Title: FUSED TRICYCLIC UREA COMPOUNDS AS RAF KINASE AND/OR RAF KINASE DIMER INHIBITORS

Abstract: Provided are certain fused tricyclic urea compounds and salts thereof, compositions thereof, and methods of use therefor.
Disclosed herein are fused tricyclic urea compounds, pharmaceutical compositions comprising at least one such fused tricyclic urea compound, processes for the preparation thereof, and the use thereof in therapy. Disclosed herein are certain tricyclic urea compounds that can be useful for inhibiting Raf kinase and/or Raf kinase dimer and for treating disorders mediated thereby.

reports suggest that B-Raf is one of the most frequently mutated genes in human cancers. B-Raf kinase can represent an excellent target for anticancer therapy based on preclinical target validation, epidemiology and drugability. Recent approval of B-raf inhibitors, vemurafenib and dabrafenib, validated the utility of B-raf inhibitors in treatment of B-raf mutant melanoma.

In addition to B-raf mutation that activate the Raf/MEK/ERK pathway, mutations in RAS GTPase or aberrations of growth factor receptors that are upstream of Raf/MEK/ERK signaling also lead to constant activation of the pathway that gives rise to cancer. Approximately 30% of human tumors contain mutations in one of the three Ras genes (Downward, Nat Rev Cancer. 2003 Jan;3(1): 11-22; K-Ras, N-Ras and H-Ras that are associated with increased level of Ras-GRP and thus constitutive activation of downstream signaling pathways. K-ras or N-ras mutations account for 59% of pancreatic cancer, 39% of colorectal cancer, 30% of cancer of Biliary Tract, 17% of Non-samll -cell-lung cancer, 15% of ovarian cancer, 15% of endometrium cancer, and 23% of blood cancer (Sanger Institut, Cosmic Database January 2013, cancer.sanger.ac.uk). Despite the spectacular success of first generation B-RAF inhibitor, such as vemurafenib and dabrafenib, in treatment of B-RAF V600E melanoma, it is ineffective against tumors with activating RAS mutations and in some cases it can even promote tumor growth (Niault et al., J Cell Biol. 2009 Nov 2;187(3):335-42). Preclinical data demonstrated that this could be caused by paradoxical increase in MAPK signalling by RAF inhibitors through induction of B-RAF/C-RAF heterodimer in the context of mutated of activated RAS that RAF inhibitors bind to one RAF protomer in the dimer transactivates the other protomer (Hatzivassiliou et al, Nature. 2010 Mar 18;464(7287):431-5; Poulakakos et al., Nature. 2010 Mar 18;464(7287):427-30; Heidorn et al, Cell. 2010 Jan 22;140(2):209-21). The expression of B-RAF V600E splice variant (p61) with enhanced dimerization potential has also been shown to contribute to resistant to RAF inhibitors (Poulakakos et al, Nature. 2011 Nov 23;480(7377):387-90). It is also reported that C-RAF/B-RAF dimers are much better MEK kinases than the respective monomers or homodimers (Rushworth et al, Mol Cell Biol. 2006 Mar;26(6):2262-72). These findings suggest that RAF dimer play an important role in disease association. Therefore, inhibiting the activity of RAF dimer represents a novel stand-alone approach to block aberrant RAF signalling triggered not only by V600E mutation, but also by oncogenic RAS mutations and aberrations of growth factor receptors.

As mentioned earlier, the presence of constitutively dimerized p61 contribute to resistant to vemurafenib and this splice variant were identified in 6 of 9 melanoma patients with acquired vemurafenib resistance (Poulakakos et al, Nature. 2011 Nov 23;480(7377):387-90). The ineffectiveness of vemurafenib in p61 expressing cells and the paradoxical activation of MAPK pathway by vemurafenib in wild-type B-RAF cells predict that any cell that can induce dimeric
RAF will be able to induce resistant to the first generation B-RAF inhibitors. In fact, this has been reported through a number of different mechanisms including upregulation of receptor tyrosine kinases and the acquisition of additional genetic mutations such as concomitant B-RAF and N-RAS mutations (Nazarian et al., Nature. 2010 Dec 16;468(7326):973-7; Tap et al., Neoplasia 2010 Aug; 12(8):637-49). Therefore, inhibitors of RAF dimers could also potentially be effective in treating tumors that are resistant to the first generation B-RAF inhibitors, such as vemurafenib and dabrafenib.

