branched alkyl; and C₂ to C₆ substituted alkyl.

34. The method of claim 33, wherein the cyclooxygenase inhibitor comprises an indenacetic acid functional group and the moiety is selected from the group consisting of hydrogen and fluorine.

35. The method of claim 33, wherein the peroxisome proliferators activated receptor (PPAR) isoform is PPAR γ .

36. The method of claim 33, wherein the peroxisome proliferators activated receptor (PPAR) isoform is present in a subject.

37. The method of claim 36, wherein the subject is a mammal.

38. The method of claim 37, wherein the mammal is a human.

39. The method of claim 33, wherein the compound is a non-steroidal anti-inflammatory drug.

40. The method of claim 33, wherein the non-steroidal anti-inflammatory drug is selected from the group consisting of indomethacin and sulindac, pharmaceutically acceptable salts thereof, and combinations thereof.

41. The method of claim 33, wherein the derivative causes substantially less gastrointestinal toxicity than does the compound.

42. A method for altering specificity of a cyclooxygenase-inhibiting compound, the method comprising:

- (a) providing a compound having cyclooxygenase inhibitory activity, the compound comprising an indoleacetic acid or indenacetic acid functional group having a 2' methyl group; and
- 30 (b) replacing the 2' methyl group with a moiety selected from the group consisting of hydrogen; halo; halomethyl, wherein at least one hydrogen of the methyl group is substituted with a halogen; C₂ to C₆ alkyl; C₂ to C₆ branched alkyl; and C₂ to C₆

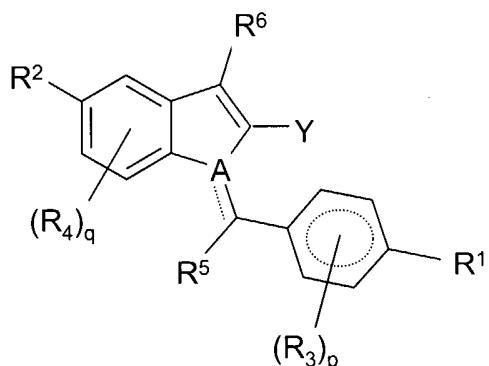

substituted alkyl to create a derivative, wherein the derivative substantially lacks cyclooxygenase inhibitory activity.

43. The method of claim 42, wherein the compound comprises an indenacetic acid functional group and the moiety is selected from the group consisting of hydrogen and fluorine.

44. The method of claim 42, wherein the compound is a non-steroidal anti-inflammatory drug.

45. The method of claim 44, wherein the non-steroidal anti-inflammatory drug is selected from the group consisting of indomethacin and sulindac, pharmaceutically acceptable salts thereof, and combinations thereof.

46. The method of any of claims 1, 9, 17, 24, and 33, wherein the derivative has the following formula:

15

Formula I

wherein

20 R^1 is selected from the group consisting of hydrogen, halo, CF_3 ; SCH_3 ; $SOCH_3$; SO_2CH_3 ; SO_2NH_2 ; C_1 to C_6 alkyl, branched alkyl, or substituted alkyl; C_1 to C_6 alkoxy, branched alkoxy, or substituted alkoxy; C_1 to C_6 alkylcarboxylic acid, branched alkylcarboxylic acid, or substituted alkylcarboxylic acid; and CH_2N_3 ;

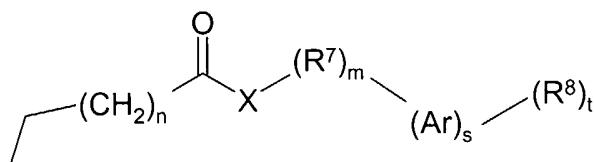

25 R^2 is selected from the group consisting of hydrogen, halo, CF_3 ; SCH_3 ; $SOCH_3$; SO_2CH_3 ; SO_2NH_2 ; $CONH_2$; C_1 to C_6 alkyl, branched alkyl, or substituted alkyl; C_1 to C_6 alkoxy, branched alkoxy, or substituted alkoxy; benzyloxy; C_1 to C_6 alkylcarboxylic acid, branched alkylcarboxylic acid, or substituted alkylcarboxylic acid.

acid; and CH_2N_3 ;

