The invention provides compounds of formula (I) wherein R’-R⁴ have any of the values defined in the specification, and salts thereof. The compounds are useful as dopamine receptor modulators for the treatment of diseases where modulation of dopamine receptors is implicated (e.g. sexual dysfunction, prolactinoma, Parkinson’s disease, and Cushing’s disease).

![Diagram of compound (I)]
ERGOLINE DERIVATIVES AS DOPAMINE RECEPTOR MODULATORS

Priority of Invention

This application claims priority to United States Provisional Application Number 61/728,121 that was filed on November 19, 2012. The entire content of this provisional application is hereby incorporated herein by reference.

Background of the Invention

Unfortunately, cabergoline is also a potent agonist of the 5-HT2B receptor (with a reported Kj of 1.2 nM) and, like other 5-HT2B agonists such as nor-dexfenfluramine, is known to cause cardiac-valve regurgitation (CVR) in patients. This potentially fatal complication has greatly limited the

In spite of the above reports, there is currently a need for therapeutic agents that have the useful therapeutic properties of cabergoline, but that lack the unwanted effects associated with agonism of the 5-HT3 receptor.

**Summary of the Invention**

Applicant has identified a series of compounds that have reduced agonist activity at the 5-HT3 receptor. Representative compounds were found to modulate the D2 receptor and/or the D4 receptor. Accordingly, the compounds are useful for treating diseases and conditions wherein the activity of dopamine receptors is implicated (e.g. sexual dysfunction, prolactinomas, Parkinson's disease, and Cushings disease). Accordingly the invention provides a compound of formula I:

![Chemical Structure](attachment://structure.png)

wherein:

R1 is -C(=0)NR2R3, -C(=0)OR4, (C1-C6)alkyl, (C1-C6)alkanoyl, (C1-C6)alkoxycarbonyl, or (C1-C6)alkanoyloxy, wherein any (C1-C6)alkyl, (C1-C6)alkanoyl, (C1-C6)alkoxycarbonyl, or (C1-C6)alkanoyloxy can optionally be substituted with one or more halo, hydroxy, (Q-C1-alkoxy, (Q-C1-alkanoyl, (Q-C1-alkoxycarbonyl, (Q-C1-alkanoyloxy, or NR5R6; R2 is H or (C1-C6)alkyl;

R3 is methyl;

R4 is H, halo, -C(=0)NR5R6, -C(=0)OR7, (C1-C6)alkyl, (C1-C6)alkanoyl, (C1-C6)alkoxycarbonyl, or (Q-C1-alkanoyloxy, wherein any (C1-C6)alkyl, (C1-C6)alkanoyl, (C1-C6)alkoxycarbonyl, or (C1-C6)alkanoyloxy can optionally be substituted with one or more halo, hydroxy, (C1-C6)alkoxy, (C1-C6)alkanoyl, (C1-C6)alkoxycarbonyl, (C1-C6)alkanoyloxy, or NR5R6;
R_a and R_b are each independently H, (C_1-C_6)alkyl, -C(=0)NR_fR_g, or (C_1-C_6)alkanoyl, wherein any (Q-C^alkyl or (Q-C^alkanoyl can optionally be substituted with one or more NRfR_g; or R_a and R_b together with the nitrogen to which they are attached form a heterocyclic ring;

R_c is H, (CrC_6)alkyl, or aryl;

R_d and R_e are each independently H or (C_1-C_6)alkyl; or R_d and R_e together with the nitrogen to which they are attached form a heterocyclic ring; and

R_f and R_g are each independently H or (C_1-C_6)alkyl; or R_f and R_g together with the nitrogen to which they are attached form a heterocyclic ring;

R_h and R_k are each independently H, (C_1-C_6)alkyl or (Q-C^alkanoyl, wherein any (C_1-C_6)alkyl or (d-C^alkanoyl can optionally be substituted with one or more NRfR_g; or R_h and R_k together with the nitrogen to which they are attached form a heterocyclic ring;

R_m and R_n are each independently H or (d-C^alkyl; or R_m and R_n together with the nitrogen to which they are attached form a heterocyclic ring;

or a salt thereof.

The invention also provides a pharmaceutical composition comprising a compound of formula I or a pharmaceutically acceptable salt thereof, and a pharmaceutically acceptable diluent or carrier.

The invention also provides a method for treating sexual dysfunction, prolactinoma, Parkinson's disease, depression, restless leg syndrome, or Cushings disease in an animal comprising administering a compound of formula I or a pharmaceutically acceptable salt thereof to the animal.

As described herein, sexual dysfunction includes, for example, decreased desire and orgasm disorders (endogenous or induced, e.g., induced by drugs (e.g., SSRIs, such as fluoxetine)). In certain embodiments, the sexual dysfunction is anorgasmia induced by administration of an SSRI (e.g., chronic administration of the SSRI).

The invention also provides a compound of formula I or a pharmaceutically acceptable salt thereof for use in medical therapy.

The invention also provides a compound of formula I or a pharmaceutically acceptable salt thereof for the prophylactic or therapeutic treatment of sexual dysfunction, prolactinoma, Parkinson's disease, depression, restless leg syndrome, or Cushings disease.

The invention also provides the use of a compound of formula I or a pharmaceutically acceptable salt thereof to prepare a medicament for treating sexual dysfunction, prolactinoma, Parkinson's disease, depression, restless leg syndrome, or Cushings disease in an animal (e.g. a
mammal such as a human).

The invention also provides a method for modulating the activity of a dopamine receptor in an animal comprising administering a compound of formula I or a pharmaceutically acceptable salt thereof to the animal.

The invention also provides a compound of formula I or a pharmaceutically acceptable salt thereof for the prophylactic or therapeutic treatment of a disease associated with a dopamine receptor.

The invention also provides the use of a compound of formula I or a pharmaceutically acceptable salt thereof to prepare a medicament for modulating the activity of a dopamine receptor in an animal (e.g. a mammal such as a human).

The invention also provides processes and intermediates disclosed herein that are useful for preparing a compound of formula I or a salt thereof.

**Detailed Description**

The following definitions are used, unless otherwise described: halo is fluoro, chloro, bromo, or iodo. Alkyl, alkoxy, etc. denote both straight and branched groups; but reference to an individual radical such as propyl embraces only the straight chain radical, a branched chain isomer such as isopropyl being specifically referred to. Aryl denotes a phenyl radical or an ortho-fused bicyclic carbocyclic radical having about nine to ten ring atoms in which at least one ring is aromatic. Heteroaryl encompasses a radical of a monocyclic aromatic ring containing five or six ring atoms consisting of carbon and one to four heteroatoms each selected from the group consisting of non-peroxide oxygen, sulfur, and N(X) wherein X is absent or is H, O, (Ci-C5)alkyl, phenyl or benzyl, as well as a radical of an ortho-fused bicyclic heterocycle of about eight to ten ring atoms comprising one to four heteroatoms each selected from the group consisting of non-peroxide oxygen, sulfur, and N(X).