To evaluate the inhibitory effect of compounds on RAF dimers, it is important to first induce the dimer formation of RAF proteins. The expression of p61 B-RAF splice variant drives activation of MAPK pathway through its ability to form constitutive p61 homodimer (Poulidakos et al., Nature. 2011 Nov 23;480(7377):387-90), therefore A375 stably expressing p61 (A375-p61) was also utilized to evaluate compounds' effect on RAF dimer through measuring IC₅₀ of ERK phosphorylation. Since A375-p61 cells are addicted to p61, the measurement of half-maximal effect concentration (EC₅₀) on cell proliferation was also utilized for this purpose. Finally, it is also reported that mutant Ras induce RAF dimers (Luo et al., Nature. 1996 Sep 12;383(6596):181-5; Weber et al., Cancer Res. 2001 May 1; 61(9):3595-8; Garnett et al., Mol Cell. 2005 Dec 22;20(6):963-9)The ability of compounds to inhibit ERK phosphorylation in RAS mutant cell such as Calu-6 serves as another way to evaluate compounds' ability to inhibit the RAF dimer activities.

Inhibitors of Raf kinases have been discussed for use in disruption of tumor cell growth and hence in the treatment of cancers, e.g. melanoma, colorectal cancer including large intestinal colon carcinoma, histiocytic lymphoma, lung adenocarcinoma, small cell lung cancer, and pancreatic and breast carcinoma (Crum, Current Pharmaceutical Design 8: 2243-2248, 2002; Sebastien et al., Current Pharmaceutical Design 8: 2249-2253, 2002), and /or in the treatment or prophylaxis of disorders associated with neuronal degeneration resulting from ischemic events, including cerebral ischemia after cardiac arrest, stroke and multi-infarct dementia. Inhibitors of Raf kinases have also been discussed for use after cerebral ischemic events such as those resulting from head injury, surgery and /or during childbirth (York et al., Mol. and Cell. Biol. 20(21): 8069-8083, 2000; Chin et al., Neurochem. 90: 595-608, 2004), as well as in polycystic kidney disease (Nagao et al., Kidney Int. 63(2): 427-437, 2003).

In addition, certain hyperproliferative disorders may be characterized by the over activation of Raf kinase functions, for example, by mutations or over expression of the protein. Accordingly, inhibitors of Raf kinases can be useful in the treatment of hyperproliferative disorders, such as cancer.

Disclosed herein are methods to evaluate inhibition of RAF dimer activity in cells and compounds that can inhibit Raf kinases, including wild-type B-RAF and V600E B-RAF mutant and the Raf dimer activity in cells.

The term "cycloalkyl" herein refers to a hydrocarbon group selected from saturated and partially unsaturated cyclic hydrocarbon groups, comprising monocyclic and polycyclic (e.g., bicyclic and tricyclic) groups. For example, the cycloalkyl group may comprise from 3 to 12, such as 3 to 8, further such as 3 to 6, 3 to 5, or 3 to 4 carbon atoms. Even further for example, the cycloalkyl group may be selected from monocyclic group comprising from 3 to 12, such as 3 to 8, 3 to 6 carbon atoms. Examples of the monocyclic cycloalkyl group include cyclopropyl, cyclobutyl, cyclopentyl, 1-cyclopent-1-enyl, 1-cyclopent-2-enyl, 1-cyclopent-3-enyl, cyclohexyl, 1-cyclohex-1-enyl, 1-cyclohex-2-enyl, 1-cyclohex-3-enyl, cyclohexadienyl, cycloheptyl, cyclooctyl, cyclononyl, cyclodecyl, cycloundecyl, and cyclododecyl groups. Examples of the bicyclic cycloalkyl groups include those having from 7 to 12 ring atoms arranged as a bicyclic ring selected from [4,4], [4,5], [5,5], [5,6] and [6,6] ring systems, or as a bridged bicyclic ring selected from bicyclo[2.2.1]heptane, bicyclo[2.2.2]octane, and bicyclo[3.2.2]nonane. Further examples of the bicyclic cycloalkyl groups include those arranged as a bicyclic ring selected from [5,6] and [6,6] ring systems, such as wherein the wavy lines indicate the points of attachment. The ring may be saturated or have at least one double bond (i.e. partially unsaturated), but is not fully conjugated, and is not aromatic, as aromatic is defined herein.

The term "Aryl" herein refers to a group selected from:

- 5- and 6-membered carbocyclic aromatic rings, for example, phenyl;
bicyclic ring systems such as 7 to 12 membered bicyclic ring systems wherein at least one ring is carbocyclic and aromatic, selected, for example, from naphthalene, indane, and 1,2,3,4-tetrahydroquinoline; and tricyclic ring systems such as 10 to 15 membered tricyclic ring systems wherein at least one ring is carbocyclic and aromatic, for example, fluorene.