5 R^3 and R^4 are each independently selected from the group consisting of hydrogen; halo; CF_3 ; C_1 to C_6 alkyl, branched alkyl, or substituted alkyl; C_1 to C_6 alkoxy, branched alkoxy, or substituted alkoxy; aryl; substituted aryl; benzyloxy; SCH_3 ; SOCH_3 ; SO_2CH_3 ; and SO_2NH_2 ;

R^5 is selected from the group consisting of hydrogen, C_1 to C_6 alkyl, branched alkyl, or substituted alkyl, and $=\text{O}$;

10 R^6 is selected from the group consisting of hydrogen; C_1 to C_6 alkyl, branched alkyl, or substituted alkyl; C_1 to C_6 alkoxy, branched alkoxy, or substituted alkoxy; benzyloxy; C_1 to C_6 alkylcarboxylic acid, branched alkylcarboxylic acid, or substituted alkylcarboxylic acid; and the following structure:

15 wherein

Ar is cyclohexyl or phenyl;

R^7 is hydrogen; C_1 to C_6 alkyl, branched alkyl, or substituted alkyl;

20 R^8 is hydrogen, halo, C_1 to C_6 alkyl, branched alkyl, and substituted alkyl; C_1 to C_6 alkoxy, branched alkoxy, and substituted alkoxy; C_1 to C_6 alkylcarboxylic acid, branched alkylcarboxylic acid, or substituted alkylcarboxylic acid; amino; nitro; CF_3 ; bromoacetamidyl; benzoyl; or 2-phenyl-oxiranyl;

25 X is O or NR^9 , wherein R^9 is hydrogen or alkyl; and m , n , and t are each individually 0, 1, 2, 3, 4, or 5;

30 Y is selected from the group consisting of hydrogen; halo; halomethyl, wherein at least one hydrogen of the methyl group is substituted with a halogen; C_2 to C_6 alkyl; C_2 to C_6 branched alkyl;

and C₂ to C₆ substituted alkyl;

A is selected from the group consisting of carbon and nitrogen;

p and q are both individually 0, 1, 2, 3, or 4;

the bond between the carbon bound to R⁵ and the indene ring and is

5 a single bond or a double bond; and

the six-membered ring to which R¹ is bound is cyclohexyl or phenyl.

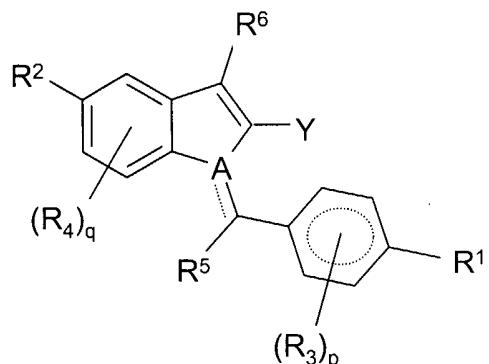

47. The method of claim 46, wherein wherein the derivative is selected from the group consisting of 2-Des-methylindomethacin, eindenic acid sulfide, eindenic acid sulfoxide, and eindenic acid sulfone.

10 48. The method of claim 46, wherein the derivative is eindenic acid sulfide.

49. The method of claim 46, further comprising derivatizing a carboxylic acid moiety present on the compound to an ester or an amide.

15 50. The method of claim 49, wherein the ester or amide has a structure presented in Table 3.

51. A compound of the following formula:

Formula I

wherein

20 R¹ is selected from the group consisting of hydrogen, halo, CF₃, SCH₃; SOCH₃; SO₂CH₃; SO₂NH₂; C₁ to C₆ alkyl, branched alkyl, or substituted alkyl; C₁ to C₆ alkoxy, branched alkoxy, or substituted alkoxy; C₁ to C₆ alkylcarboxylic acid, branched alkylcarboxylic acid, or substituted alkylcarboxylic acid; and CH₂N₃;

25 R² is selected from the group consisting of hydrogen, halo, CF₃, SCH₃; SOCH₃; SO₂CH₃; SO₂NH₂; CONH₂; C₁ to C₆ alkyl,

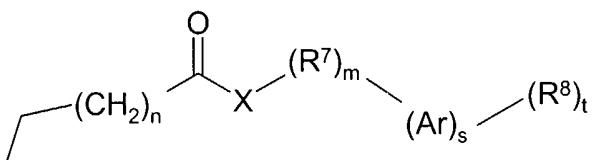

branched alkyl, or substituted alkyl; C₁ to C₆ alkoxy, branched alkoxy, or substituted alkoxy; benzyloxy; C₁ to C₆ alkylcarboxylic acid, branched alkylcarboxylic acid, or substituted alkylcarboxylic acid; and CH₂N₃;