The term "heterocyclic ring" refers to a saturated or a partially unsaturated (i.e., having one or more double and/or triple bonds within the ring) 3-15 membered mono-, bi-, or tricyclic group in which one or more (e.g. 1, 2, 3, or 4) ring atoms are heteroatoms independently selected from nitrogen, oxygen, and sulfur, the remaining ring atoms being carbon. In one embodiment, heterocyclic ring is a saturated or partially unsaturated 4-6 membered monocyclic group. A heterocyclic ring may be substituted with one or more (e.g. 1, 2 or 3) oxo groups and the sulfur and nitrogen atoms may also be present in their oxidized forms. Examples of heterocyclic rings include aziridine, azetadine, morpholino, piperazino, pyrrolidino or piperidino.
It will be appreciated by those skilled in the art that compounds of the invention having a chiral center may exist in and be isolated in optically active and racemic forms. Some compounds may exhibit polymorphism. It is to be understood that the present invention encompasses any racemic, optically-active, polymorphic, or stereoisomeric form, or mixtures thereof, of a compound of the invention, which possess the useful properties described herein, it being well known in the art how to prepare optically active forms (for example, by resolution of the racemic form by recrystallization techniques, by isolation from biological sources, by synthesis from optically-active starting materials, by chiral synthesis, or by chromatographic separation using a chiral stationary phase.

Specific values listed below for radicals, substituents, and ranges, are for illustration only; they do not exclude other defined values or other values within defined ranges for the radicals and substituents.

Specifically, \((C_1-C_6)\)alkyl can be methyl, ethyl, propyl, isopropyl, butyl, iso-butyl, sec-butyl, pentyl, 3-pentyl, or hexyl; \((C_1-C_6)\)alkoxy can be methoxy, ethoxy, propoxy, isopropoxy, butoxy, isobutoxy, sec-butoxy, pentoxy, 3-pentoxy, or hexyloxy; \((Q-C^alkanoyl)\) can be acetyl, propanoyl or butanoyl; halo\((C_i-C_6)\)alkyl can be iodomethyl, bromomethyl, chloromethyl, fluoromethyl, trifluoromethyl, 2-chloroethyl, 2-fluoroethyl, 2,2,2-trifluoroethyl, or pentafluoroethyl; \((C_1-C_6)\)alkoxycarbonyl can be methoxycarbonyl, ethoxycarbonyl, propoxycarbonyl, isopropoxycarbonyl, butoxycarbonyl, pentoxy carbonyl, or hexyloxy carbonyl; \((C_2-C_6)\)alkanoyloxy can be acetoxy, propanoyloxy, butanoyloxy, isobutanoyloxy, pentanoyloxy, or hexanoyloxy; and aryl can be phenyl, indenyl, or naphthyl.

A specific compound of formula I is a compound of formula la:

\[
\text{R}^1 \quad \text{N} \quad \text{CH}_3 \\
\text{H} \quad \text{H}^\text{a} \\
\text{N} \quad \text{R}^2 \text{ (la)}
\]

or a salt thereof. In one embodiment the invention provides a compound of formula I that is at least about 60, 75, 80, 90, 95, 98, or 99 percent enriched in the diasteromer of formula la.
A specific compound of formula I is a compound of formula lb:

![Chemical structure of lb](image)

or a salt thereof.

A specific compound of formula I is a compound of formula lc:

![Chemical structure of lc](image)
A specific compound of formula I is a compound of formula Id:

![Chemical structure](Image)

A specific value for $R^1$ is $\text{-C(=0)NR}_aR_b$.

A specific value for $R^1$ is $\text{-C(=0)OR}_c$.

A specific value for $R^1$ is $(\text{C}_1-\text{C}_6)\text{alkyl}$, $(\text{d-C}_6)\text{alkanoyl}$, $(\text{C}_1-\text{C}_6)\text{alkoxycarbonyl}$, or $(\text{C}_1-\text{C}_6)\text{alkanoyloxy}$, wherein any $(\text{C}_1-\text{C}_6)\text{alkyl}$, $(\text{C}_1-\text{C}_6)\text{alkanoyl}$, $(\text{C}_1-\text{C}_6)\text{alkoxycarbonyl}$, or $(\text{C}_1-\text{C}_6)\text{alkanoyloxy}$ can optionally be substituted with one or more halo, hydroxy, $(\text{Q-C}^\text{alkoxy}$, $(\text{Q-C}^\text{alkanoyloxy}$, or$\text{NR}_jR_e$.

A specific value for $R^1$ is $(\text{C}_1-\text{C}_6)\text{alkyl}$, optionally substituted with one or more $(\text{C}_1-\text{C}_6)\text{alkoxy}$.

A specific value for $R^1$ is dimethoxymethyl.

A specific value for $R^1$ is $7V-(3\text{-dimethylaminopropyl})\text{aminocarbonyl}$.

A specific value for $R^1$ is:
A specific value for $R^1$ is:

A specific value for $R^2$ is $H$.

A specific value for $R^2$ is (C1-C6)alkyl.

A specific value for $R^2$ is methyl.

In one embodiment of the invention $R_a$ and $R_b$ are each independently $H$, (CrC^alkyl or (C1-C6)alkanoyl, wherein any (C1-C6)alkyl or (C1-C6)alkanoyl can optionally be substituted with one or more $NRfR_g$; or $R_a$ and $R_b$ together with the nitrogen to which they are attached form a morpholino, piperazino, pyrrolidino or piperidino.

In one embodiment of the invention $R_d$ and $R_e$ are each independently $H$ or (C1-C6)alkyl; or $R_d$ and $R_e$ together with the nitrogen to which they are attached form a morpholino, piperazino, pyrrolidino or piperidino.

In one embodiment of the invention $R_f$ and $R_g$ are each independently $H$ or (C1-C6)alkyl; or $R_f$ and $R_g$ together with the nitrogen to which they are attached form a morpholino, piperazino, pyrrolidino or piperidino.

In one embodiment of the invention $R_h$ and $R_k$ are each independently $H$, (Q-C^alkyl or (C1-C6)alkanoyl, wherein any (Q-C^alkyl or (C1-C6)alkanoyl can optionally be substituted with one or more $NRfR_g$; or $R_a$ and $R_b$ together with the nitrogen to which they are attached form a morpholino, piperazino, pyrrolidino or piperidino.

In one embodiment of the invention $R_m$ and $R_n$ are each independently $H$ or (C1-C6)alkyl; or $R_d$ and $R_e$ together with the nitrogen to which they are attached form a morpholino, piperazino, pyrrolidino or piperidino.