For example, the aryl group is selected from 5 and 6-membered carbocyclic aromatic rings fused to a 5- to 7-membered cycloalkyl or heterocyclic ring optionally comprising at least one heteroatom selected from N, O, and S, provided that the point of attachment is at the carbocyclic aromatic ring when the carbocyclic aromatic ring is fused with a heterocyclic ring, and the point of attachment can be at the carbocyclic aromatic ring or at the cycloalkyl group when the carbocyclic aromatic ring is fused with a cycloalkyl group. Bivalent radicals formed from substituted benzene derivatives and having the free valences at ring atoms are named as substituted phenylene radicals. Bivalent radicals derived from univalent polycyclic hydrocarbon radicals whose names end in "-yl" by removal of one hydrogen atom from the carbon atom with the free valence are named by adding "-idene" to the name of the corresponding univalent radical, e.g., a naphthyl group with two points of attachment is termed naphthylidene. Aryl, however, does not encompass or overlap in any way with heteroaryl, separately defined below. Hence, if one or more carbocyclic aromatic rings are fused with a heterocyclic aromatic ring, the resulting ring system is heteroaryl, not aryl, as defined herein.

The term "halogen" or "halo" herein refers to F, Cl, Br or I. The term "heteroaryl" herein refers to a group selected from:

5- to 7-membered aromatic, monocyclic rings comprising at least one heteroatom, for example, from 1 to 4, or, in some embodiments, from 1 to 3, heteroatoms, selected from N, O, and S, with the remaining ring atoms being carbon; 8- to 12-membered bicyclic rings comprising at least one heteroatom, for example, from 1 to 4, or, in some embodiments, from 1 to 3, or, in other embodiments, 1 or 2, heteroatoms, selected from N, O, and S, with the remaining ring atoms being carbon and wherein at least one ring is aromatic and at least one heteroatom is present in the aromatic ring; and 11- to 14-membered tricyclic rings comprising at least one heteroatom, for example, from 1 to 4, or in some embodiments, from 1 to 3, or, in other embodiments, 1 or 2, heteroatoms, selected from N, O, and S, with the remaining ring atoms being carbon and wherein at least one ring is aromatic and at least one heteroatom is present in an aromatic ring.
For example, the heteroaryl group includes a 5- to 7-membered heterocyclic aromatic ring fused to a 5- to 7-membered cycloalkyl ring. For such fused, bicyclic heteroaryl ring systems wherein only one of the rings comprises at least one heteroatom, the point of attachment may be at the heteroaromatic ring or at the cycloalkyl ring.

When the total number of S and O atoms in the heteroaryl group exceeds 1, those heteroatoms are not adjacent to one another. In some embodiments, the total number of S and O atoms in the heteroaryl group is not more than 2. In some embodiments, the total number of S and O atoms in the aromatic heterocycle is not more than 1.

Examples of the heteroaryl group include, but are not limited to, (as numbered from the linkage position assigned priority) pyridyl (such as 2-pyridyl, 3-pyridyl, or 4-pyridyl), cinnolinyl, pyrazinyl, 2,4-pyrimidinyl, 3,5-pyrimidinyl, 2,4-imidazolyl, imidazopyridinyl, isoxazolyl, oxazolyl, thiazolyl, isothiazolyl, thiadiazolyl, tetrazolyl, thienyl, triazinyl, benzothienyl, furanyl, benzofuranyl, benzimidazolyl, indolyl, isoindolyl, indolyl, phthalazinyl, pyrazinyl, pyridazinyl, pyrrolyl, triazolyl, quinolinyl, isoquinolinyl, pyrazolyl, pyrrolopyridinyl (such as 1H-pyrrolo[2,3-b]pyridin-5-yl), pyrazolopyridinyl (such as 1H-pyrazolo[3,4-b]pyridin-5-yl), benzoxazolyl (such as benzo[d]oxazol-6-yl), pteridinyl, purinyl, 1-oxa-2,3-diazolyl, 1-oxa-2,4-diazolyl, 1-oxa-2,5-diazolyl, 1-oxa-3,4-diazolyl, 1-thia-2,3-diazolyl, 1-thia-2,4-diazolyl, 1-thia-2,5-diazolyl, 1-thia-3,4-diazolyl, furazanyl, benzofurazanyl, benzothiophenyl, benzothiazolyl, benzoxazolyl, quinazolinyl, quinoxalinyl, naphthyridinyl, furopyridinyl, benzothiazolyl (such as benzo[d]thiazol-6-yl), indazolyl (such as 1H-indazol-5-yl) and 5,6,7,8-tetrahydroisoquinoline.

