TECHNICAL FIELD

The invention is directed to TREM-1 mAbs and to mutation of specific negatively charged and uncharged amino acids involved in either TREM-1 mAb self-interactions or TREM-1 mAb to TREM-1 interactions in order to lower the mAb solution viscosity and retain target affinity, and the invention relates to uses for such antibodies for therapeutic and pharmaceutical uses.

SEQUENCE LISTINGS OF THE INVENTION

SEQ ID NO: 1 represents the amino acid sequence of wild type (wt) human TREM-1.

SEQ ID NO: 2 represents the amino acid sequence of the heavy chain of a humanised TREM-1 antibody (mAb 0170 of WO2013/120553).

SEQ ID NO: 3 represents the amino acid sequence of the light chain of a humanised TREM-1 antibody (mAb 0170 of WO2013/120553).

SEQ ID NO: 4 represents the amino acid sequence of the light chain of a humanised TREM-1 antibody (mAb 0317, E27Q, E97S).

SEQ ID NO: 5 represents the amino acid sequence of the light chain of a humanised TREM-1 antibody (mAb 0318, E27Q, E97Q).

SEQ ID NO: 6 represents the amino acid sequence of the light chain of a humanised TREM-1 antibody (mAb 0319, E97S).

SEQ ID NO: 7 represents the amino acid sequence of the light chain of a humanised TREM-1 antibody (mAb 0320, E97Q).

SEQ ID NO: 8 represents the amino acid sequence of the light chain of a humanised TREM-1 antibody (mAb 0321, E27Q).

SEQ ID NO: 9 represents the amino acid sequence of the light chain of a humanised TREM-1 antibody (mAb 0322, F32A).

SEQ ID NO: 10 represents the amino acid sequence of the light chain of a humanised TREM-1 antibody (mAb 0323, F32S).

SEQ ID NO: 11 represents the amino acid sequence of the heavy chain of a humanised TREM-1 antibody (mAb 0324, A59Y).
SEQ ID NO: 12 represents the amino acid sequence of the heavy chain of a humanised TREM-1 antibody (mAb 0325, N57S).

SEQ ID NO: 13 represents the amino acid sequence of the heavy chain of a humanised TREM-1 antibody (mAb 0326, A59Y, N57S).

SEQ ID NO: 14 represents the amino acid sequence of the light chain of a humanised TREM-1 antibody (mAb 0330, F32A, E27Q, E97Q).

SEQ ID NO: 15 represents the amino acid sequence of the heavy chain of a humanised TREM-1 antibody (mAb 0332, A59Y; 0332 is a mAb combined of SEQ ID NO: 15 as the HC and SEQ ID NO 5 as the LC, Table 1).

SEQ ID NO: 16 represents the amino acid sequence of the heavy chain of a humanised TREM-1 antibody (mAb 0333, A59Y; 0333 is a mAb combined of SEQ ID NO: 16 as the HC and SEQ ID NO 14 as the LC, Table 1).

SEQ ID NO: 17 represents the amino acid sequence of full length cTREM-1.

SEQ ID NO 18 represents the heavy chain of the Fab region of mAb 0170.

SEQ ID NO 19 represents the light chain of the Fab region of mAb 0170.

**BACKGROUND**

TREM-1 is an activating receptor expressed on monocytes, macrophages and neutrophils. These cells play a central role in chronic inflammatory diseases by releasing cytokines and other mediators that drive inflammation. TREM-1 mRNA and protein expression is up-regulated in patients with RA and IBD, and TREM-1-positive cells accumulate at sites of inflammation, correlating with disease severity. Peptidoglycan-recognition-protein 1 (PGLYRP1) expressed primarily by activated neutrophils is a ligand for TREM-1 and mediate TREM-1 signalling upon binding.

*In vitro*, engagement of TREM-1 triggers secretion of pro-inflammatory cytokines including TNF, IL-8, and monocyte chemotactic protein-1. In addition, TREM-1 signalling synergizes with multiple Toll-like Receptors (TLR) to further boost pro-inflammatory signals. In turn, this up-regulates expression of TREM-1, leading to a vicious cycle amplifying the inflammation. Increasing evidence indicates that TLRs contribute to the development and progression of chronic inflammatory diseases such as RA and IBD.

WO 2013/120553 discloses humanized anti-TREM-1 mAbs which inhibit both human and cynomolgus TREM-1 function. However, the viscosity profile of anti-TREM-1 mAbs may
hamper the manufacturing process to produce a drug product at >50 mg/ml and could limit the optimal dose setting in the clinic. High dosage (several mg/kg) of protein therapeutics is often needed to achieve an adequate clinical effect and since the vast majority of these therapeutics are administered by subcutaneous delivery, the consequence is that patient self-administration of the therapeutic is limited to volumes of < 1.5 mL (Shire et al., J. Pharm. Sci. 2004, 93, 1390-1402). The development of high concentration protein formulations suitable for patient self-administration is a general obstacle for manufacturing and delivery when protein formulation results in high viscosity of the resultant solution.

Charge distribution of mAbs has been studied with regards to the effect on the viscosity behaviour of mAb solutions (Ydav et al., Mol. Pharmaceutics 2012, 9, 791-802). Also, weak non-specific charge interactions that persist in dilute solutions have been shown to influence the viscosity of concentrated mAb solutions (Connolly et al., Biophys. J., 2012, 103, 69-78). The remedies to reduce the viscosity of mAb solutions have been to introduce site-directed charge swap mutations that disrupt direct charge-charge intermolecular interactions (Ydav et al., Mol. Pharmaceutics 2012, 9, 791-802) or the addition of salts or counter ions (Liu et al., J. Pharm. Sci. 2005, 94, 1928-1940; Ydav et al., J. Pharm. Sci. 2010, 99, 1152-1168; Ydav et al., J. Pharm. Sci. 2012, 101, 998-1011; Kanai et al., J. Pharm. Sci. 2008, 97, 4219-4227). The addition of salts and counter ions can, however, result in adverse effects for the patient in terms of hyper-osmolality of the administered solution.

Disclosed herein are TREM-1 antibodies generated by site-specific mutation of the CDR's of the WO 2013/120553 disclosed humanized anti-TREM-1 mAb 0170. The disclosed antibodies do not disrupt direct mAb intermolecular charge-charge self-interactions but do have a favourable viscosity profile and maintained target binding profile. The favourable viscosity profile allows drug product to be produced at high concentrations that could be essential for therapeutic and pharmaceutical use. Such antibodies may have a substantial impact upon the quality of life of individuals with sepsis or a chronic inflammatory disease such as rheumatoid arthritis, psoriatic arthritis and inflammatory bowel disease.

**SUMMARY**

A primary aspect of the invention is directed to an anti-TREM-1 mAb with a viscosity profile in the range expected for monomeric mAbs and which blocks TREM-1 function as potently as mAb0170 of WO 2013/120553. Further to the advantageous viscosity profiles of the variant mAbs of the invention, said variants do not show agonism to the TREM-1 receptor.

One aspect of the invention is directed to an antibody or fragment thereof that is capable of binding to and blocking TREM-1, characterized in that the antibody, or an antibody
fragment of said antibody, has a viscosity of less than 5 cP at a concentration of 80 mg/mL, preferably less than 4 cP.

The antibody or fragment thereof may comprise a variant of SEQ ID NO: 3, wherein one or more of the negatively charged residues in CDR1 and CDR3 region of SEQ ID NO: 3 are substituted with uncharged amino acid residues, as described herein.

The antibody or fragment thereof may comprise a variant of SEQ ID NO: 3 wherein phenylalanine at position 32 of SEQ ID NO 3 is mutated to an amino acid selected from amino acid residues glycine, serine, threonine, cysteine, alanine, valine, leucine, isoleucine and methionine, preferably selected from alanine, glycine, serine valine and leucine, more preferably wherein F32 of SEQ ID NO: 3 is mutated to alanine or serine.

The antibody or fragment thereof may comprise a variant of SEQ ID NO: 2 wherein any one of residues Y32, R52, S55, S56, N57, A59, M102, 1104 and R106 of SEQ ID NO: 2 or F32, D33, Y34, Y53, R54, D98 of SEQ. ID NO 3 ("Fab-Fab interaction" mutations) is substituted with another amino acid, such as natural amino acid, preferably an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, lysine, arginine, tryptophan, histidine and tyrosine.

A further aspect of the invention is directed to an antibody or fragment thereof that is capable of specifically binding to and blocking TREM-1 of SEQ ID NO: 1 and comprises variants of SEQ ID NO: 2 or SEQ ID NO: 3 or both, wherein the variants are selected from the group consisting of "Fab-Fab interaction" mutations, "Fab-TREM-1 interaction" mutations and "charge-patch" mutations of SEQ ID NO: 2 or SEQ ID NO: 3 (table 1).

In one embodiment of an antibody or fragment thereof of the invention, one or more of the negatively charged residues in CDR1 and CDR3 regions of SEQ ID NO: 3 are substituted with uncharged amino acid residues. In one embodiment, the negatively charged residues in CDR1 and CDR3 regions of SEQ ID NO: 3 are substituted with uncharged amino acid residues.