In one embodiment of the invention the compound is a partial agonist of 5-HT2B.
In one embodiment of the invention the compound is not an agonist or a partial agonist of 5-HT2B.

In one embodiment of the invention the compound is an antagonist of 5-HT2B.

In one embodiment the invention provides compounds that demonstrate less than 10% agonism of 5-HT2B in the functional assay reported by Porter, R. H. P., et al., *Br. J. Pharmacol.* 1999, **128**, 13-20.

In one embodiment the invention provides compounds that demonstrate less than 5% agonism of 5-HT2B in the functional assay reported by Porter, R. H. P., et al., *Br. J. Pharmacol.* 1999, **128**, 13-20.

Processes for preparing compounds of formula I are provided as further embodiments of the invention and are illustrated by the following procedures in which the meanings of the generic radicals are as given above unless otherwise qualified.

Compounds of the invention can be prepared as illustrated in Schemes 1 and 2.

**Scheme 1. Synthesis of Compounds of the Invention**

(a) R³-NH₂, acetic acid, 120 °C; (b) toluene, 115 °C.
Scheme 2. Alternate Synthesis of Compounds of the Invention

(a) i. CH₂C₂, 0 °C; ii. NEt₃, p-toluenesulfonyl chloride, reflux. (b) NEt₃, CH₂C₂₁₂.

In cases where compounds are sufficiently basic or acidic, a salt of a compound of formula I can be useful as an intermediate for isolating or purifying a compound of formula I. Additionally, administration of a compound of formula I as a pharmaceutically acceptable acid or base salt may be appropriate. Examples of pharmaceutically acceptable salts are organic acid addition salts formed with acids which form a physiological acceptable anion, for example, tosylate, methanesulfonate, acetate, citrate, malonate, tartarate, succinate, benzoate, ascorbate, a-ketoglutarate, and a-glycerophosphate. Suitable inorganic salts may also be formed, including hydrochloride, sulfate, nitrate, bicarbonate, and carbonate salts.

Pharmaceutically acceptable salts may be obtained using standard procedures well known in the art, for example by reacting a sufficiently basic compound such as an amine with a suitable acid affording a physiologically acceptable anion. Alkali metal (for example, sodium, potassium or lithium) or alkaline earth metal (for example calcium) salts of carboxylic acids can also be made.

The compounds of formula I can be formulated as pharmaceutical compositions and administered to a mammalian host, such as a human patient in a variety of forms adapted to the chosen route of administration, i.e., orally or parenterally, by intravenous, intramuscular, topical or subcutaneous routes.
Thus, the present compounds may be systemically administered, e.g., orally, in combination with a pharmaceutically acceptable vehicle such as an inert diluent or an assimilable edible carrier. They may be enclosed in hard or soft shell gelatin capsules, may be compressed into tablets, or may be incorporated directly with the food of the patient's diet. For oral therapeutic administration, the active compound may be combined with one or more excipients and used in the form of ingestible tablets, buccal tablets, troches, capsules, elixirs, suspensions, syrups, wafers, and the like. Such compositions and preparations should contain at least 0.1% of active compound. The percentage of the compositions and preparations may, of course, be varied and may conveniently be between about 2 to about 60% of the weight of a given unit dosage form. The amount of active compound in such therapeutically useful compositions is such that an effective dosage level will be obtained.

The tablets, troches, pills, capsules, and the like may also contain the following: binders such as gum tragacanth, acacia, corn starch or gelatin; excipients such as dicalcium phosphate; a disintegrating agent such as corn starch, potato starch, alginic acid and the like; a lubricant such as magnesium stearate; and a sweetening agent such as sucrose, fructose, lactose or aspartame or a flavoring agent such as peppermint, oil of wintergreen, or cherry flavoring may be added. When the unit dosage form is a capsule, it may contain, in addition to materials of the above type, a liquid carrier, such as a vegetable oil or a polyethylene glycol. Various other materials may be present as coatings or to otherwise modify the physical form of the solid unit dosage form. For instance, tablets, pills, or capsules may be coated with gelatin, wax, shellac or sugar and the like. A syrup or elixir may contain the active compound, sucrose or fructose as a sweetening agent, methyl and propylparabens as preservatives, a dye and flavoring such as cherry or orange flavor. Of course, any material used in preparing any unit dosage form should be pharmaceutically acceptable and substantially non-toxic in the amounts employed. In addition, the active compound may be incorporated into sustained-release preparations and devices.

The active compound may also be administered intravenously or intraperitoneally by infusion or injection. Solutions of the active compound or its salts can be prepared in water, optionally mixed with a nontoxic surfactant. Dispersions can also be prepared in glycerol, liquid polyethylene glycols, triacetin, and mixtures thereof and in oils. Under ordinary conditions of storage and use, these preparations contain a preservative to prevent the growth of microorganisms.

The pharmaceutical dosage forms suitable for injection or infusion can include sterile aqueous solutions or dispersions or sterile powders comprising the active ingredient which are adapted for the extemporaneous preparation of sterile injectable or infusible solutions or dispersions,
optionally encapsulated in liposomes. In all cases, the ultimate dosage form should be sterile, fluid and stable under the conditions of manufacture and storage. The liquid carrier or vehicle can be a solvent or liquid dispersion medium comprising, for example, water, ethanol, a polyol (for example, glycerol, propylene glycol, liquid polyethylene glycols, and the like), vegetable oils, nontoxic glyceryl esters, and suitable mixtures thereof. The proper fluidity can be maintained, for example, by the formation of liposomes, by the maintenance of the required particle size in the case of dispersions or by the use of surfactants. The prevention of the action of microorganisms can be brought about by various antibacterial and antifungal agents, for example, parabens, chlorobutanol, phenol, sorbic acid, thimerosal, and the like. In many cases, it will be preferable to include isotonic agents, for example, sugars, buffers or sodium chloride. Prolonged absorption of the injectable compositions can be brought about by the use in the compositions of agents delaying absorption, for example, aluminum monostearate and gelatin.

Sterile injectable solutions are prepared by incorporating the active compound in the required amount in the appropriate solvent with various of the other ingredients enumerated above, as required, followed by filter sterilization. In the case of sterile powders for the preparation of sterile injectable solutions, the preferred methods of preparation are vacuum drying and the freeze drying techniques, which yield a powder of the active ingredient plus any additional desired ingredient present in the previously sterile-filtered solutions.

For topical administration, the present compounds may be applied in pure form, i.e., when they are liquids. However, it will generally be desirable to administer them to the skin as compositions or formulations, in combination with a dermatologically acceptable carrier, which may be a solid or a liquid.