5 R³ and R⁴ are each independently selected from the group consisting of hydrogen; halo; CF₃; C₁ to C₆ alkyl, branched alkyl, or substituted alkyl; C₁ to C₆ alkoxy, branched alkoxy, or substituted alkoxy; aryl; substituted aryl; benzyloxy; SCH₃; SOCH₃; SO₂CH₃; and SO₂NH₂;

10 R⁵ is selected from the group consisting of hydrogen, C₁ to C₆ alkyl, branched alkyl, or substituted alkyl, and =O;

R⁶ is selected from the group consisting of hydrogen; C₁ to C₆ alkyl, branched alkyl, or substituted alkyl; C₁ to C₆ alkoxy, branched alkoxy, or substituted alkoxy; benzyloxy; C₁ to C₆ alkylcarboxylic acid, branched alkylcarboxylic acid, or substituted alkylcarboxylic acid; and the following structure:

15

wherein

Ar is cyclohexyl or phenyl;

20 R⁷ is hydrogen; C₁ to C₆ alkyl, branched alkyl, or substituted alkyl;

R⁸ is hydrogen, halo, C₁ to C₆ alkyl, branched alkyl, and substituted alkyl; C₁ to C₆ alkoxy, branched alkoxy, and substituted alkoxy; C₁ to C₆ alkylcarboxylic acid, branched alkylcarboxylic acid, or substituted alkylcarboxylic acid; amino; nitro; CF₃; bromoacetamidyl; benzoyl; or 2-phenyl-oxiranyl;

X is O or NR⁹, wherein R⁹ is hydrogen or alkyl; and

30 m, n, and t are each individually 0, 1, 2, 3, 4, or 5;

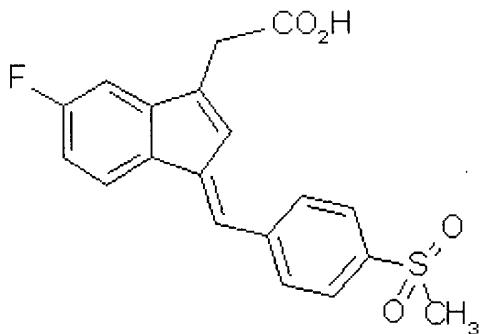

Y is selected from the group consisting of hydrogen; halo; halomethyl, wherein at least one hydrogen of the methyl group is substituted with a halogen; C₂ to C₆ alkyl; C₂ to C₆ branched alkyl; and C₂ to C₆ substituted alkyl;

5 A is selected from the group consisting of carbon and nitrogen; p and q are both individually 0, 1, 2, 3, or 4; the bond between the carbon bound to R⁵ and the indene ring and is a single bond or a double bond; and the six-membered ring to which R¹ is bound is cyclohexyl or phenyl.

10 52. The compound of claim 51, wherein R¹ is selected from the group consisting of C₁ to C₆ alkylcarboxylic acid and branched C₁ to C₆ alkylcarboxylic acid; R² is selected from the group consisting of halo, C₁ to C₆ alkyl or branched alkyl, SCH₃, SOCH₃, SO₂CH₃, and SO₂NH₂; and 15 R³-R⁵ and R⁷-R¹⁰ are each independently selected from the group consisting of hydrogen, C₁ to C₆ alkyl or branched alkyl, and halo.