In one embodiment, an antibody or fragment thereof of the invention comprises a variant of SEQ ID NO 3 wherein any one of the "charge patch" residues DI, D30, D33, D74, D98, E27, E97 of SEQ ID NO: 3 is mutated to an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine. In one embodiment, more than one of the "charge patch" residues DI, D30, D33, D74, D98, E27, E97 of SEQ ID NO 3 is mutated to an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine.
In one embodiment, one of E27 and E97 of the CDR1 and CDR3 regions of SEQ ID NO 3 is substituted with an uncharged amino acid residue, such as an amino acid selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine. By way of example, E27 of SEQ ID NO 3 may remain unmutated and E97 may be mutated with an amino acid selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine. Alternatively, E97 of SEQ ID NO 3 may remain unmutated and E27 may be substituted with an amino acid selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine, more preferably with an amino acid selected from the group consisting of serine and glutamine.

In one embodiment, both E27 and E97 of the CDR1 and CDR3 regions of SEQ ID NO 3 are substituted with uncharged amino acid residues, such as an amino acid selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine. By way of example, E27 of SEQ ID NO 3 may be mutated to glutamine and E97 of SEQ ID NO 3 may be substituted with an amino acid selected from the group consisting of glycine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine, more preferably with an amino acid selected from the group consisting of serine and glutamine. In one embodiment of the antibody or fragment of the invention, E97 of SEQ ID NO: 3 is mutated to glutamine and E27 is substituted with an amino acid selected from the group consisting of glycine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine, more preferably with an amino acid selected from the group consisting of serine and glutamine. By way of example, both E27 and E97 of SEQ ID NO: 3 may be mutated to glutamine.

In a further aspect, the invention provides an antibody or fragment thereof comprising a variant of SEQ. ID. NO 2 wherein any one of residues Y32, R52, S55, S56, N57, A59, M102, 1104 and R106 of SEQ ID NO: 2 or F32, D33, Y34, Y53, R54, D98 of SEQ ID NO: 3 ("Fab-Fab interaction" mutations) is substituted with another amino acid, such as natural amino acid, preferably an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, lysine, arginine, tryptophan, histidine and tyrosine.

In one embodiment of the antibody or fragment thereof of the invention, at least one of residues A59 and N57 of SEQ ID NO: 2 is mutated to an amino acid residue, such as a natural amino acid, preferably an amino acid selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, lysine, arginine, tryptophan, histidine and tyrosine, more preferably serine or tyrosine. By way of example, A59 of SEQ ID NO: 2 may remain unmutated and N57 may be mutated to another amino acid residue, such as a natural amino acid, preferably selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine,
lysine, arginine, tryptophan, histidine and tyrosine, more preferably serine or tyrosine. Alternatively, N57 of SEQ ID NO: 2 may remain unmutated and A59 of SEQ ID NO: 2 may be mutated to another amino acid residue, such as a natural amino acid, preferably selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, lysine, arginine, tryptophan, histidine and tyrosine, more preferably serine or tyrosine. In a further embodiment, both A59 and N57 of SEQ ID NO: 2 are mutated to another amino acid residue, such as a natural amino acid, preferably selected from the group consisting glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, lysine, arginine, tryptophan, histidine and tyrosine, more preferably serine or tyrosine.

A further aspect of the invention is directed to an improved preclinical evaluation value obtained by introduction of site-directed mutations in SEQ ID NO: 3 in the "Fab-TREM-1 interaction" amino acid residues to achieve the same mAb affinity for cynomolgus TREM-1 as for human TREM-1 of SEQ ID NO: 1, such as wherein a Phe residue of SEQ ID NO: 3 is substituted with Ala or Ser.

The invention thus provides an antibody or fragment thereof wherein the "Fab-TREM-1 interaction" amino acid residue, F32 of SEQ ID NO: 3, is substituted with an amino acid residue selected from the group consisting of glycine, alanine, serine, threonine, proline and cysteine.

A further aspect of the invention is directed to a combined effect of improved viscosity properties and improved preclinical evaluation value obtained by introduction of site-directed mutations in SEQ ID NO: 2 in the mAb-TREM-1 interface to achieve the same mAb affinity for cynomolgus as exist for human TREM-1 of SEQ ID NO: 1 (e.g. as described above) in combination with substitution of negatively charged residues in CDR1 and CDR3 regions of SEQ ID NO: 3 with uncharged amino acid residues (e.g. as described above).

In accordance with any of the above-described aspects of the invention, there is provided an antibody or fragment thereof wherein:

i) at least one negatively charged residue of the CDR1 and CDR3 regions of SEQ ID NO: 3 is mutated to an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine; and

ii) at least one residue of residues Y32, R52, S55, S56, N57, A59, M102, 1104 and R106 of SEQ ID NO: 2 or F32, D33, Y34, Y53, R54, D98 of SEQ ID NO: 3 ("Fab-Fab interaction" mutations) is mutated to an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, lysine, arginine, and tryptophan, histidine and tyrosine.

In one embodiment, there is provided an antibody or fragment thereof wherein:
i) one or both of E27 and E97 of SEQ ID NO: 3 is/are mutated to an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine; and

ii) one or both of A59 and N57 of SEQ ID NO: 2 is/are mutated to an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, lysine, arginine, tryptophan, histidine and tyrosine, more preferably serine or tyrosine.

The invention further relates to an antibody or fragment thereof comprising any one of SEQ ID NOs 4 to 16.

**BRIEF Description of drawings**

Figure 1 depicts the viscosity profile of anti-TREM-1 mAb variants and their exponential curve fits.

Figure 2 depicts the ability of mAb 0170 variants to inhibit human TREM-1 signalling in human TREM-1 reporter cell line (BWZ’36/hTREM-I) stimulated with PGN and (A) recombinant PGLYRP1 or (B) PGLYRP1 expressed by activated neutrophils (average of N donors).

Figure 3 depicts the ability of mAb 0170 variants to inhibit cynomolgus TREM-1 signalling in cynomolgus TREM-1 reporter cell line (TE426.27) stimulated with PGN and recombinant PGLYRP1.

Figure 4 depicts the ability of mAb 0170 variants to inhibit TNFa release from hypoxic M2 macrophages stimulated with PGN and recombinant PGLYRP1.

Figure 5 depicts the agonistic potential of plate-bound of mAb 0170 variants to induce TNF release from hypoxic M2 macrophages. MAb 1278 (R&D) was used as positive control.

Figure 6 depicts the hydrodynamic radius of the anti-TREM-1 mAb variants compared to mAb 0170.

**DESCRIPTION**

TREM-1 is a transmembrane protein that consists of 234 amino acids, including a single extracellular immunoglobulin domain and a short cytoplasmic tail with no apparent signaling motif. When activated, TREM-1 associates with the ITAM-containing signaling
adaptor protein, DAP12. Downstream signalling may include activation of the NFAT transcription factor, causing an up-regulation of pro-inflammatory cytokine production.

The present invention relates to antibodies that are capable of specifically binding and blocking the function of TREM-1. Antibodies of the invention may block TREM-1 function by reducing/blocking TREM-1 activation and downstream signalling.

Antibodies according to the invention may block TREM-1 by means of one or a combination of several different mechanisms, blocking TREM-1 directly or indirectly. For example, antibodies of the invention may prevent the natural ligand of TREM-1, peptidoglycan recognition protein 1 (PGLYRP1), from creating a functional complex with TREM-1 and/or antibodies of the invention may block TREM-1 by preventing individual TREM-1 molecules from forming dimers or multimers. TREM-1 dimerisation or multimerisation may be reduced or prevented by TREM-1 antibodies that are capable of binding to a portion of TREM-1 that would otherwise reside in the interface of a TREM-1 dimer, thus preventing individual TREM-1 molecules from associating with one another.

TREM-1 dimerisation or multimerisation may be reduced or prevented by TREM-1 antibodies that interfere with the interaction of TREM-1 with its ligand. Antibodies according to the current invention may block PGLYRP1-induced activation of TREM-1. PGLYRP1, a highly conserved, 196 amino acid long protein consisting of a signal peptide and a peptidoglycan binding domain, is expressed in neutrophils and released upon their activation. Antibodies according to the current invention may down-regulate pro-inflammatory cytokine release from myeloid cells. Antibodies according to the current invention may block the release of TNF, MIP-1beta, MCP-1, IL-1beta, GM-CSF, IL-6 and/or IL-8 from macrophages, neutrophils, synovial tissue cells and/or a reporter cell, as disclosed herein.

Antibodies of the invention may be capable of binding both human TREM-1 and TREM-1 from another species than a human being. The term “TREM-1”, as used herein, thus encompasses any naturally occurring form of TREM-1 which may be derived from any suitable organism. For example, TREM-1 for use as described herein may be vertebrate TREM-1, such as mammalian TREM-1, such as TREM-1 from a primate (such as a human, a chimpanzee, a cynomolgus monkey or a rhesus monkey); a rodent (such as a mouse or a rat), a lagomorph (such as a rabbit), or an artiodactyl (such as a cow, sheep, pig or camel). Preferably, the TREM-1 is SEQ ID NO: 1 (human TREM-1). The TREM-1 may be a mature form of TREM-1 such as a TREM-1 protein that has undergone post-translational processing within a suitable cell. Such a mature TREM-1 protein may, for example, be glycosylated. The TREM-1 may be a full length TREM-1 protein.

Antibodies of the invention may be monoclonal antibodies, in the sense that they are directly or indirectly derived from a single clone of a B lymphocyte. TREM-1 antibodies...
may be produced, screened and purified using, for example, the methods described in the Examples of WO2013/120553. In brief, a suitable mouse such as a TREM-1 or TREM-1/TREM-3 knock-out (KO) mouse may be immunised with TREM-1, a cell expressing TREM-1 or a combination of both.