Useful solid carriers include finely divided solids such as talc, clay, microcrystalline cellulose, silica, alumina and the like. Useful liquid carriers include water, alcohols or glycols or water-alcohol/glycol blends, in which the present compounds can be dissolved or dispersed at effective levels, optionally with the aid of non-toxic surfactants. Adjuvants such as fragrances and additional antimicrobial agents can be added to optimize the properties for a given use. The resultant liquid compositions can be applied from absorbent pads, used to impregnate bandages and other dressings, or sprayed onto the affected area using pump-type or aerosol sprayers.

Thickeners such as synthetic polymers, fatty acids, fatty acid salts and esters, fatty alcohols, modified celluloses or modified mineral materials can also be employed with liquid carriers to form spreadable pastes, gels, ointments, soaps, and the like, for application directly to the skin of the user.
Examples of useful dermatological compositions which can be used to deliver the compounds of formula I to the skin are known to the art; for example, see Jacquet et al. (U.S. Pat. No. 4,608,392), Geria (U.S. Pat. No. 4,992,478), Smith et al. (U.S. Pat. No. 4,559,157) and Wortzman (U.S. Pat. No. 4,820,508).

Useful dosages of the compounds of formula I can be determined by comparing their in vitro activity, and in vivo activity in animal models. Methods for the extrapolation of effective dosages in mice, and other animals, to humans are known to the art; for example, see U.S. Pat. No. 4,938,949.

The amount of the compound, or an active salt or derivative thereof, required for use in treatment will vary not only with the particular salt selected but also with the route of administration, the nature of the condition being treated and the age and condition of the patient and will be ultimately at the discretion of the attendant physician or clinician.

The desired dose may conveniently be presented in a single dose or as divided doses administered at appropriate intervals, for example, as two, three, four or more sub-doses per day. The sub-dose itself may be further divided, e.g., into a number of discrete loosely spaced administrations; such as multiple inhalations from an insufflator or by application of a plurality of drops into the eye.

Compounds of the invention can also be administered in combination with other therapeutic agents, for example, other agents that are useful for the treatment of depression. Examples of such agents include selective serotonin reuptake inhibitors such as for example, citalopram, dapoxetine, escitalopram, fluoxetine, fluvoxamine, indalpine, paroxetine, sertraline, vilazodone, and zimelidine.

The biological activity of representative compounds of the invention can be determined using a number of assays that are known. For example, 5-HT$_3$Bfunctional assays were performed following the procedure reported by Porter, R. H. P., et al., *Br. J Pharmacol.* 1999, 128, 13-20. 5-HT$_2$Bbinding assays were performed following the procedure reported by Choi, D.-S., et al., *FEBS Lett.* 1994, 352, 393-399, using an agonist radioligand. D$_2$ and D$_4$ functional assays were performed following the method reported by Jensen, N. H., et al., *Neuropsychopharmacology* 2007, 33, 2303-2312. Results from these assays are shown below.
Compound 1 and cabergoline were evaluated in a competitive binding assay at the 5-HT₂B receptor against 125I-radiolabeled 2,5-dimethoxy-4-iodoamphetamine, as well as in a 5-HT₂B functional assay using HTRF quantitation of IPI accumulation. Compound 1 was not significantly less active at the 5-HT₂B receptor than cabergoline. Both compounds were full agonists at the 5-HT₂B receptor.

Compound 8 demonstrated similar potency as cabergoline and compound 1 in a 5-HT₂B radioactive binding assay. A 5-HT₂B functional assay showed that the change from a 6-allyl group to a 6-methyl group was not enough to completely eliminate 5-HT₂B agonism, as compound 8 is a partial agonist, with an EC₅₀ of 16 nM and a Eₘ₉ₐₓ of 38%.
Compounds 9 and 15 showed no agonism in 5-HT₂B functional assays (n=6), while compound 14 showed minimal to no agonism in these assays (Eₘₐₓ < 12% in all cases). All three compounds were potent antagonists against serotonin at the 5-HT₂B receptor. These results demonstrated that it is indeed possible to synthesize compounds in which 5-HT₂B agonism has been eliminated. Further investigation into 9 revealed that it is a full D₄ agonist, a potent but partial D₂ agonist (EC₅₀ 1.4 nM, Eₘₐₓ 50%).

The invention will now be illustrated by the following non-limiting Examples.

**Examples**

**H NMR and ¹³C NMR** Spectra were recorded on a Bruker 400 spectrometer. The H NMR data are reported as follows: chemical shift in parts per million downfield of tetramethylsilane (TMS), multiplicity (s = singlet, b = broad singlet, d = doublet, t = triplet, q = quartet, quint = quintet and m = multiplet), coupling constant (Hz), and integrated value. The ¹³C NMR spectra were measured with complete proton decoupling. LC/MS analysis was carried out using a BEH C₁₈ column (2.1mm x 50 mm, 5 um) on a Waters Acquity UPLC system with a Waters ZQ mass detector.

**Example 1** Preparation of (5R,8R,10R)-6- Allyl- N-[3-(morpholino)propyl]-N-[(ethylamino)carbonyl]ergoline-8-carboxamide (1)

**a. ^-(S-morpholinoprop^-TV-ethylcarbodiimide (6).**

![Structural formula](Image)

To a stirred solution of ethyl isocyanate (1.035 g, 14.56 mmol) in CH₂Cl₂ (7.5 mL) at 0 °C was added a solution of 3-morpholinopropylamine (2.017 g, 13.99 mmol) in CH₂Cl₂ (2.5 mL) dropwise over 15 min. After stirring an additional 15 min., triethylamine (5.0 mL, 35.87 mmol) was added followed by p-toluenesulfonyl chloride (3.06 g, 16.05 mmol) in 3 mL of CH₂Cl₂ (added over 5 min.). The mixture was heated to a gentle reflux for three hours. After cooling to rt, Na₂CO₃ (4.0 g,
37.7 mmol) and ice water (40 mL) were added. After stirring for 20 min., the organic layer was removed and the aqueous layer extracted with CH\textsubscript{2}C\textsubscript{12} (30 mL). The combined organic layers were dried (Na\textsubscript{2}S\textsubscript{0.4}), filtered, and concentrated under reduced pressure. The crude material was used without further purification in the next step.

b. (5\textsubscript{R},8\textsubscript{R},10\textsubscript{R})-6-AUyl-N-[3-(morpholino)propyl]-7V-[(ethlamino)carbonyl]-ergoline-8-carboxamide (1).

\end{tabular}}
\]

Cabergolinic acid (2) was synthesized from cabergoline by the method of Wang and coworkers (Wang, Z.-X.; Li, Y.; Kondamreddy, M. et al. US 2007-797510, 2008). Cabergolinic acid (17.0 mg, 0.057 mmol) and 7V-(3-morpholinopropyl)-N'-ethylcarbodiimide (27.8 mg, 0.14 mmol) were stirred in CH\textsubscript{2}C\textsubscript{12} (2 mL) and NEt\textsubscript{3} (0.020 mL) overnight. The reaction mixture was concentrated under reduced pressure and the resulting residue purified by chromatography (20% acetonitrile/water to 100% acetonitrile, C\textsubscript{18} column) to yield 8.6 mg white solid (30% yield).