Compounds described herein may contain an asymmetric center and may thus exist as enantiomers. Where the compounds described herein possess two or more asymmetric centers, they may additionally exist as diastereomers. All stereoisomers of the compounds disclosed herein and /or pharmaceutically
acceptable salts thereof are intended to be included. Unless specifically mentioned otherwise, reference to one isomer applies to any of the possible isomers. Whenever the isomeric composition is unspecified, all possible isomers are included.

It may be advantageous to separate reaction products from one another and/or from starting materials. The desired products of each step or series of steps is separated and/or purified (hereinafter separated) to the desired degree of homogeneity by the techniques common in the art. Typically such separations involve multiphase extraction, crystallization from a solvent or solvent mixture, distillation, sublimation, or chromatography. Chromatography can involve any number of methods including, for example: reverse-phase and normal phase; size exclusion; ion exchange; high, medium and low pressure liquid chromatography methods and apparatus; small scale analytical; simulated moving bed ("SMB") and preparative thin or thick layer chromatography, as well as techniques of small scale thin layer and flash chromatography. One skilled in the art will apply techniques most likely to achieve the desired separation.

Diastereomeric mixtures can be separated into their individual diastereomers on the basis of their physical chemical differences by methods well known to those skilled in the art, such as by chromatography and/or fractional crystallization. Enantiomers can be separated by converting the enantiomeric mixture into a diastereomeric mixture by reaction with an appropriate optically active compound (e.g., chiral auxiliary such as a chiral alcohol or Mosher's acid chloride), separating the diastereomers and converting (e.g., hydrolyzing) the individual diastereoisomers to the corresponding pure enantiomers. Enantiomers can also be separated by use of a chiral HPLC column.
A single stereoisomer, e.g., a substantially pure enantiomer, may be obtained by resolution of the racemic mixture using a method such as formation of diastereomers using optically active resolving agents (Elie, E. and Wilen, S. Stereochemistry of Organic Compounds. New York: John Wiley & Sons, Inc., 1994; Lochmuller, C. H., et al. "Chromatographic resolution of enantiomers: Selective review." J. Chromatogr., 113(3) (1975): pp. 283-302). Racemic mixtures of chiral compounds of the invention can be separated and isolated by any suitable method, including: (1) formation of ionic, diastereomeric salts with chiral compounds and separation by fractional crystallization or other methods, (2) formation of diastereomeric compounds with chiral derivatizing reagents, separation of the diastereomers, and conversion to the pure stereoisomers, and (3) separation of the substantially pure or enriched stereoisomers directly under chiral conditions. "Pharmaceutically acceptable salts" include, but are not limited to salts with inorganic acids, selected, for example, from hydrochlorates, phosphates, diphosphates, hydrobromates, sulfates, sulfinites, and nitrates; as well as salts with organic acids, selected, for example, from maleates, maleates, fumarates, tartarates, succinates, citrates, lactates, methanesulfonates, p-toluenesulfonates, 2-hydroxyethylsulfonates, benzoates, salicylates, stearates, alkanoates such as acetate, and salts with HOOC-(CH₂)n-COOH, wherein n is selected from 0 to 4. Similarly, examples of pharmaceutically acceptable cations include, but are not limited to, sodium, potassium, calcium, aluminum, lithium, and ammonium.

In addition, if a compound disclosed herein is obtained as an acid addition salt, the free base can be obtained by basifying a solution of the acid salt. Conversely, if the product is a free base, an addition salt, such as a pharmaceutically acceptable addition salt, may be produced by dissolving the free base in a suitable organic solvent and treating the solution with an acid, in accordance with conventional procedures for preparing acid addition salts from base compounds. Those skilled in the art will recognize various synthetic methodologies that may be used without undue experimentation to prepare non-toxic pharmaceutically acceptable addition salts.

As defined herein, "pharmaceutically acceptable salts thereof" include salts of at least one compound of Formulae I, II, and/or III, and salts of the stereoisomers of at least one compound of Formulae I, II, and/or III, such as salts of enantiomers, and/or salts of diastereomers.