Antibodies of the invention may be polyclonal in the sense of being a mixture of monoclonal antibodies according to the current invention.

Primary screening of hybridoma supernatants may be performed using direct ELISA or FMAT and secondary screening may be performed using flow cytometry. Positive hybridoma supernatants may then be screened in a reporter gene assay.

Antibodies may be recombinantly expressed in prokaryotic or eukaryotic cells. The prokaryotic cell may be E.coli. The eukaryotic cell may be a yeast, insect or mammalian cell, such as a cell derived from an organism that is a primate (such as a human, a chimpanzee, a cynomolgus monkey or a rhesus monkey), a rodent (such as a mouse or a rat), a lagomorph (such as a rabbit) or an artiodactyl (such as a cow, sheep, pig or camel). Suitable mammalian cell lines include, but are not limited to, HEK293 cells, CHO cells and HEla cells. TREM-1 antibodies may also be produced by means of other methods known to the person skilled in the art, such as a phage display or a yeast display.

Once produced, antibodies may be screened for binding to, for example, full length TREM-1 or mutants thereof using the methods described in the Examples of WO2013/120553.

Functional TREM-1 antibodies of the current invention are antibodies that are capable of specifically binding TREM-1 and that have an effect upon TREM-1 activation and downstream signalling by either blocking or stimulating TREM-1 and they are herein referred to as "functional TREM-1 antibodies". The method of identifying a functional TREM-1 antibody comprises (a) culturing a first cell expressing TREM-1, a signalling protein and a reporter construct; (b) measuring the activity of the first cell when said cell is incubated with a TREM-1 modifying agent; (c) contacting the co-culture of (b) with a TREM-1 antibody; and (d) measuring that the activity of the first cell is less than or more than the activity measured in (b).

The "first cell" of (a) may be a cell of haematopoietic origin, such as a myeloid cell, such as a T-cell. The signalling protein of (a) may be any signalling protein that is capable of forming a complex with TREM-1. Suitable signalling proteins include DAP10, DAP12, TCR zeta, Fc gamma RIII and an Fc receptor, or part thereof. The reporter construct of (a) may be any construct that is capable of being activated via the signalling protein and generating a recognisable signal. Suitable reporter constructs comprise a transcription factor and a reporter gene. The signalling protein may signal via a transcription factor
selected from the group consisting of the NFAT and NFkB. The reporter gene is a gene that is not natively expressed in said first cell and may be but is not limited to be a gene that encodes β-galactosidase, luciferase, green fluorescent protein (GFP) or chloramphenicol transferase. Said first cell may be transfected with a transcription factor and a reporter gene using methods that are well known in the art.

The "BWZ/hTREM-1 reporter cell" and "TE426.27 reporter cell" described in the Examples is one example of a "first cell".

The modifying agent of (b) may be a TREM-1 ligand or an activated neutrophil. The "TREM-1 antibody" of (c) may be a TREM-1 specific hybridoma supernatant or a purified antibody. The activity measured in (d) is the signal produced by the reporter construct. An example of such signalling is the luminescence caused by NFAT-driven LacZ (β-lactamase luciferase) production.

The method may be tailored to identify a blocking TREM-1 antibody. The method of identifying a blocking TREM-1 antibody comprises (a) culturing a first cell expressing TREM-1, a signalling protein and a reporter construct; (b) measuring the activity of the first cell when said cell is incubated with an activated neutrophil; (c) contacting the co-culture of the first cell and the activated neutrophil with a TREM-1 antibody; and (d) measuring that the activity of the first cell is less than the activity measured in (b).

The method may also be tailored to identify a stimulating TREM-1 antibody. The method of identifying a stimulating TREM-1 antibody comprises (a) culturing a first cell expressing TREM-1, a signalling protein and a reporter construct; (b) measuring the activity of the first cell; (c) contacting/incubating said cell with a TREM-1 antibody; and (d) measuring that the activity of the first cell is more than the activity of the measured in (b).

The present invention relates to blocking TREM-1 antibodies that may be identified by means of the method, herein disclosed, of identifying a blocking antibody. When tested using the method described above and in the Examples, an antibody according to the current invention may, at a concentration of less than 50 µg/ml, such as less than 40 µg/ml, such as less than 30 µg/ml, such as less than 20 µg/ml, such as less than 10 µg/ml, such as less than 5 µg/ml, such as less than 1 µg/ml - be capable of reducing the activity of said first cell by 50%, such as 60%, such as 70%, such as 80%, such as 90%, such as 95%, such as 100%. An antibody according to the invention may be capable of completely extinguishing the activity of the first cell. When tested using the method described above and in the Examples, an antibody according to the current invention may, at a concentration of less than 1 µg/ml - such as less than 0.9 µg/ml, such as less than 0.8 µg/ml, such as less than 0.7 µg/ml, such as less than 0.6 µg/ml, such as less
than 0.5 µg/µl, such as less than 0.4 µg/µl, such as less than 0.3 µg/µl, such as less than 0.2 µg/µl - be capable of extinguishing the activity of the first cell.

The present invention also relates to blocking TREM-1 antibodies that may be identified by other means than the method herein disclosed.

The term "antibody" herein refers to a protein, derived from a germline immunoglobulin sequence, which is capable of specifically binding to an antigen (TREM-1) or a portion thereof. The term includes full length antibodies of any class or isotype (that is, IgA, IgE, IgG, IgM and/or IgY) and any single chain or fragment thereof. An antibody that specifically binds to an antigen, or portion thereof, may bind exclusively to that antigen, or portion thereof, or it may bind to a limited number of homologous antigens, or portions thereof. Full-length antibodies usually comprise at least four polypeptide chains: two heavy (H) chains and two light (L) chains that are interconnected by disulfide bonds. One immunoglobulin sub-class of particular pharmaceutical interest is the IgG family. In humans, the IgG class may be sub-divided into 4 sub-classes: IgG1, IgG2, IgG3 and IgG4, based on the sequence of their heavy chain constant regions. The light chains can be divided into two types, kappa and lambda, based on differences in their sequence composition. IgG molecules are composed of two heavy chains, interlinked by two or more disulfide bonds, and two light chains, each attached to a heavy chain by a disulfide bond. A heavy chain may comprise a heavy chain variable region (VH) and up to three heavy chain constant (CH) regions: CH1, CH2 and CH3. A light chain may comprise a light chain variable region (VL) and a light chain constant region (CL). VH and VL regions can be further subdivided into regions of hypervariability, termed complementarity determining regions (CDRs), interspersed with regions that are more conserved, termed framework regions (FR). VH and VL regions are typically composed of three CDRs and four FRs, arranged from amino-terminus to carboxy-terminus in the following order: FR1, CDR1, FR2, CDR2, FR3, CDR3, FR4. The hypervariable regions of the heavy and light chains form a [binding] domain that is capable of interacting with an antigen, whilst the constant region of an antibody may mediate binding of the immunoglobulin to host tissues or factors, including but not limited to various cells of the immune system (effector cells), Fc receptors and the first component (Clq) of the classical complement system.

Antibodies of the current invention may be isolated. The term "isolated antibody" refers to an antibody that has been separated and/or recovered from (an)other component(s) in the environment in which it was produced and/or that has been purified from a mixture of components present in the environment in which it was produced.

Certain antigen-binding fragments of antibodies may be suitable in the context of the current invention, as it has been shown that the antigen-binding function of an antibody can be performed by fragments of a full-length antibody. The term "antigen-binding
fragment” of an antibody refers to one or more fragment(s) of an antibody that retain the ability to specifically bind to an antigen, such as TREM-1, as described herein. Examples of antigen-binding fragments include Fab, Fab', F(ab)2, F(ab')2, F(ab)S, Fv (typically the VL and VH domains of a single arm of an antibody), single-chain Fv (scFv; see e.g., Bird et al., Science 1988; 242:425-426; and Huston et al. PNAS 1988; 85:5879-5883), dsFv, Fd (typically the VH and CH1 domain), and dAb (typically a VH domain) fragments; VH, VL, VhH, and V-NAR domains; monovalent molecules comprising a single VH and a single VL chain; minibodies, diabodies, triabodies, tetrabodies, and kappa bodies (see, e.g., Ill et al., Protein Eng 1997; 10:949-57); camel IgG; IgNAR; as well as one or more isolated CDRs or a functional paratope, where the isolated CDRs or antigen-binding residues or polypeptides can be associated or linked together so as to form a functional antibody fragment. Various types of antibody fragments have been described or reviewed in, e.g., Holliger and Hudson, Nat Biotechnol 2005;23: 1126-1136; WO2005040219, and published U.S. Patent Applications 20050238646 and 20020161201. These antibody fragments may be obtained using conventional techniques known to those of skill in the art, and the fragments may be screened for utility in the same manner as intact antibodies.

An antibody of the invention may be a human antibody or a humanised antibody. The term “human antibody”, as used herein, is intended to include antibodies having variable regions in which at least a portion of a framework region and/or at least a portion of a CDR region are derived from human germline immunoglobulin sequences. (For example, a human antibody may have variable regions in which both the framework and CDR regions are derived from human germline immunoglobulin sequences.) Furthermore, if the antibody contains a constant region, the constant region is also derived from human germline immunoglobulin sequences. The human antibodies of the invention may include amino acid residues not encoded by human germline immunoglobulin sequences (e.g., mutations introduced by random or site-specific mutagenesis in vitro or by somatic mutation in vivo).