Compound 1 could also be synthesized from amide 4 according to the procedure for the synthesis of cabergoline developed by Ashford and coworkers (Ashford, S. W., et al., J. Org. Chem. 2002, 67, 7147-7150). \textsuperscript{1}H NMR (400 MHz, CDC\textsubscript{13}): 9.28 (bs, 1 H), 7.91 (bs, 1 H), 7.23-7.13 (m, 2H), 6.93-6.87 (m, 2H), 6.02-5.88 (m, 1H), 5.26 (d, J = 17.0 Hz, 1H), 5.19 (d, J = 9.8 Hz, 1H), 4.01-3.80 (m, 2H), 3.77-3.65 (m, 4H), 3.58 (dd, J = 14.5, 5.9 Hz, 1H), 3.46 (dd, J = 14.3, 3.9 Hz, 1H), 3.39-3.25 (m, 6H), 1.96-1.72 (m, 3H), 1.19 (t, J = 7.3 Hz, 3H). LC/MS calculated for C\textsubscript{28}H\textsubscript{39}N\textsubscript{5}O\textsubscript{3} + H\textsuperscript{+}, 494.3; observed, 494.3.
Example 2  Preparation of (5R,8R,10^)-6-Allyl-N-[3-(morpholino)propyl]ergoline-8-carboxamide (4).

Cabergoline (40.0 mg, 0.089 mmol) and 3-morpholinopropylamine (0.400 mL, 2.74 mmol) were stirred under nitrogen in a sealed tube at 65 °C for 6 d. After cooling, the reaction mixture was dissolved in CH₂Cl₂ and extracted several times with phosphate buffer (pH 6.0) to remove excess 3-morpholinopropylamine. Each buffer extract was then extracted with CH₂Cl₂, and the organic phase extracted several times with additional phosphate buffer. The combined organic layers were dried under vacuum to afford 30 mg of compound 4 as a brown solid (80% yield). ¹H NMR (400 MHz, CDCl₃): 8.00 (bs, 1H), 7.21-7.11 (m, 2H), 6.93-6.83 (m, 3H), 6.04-5.91 (m, IH), 5.25 (d, J = 17.1 Hz, IH), 5.19 (d, J = 10.1 Hz, IH), 3.76-3.66 (m, 4H), 3.58 (dd, J = 14.5, 5.7 Hz, IH), 3.50-3.32 (m, 4H), 3.23-3.15 (m, IH), 3.03-2.93 (m, IH), 2.83-2.58 (m, 3H), 2.58-2.41 (m, 8H), 1.78-1.66 (m, 3H). ¹³C NMR (CDCl₃): 25.0, 26.7, 31.4, 39.3, 40.6, 44.1, 53.8, 55.7, 56.5, 58.0, 63.6, 67.1, 108.7, 111.8, 113.1, 117.8, 118.4, 123.1, 126.1, 132.9, 133.3, 133.8, 173.7. LC/MS calculated for C₂₅H₃₄N₄O₂⁺ H⁺, 423.3; observed, 423.4.

Example 3  Preparation of (5R,8R,10R)-6-Methyl-ergoline-8-carboxylic acid methyl ester (7).

To a solution of dihydroergotamine methane sulfonate salt (617.5 mg, 0.908 mmol) in methanol (35 mL) was added NaOH (7.05 g, 176 mmol) in water (35 mL). The solution was stirred under nitrogen for 72 h, then diluted with dry methanol (250 mL) and acidified with concentrated
H₂SO₄. After stirring for 48 h, the mixture was diluted with water (600 mL), neutralized with K₂CO₃, and extracted with CH₂Cl₂ (3 x 300 mL). The combined organic layers were dried (MgSO₄), filtered, and concentrated under reduced pressure. Flash chromatography (CH₂Cl₂/methanol/NEt₃ 94:5:1, silica gel) resulted in 143.7 mg of compound 7 as a slightly yellow solid (56% yield). \(^1^H\) NMR (400 MHz, CDCl₃): 7.94 (bs, 1 H), 7.21-7.12 (m, 2H), 6.95 (bd, \(J = 6.2\) Hz, 1H), 6.89 (bs, 1 H), 3.74 (s, 3H), 3.41 (dd, \(J = 14.7, 4.3\) Hz, 1H), 3.32-3.21 (m, 1H), 3.04-2.89 (m, 3H), 2.77-2.62 (m, 1H), 2.51 (s, 3H), 2.36 (t, \(J = 11.5\) Hz, 1H), 2.24-2.16 (m, 1H), 1.60 (q, \(J = 11.5\) Hz, 1H). \(^{13}\)C NMR (CDCl₃): 26.9, 30.6, 40.2, 41.5, 43.1, 51.8, 58.7, 66.7, 108.7, 111.8, 113.3, 117.8, 123.2, 126.1, 132.7, 133.3, 174.4.

Example 4 Preparation of 6-Methylcabergoline (8).

a. \((5R,8R,10R)-6\)-Methyl-ergoline-8-carboxylic acid.

![Chemical Structure](attachment:structure.png)

To a solution of ester 7 (135.6 mg, 0.477 mmol) in methanol (5 mL) was added NaOH (183 mg) in water (0.30 mL). After 3 h, TLC analysis showed no remaining starting material. The reaction mixture was diluted with water (5 mL), acidified to pH 6 by slow addition of HCl, and then stirred at 0 °C for 90 min. The resulting solid was collected by filtration and washed with cold water. After drying, 91.9 mg of a white solid was obtained (71% yield). \(^1^H\) NMR (400 MHz, (CD₃)₂SO): 12.34 (bs, 1H), 10.62 (bs, 1H), 7.12 (d, \(J = 8.0\) Hz, 1H), 7.01 (t, \(J = 7.6\) Hz, 1H), 6.97 (bs, 1H), 6.79 (d, \(J = 7.1\) Hz, 1H), 3.35-3.25 (m, 1H), 3.14-3.07 (m, 1H), 2.85-2.68 (m, 3H), 2.57-2.50 (m, 1H), 2.37 (s, 3H), 2.16 (t, \(J = 11.4\) Hz, 1H), 2.03-1.94 (m, 1H), 1.34 (q, \(J = 13.0\) Hz, 1H).
b. 6-Methylcabergoline (8).