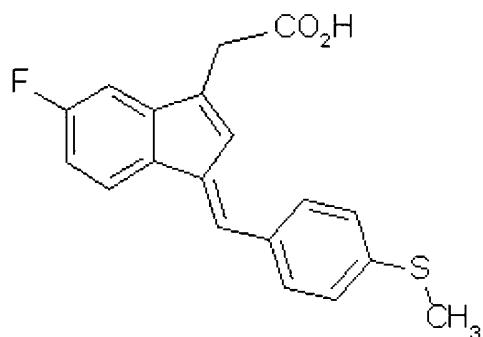

53. The compound of claim 51, wherein the compound has the following formula:

20

Eindenic acid sulfone

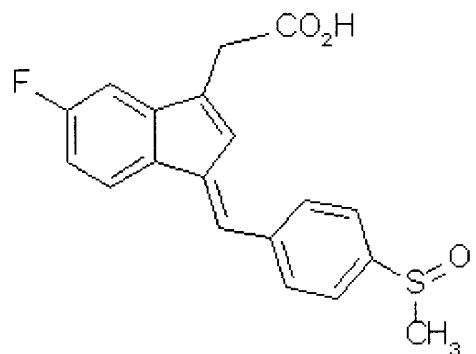

54. The compound of claim 51, wherein the compound has the following formula:

5

Eindenic acid sulfide

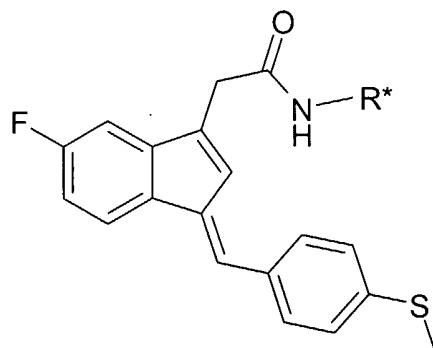

55. The compound of claim 51, wherein the compound has the following formula:

10

Eindenic acid sulfoxide

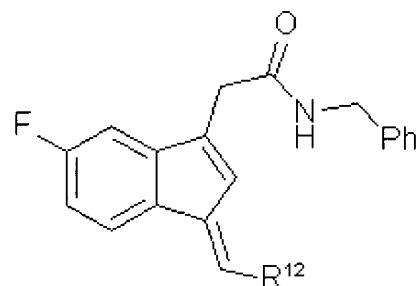

56. The compound of claim 51, wherein the compound has the following general formula:

wherein R^* is selected from the group consisting of C_1 to C_6 alkyl, branched alkyl, and cyclic alkyl; C_1 to C_6 alkylcarboxylic acid, branched alkylcarboxylic acid, and cyclic alkylcarboxylic acid; and C_1 to C_6 aryl and C_1 to C_6 substituted aryl.

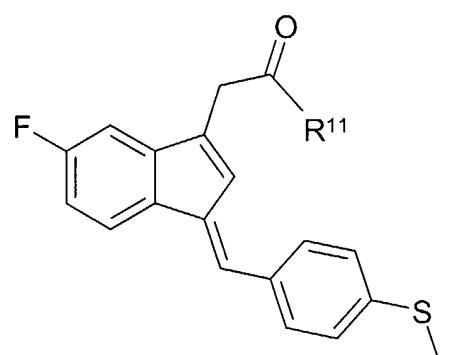

5 57. The compound of claim 56, wherein R^* is a singly or multiply substituted aryl, wherein each substituent is selected from the group consisting of a halogen, NH_2 , OCH_3 , CF_3 , OH , C_1 to C_4 alkyl or branched alkyl, NO_2 , benzoyl, 2-phenyl-oxirane, and $NH-CO-CH_2Br$.

10 58. The compound of claim 51, wherein the compound has the following general formula:

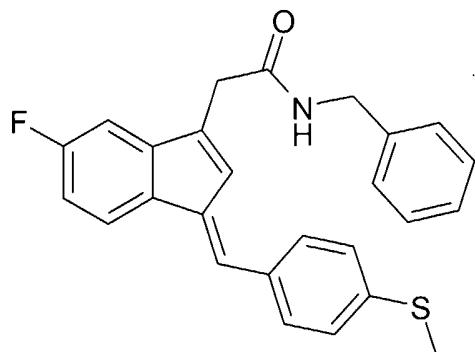

15 wherein R^{12} is selected from the group consisting of phenyl, phenyl- CH_3 , phenyl-COOH, phenyl-SCH₃, phenyl-SOCH₃, phenyl-SO₂CH₃, *o*-, *m*-, or *p*-halo-phenyl and combinations thereof, phenyl-CH₂N₃, and C_3 to C_6 cycloalkyl.

59. The compound of claim 51, wherein the compound has the following general formula:

20 wherein R^{11} is selected from the group consisting of R^{11} groups listed in Table 1.

60. The compound of claim 51, wherein the compound has the following structure:

Compound J