In this scheme, a commercially available 4-methoxyphenol 1 is reacted with 2-bromo-l,l-diethoxyethane to form formula 2, then the ring is closed in the presence of acidic condition to give 5-methoxybenzofuran 3. Then the methyl group is removed and the hydroxy group of formula 4 is protected with a hydroxy protecting group (such as methyl, ethyl, isopropyl, benzyl, p-methoxybenzyl, trityl, methoxymethyl, tetrahydropranyl acetyl, benzoate, trimethylsilyl, triethylsilyl, tri-isopropylsilyl, tert-butyldimethylsilyl or tert-butylidiphenylsilyl, further such as benzyl from benzyl bromide, and tert-butylidiphenylsilyl from TBSCI) to provide a protected hydroxybenzofuran of formula 5. The compound of formula 5 is reacted with alkyl diazo-acetate (such as ethyl diazo-acetate) in the presence of a Rh or Cu catalyst to provide a cyclopropane derivative of formula 6. The chiral derivative of formula 6 may be obtained by using a chiral catalyst formed in situ from Cu(OOCF$_3$)$_2$ and a chiral amino alcohol or by using a commercially available chiral Rh catalyst. The compound of formula 6 is deprotected as described above to provide a phenol derivative (for example, the TMS protecting group may be removed by treating with HCl/EtOH). Formula 7 can be obtained using simple recrystallization.

The resulting phenol derivative of formula 7 is reacted with haloheteroaryl derivative (such as fluoro-substituted heteroaryl derivative) to provide a compound of formula 8, which subsequently is hydrolyzed into the free acid of formula 9 by using a base such as sodium hydroxide. A compound of formula 9 is reacted with DPPA (diphenylphosphoryl azide) to form formula 10, which is rearranged to afford a compound of Formula I in the presence of the aniline.

In some embodiments, a large number of tablets can be prepared by conventional procedures so that the dosage unit comprises, for example, 100 milligrams of the at least one compound selected from compounds of Formula (I), (II), or (III), stereoisomers thereof, and pharmacologically acceptable salts thereof, 0.2 milligrams of colloidal silicon dioxide, 5 milligrams of magnesium stearate, 275 milligrams of microcrystalline cellulose, 11 milligrams of starch and 98.8 milligrams of lactose. Appropriate coatings may be applied to increase palatability or delay absorption.

In some embodiments, a parenteral composition suitable for administration by injection can be prepared by stirring 1.5% by weight of the at least one compound and/or at least an enantiomer, a diastereomer, or pharmacologically acceptable salt thereof disclosed herein in 10% by volume propylene glycol. The solution is made to the expected volume with water for injection and sterilized.

In some embodiment, an aqueous suspension can be prepared for oral administration. For example, each 5 milliliters of an aqueous suspension comprising 100 milligrams of finely divided at least one compound selected from compounds of Formula (I), (II), or (III), stereoisomers thereof, and pharmacologically acceptable salts thereof, 100 milligrams of sodium carboxymethyl cellulose, 5 milligrams of sodium benzoate, 1.0 grams of sorbitol solution, U.S.P., and 0.025 milliliters of vanillin can be used.

The same dosage forms can generally be used when the at least one compound selected from compounds of Formula (I), (II), or (III), stereoisomers thereof, and pharmacologically acceptable salts thereof are administered stepwise or in conjunction with at least one other therapeutic agent. When drugs are administered in physical combination, the dosage form and
administration route should be selected depending on the compatibility of the combined drugs. Thus the term "coadministration" is understood to include the administration of at least two agents concomitantly or sequentially, or alternatively as a fixed dose combination of the at least two active components.

The at least one compound selected from compounds of Formula (I), (II), or (III), stereoisomers thereof, and pharmaceutically acceptable salt thereof disclosed herein can be administered as the sole active ingredient or in combination with at least one second active ingredient, selected, for example, from other active ingredients known to be useful for treating cancers in a patient.

Example 1: Synthesis of Compounds 1.1-1.87

**Compound 1.1:** 1-((1S,1aS,6bS)-5-((7-oxo-5,6,7,8-tetrahydro-1,8-naphthyridin-4-yl) oxy)-la,6b-dihydro-1H-cyclopropa[b]benzofuran-1-yl)-3-(3-(trifluoromethyl) phenyl)urea

Step A: 1-(2,2-diethoxyethoxy)-4-methoxybenzene
To a stirred solution of 4-methoxyphenol (500 g, 4 mol) in DMSO (500 mL) was added KOH (400 g, 7.1 mol, 1.78 eq) at room temperature. After stirring for 20 min, the resulted mixture was heated to 120 °C. 2-bromo-1,1-diethoxyethane (850 g, 4.3 mol) was added in drops within 2 hour at this temperature and stirred for another 2 hours. The mixture was treated with water (1000 mL) and PE (1000 mL), filtered through a celite pad. The liquid phase was extracted with PE (500 mL × 2). The combined organics was washed with aqueous NaOH (2 N, 300 mL × 2), brine (500 mL × 3), dried over anhydrate sodium sulfate and concentrated under reduced pressure to give the title compound (850 g, 88%) as a light yellow oil which was used into next step directly.