Such a human antibody may be a human monoclonal antibody. Such a human monoclonal antibody may be produced by a hybridoma, which includes a B cell obtained from a transgenic nonhuman animal, e.g., a transgenic mouse, having a genome comprising a human heavy chain transgene and a light chain transgene fused to an immortalized cell.

Human antibodies may be isolated from sequence libraries built on selections of human germline sequences, further diversified with natural and synthetic sequence diversity.

Human antibodies may be prepared by in vitro immunisation of human lymphocytes followed by transformation of the lymphocytes with Epstein-Barr virus.
The term "human antibody derivative" refers to any modified form of the human antibody, such as a conjugate of the antibody and another agent or antibody.

The term "humanised antibody", as used herein, refers to a human/non-human chimeric antibody that contains one or more sequences (CDR regions or parts thereof) that are derived from a non-human immunoglobulin. A humanised antibody is, thus, a human immunoglobulin (recipient antibody) in which at least residues from a hyper-variable region of the recipient are replaced by residues from a hyper-variable region of an antibody from a non-human species (donor antibody) such as from a mouse, rat, rabbit or non-human primate, which have the desired specificity, affinity, sequence composition and functionality. In some instances, FR residues of the human immunoglobulin are replaced by corresponding non-human residues. An example of such a modification is the introduction of one or more so-called back-mutations, which are typically amino acid residues derived from the donor antibody. Humanisation of an antibody may be carried out using recombinant techniques known to the person skilled in the art (see, e.g., Antibody Engineering, Methods in Molecular Biology, vol. 248, edited by Benny K. C. Lo). A suitable human recipient framework for both the light and heavy chain variable domain may be identified by, for example, sequence or structural homology. Alternatively, fixed recipient frameworks may be used, e.g., based on knowledge of structure, biophysical and biochemical properties. The recipient frameworks can be germline derived or derived from a mature antibody sequence. CDR regions from the donor antibody can be transferred by CDR grafting. The CDR grafted humanised antibody can be further optimised for e.g. affinity, functionality and biophysical properties by identification of critical framework positions where re-introduction (backmutation) of the amino acid residue from the donor antibody has beneficial impact on the properties of the humanised antibody. In addition to donor antibody derived backmutations, the humanised antibody can be engineered by introduction of germline residues in the CDR or framework regions, elimination of immunogenic epitopes, site-directed mutagenesis, affinity maturation, etc.

Furthermore, humanised antibodies may comprise residues that are not found in the recipient antibody or in the donor antibody. These modifications are made to further refine antibody performance. In general, a humanised antibody will comprise at least one - typically two - variable domains, in which all or substantially all of the CDR regions correspond to those of a non-human immunoglobulin and in which all or substantially all of the FR residues are those of a human immunoglobulin sequence. The humanised antibody can, optionally, also comprise at least a portion of an immunoglobulin constant region (Fc), typically that of a human immunoglobulin.

The term "humanised antibody derivative" refers to any modified form of the humanised antibody, such as a conjugate of the antibody and another agent or antibody.
The term "chimeric antibody", as used herein, refers to an antibody whose light and heavy chain genes have been constructed, typically by genetic engineering, from immunoglobulin variable and constant region genes that originate from different species. For example, the variable segments of genes from a mouse monoclonal antibody may be joined to human constant segments.

The fragment crystallisable region ("Fc region"/"Fc domain") of an antibody is the N-terminal region of an antibody, which comprises the constant CH2 and CH3 domains. The Fc domain may interact with cell surface receptors called Fc receptors, as well as some proteins of the complement system. The Fc region enables antibodies to interact with the immune system. In one aspect of the invention, antibodies may be engineered to include modifications within the Fc region, typically to alter one or more of its functional properties, such as serum half-life, complement fixation, Fc-receptor binding, protein stability and/or antigen-dependent cellular cytotoxicity, or lack thereof, among others. Furthermore, an antibody of the invention may be chemically modified (e.g., one or more chemical moieties can be attached to the antibody) or be modified to alter its glycosylation, again to alter one or more functional properties of the antibody. An IgGl antibody may carry a modified Fc domain comprises one or more, and perhaps all of the following mutations that will result in decreased affinity to certain Fc receptors (L234A, L235E, and G237A) and in reduced Clq-mediated complement fixation (A330S and P331S), respectively (residue numbering according to the EU index).

The isotype of an antibody of the invention may be IgG, such as IgGl, such as IgG2, such as IgG4. If desired, the class of an antibody may be "switched" by known techniques. For example, an antibody that was originally produced as an IgM molecule may be class switched to an IgG antibody. Class switching techniques also may be used to convert one IgG subclass to another, for example: from IgGl to IgG2 or IgG4; from IgG2 to IgGl or IgG4; or from IgG4 to IgGl or IgG2. Engineering of antibodies to generate constant region chimeric molecules, by combination of regions from different IgG subclasses, can also be performed.

In one embodiment, the hinge region of CHI is modified such that the number of cysteine residues in the hinge region is altered, e.g., increased or decreased. This approach is described further for instance in U.S. Patent No. 5,677,425 by Bodmer et al.

The constant region may be modified to stabilize the antibody, e.g., to reduce the risk of a bivalent antibody separating into two monovalent VH-VL fragments. For example, in an IgG4 constant region, residue S228 (residue numbering according to the EU index) may be mutated to a proline (P) residue to stabilise inter heavy chain disulphide bridge formation at the hinge (see, e.g., Angal et al., Mol Immunol. 1995; 30: 105-8).
Antibodies or fragments thereof may also be defined in terms of their complementarity-determining regions (CDRs). The term "complementarity-determining region" or "hypervariable region", when used herein, refers to the regions of an antibody in which amino acid residues involved in antigen binding are situated. The region of hypervariability or CDRs can be identified as the regions with the highest variability in amino acid alignments of antibody variable domains. Databases can be used for CDR identification such as the Kabat database, the CDRs e.g. being defined as comprising amino acid residues 24-34 (L1), 50-59 (L2) and 89-97 (L3) of the light-chain variable domain and 31-35 (H1), 50-65 (H2) and 95-102 (H3) in the heavy-chain variable domain; (Kabat et al. 1991; Sequences of Proteins of Immunological Interest, Fifth Edition, U.S. Department of Health and Human Services, NIH Publication No. 91-3242) Alternatively CDRs can be defined as those residues from a "hypervariable loop" (residues 26-33 (L1), 50-52 (L2) and 91-96 (L3) in the light-chain variable domain and 26-32 (H1), 53-55 (H2) and 96-101 (H3) in the heavy-chain variable domain; Chothia and Lesk, J. Mol. Biol 1987; 196: 901-917). Typically, the numbering of amino acid residues in this region is performed by the method described in Kabat et al., supra. Phrases such as "Kabat position", "Kabat residue", and "according to Kabat" herein refer to this numbering system for heavy chain variable domains or light chain variable domains. Using the Kabat numbering system, the actual linear amino acid sequence of a peptide may contain fewer or additional amino acids corresponding to a shortening of, or insertion into, a framework (FR) or CDR of the variable domain. For example, a heavy chain variable domain may include amino acid insertions (residue 52a, 52b and 52c according to Kabat) after residue 52 of CDR H2 and inserted residues (e.g. residues 82a, 82b, and 82c, etc. according to Kabat) after heavy chain FR residue 82. The Kabat numbering of residues may be determined for a given antibody by alignment at regions of homology of the sequence of the antibody with a "standard" Kabat numbered sequence.

The term "framework region" or "FR" residues refer to those VH or VL amino acid residues that are not within the CDRs, as defined herein.

The mAb 0170 antibody has a variable heavy chain sequence as shown in SEQ ID NO: 2 and a variable light chain sequence as shown in SEQ ID NO: 3. An antibody of the invention may comprise this variable heavy chain sequence and/or this variable light chain sequence. The mAb 0170 antibody has the CDR sequences shown at amino acids 31 to 35, 50 to 68 and 101 to 110 of SEQ ID NO: 2 and amino acids 24 to 38, 54 to 60 and 93 to 101 of SEQ ID NO: 3.

The heavy chain of an antibody according to the invention may comprise a CDR1 sequence of amino acids 31 to 35 (TYAMH) of SEQ ID NO: 2, wherein one of these amino acids may be substituted by a different amino acid.
The heavy chain of an antibody according to the invention may comprise a CDR2 sequence of amino acids 50 to 68 (RIRTKSSNYATYYADSVKD) of SEQ ID NO: 2, wherein one, two or three of these amino acids may be substituted by a different amino acid.

The heavy chain of an antibody according to the invention may comprise a CDR3 sequence of amino acids 101 to 110 (DMGQRRQFAY) of SEQ ID NO: 2, wherein one, two or three of these amino acids may be substituted by a different amino acid.

The light chain of an antibody according to the invention may comprise a CDR1 sequence of amino acids 24 to 38 (RASEVSVDTFDYSFLH) of SEQ ID NO: 3, wherein one, two or three of these amino acids may be substituted with a different amino acid.

The light chain of an antibody according to the invention may comprise a CDR2 sequence of amino acids 54 to 60 (RASNLES) of SEQ ID NO: 3, wherein one or two of these amino acids may be substituted with a different amino acid.

