UNITED STATES PATENT OFFICE

HARRY NATKIEL, OF NEW YORK, N. Y., ASSIGNOR TO THE RIESER COMPANY, INC., OF
NEW YORK, N. Y., A CORPORATION OF NEW YORK

BOB HOLDER

Application filed November 1, 1927. Serial No. 230,280.

This invention relates to hair-dressing accessories and has particular reference to a holder which is especially designed for bobbed hair to be used at the sides of the head.

The present invention comprehends an improved holder for this purpose, which is constructed in such a manner as to more effectually retain itself in place against accidental displacement and loss.

More specifically the invention comprehends a holder for bobbed hair, constructed from a length of flat material of substantially greater width than thickness, which material is cut, bent and formed to provide substantially parallel closely spaced legs joined at one end by a looped connecting bight and in which the confronting inner surfaces of the legs are formed with transverse serrations defining alternately arranged relatively wide and narrow hair-receiving and clamping spaces.

Other objects reside in the simplicity of construction, the economy of production, and the efficiency derived therefrom.

With the above recited and other objects in view, reference is had to the following description and accompanying drawings in which there is exhibited certain examples or embodiments of the invention, while the appended claims define the actual scope of the invention.

In the drawings—

Figure 1 is a view illustrating the holder in use;

Fig. 2 is an edge view of the holder;

Fig. 3 is a side view thereof;

Fig. 4 is an edge view of a modified adaptation of the invention.

Referring to the drawings by characters of reference and particularly to the form of the invention illustrated in Figs. 1, 2 and 3, the holder is constructed from a single length of flat material which is of substantially greater width than thickness and which is cut, bent and formed to provide a pair of substantially parallel closely spaced legs 10 and 11 joined at one end by a bight 12 with the upper surfaces in confronting relation. Intermediate their length the legs 10 and

11 are formed, respectively, with sinuous portions 13 and 14, so related as to define alternately arranged communicating relatively wide and narrow hair-receiving spaces *a* and *b*. By constructing the holder in the manner set forth, it obtains a more effectual grip upon the hair for retaining itself in place while holding the strands of hair at the side of the head against separation.

In the modified adaptation of the invention illustrated in Fig. 4, the legs 10 and 11 which are joined by the bight 12, are formed on their inner confronting faces with serrations 13*a* and 14*a* respectively, which define the alternately arranged communicating relatively wide and narrow hair-receiving and clamping spaces *c* and *d*.

What is claimed is:

1. A bob holder including a pair of closely spaced legs joined by a substantially semi-circular connecting bight at one end, said legs being of greater width than thickness and said legs intermediate their ends having their confronting faces provided with complementary retaining and placement serrations, which serrations are slightly spaced apart at their projecting edges to define alternately arranged relatively wider clamping spaces.

2. A bob holder constructed of a length of flat resilient material having a substantially greater width than thickness, said length of material being bent transversely of its width and intermediate its ends to provide a pair of closely spaced legs joined by a substantially semi-circular bight, said legs having sinuous portions intermediate the length thereof defining alternately arranged communicating relatively wide and narrow hair receiving and clamping spaces.

Signed at New York, in the county of New York and State of New York, this 31st day of October, A. D. 1927.

HARRY NATKIEL.