The reaction mixture was cooled to 0 °C and added into warmed BBr₃ with toluene with water within KOH reduced filtered generated pressure 2), mixture 3H) 9.0 ppm.

Step B: 5-methoxybenzofuran

The mixture of the product of Step A (420 g, 1.87 mmol) and Amberlyst 15 (42 g) in toluene (2 L) was stirred at reflux for 6 hrs with concomitant azeotrope removal of EtOH generated in the reaction (keep the solvent more than 1.5 L). The resulting reaction mixture was filtered and the resin was washed with an excess of toluene. The combined filtrates were concentrated to dryness under reduced pressure. The crude product was distilled at 100 °C under reduced pressure through a lab oil pump to afford (105 g, 74 °C fraction). The solid was diluted with 1000 mL of PE and washed with NaOH (3 M, 200 mL x 2), brine (500 mL x 3), dried over anhydrate sodium sulfate and concentrated under reduced pressure to give the title compound (85 g, 33%) as a white solid. 1HNMR (400 MHz, CDCl₃) δ 7.59 (d, J = 2.0 Hz, 1H), 7.39 (d, J = 9.0 Hz, 1H), 7.05 (d, J = 2.4 Hz, 1H), 6.90 (dd, J = 9.0, 2.4 Hz, 1H), 6.73 – 6.68 (m, 1H), 3.84 (s, 3H) ppm.

To a solution of the product of Step B (50 g, 0.34 mol) in CH₂Cl₂ (1200 mL) was added BBr₃ (32.5 mL, 0.34 mol) in drops at -20 °C under N₂. After the addition, the mixture was warmed to 20 °C and stirred for 2 hrs. The reaction mixture was cooled to 0 °C and added into a
solution of NH$_3$/MeOH (3 mol/L, 500 mL) using a canula at -20 °C over a period of 15 min carefully. The mixture was concentrated and the residue was added EA (500 mL). The solid was filtered off through a silica pad and the filtrate was concentrated under reduced pressure to give the crude product (crude, 48 g) as a oil which was used for the next step directly. $^1$H NMR (400 MHz, DMSO-$d_6$) δ 9.14 (s, 1H), 7.86 (d, $J = 2.0$ Hz, 1H), 7.36 (d, $J = 8.8$ Hz, 1H), 6.94 (d, $J = 2.4$ Hz, 1H), 6.79 (dd, $J = 2.0$, 0.9 Hz, 1H), 6.74 (dd, $J = 8.8$, 2.4 Hz, 1H) ppm. MS: M/e 135 (M+1)$^+$

![Chemical structure of Compound 2.6]
Step A: methyl 4-chloropicolinate

Anhydrous DMF (1 mL) was slowly added to sulfurous dichloride (30 mL) at 45 °C. The solution was stirred at room temperature for 10 min, and then picolinic acid (10 g, 81 mmol) was added over 30 min. The resulting solution was heated at 72 °C for 16 hours to generate yellow solid. The mixture was cooled to room temperature, diluted with toluene (50 mL) and concentrated to 20 mL. The toluene addition/concentration process was repeated twice. The resulting solution and solid was added into 20 mL methanol at ice bath to keep the internal temperature below 55 °C. The mixture was stirred at room temperature for 45 min, cooled to 5 °C and treated with ethyl ether (20 mL) dropwisely. The resulting solid was filtered, washed with ethyl ether (20 mL) and dried under 35 °C to provide a white yellow solid. After the solid were solvated to hot water (50 mL, 45 °C), sodium bicarbonate aqueous solution was added to adjust pH to 8-9. The mixture was extracted with ethyl acetate (2 x 30 mL) and the organic phase was concentrated to give desired compound (5.5 g, yield: 39.6%) as off-white solid.

Step B: 4-chloro-N-methylpicolinamide
To a solution of the product of Step A (5.5 g, 32.2 mmol) in methanol (60 mL) was added methylamine in methanol (2.2 mL) at 5 °C. The mixture was stirred at 0 ~ 5 °C for 2 hours. The solvent was evaporated at 40 ~ 50 °C to give the title compound (6.2 g, yield: 90%) as a yellow solid. H NMR (400 MHz, OMSO-d6) δ 8.85 (br, 1H), 8.63 (d, J = 5.2 Hz, 1H), 8.05 - 8.02 (m, 1H), 7.76 (dd, J = 5.2, 2.0 Hz, 1H), 2.85 (d, J = 4.8 Hz, 3H). MS: M/e 171 (M+1) +.