6-Methyl-ergoline-8-carboxylic acid (90 mg, 0.33 mmol) and N-(3-dimethylaminopropyl)-N-ethylcarbodiimide HCl (83 mg, 0.43 mmol) were stirred in CH₂Cl₂ (5 mL) and NEt₃ (0.050 mL) overnight. The reaction mixture was concentrated under reduced pressure and the resulting residue purified by chromatography (5% acetonitrile/water to 100% acetonitrile, C₁₈ column) to yield 18.2 mg of compound 8 as a white solid (13% yield). ¹H NMR (400 MHz, CDCl₃): 9.43 (bs, 1H), 7.91 (bs, IH), 7.22-7.12 (m, 2H), 6.94-6.87 (m, 2H), 3.95-3.76 (m, 2H), 3.51-3.40 (m, IH), 3.41 (dd, J = 14.7, 4.3 Hz, IH), 3.36-3.24 (m, 2H), 3.10 (dm, J = 11.1 Hz, IH), 3.07-2.97 (m, IH), 2.85-2.79 (m, IH), 2.75-2.65 (m, IH), 2.51 (t, J = 11.2 Hz, IH), 2.51 (s, 3H), 2.39-2.32 (m, 2H), 2.32-2.25 (m, IH), 2.25 (s, 6H), 1.87 (quint, J = 6.9 Hz, 2H), 1.78 (q, J = 12.4 Hz, IH), 1.19 (t, J = 7.3 Hz, 3H).

LC/MS calculated for C₂₄H₃₅N₅O₂+H⁺, 426.3; observed, 426.4.

Example 5 Preparation of (5R,8S,10R)-1,6-Dimethyl-8-aminomethyl-ergoline (10).

Metergoline (2.06 g, 5.1 mmol) was dissolved in methanol (50 mL) and 10% Pd/C was added (99 mg). The reaction mixture was stirred under a balloon filled with hydrogen for 2 h., filtered through celite, and concentrated under reduced pressure to afford 1.40 g of product as a slightly yellow, foamy solid. ¹H NMR (400 MHz, CDCl₃): 7.19 (t, J = 7.6 Hz, IH), 7.11 (d, J = 8.2 Hz, IH), 6.92 (d, J = 7.1 Hz, IH), 6.72 (bs, IH), 3.75 (s, 3H), 3.39 (dd, J = 14.7, 4.3 Hz, IH), 3.17-
3.08 (m, 1H), 3.03-2.93 (m, 1H), 2.78-2.61 (m, 4H), 2.48 (s, 3H), 2.18-2.09 (m, 1H), 2.03-1.88 (m, 2H), 1.10 (q, $J = 12.1$ Hz, 1H). $^1$C NMR (CDCl$_3$): 27.0, 32.2, 32.8, 39.4, 40.6, 43.4, 46.6, 61.8, 67.6, 106.7, 110.8, 112.6, 122.5, 122.7, 126.5, 133.6, 134.4. LC/MS calculated for C$_{17}$H$_{21}$N$_3$ + H$^+$, 270.2; observed, 270.4.

Example 6  Preparation of (5S,8R,10R)-1,6-Dimethyl-ergoline-8-carboxylic acid methyl ester (13).

\[
\begin{align*}

\text{H} & \\
\end{align*}
\]

Compound 10 (563.3 mg, 2.09 mmol), 4-formyl-l-methylpyridinium benzenesulphonate (1.033 g, 3.70 mmol), and anhydrous MgSO$_4$ (1.90 g) were stirred in CH$_2$Cl$_2$ (15 mL) and DMF (5 mL) for 75 min. After the MgSO$_4$ was removed by filtration, DBU (1.0 mL, 6.69 mmol) was added by syringe and stirring continued for 40 min. Next, a saturated solution of chilled aqueous oxalic acid (60 mL) was added and the reaction mixture was stirred for 45 min. The mixture was diluted with water (300 mL), neutralized with K$_2$CO$_3$, and extracted with CH$_2$Cl$_2$ (2 x 300 mL). The combined organic layers were dried (MgSO$_4$), filtered, and concentrated under reduced pressure to obtain 620.3 mg of crude aldehyde 12 as a black oil.

The aldehyde was dissolved in THF (18 mL) and methanol (18 mL). Ag$_2$O (2.21 g, 9.54 mmol) was added, followed quickly by 10% NaOH (6.00 mL). After 1 h, TLC analysis determined there was remaining aldehyde, so an additional 1.20 g of Ag$_2$O was added. After stirring an additional 15 min., the mixture was filtered and methanol (150 mL) and concentrated H$_2$SO$_4$ (10 mL) were added. The solution was left to stir overnight. The solution was diluted with water (500 mL), neutralized with NaHCO$_3$, and extracted with CH$_2$Cl$_2$ (2 x 400 mL). The combined organic layers were dried (MgSO$_4$), filtered, and concentrated under reduced pressure. Flash chromatography (CH$_2$Cl$_2$/methanol/NEt$_3$ 94:5:1, silica gel) furnished in 199 mg of 13 as a yellow solid (32% yield from metergoline). If not all aldehyde was oxidized prior to removal of the Ag$_2$O, this procedure also produced acetal 15 as a brown solid.

$^1$H NMR of 13 (400 MHz, CDCl$_3$): 7.19 (t, $J = 7.6$ Hz, 1H), 7.12 (d, $J = 8.2$ Hz, 1H), 6.93 (d, $J = 7.1$ Hz, 1H), 6.73 (bs, 1H), 3.76 (s, 3H), 3.74 (s, 3H), 3.38 (dd, $J = 14.7, 4.3$ Hz, 1H), 3.29-3.23 (m, 1H),
3.02-2.90 (m, 3H), 2.73-2.63 (m, 1H), 2.50 (s, 3H), 2.35 (t, J = 11.5 Hz, 1H), 2.24-2.12 (m, 1H), 1.58 (q, J = 13.1 Hz, 1H). 13C NMR (CDCl3): 26.9, 30.6, 32.8, 40.1, 41.5, 43.1, 51.8, 58.7, 66.8, 106.9, 110.5, 112.7, 122.6, 122.7, 126.4, 132.8, 134.4, 174.4. LC/MS calculated for C₁₈H₂₈N₂O₂ + H⁺, 369.3; observed, 359.2. 

Example 7 Preparation of (5R,8R,10R)-1,6-Dimethyl-/N-[3-(dimethylamino)propyl]ergoline-8-carboxamide (14).