The light chain of an antibody according to the invention may comprise a CDR3 sequence of amino acids 93 to 101 (QQSNEPDYT) of SEQ ID NO: 3, wherein one or two of these amino acids may be substituted with a different amino acid.

The mAb 0170 antibody has a heavy chain sequence as shown in SEQ ID NO: 2 and a light chain sequence as shown in SEQ ID NO: 3. An antibody of the invention may comprise this heavy chain sequence or this light chain sequence. Either the heavy or light chain of the antibody of the invention, or both, may be a variant of mAb 0170. The mAb 0170 antibody has the CDR sequences shown at amino acids 31 to 35, 50 to 68 and 101 to 110 of SEQ ID NO: 2 and amino acids 24 to 38, 54 to 60 and 93 to 101 of SEQ ID NO: 3. An antibody of the invention may comprise 1, 2, 3, 4, 5 or all 6 of these CDR sequences.

The heavy chain of an antibody according to the invention may comprise a CDRH3 sequence of amino acids 101 to 110 (DMGIRRRQFAY) of SEQ ID NO: 2, wherein one, two or three of these amino acids may be substituted by a different amino acid.

The term "antigen" (Ag) refers to the molecular entity used for immunization of an immunocompetent vertebrate to produce the antibody (Ab) that recognizes the Ag. Herein, Ag is termed more broadly and is generally intended to include target molecules that are specifically recognized by the Ab, thus including fragments or mimics of the molecule used in the immunization process, or other process, e.g. phage display, used for generating the Ab.

The term "epitope", as used herein, is defined in the context of a molecular interaction between an "antigen binding polypeptide", such as an antibody (Ab), and its
corresponding antigen (Ag). Generally, "epitope" refers to the area or region on an Ag to which an Ab specifically binds, i.e. the area or region in physical contact with the Ab. Physical contact may be defined through various criteria (e.g. a distance cut-off of 2-6Å, such as 3Å, such as 4Å, such as 5Å; or solvent accessibility) for atoms in the Ab and Ag molecules. A protein epitope may comprise amino acid residues in the Ag that are directly involved in binding to a Ab (also called the immunodominant component of the epitope) and other amino acid residues, which are not directly involved in binding, such as amino acid residues of the Ag which are effectively blocked by the Ab, i.e. amino acid residues within the "solvent-excluded surface" and/or the "footprint" of the Ab.

The term epitope herein comprises both types of binding region in any particular region of TREM-1 that specifically binds to a TREM-1 antibody. TREM-1 may comprise a number of different epitopes, which may include, without limitation, conformational epitopes which consist of one or more non-contiguous amino acids located near each other in the mature TREM-1 conformation and post-translational epitopes which consist, either in whole or part, of molecular structures covalently attached to TREM-1, such as carbohydrate groups.

The epitope for a given antibody (Ab)/antigen (Ag) pair can be described and characterized at different levels of detail using a variety of experimental and computational epitope mapping methods. The experimental methods include mutagenesis, X-ray crystallography, Nuclear Magnetic Resonance (NMR) spectroscopy, Hydrogen deuterium exchange Mass Spectrometry (HX-MS) and various competition binding methods; methods that are known in the art. As each method relies on a unique principle, the description of an epitope is intimately linked to the method by which it has been determined. Thus, depending on the epitope mapping method employed, the epitope for a given Ab/Ag pair may be described differently.

At its most detailed level, the epitope for the interaction between the Ag and the Ab can be described by the spatial coordinates defining the atomic contacts present in the Ag-Ab interaction, as well as information about their relative contributions to the binding thermodynamics. At a less detailed level, the epitope can be characterized by the spatial coordinates defining the atomic contacts between the Ag and Ab. At an even less detailed level the epitope can be characterized by the amino acid residues that it comprises as defined by a specific criteria such as the distance between or solvent accessibility of atoms in the Ab:Ag complex. At a further less detailed level the epitope can be characterized through function, e.g. by competition binding with other Abs. The epitope can also be defined more generically as comprising amino acid residues for which substitution by another amino acid will alter the characteristics of the interaction between the Ab and Ag.
In the context of an X-ray derived crystal structure defined by spatial coordinates of a complex between an Ab, e.g. a Fab fragment, and its Ag, the term epitope is herein, unless otherwise specified or contradicted by context, specifically defined as TREM-1 residues characterized by having a heavy atom (i.e. a non-hydrogen atom) within a distance of, eg., 4 Å from a heavy atom in the Ab.

From the fact that descriptions and definitions of epitopes, dependant on the epitope mapping method used, are obtained at different levels of detail, it follows that comparison of epitopes for different Abs on the same Ag can similarly be conducted at different levels of detail.

Epitopes described on the amino acid level, e.g. determined from an X-ray structure, are said to be identical if they contain the same set of amino acid residues. Epitopes are said to overlap if at least one amino acid is shared by the epitopes. Epitopes are said to be separate (unique) if no amino acid residue are shared by the epitopes.

Epitopes may also be defined indirectly, by means of comparing the binding kinetics of antibodies to wild type human TREM-1 with those of human TREM-1 variants that have alanine mutations in anticipated epitopes. Decreased affinity or abrogated binding of an antibody to variants of human TREM-1 in which an amino acid residue has been replaced with an alanine residue indicates that the mutated amino acid contributes to the interaction between said antibody and wild type human TREM-1. This approach provides a negative identification of the epitope. The method is compromised in effectively defining the epitope by the fact that protein misfolding or unfolding would give similar results as abrogation of interaction. The analysis can be complemented by comparative gain of function mutational analyses of an orthologous target protein (eg., cynomolgus monkey TREM-1), if a cross-reactive antibody exists. The comparison will define the epitope differences between the antibody that does not cross-react with, eg., cynomolgus monkey TREM-1 and the cross-reactive antibody.

Indirect identification of the epitope can also be provided by means of measuring antibody (or antibody fragment) binding to variants of the wild type antigen (TREM-1). If an antibody or fragment thereof binds, eg., human but not cynomolgus monkey TREM-1 and if said antibody or fragment thereof is capable of binding a partly humanised variant of cynomolgus monkey TREM-1 then this regained binding indicates that the substituted amino acid residue(s) is/are important for the interaction of the antibody with the antigen. In the same way, increased affinity for humanized variants of cynomolgus monkey TREM-1, of an anti-human TREM-1 antibody (or its Fab fragment) that has a weaker binding to cynomolgus monkey TREM-1 compared to human TREM-1, can provide information on the identity of residues composing the binding epitope.
The effect of the same mutations on any given cross-reactive antibody makes it possible to discriminate between possible protein misfolding (abrogated binding to both antibodies) and loss of interaction in human TREM-1 (binding to one of the antibodies and abrogated binding to the other antibody), whilst unambiguously providing information on the epitope differences between the antibody that does not cross-react and the cross reactive antibody on an amino acid level.

Antibodies of the current invention may be capable of binding variants of human TREM-1 as determined using, eg., surface plasmon resonance.

Antibodies of the current invention may be capable of binding variants of cynomolgus monkey TREM-1 as determined using, eg., surface plasmon resonance.

An antibody of the invention may be capable of specifically binding TREM-1, wherein said antibody is capable of specifically binding (i) at least one amino acid residue selected from the group consisting of the A21, T22, K23, L24, T25, E26, and (ii) at least one amino acid residue selected from the group consisting of the A49, S50, S51, Q52, K53, A54, W55, Q56, 157, 158, R59, D60, G61, E62, M63, P64, K65, T66, L67, A68, C69, T70, E71, R72, P73, S74, K75, N76, S77, H78, P79, V80, Q81, V82, G83, R84, 185 and (iii) at least one amino acid residue selected from the group consisting of the C113, V114, 1115, Y116, Q117, P118 and P119 of human TREM-1.

An antibody of the invention may be capable of specifically binding a polypeptide comprising amino acids D38 to F48 of SEQ ID NO: 1 (human TREM-1), as determined using, eg., HX-MS or X-ray diffraction.

An antibody of the invention may have an epitope comprising one, two, three, four, five, six, seven or all of the amino acid residues D38, V39, K40, C41, D42, Y43, T44 and L45 of SEQ ID NO: 1 (human TREM-1) and one, two or all of the amino acid residues selected from the group consisting of the E46, K47 and F48 of SEQ ID NO: 1 (human TREM-1), as determined using, eg., HX-MS or X-ray diffraction.

An antibody of the invention may have an epitope comprising one, two, three or all of the amino acid residues selected from the group consisting of the D42, E46, D92 and H93 of SEQ ID NO: 1 (human TREM-1), as determined using variants of TREM-1 and surface plasmon resonance.

An antibody of the invention may have an epitope comprising at least the amino acid residues E46 and/or D92 of SEQ ID NO: 1 (human TREM-1), as determined using variants of TREM-1 and surface plasmon resonance.
An antibody of the invention may further comprise one, two or all of the amino acid residues selected from the group consisting of L31, 186 and V101 of SEQ ID NO: 1 (human TREM-1).

An antibody of the invention may be capable of specifically binding a polypeptide comprising amino acid residues E19 to L26 of cynomolgus monkey TREM-1 (SEQ ID NO: 17), as determined using, eg. HX-MS or X-ray diffraction.