The mixture of (S,S,6R)-ethyl 5-hydroxy-la,6b-dihydro-lH-cyclopropa[b]benzofuran-1-carboxylate (the product of Step G in synthesis of Compound 1.1, 2.2 g, 10 mmol), tert-butyl (4-fluoropyridin-2-yl)carbamate (2.1 g, 10 mmol) and cesium carbonate (6.5 g, 20 mmol) in

The residue was diluted with EA (300 mL), washed with brine (100 mL x 3), dried over anhydrous sodium sulfate and concentrated under reduced pressure. The residue was purified by silica gel chromatography (silica weight: 20 g, petroleum ether/EA: 2/3, 1500 mL) to give the target compound (1.0 g, 30%) as brown oil.  

H NMR (400 MHz, DMSO-<sup>6</sup>) δ 7.83 (d, J = 6.0 Hz, 1H), 7.37 (d, J = 2.4 Hz, 1H), 7.08 - 6.96 (m, 2H), 6.16 (dd, J = 6.0, 2.4 Hz, 1H), 5.95 (s, 2H), 5.81 (d, J = 2.4 Hz, 1H), 5.35 (dd, J = 5.2, 1.2 Hz, 1H), 4.17 (q, J = 7.2 Hz, 2H), 3.44 (dd, J = 5.2, 3.2 Hz, 1H), 1.39 (dd, J = 3.2, 1.2 Hz, 1H), 1.27 (t, J = 7.2 Hz, 3H)ppm.

A mixture of the product of step A (600 mg, 2 mmol) in sodium hydroxide aqueous solution (2 mol/L, 2 mL, 4 mmol) and THF (8 mL) was stirred at 60 °C for 2 hours. The solid was collected and dried in air to afford the title compound (500 mg, yield: 88%) as a white solid. H NMR (400 MHz, DMSO-<sup>6</sup>) δ 7.73 (d, J = 5.6 Hz, 1H), 7.27 (d, J = 2.4 Hz, 1H), 6.97-6.88 (m, 2H), 6.09 (dd, J = 5.6, 2.4 Hz, 1H), 5.90 (s, 2H), 5.71 (d, J = 2.0 Hz, 1H), 5.19 (d, J = 5.2 Hz, 1H), 3.27 (dd, J = 5.2, 2.8 Hz, 1H), 1.15 - 1.13 (m, 1H)ppm.

**Raf 1IC50 Assay Protocol**

Compounds disclosed herein were tested against B-Raf (V600E) (PV3849, from Invitrogen) or C-Raf (Y340D/Y341D) (PV3805, from Invitrogen) in a time-resolved fluorescence energy transfer assay. The assay was carried out in reactions (10 µL) containing 0.0625nM B-Raf or 0.5nM C-Raf, 25 mM Tris pH7.4, 10 mM MgCl2, 0.5 mM EGTA, 0.5 mM Na3V04, 5 mM beta-glycerophosphate, 0.01% Triton X-100, 2.5 mM DTT, 0.1% BSA, 0.1 mM ATP, 13.7 nM GST-tagged MEK1 (Full-length protein with K97R mutation, recombinant protein purified from bacterial expression system) and 0-5 µM compounds disclosed herein (final concentration of 1% DMSO). The enzyme was incubated with the compounds at room temperature for 60 minutes and the reactions were initiated by the addition of ATP and GST-MEK1. After reaction at room temperature for 60 minutes, an equal volume of stop/detection solution was added according to the manufacturer’s instruction (CisBio Bioassays). The stop/detection solution contained Eu3+ cryptate-conjugated anti-phospho MEK1/2 (Ser217/221) rabbit polyclonal antibody and d2-conjugated anti-GST mouse monoclonal antibody in buffer containing 25 mM Tris pH7.4, 400 mM KF, 50 mM EDTA, 0.01% BSA and 0.01% Triton X-100. Plates were sealed and incubated at room temperature for 2 hours, and the TR-FRET signals (ratio of fluorescence emission at 665 nm over emission at 620 nm with excitation at 337 nm wavelength) were recorded on a PHERAsstar FS plate reader (BMG Labtech). Phosphorylation of MEK1 led to the binding of anti-phospho-MEK1/2 antibody to GST-MEK1 protein that place fluorescent donor (Eu3+ cryptate) in close proximity to the accepter d2 on the anti-GST antibody, thus resulting in a high
degree of fluorescence resonance energy transfer from the donor fluorophore (at 620 nm) to the
acceptor fluorophore (at 665 nm). Inhibition of RAF kinase activity resulted in decrease of the
TR-FRET signal. The IC50 for each compound was derived from fitting the dose-response %
inhibition data to the four-parameter logistic model by Graphpad Prism software.