Compound 13 (141.8 mg, 0.476 mmol), acetic acid (0.050 mL, 0.873 mmol), and 3-dimethylamino-1-propylamine (11.9 mmol) were heated in a microwave reactor to 120 °C for 20 h. The resulting gel was placed under vacuum 2 h and then suspended in 8 mL of saturated sodium bicarbonate solution and extracted with ethyl acetate (3 x 10 mL). The combined organic layers were dried (MgSO₄), filtered, and concentrated under reduced pressure. As NMR analysis showed some acetic acid and 3-dimethylamino-1-propylamine amine remaining, the material was suspended in 10 mL of aqueous K₂CO₃ solution and extracted with ethyl acetate (3 x 10 mL). The combined organic layers were dried (MgSO₄), filtered, and concentrated under reduced pressure to afford 14 as an orange solid (155.5 mg, 89% yield). 1H NMR (400 MHz, CDCl₃): 7.62 (bs, 1H), 7.18 (t, J = 7.6 Hz, 1H), 7.12 (d, J = 8.2 Hz, 1H), 6.90 (d, J = 7.0 Hz, 1H), 6.73 (bs, 1H), 3.76 (s, 3H), 3.44-3.35 (m, 3H), 3.22-3.14 (m, 1H), 3.00-2.92 (m, 1H), 2.86-2.78 (1H), 2.75-2.63 (2H), 2.49 (s, 3H), 2.43 (t, J = 6.0 Hz, 2H), 2.37 (t, J = 11.5 Hz, 1H), 2.26 (s, 6H), 2.24-2.15 (m, 1H), 1.72-1.60 (m, 3H). 13C NMR (CDCl₃): 25.5, 27.0, 30.9, 32.8, 40.1, 40.3, 43.2, 43.7, 45.5, 59.4, 59.8, 66.9, 106.9, 110.6, 112.6, 122.6, 122.7, 126.4, 133.0, 134.4, 173.3. LC/MS calculated for C₂₂H₃₂N₄O + H⁺, 369.3; observed,
Example 8  Preparation of 1,6-Dimethylcabergoline (9).

Amide 14 (126.8 mg, 0.34 mmol) was dissolved in toluene (6 mL) and ethyl isocyanate was added (1.0 mL, 12.7 mmol). The reaction mixture was heated in a microwave reactor to 115 °C for 18 h and then concentrated under reduced pressure. The resulting residue was purified by chromatography (5% acetonitrile/water to 100% acetonitrile, C18 column) to yield 62.1 mg yellow solid (41% yield).

^1H NMR (400 MHz, CDCl₃): 9.43 (s, 1H), 7.17 (t, J = 7.6 Hz, 1H), 7.11 (d, J = 8.2 Hz, 1H), 6.8 (d, J = 7.0 Hz, 1H), 6.73 (bs, 1H), 3.94-3.70 (m, 2H), 3.76 (s, 3H), 3.51-3.35 (m, 1H), 3.38 (dd, J = 14.7, 4.3 Hz, 1H), 3.35-3.23 (m, 2H), 3.13-3.06 (m, 1H), 3.05-2.95 (m, 1H), 2.88-2.78 (m, 1H), 2.75-2.63 (m, 1H), 2.51 (t, J = 11.2 Hz, 1H), 2.24 (s, 3H), 2.39-2.32 (m, 2 H), 2.32-2.20 (m, 1H), 2.24 (s, 6H), 1.86 (quint, J = 6.9 Hz, 2H), 1.77 (q, J = 12.4 Hz, 1H), 1.19 (t, J = 7.3 Hz, 3H). LC/MS calculated for C25H₅₇N₅O₂ + H⁺, 440.3; observed, 440.5.

Example 9  Effects of Cabergoline on Sexual Function in Rats. It was determined that the administration of cabergoline to rats had an acute effect that remained throughout the entire expanse of the test, as described herein. Specifically, male rats that were administered cabergoline ejaculated significantly more times than controls and had more intromissions before ejaculation with shorter ejaculation latencies. These results indicated that they were more vigorous copulators; reduced ejaculation latency with fewer intromissions before ejaculation would have indicated that cabergoline was possibility inducing a premature ejaculation state, whereas significantly more intromissions demonstrated that the rats were copulating at a faster rate. Additionally, rats administered cabergoline pursued the females more (hence had more intromissions) and their anticipatory level changes prior to copulation (a measure of their anticipatory desire) increased as well, suggesting that
they were more behaviorally aroused in anticipation of sex. This correlates with the observation that
the rats receiving cabergoline did not object to the gavage, in comparison with the controls, which
objected to the gavage with typical vehemence (squealing, trying to kick the tube as it was inserted,
etc.). The cabergoline rats may have found the sex more pleasurable, and therefore, did not object to
the gavage. This can be tested by seeing whether it can potentiate the induction of a conditioned
partner preference. For example, a study could be performed where rats take the drug immediately
before their first sexual experience with an almond-scented female and 4 days later the cabergoline
rats are put in an open field with two females, one scented and the other unscented. Males given
their first, e.g., 10, copulatory experiences with scented females would show a significant
conditioned ejaculatory preference to ejaculate preferentially with the scented female. These results
would indicate that cabergoline is embellishing the pleasure or reward induced by intromissions and
especially ejaculations and would mean that the drug could be used medically to help men or women
with orgasm dysfunction. Cabergoline could also be similarly tested on males that have had their
ejaculations reduced to near zero by chronic administration of the SSRI fluoxetine. SSRIs are
known to induce anorgasmia, and currently there is no treatment for this side effect. Thus, these
studies suggest cabergoline may be used to treat sexual dysfunction (e.g., orgasm dysfunction,
including, e.g., anorgasmia induced by SSRIs (e.g., fluoxetine)).

Example 10 The following illustrate representative pharmaceutical dosage forms, containing a
compound of formula I ('Compound X'), for therapeutic or prophylactic use in humans.

(i) Tablet 1  
| Compound X | 100.0 |
| Lactose      | 77.5  |
| Povidone     | 15.0  |
| Croscarmellose sodium | 12.0 |

The above formulations may be obtained by conventional procedures well known in the pharmaceutical art.

All publications, patents, and patent documents are incorporated by reference herein, as though individually incorporated by reference. The invention has been described with reference to various specific and preferred embodiments and techniques. However, it should be understood that many variations and modifications may be made while remaining within the spirit and scope of the invention.
What is claimed is:

1. A compound of formula I:

   \[
   \text{R}^1 \text{ is } - \text{C}(=0)\text{NR}^a\text{R}^b, - \text{C}(=0)\text{O}\text{R}^c, (\text{d-C}_6)\text{alkyl}, (\text{C}_1\text{-C}_6)\text{alkanoyl}, (\text{C}_1\text{-C}_6)\text{alkoxycarbonyl}, \text{or} (\text{C}_1\text{-C}_6)\text{alkanoyloxy}, \text{wherein any} (\text{C}_1\text{-C}_6)\text{alkyl}, (\text{C}_1\text{-C}_6)\text{alkanoyl}, (\text{C}_1\text{-C}_6)\text{alkoxycarbonyl}, \text{or} (\text{Q}\text{-C}_6)\text{alkanoyloxy can optionally be substituted with one or more halo, hydroxy, (C}_1\text{-C}_6)\text{alkoxy, (Q}\text{-C}_6)\text{alkanoyloxy, or NR}_d\text{R}_e;}
   \]

   \[
   \text{R}^2 \text{ is H or (C}_1\text{-C}_6)\text{alkyl;}
   \]