An antibody of the invention may be capable of specifically binding human TREM-1, wherein the epitope of said antibody comprises one, two, three, four, five, six, seven, eight, nine or all of the amino acid residues selected from the group consisting of the V39, K40, C41, D42, Y43, L45, E46, K47, F48 and A49 of SEQ ID NO: 1.

An antibody of the invention may be capable of specifically binding human TREM-1, wherein the epitope of said antibody comprises the D42 of SEQ ID NO: 1. An antibody of the invention may be capable of specifically binding human TREM-1, wherein the epitope of said antibody comprises the E46 of SEQ ID NO: 1. The epitope of said antibody may comprise the V39, C41, D42, Y43, L45 of SEQ ID NO: 1. The epitope of said antibody may comprise the E46, K47 and A49 of SEQ ID NO: 1. The epitope of said antibody may further comprise the F48 of SEQ ID NO: 1.

The definition of the term "paratope" is derived from the above definition of "epitope" by reversing the perspective. Thus, the term "paratope" refers to the area or region on the antibody to which an antigen specifically binds, i.e. with which it makes physical contact to the antigen.

In the context of an X-ray derived crystal structure, defined by spatial coordinates of a complex between an antibody, such as a Fab fragment, and its antigen, the term paratope is herein, unless otherwise specified or contradicted by context, specifically defined as antigen residues characterized by having a heavy atom (i.e. a non-hydrogen atom) within a distance of 4 Å from a heavy atom in TREM-1.

The epitope and paratope for a given antibody (Ab)/antigen (Ag) pair may be identified by routine methods. For example, the general location of an epitope may be determined by assessing the ability of an antibody to bind to different fragments or variant TREM-1 polypeptides. The specific amino acids within TREM-1 that make contact with an antibody (epitope) and the specific amino acids in an antibody that make contact with TREM-1 (paratope) may also be determined using routine methods. For example, the antibody and target molecule may be combined and the Ab:Ag complex may be crystallised. The crystal structure of the complex may be determined and used to identify specific sites of interaction between the antibody and its target.
Antibodies that bind to the same antigen can be characterised with respect to their ability to bind to their common antigen simultaneously and may be subjected to "competition binding"/"binning". In the present context, the term "binning" refers to a method of grouping antibodies that bind to the same antigen. "Binning" of antibodies may be based on competition binding of two antibodies to their common antigen in assays based on standard techniques such as surface plasmon resonance (SPR), ELISA or flow cytometry.

An antibody's "bin" is defined using a reference antibody. If a second antibody is unable to bind to an antigen at the same time as the reference antibody, the second antibody is said to belong to the same "bin" as the reference antibody. In this case, the reference and the second antibody competitively bind the same part of an antigen and are coined "competing antibodies". If a second antibody is capable of binding to an antigen at the same time as the reference antibody, the second antibody is said to belong to a separate "bin". In this case, the reference and the second antibody do not competitively bind the same part of an antigen and are coined "non-competing antibodies".

Antibody "binning" does not provide direct information about the epitope. Competing antibodies, i.e. antibodies belonging to the same "bin" may have identical epitopes, overlapping epitopes or even separate epitopes. The latter is the case if the reference antibody bound to its epitope on the antigen takes up the space required for the second antibody to contact its epitope on the antigen ("steric hindrance"). Non-competing antibodies generally have separate epitopes.

An antibody of the invention may compete with mAb 0170 for binding to human TREM-1.

An antibody of the invention may compete with mAb 0170 for binding to cynomolgus monkey TREM-1. In other words, an antibody of the invention may belong to the same "bin" as mAb 0170.

The term "binding affinity" herein refers to a measurement of the strength of a non-covalent interaction between two molecules, e.g. an antibody, or fragment thereof, and an antigen. The term "binding affinity" is used to describe monovalent interactions (intrinsic activity).

Binding affinity between two molecules, e.g. an antibody, or fragment thereof, and an antigen, through a monovalent interaction may be quantified by determination of the equilibrium dissociation constant ($K_D$). In turn, $K_D$ can be determined by measurement of the kinetics of complex formation and dissociation, e.g. by the SPR method. The rate constants corresponding to the association and the dissociation of a monovalent complex are referred to as the association rate constant $k_a$ (or $k_{on}$) and dissociation rate constant $k_d$ (or $k_{off}$), respectively. $K_D$ is related to $k_a$ and $k_d$ through the equation $K_D = k_d / k_a$. 
Following the above definition, binding affinities associated with different molecular interactions, such as comparison of the binding affinity of different antibodies for a given antigen, may be compared by comparison of the $K_D$ values for the individual antibody/antigen complexes.

An antibody of the invention may bind human TREM-1 with an affinity ($K_D$) that is $1 \times 10^{-7}$ M or less, $1 \times 10^{-8}$ M or less, or $1 \times 10^{-9}$ M or less, $1 \times 10^{-10}$ M or less, $1 \times 10^{-11}$ M or less, or $1 \times 10^{-12}$ M or less, or $1 \times 10^{-13}$ M or less, as determined using surface plasmon resonance. An antibody of the invention may bind cynomolgus monkey TREM-1 with an affinity ($K_D$) that is $1 \times 10^{-7}$ M or less, $1 \times 10^{-8}$ M or less, or $1 \times 10^{-9}$ M or less, $1 \times 10^{-10}$ M or less, $1 \times 10^{-11}$ M or less, $1 \times 10^{-12}$ M or less or $1 \times 10^{-13}$ M or less, as determined using surface plasmon resonance.

The term "binding specificity" herein refers to the interaction of a molecule such as an antibody, or fragment thereof, with a single exclusive antigen, or with a limited number of highly homologous antigens (or epitopes). In contrast, antibodies that are capable of specifically binding to TREM-1 are not capable of binding dissimilar molecules. Antibodies according to the invention may not be capable of binding Nkp44, the Natural killer cell p44-related protein.

The specificity of an interaction and the value of an equilibrium binding constant can be determined directly by well-known methods. Standard assays to evaluate the ability of ligands (such as antibodies) to bind their targets are known in the art and include, for example, ELISAs, Western blots, RIAs, and flow cytometry analysis. The binding kinetics and binding affinity of the antibody also can be assessed by standard assays known in the art, such as SPR.

A competitive binding assay can be conducted in which the binding of the antibody to the target is compared to the binding of the target by another ligand of that target, such as another antibody.

In another aspect, the present invention provides compositions and formulations comprising molecules of the invention, such as the TREM-1 antibodies, polynucleotides, vectors and cells described herein. For example, the invention provides a pharmaceutical composition that comprises one or more TREM-1 antibodies of the invention, formulated together with a pharmaceutically acceptable carrier.

Accordingly, one object of the invention is to provide a pharmaceutical formulation comprising such a TREM-1 antibody which is present in a concentration from 0.25 mg/ml to 250 mg/ml, such as a concentration of from 10 to 200 mg/ml, and wherein said formulation has a pH from 2.0 to 10.0, such as a pH of from 4.0 to 8.0. The formulation may further comprise one or more of a buffer system, a preservative, a tonicity agent, a
chelating agent, a stabilizer and/or a surfactant, as well as various combinations thereof. The use of preservatives, isotonic agents, chelating agents, stabilizers and surfactants in pharmaceutical compositions is well-known to the skilled person. Reference may be made to Remington: The Science and Practice of Pharmacy, 19th edition, 1995.

In one embodiment, the pharmaceutical formulation is an aqueous formulation. Such a formulation is typically a solution or a suspension, but may also include colloids, dispersions, emulsions, and multi-phase materials. The term "aqueous formulation" is defined as a formulation comprising at least 50% w/w water. Likewise, the term "aqueous solution" is defined as a solution comprising at least 50% w/w water, and the term "aqueous suspension" is defined as a suspension comprising at least 50% w/w water.

In another embodiment, the pharmaceutical formulation is a freeze-dried formulation, to which the physician or the patient adds solvents and/or diluents prior to use.

In a further aspect, the pharmaceutical formulation comprises an aqueous solution of such an antibody, and a buffer, wherein the antibody is present in a concentration from 1 mg/ml or above, and wherein said formulation has a pH from about 2.0 to about 10.0, such as a pH of from 4.0 to 8.0.

The TREM-1 antibodies of the present invention and pharmaceutical compositions comprising such antibodies may be used for the treatment of inflammatory diseases such as the following: inflammatory bowel disease (IBD), Crohn's disease (CD), ulcerative colitis (UC), irritable bowel syndrome, rheumatoid arthritis (RA), psoriasis, psoriatic arthritis, systemic lupus erythematosus (SLE), lupus nephritis, type I diabetes, Grave's disease, multiple sclerosis (MS), autoimmune myocarditis, Kawasaki disease, coronary artery disease, chronic obstructive pulmonary disease, interstitial lung disease, autoimmune thyroiditis, scleroderma, systemic sclerosis, osteoarthritis, atopic dermatitis, vitiligo, graft versus host disease, Sjogren's syndrome, autoimmune nephritis, Goodpasture's syndrome, chronic inflammatory demyelinating polyneuropathy, allergy, asthma and other autoimmune diseases that are a result of either acute or chronic inflammation.