WT B-Raf IC50 Assay Protocol

Compounds disclosed herein were tested against wild type B-Raf (PV3848, from Invitrogen) in a time-resolved fluorescence energy transfer assay. The assay was carried out in reactions (10 µL) containing 0.5nM B-Raf, 25 mM Tris pH7.4, 10 mM MgCl2, 0.5 mM EGTA, 0.5 mM Na3VO4, 5 mM beta-glycerophosphate, 0.01% Triton X-100, 2.5 mM DTT, 0.1% BSA, 2.9 µM or 2.5 mM ATP, 10 nM GST-tagged MEK1 (Full-length protein with K97R mutation, recombinant protein purified from bacterial expression system) and 0-10 µM compounds disclosed herein (final concentration of 1% DMSO). The enzyme was incubated with the compounds at room temperature for 120 minutes and the reactions were initiated by the addition of ATP and GST-MEK1. After incubating at room temperature for 60 minutes, an equal volume of stop buffer containing 25 mM Tris pH7.4, 400 mM KF, 50 mM EDTA, 0.1% BSA, 0.01% Triton X-100, 1 test of Eu3+ Cryptate-conjugated rabbit polyclonal antibody anti-Phospho MEK1/2 (Ser217/221) and 1 test of d2-conjugated mouse monoclonal antibody anti-glutathione S-transferase was added to stop the reactions. Plates were sealed and incubated at room temperature for 1.5 hours, and then the TR-FRET signals were read on BMG PHERAstar FS instrument. The IC50 for each compound was calculated by non linear regression by Graphpad Prism software.

P61-A375 Cell Expression

To express p61 in mammalian cells, cDNA encoding the p61 (Poulikakos et al., Nature, 2011 Nov 23; 480(7377):387-90) was synthesized by Genscript and cloned into pLVX-IRES-Puro vector (Clontech). The cDNA was a modified form of p61 in which sequencing encoding the flag-epitope had been inserted to the C-terminus, resulting in the expression of flag-tagged forms of protein. A375 cells were stably transfected with the Flag-p61 expressing plasmid and selected with DMEM containing 0.3ng/mL puromycin (Invitrogen). Cells were cloned by limiting dilution in a 96-wells plate and the clones screened by western blot analysis using a monoclonal antibody directed against the flag-epitope.

ERK Phosphorylation Inhibition IC50 Assay Protocol
To determine inhibition of ERK phosphorylation, A375, p61-A375, Calu-6 and HeLa were seeded at $3 \times 10^4$ per well of a 96-wells plate and left to attach for 16 hours. Growth medium was then replaced with 100 µM of serum free DMEM, cells were then treated with a 10-point titration of compounds disclosed herein. After 1 hour compound treatment, 50 µL of lysis buffer (Cisbio) were added to each well and incubated at room temperature with shaking for 30 minutes. A total of 16 µL of cell lysate from each well of a 96-well plate was transferred to a 384-well small volume white plate. Lysate from each well was incubated with 2 µL of Eu$^{3+}$-cryptate (donor) labeled anti-ERK antibody (Cisbio) and 2 µL of D2 (acceptor) labeled anti-phospho-ERK antibody (Cisbio) for 2 hours at room temperature. When donor and acceptor are in close proximity, excitation of the donor with laser triggers a Fluorescence Resonance Energy Transfer (FRET) towards the acceptor, which in turn fluoresces at 655 nm wavelength. Fluorescence values were measured using a BMG reader.

IC$_{50}$ values for ERK inhibition were calculated by fitting dose-dependent data to the four-parameter logistic model using GraphPad Prism software.

**Anti-Proliferative Activity EC50 Assay Protocol**

The growth-inhibitory activity of compounds in A375 and p61-A375, was determined using CellTiter-Glo luminescent cell viability assay (Promega). The 2,000 cells were seeded per well of a 96-well plate to ensure logarithmic growth could occur over the 3 days treatment period. Cells were left to attach for 16 hours, cells were treated in duplicate with a 10-point dilution series. Following a 3-day exposure to compounds disclosed herein, a volume of CellTiter-Glo reagent equal to the volume of cell culture medium present in each well was added. Mixture was mixed on an orbital shaker for 2 minutes to allow cell lysis, followed by 10 minutes incubation at room temperature to allow stabilization of luminescent signal, which corresponded to quantitation of ATP and thus the quantitation of metabolically active cells. Luminescent signal was measured using Pherastar FS reader (BMG Labtech).

EC$_{50}$ values for cell viability were calculated with GraphPad Prism software and are the mean of 3 independent assays. EC$_{50}$ values for growth inhibition were calculated by fitting dose-dependent data to the four-parameter logistic model using GraphPad Prism software.