   \[
   \text{R}^3 \text{ is methyl;}
   \]

   \[
   \text{R}^4 \text{ is H, halo, - C}(=0)\text{NR}_h\text{R}_k, - \text{C}(=0)\text{O}\text{R}^c, (\text{d-C}_6)\text{alkyl}, (\text{d-C}_6^\text{alkanoyl, (C}_1\text{-C}_6)\text{alkoxycarbonyl, or (C}_1\text{-C}_6)\text{alkanoyloxy, wherein any} (\text{C}_1\text{-C}_6)\text{alkyl, (C}_1\text{-C}_6)\text{alkanoyl, (C}_1\text{-C}_6)\text{alkoxycarbonyl, or (C}_1\text{-C}_6)\text{alkanoyloxy can optionally be substituted with one or more halo, hydroxy, (C}_1\text{-C}_6)\text{alkoxy, (C}_1\text{-C}_6)\text{alkanoyl, (C}_1\text{-C}_6)\text{alkoxycarbonyl, (C}_1\text{-C}_6)\text{alkanoyloxy, or NR}_m\text{R}_n;}
   \]

   \[
   \text{R}_a \text{ and } \text{R}_b \text{ are each independently H, (C}_1\text{-C}_6)\text{alkyl, - C}(=0)\text{NR}_f\text{R}_g \text{ or (C}_1\text{-C}_6)\text{alkanoyl, wherein any} (\text{Q}\text{-C}_6)\text{alkyl \text{ or (C}_1\text{-C}_6)\text{alkanoyl can optionally be substituted with one or more NR}_f\text{R}_g; or R}_a \text{ and R}_b \text{ together with the nitrogen to which they are attached form a heterocyclic ring;}
   \]

   \[
   \text{R}_c \text{ is H, (C}_1\text{-C}_6)\text{alkyl, or aryl;}
   \]

   \[
   \text{R}_d \text{ and } \text{R}_e \text{ are each independently H or (C}_1\text{-C}_6)\text{alkyl; or } \text{R}_d \text{ and } \text{R}_e \text{ together with the nitrogen to which they are attached form a heterocyclic ring;}
   \]

   \[
   \text{R}_f \text{ and } \text{R}_g \text{ are each independently H or (C}_1\text{-C}_6)\text{alkyl; or } \text{R}_f \text{ and } \text{R}_g \text{ together with the nitrogen to which they are attached form a heterocyclic ring;}
   \]

   \[
   \text{R}_h \text{ and } \text{R}_k \text{ are each independently H, (C}_1\text{-C}_6)\text{alkyl or (C}_1\text{-C}_6)\text{alkanoyl, wherein any} (\text{C}_1\text{-}
C₆alkyl or (C₁-C₆)alkanoyl can optionally be substituted with one or more NRᵣRᵣ; or Rᵣ and Rₖ together with the nitrogen to which they are attached form a heterocyclic ring; and

Rₘ and Rₙ are each independently H or (C₁-C₆)alkyl; or Rₘ and Rₙ together with the nitrogen to which they are attached form a heterocyclic ring;

or a salt thereof.

2. The compound of claim 1 which is a compound of formula la:

![Chemical Structure](image)

or a salt thereof.

3. The compound of claim 1 or 2 wherein R¹ is -C(=0)NRₐRₐ.

4. The compound of claim 1 or 2 wherein R¹ is -C(=0)ORc.

5. The compound of claim 1 or 2 wherein R¹ is (C₁-C₆)alkyl, (CrC₆)alkanoyl, (C₁-C₆)alkoxycarbonyl, or (C₁-C₆)alkanoyloxy, wherein any (C₁-C₆)alkyl, (C₁-C₆)alkanoyl, (C₁-C₆)alkoxycarbonyl, or (C₁-C₆)alkanoyloxy can optionally be substituted with one or more halo, hydroxy, (C₁-C₆)alkoxy, (C₁-C₆)alkanoyl, (C₁-C₆)alkoxycarbonyl, (C₁-C₆)alkanoyloxy, or NRᵣRe.

6. The compound of claim 1 or 2 wherein R¹ is (CrC₆)alkyl, optionally substituted with one or more (C₁-C₆)alkoxy.

7. The compound of claim 1 or 2 wherein R¹ is dimethoxymethyl.

8. The compound of claim 1 or 2 wherein R¹ is N-(3-dimethylaminopropyl)aminocarbonyl.
9. The compound of claim 1 or 2 wherein R¹ is:

10. The compound of claim 1 or 2 wherein R¹ is:

11. The compound of any one of claims 1-10 wherein R² is H.

12. The compound of any one of claims 1-10 wherein R² is (C₁-C₆)alkyl.

13. The compound of any one of claims 1-10 wherein R² is methyl.

14. A pharmaceutical composition comprising a compound as described in any one of claims 1-13 and a pharmaceutically acceptable diluent or carrier.

15. A method for treating sexual dysfunction, prolactinoma, Parkinson's disease, depression, restless leg syndrome, or Cushings disease in an animal comprising administering a compound of formula I or a pharmaceutically acceptable salt thereof as described in any one of claims 1-13 to the animal.
16. A compound of formula I or a pharmaceutically acceptable salt thereof as described in any one of claims 1-13 for use in medical therapy.

17. A compound of formula I or a pharmaceutically acceptable salt thereof as described in any one of claims 1-13 for the prophylactic or therapeutic treatment of sexual dysfunction, prolactinoma, Parkinson’s disease, depression, restless leg syndrome, or Cushings disease.

18. The use of a compound of formula I or a pharmaceutically acceptable salt thereof as described in any one of claims 1-13 to prepare a medicament for treating sexual dysfunction, prolactinoma, Parkinson’s disease, depression, restless leg syndrome, or Cushings disease in an animal.

19. A method for modulating the activity of a dopamine receptor in an animal comprising administering a compound of formula I or a pharmaceutically acceptable salt thereof as described in any one of claims 1-13 to the animal.

20. A compound of formula I or a pharmaceutically acceptable salt thereof as described in any one of claims 1-13 for the prophylactic or therapeutic treatment of a disease associated with a dopamine receptor.

21. The use of a compound of formula I or a pharmaceutically acceptable salt thereof as described in any one of claims 1-13 to prepare a medicament for modulating the activity of a dopamine receptor in an animal.

* Special categories of cited documents:
  - *A* document defining the general state of the art which is not considered to be of particular relevance
  - *E* earlier application or patent but published on or after the international filing date
  - *L* later document which may throw doubts on priority claim(s) or which is considered to establish the publication date of another document
  - *O* document referred to in oral proceedings
  - *P* document published prior to the international filing date but later than the priority date claimed
  - *T* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle involved or to establish the background of the invention
  - *X* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is taken into account
  - *Y* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is taken into account
  - *Z* document member of the same family