TREM-1 antibodies of the invention may be suitable for use in the treatment of individuals with inflammatory bowel disease. Inflammatory Bowel Disease (IBD) is a disease that may affect any part of the gastrointestinal tract from mouth to anus, causing a wide variety of symptoms. IBD primarily causes abdominal pain, diarrhoea (which may be bloody), vomiting or weight loss, but may also cause complications outside of the gastrointestinal tract such as skin rashes, arthritis, inflammation of the eye, fatigue and lack of concentration. Patients with IBD can be divided into two major classes, those with ulcerative colitis (UC) and those with Crohn's disease (CD). CD
generally involves the ileum and colon, it can affect any region of the intestine but is often discontinuous (focused areas of disease spread throughout the intestine). UC always involves the rectum (colonic) and is more continuous. In CD, the inflammation is transmural, resulting in abscesses, fistulas and strictures, whereas in UC, the inflammation is typically confined to the mucosa. There is no known pharmaceutical or surgical cure for Crohn's disease, whereas some patients with UC can be cured by surgical removal of the colon. Treatment options are restricted to controlling symptoms, maintaining remission and preventing relapse. Efficacy in inflammatory bowel disease in the clinic may be measured as a reduction in the Crohn's Disease Activity Index (CDAI) score for CD which is scoring scale based on laboratory tests and a quality of life questionnaire. In animal models, efficacy is mostly measured by increase in weight and also a disease activity index (DAI), which is a combination of stool consistency, weight and blood in stool.

TREM-1 antibodies of the invention may be suitable for use in the treatment of individuals with rheumatoid arthritis. Rheumatoid arthritis (RA) is a systemic disease that affects nearly if not all of the body and is one of the most common forms of arthritis. It is characterized by inflammation of the joint, which causes pain, stiffness, warmth, redness and swelling. This inflammation is a consequence of inflammatory cells invading the joints, and these inflammatory cells release enzymes that may digest bone and cartilage. As a result, this inflammation can lead to severe bone and cartilage damage and to joint deterioration and severe pain, among other physiologic effects. The involved joint can lose its shape and alignment, resulting in pain and loss of movement.

There are several animal models for rheumatoid arthritis known in the art. For example, in the collagen-induced arthritis (CIA) model, mice develop an inflammatory arthritis that resembles human rheumatoid arthritis. Since CIA shares similar immunological and pathological features with RA, this makes it a suitable model for screening potential human anti-inflammatory compounds. Efficacy in this model is measured by decrease in joint swelling. Efficacy in RA in the clinic is measured by the ability to reduce symptoms in patients which is measured as a combination of joint swelling, erythrocyte sedimentation rate, C-reactive protein levels and levels of serum factors, such as anti-citrullinated protein antibodies.

TREM-1 antibodies of the invention may be suitable for use in the treatment of individuals with psoriasis. Psoriasis is a T-cell mediated inflammatory disorder of the skin that can cause considerable discomfort. It is a disease for which there is currently no cure and it affects people of all ages. Although individuals with mild psoriasis can often control their disease with topical agents, more than one million patients worldwide require ultraviolet light treatments or systemic immunosuppressive therapy. Unfortunately, the inconvenience and risks of ultraviolet radiation and the toxicities of many therapies limit their long-term use. Moreover, patients usually have recurrence of
psoriasis, and in some cases rebound shortly after stopping immunosuppressive therapy. A recently developed model of psoriasis based on the transfer of CD4+ T cells mimics many aspects of human psoriasis and therefore can be used to identify compounds suitable for use in treatment of psoriasis (Davenport et al., Internat. Immunopharmacol 2:653-672, 2002). Efficacy in this model is measured by reduction in skin pathology using a scoring system. Similarly, efficacy in patients is measured by a decrease in skin pathology.

TREM-1 antibodies of the invention may be suitable for use in the treatment of individuals with psoriatic arthritis. Psoriatic arthritis (PA) is a type of inflammatory arthritis that occurs in a subset of patients with psoriasis. In these patients, the skin pathology/symptoms are accompanied by a joint swelling similar to that seen in rheumatoid arthritis. It features patchy, raised, red areas of skin inflammation with scaling. Psoriasis often affects the tips of the elbows and knees, the scalp, the navel and around the genital areas or anus. Approximately 10% of patients who have psoriasis also develop an associated inflammation of their joints.

The term "treatment", as used herein, refers to the medical therapy of any human or other animal subject in need thereof. Said subject is expected to have undergone physical examination by a medical or veterinary medical practitioner, who has given a tentative or definitive diagnosis which would indicate that the use of said treatment is beneficial to the health of said human or other animal subject. The timing and purpose of said treatment may vary from one individual to another, according to many factors, such as the status quo of the subject's health. Thus, said treatment may be prophylactic, palliative, symptomatic and/or curative.

In terms of the present invention, prophylactic, palliative, symptomatic and/or curative treatments may represent separate aspects of the invention.

An antibody of the invention may be administered parenterally, such as intravenously, such as intramuscularly, such as subcutaneously. Alternatively, an antibody of the invention may be administered via a non-parenteral route, such as perorally or topically. An antibody of the invention may be administered prophylactically. An antibody of the invention may be administered therapeutically (on demand).

In a first aspect of the invention, the substitution of negatively charged residues of the CDR1 and CDR3 regions of SEQ ID NO: 3 (the variable light chain of mAb 0170) was observed to influence the viscosity of the mAb. In this first aspect of the invention, the mAb of the invention is a variant of mAb 0170 having a heavy chain and a light chain, wherein the light chain of mAb 0170, namely SEQ ID NO: 3, comprises mutations wherein negatively charged residues in CDR1 and CDR3 region of SEQ ID NO: 3 are substituted with uncharged residues. Accordingly, an aspect of the invention is directed
to a variant of mAb 0170 comprising substituting any one or any combination of residues D1, D30, D33, D74, D98, E27, E97 of SEQ ID NO: 3 with an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine. Otherwise stated, an interesting embodiment of the invention is directed to an antibody or fragment thereof comprising SEQ ID NO: 2 (or a variant thereof) as a heavy chain and as light chain comprising a variant of SEQ ID NO: 3 wherein any one or any combination of residues D1, D30, D33, D74, D98, E27, E97 of SEQ ID NO: 3 is mutated to an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine. These mutations will be referred to as "charge patch" mutations. In a preferred embodiment, at least one or both of E27 and E97 of the CDR1 and CDR3 regions of SEQ ID NO: 3 are substituted with uncharged amino acid residues, such as an amino acid selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine. In a preferred embodiment, E27 of the CDR1 and CDR3 regions of SEQ ID NO: 3 is mutated to glutamine and E97 is substituted with an amino acid selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine, more preferably with an amino acid selected from the group consisting of serine and glutamine. In a further embodiment, E27 remains unmutated and E97 is mutated with an amino acid selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine, more preferably with an amino acid selected from the group consisting of serine and glutamine. In another embodiment, residue E97 remains unmutated and E27 is substituted with an amino acid selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine, more preferably with an amino acid selected from the group consisting of serine and glutamine.

Another aspect of the invention is based on the observation that Fab-Fab dimers were formed due to interactions in the paratope area. Since mAbs comprise two Fabs, it was envisioned that mAbs would be able to multimerize, which could have an impact on the viscosity properties. Thus, another aspect of the invention is directed to mutate residues in the Fab-Fab interaction area of SEQ ID NO: 2 (namely in the variable heavy chain area of mAb 0170) to reduce Fab-Fab dimerization. These mutations are referred to as "Fab-Fab interaction" mutations. Accordingly, an aspect of the invention is directed to substituting any one of residues Y32, R52, S55, S56, N57, A59, M102, 1104 and R106 of SEQ ID NO: 2 or F32, D33, Y34, Y53, R54, D98 of SEQ ID NO 3 with an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, lysine, arginine, tryptophan, histidine and tyrosine. Otherwise stated, an interesting embodiment of the invention is directed to an antibody or fragment thereof comprising a variant of SEQ ID NO: 2 wherein any one of residues Y32, R52, S55, S56, N57, A59, M102, 1104 and R106 of SEQ ID NO: 2 or F32, D33, Y34, Y53, R54, D98 of SEQ ID NO 3 ("Fab-Fab interaction" mutations) is substituted with another amino acid, such as natural amino acid, preferably an amino acid residue
selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, lysine, arginine, tryptophan, histidine and tyrosine. Preferably, at least one of residues A59 and N57 SEQ ID NO: 2 is mutated to an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, lysine, arginine, tryptophan, histidine and tyrosine, more preferably serine or tyrosine. In one embodiment, A59 remains unmutated and N57 is mutated to an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, lysine, arginine, tryptophan, histidine and tyrosine, more preferably serine or tyrosine. In another embodiment, N57 remains unmutated and A59 is mutated to an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, lysine, arginine, tryptophan, histidine and tyrosine. In at least one embodiment, both A59 and N57 are mutated to an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, lysine, arginine, tryptophan, histidine and tyrosine, more preferably serine or tyrosine.

In an interesting embodiment, i) at least one negatively charged residues of the CDR1 and CDR3 regions of SEQ ID NO: 3 is mutated to an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine and ii) at least one residue of residues Y32, R52, S55, S56, N57, A59, M102, 1104 and R106 of SEQ ID NO: 2 or F32, D33, Y34, Y53, R54, D98 of SEQ. ID NO 3 ("Fab-Fab interaction" mutations) is mutated to an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, lysine, arginine, and tryptophan, histidine and tyrosine.

In a suitable embodiment, one or both of E27 and E97 of SEQ ID NO: 3 is/are mutated to an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine and one or both of A59 and N57 of SEQ ID NO: 2 is/are mutated to an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, lysine, arginine, tryptophan, histidine and tyrosine, more preferably serine or tyrosine.

A further aspect of the invention is based on the observation that an Ala substitution in position Y90 of SEQ ID NO 1 of TREM-1 improved the affinity of SEQ. ID NO 3 to TREM-1. The Y90 was found to interact with a phenylalanine residue of SEQ ID NO: 3. Mutation of SEQ ID NO: 3 in order to improve the Fab-TREM-1 interaction are referred to as Fab-TREM-1 interaction mutations. In one embodiment of this aspect of the invention, phenylalanine at position 32 of SEQ ID NO: 3 is mutated to an amino acid selected from amino acid residues glycine, serine, threonine, cysteine, alanine, valine, leucine, isoleucine and methionine, preferably selected from alanine, glycine, serine valine and leucine. In an interesting embodiment, F32 of SEQ ID NO: 3 is mutated to alanine or serine.
Charge patch mutations in the CDR1 and CDR3 of SEQ ID NO: 3 reduced the hydrodynamic radius (Rh) while mutations in the Fab-Fab interaction region increased Rh (Figure 6). Mutations in the “Fab-TREM-1 interaction” site did not influence Rh and had very little effect on viscosity (Figures 6 and 1, Tables 3C and 3E).

Table 1: Overview of SEQ ID No (0170) mAb variants generated. L = light chain, H = heavy chain.

The viscosity was determined for the mAb 0170 variants by DLS or micro rheology and showed that both “charge patch” mutations and “Fab-Fab interaction” mutations reduced the viscosity. The mAb variant 0318, which comprise the charge patch mutations E27Q and E97Q was found to have the lowest viscosity.

The binding kinetics of the mAb 0170 variants towards human TREM-I-Fc and cynomolgus TREM-I-Fc were determined, respectively. The mAb 0170 variants were all found to have similar affinity towards human TREM-I-Fc. Interestingly, the mAb variant,
SEQ ID NO: 9 comprising a "Fab-TREM-1 interaction" mutation was found to have increased affinity towards cynomolgus TREM-1-Fc (Table 2).

Table 2: Affinity of anti-TREM-1 mAb variants towards human TREM-1-Fc and cynomolgus TREM-1-Fc respectively.

In an embodiment with both improved affinity towards TREM-1 and having low viscosity, the mutations from SEQ ID NO: 9 were combined with the mutations in SEQ ID NO: 5 to generate the light chain from SEQ ID NO: 14 and the mutations from the light chain from SEQ ID NO: 16. The increased affinity towards cynomolgus TREM-1-Fc was retained for the mAb variants comprising the combined mutations of SEQ ID NO: 14 and the mutations did not negatively affect the affinity towards human TREM-1-Fc. Accordingly, embodiments comprising both "charge patch" mutations and "Fab-TREM-1 interaction" mutations are envisaged by the present invention, as well as embodiments comprising both "charge patch" mutations and "Fab-Fab interaction" mutations as well as embodiments comprising both "Fab-Fab interaction" mutations and "Fab-TREM-1 interaction" mutations and embodiments comprising "Fab-Fab interaction" mutations, "Fab-TREM-1 interaction" mutations and "charge patch" mutations.

Non-limiting embodiments of the present invention further comprise:

1. An antibody or fragment thereof that is capable of binding to and blocking TREM-1 of SEQ ID NO: 1, characterized in that the antibody, or an antibody fragment of said antibody, has a viscosity of less than 5 cP at a concentration of 50 mg/mL, such as less
than 4 cP, preferably less than 3 cP (wherein the method of determining viscosity versus protein concentration conditions are conventional or as described herein.)

2. An antibody or fragment thereof that is capable of binding to and blocking TREM-1, characterized in that the antibody, or an antibody fragment of said antibody, has a viscosity of less than 5 cP at a concentration of 80 mg/mL, preferably less than 4 cP (wherein the method of determining viscosity versus protein concentration conditions are conventional or as described herein.)

3. An antibody or fragment thereof according to embodiments 1 or 2 wherein the antibody or fragment thereof blocks TREM-1 function with a KD to SEQ ID NO: 1 of less than 0.5 nM, such as less than 0.4 nM, preferably of 0.3 nM or less.

4. An antibody or fragment thereof wherein the antibody or fragment thereof competitively binds with mAb 0170 for binding to SEQ ID NO: 1 and has a viscosity profile such that:
   (a) the antibody or an antibody fragment of said antibody has a viscosity of less than 5 cP at a concentration of 50 mg/mL, such as less than 4 cP, preferably less than 3 cP; or
   (b) the antibody or an antibody fragment of said antibody, has a viscosity of less than 5 cP at a concentration of 80 mg/mL, preferably less than 4 cP.

5. An antibody or fragment thereof that is capable of specifically binding to and blocking TREM-1, wherein the antibody or fragment thereof has "Fab-Fab interaction" mutations of SEQ ID NO: 2.

6. An antibody or fragment thereof that is capable of specifically binding to and blocking TREM-1 of SEQ ID NO: 1, wherein the antibody or fragment thereof has "charge patch" mutations, such as wherein at least one of the negatively charged residues of the CDR1 and CDR3 of SEQ ID NO: 3 are substituted with uncharged residues.

7. An antibody or fragment thereof according to any of the embodiments of the invention wherein negatively charged amino acids are substituted with amino acid residues which can form hydrogen bonding partners, such as mutation of an Asp or Glu residue to any one of Asn, Gin, Ser and Thr.

8. An antibody or fragment thereof according to any of the embodiments of the invention having a lowered viscosity compared to mAb 0170, but still having a $K_D$ to SEQ ID NO: 1 of less than 0.5 nM.

9. An antibody or fragment thereof according to any of the embodiments of the invention having a lowered viscosity compared to mAb 0170, a $K_D$ to SEQ ID NO: 1 of
less than 0.5 nM and a $K_D$ to SEQ ID NO: 17 of less than 0.6 nM, by substituting uncharged amino acids of SEQ ID NO: 2 and/or 3, involved in specific "Fab-Fab interactions" with amino acids with altered size or hydrogen bonding potential.

10. An antibody or fragment thereof according to any of the embodiments of the invention that is capable of specifically binding to and blocking TREM-1 of SEQ ID NO: 1 and comprises variants of SEQ ID NO: 2 or SEQ ID NO: 3 or both, wherein the variants are selected from the group consisting of "Fab-Fab interaction" mutations, "Fab-TREM-1 interaction" mutations and "charge-patch" mutations of SEQ ID NO: 2 or SEQ ID NO: 3.

11. An antibody or fragment thereof according to any of the embodiments of the invention comprising "Fab-TREM-1 interaction" mutations, such as wherein a Phe residue of SEQ ID NO: 3 is substituted with Ala or Ser.

12. An antibody or fragment thereof according to any of the embodiments of the invention which competes with SEQ ID NO: 2 or 3 for binding to SEQ ID NO: 1 and which has an epitope comprising one, two, three, four, five, six, seven or all of the amino acid residues D38, V39, K40, C41, D42, Y43, T44 and L45 and one, two or all of the amino acid residues E46, K47, F48 of SEQ ID NO: 1.

13. The antibody or fragment thereof according to any of the embodiments of the invention, which competes for binding with SEQ ID NO: 3, and comprising a Lc having one or both glutamate (E) residues of positions 27 and 97 of SEQ ID NO: 3 mutated to serine (S) or glutamine (Q), such as wherein E27Q, E97S, such as wherein both E27 and E97 are mutated to glutamine or wherein E27 remains un-mutated and E97 is mutated to S (E27, E97S), or wherein E27 remains un-mutated and E97 is mutated to Q (E27, E97Q), or wherein E97 remains un-mutated and E27 is mutated to Q or S, more preferably to Q (E27, E97Q).

14. The antibody or fragment thereof according to any of the embodiments of the invention comprising SEQ ID NO: 3, wherein the phenylalanine at position 32 (F32) is mutated, such as mutated to A (mAb 0322) or to S (mAb 0323).

15. The antibody or fragment thereof according to any one of the embodiments, comprising SEQ ID NO: 2 wherein one or both of residue N57 and residue A59 has been mutated, such as wherein residue A59 has been mutated to a tyrosine, or wherein residue N57 has been mutated to a serine, or wherein residue N57 has been mutated to a serine and residue A59 has been mutated to a tyrosine.

16. An antibody or fragment thereof comprising a variant of SEQ ID NO: 2 wherein uncharged amino acids involved in specific Fab-Fab interactions are substituted with
amino acids with altered size or hydrogen bonding potential, such as wherein alanine (A) or asparagine (N) are substituted with any one of Ser, Thr, Phe, Tyr and Trp.

17. An antibody or fragment thereof comprising a variant of SEQ ID NO: 3 and which competes for binding with SEQ ID NO: 3 wherein one or both glutamate (E) residues of positions 27 and 97 of SEQ ID NO: 3 are mutated to serine (S) or glutamine (Q), such as wherein both E27 and E97 are mutated to glutamine (318), or wherein E27 remains un-mutated and E97 is mutated to S (E27, E97S), or wherein E27 remains un-mutated and E97 is mutated to Q (E27, E97Q), or wherein E97 remains un-mutated and E27 is mutated to Q or S, more preferably to Q (E27, E97Q).

18. An antibody or fragment thereof comprising a variant of SEQ ID NO: 2 and which competes for binding with SEQ ID NO: 2, wherein one or both of residue N57 and residue A59 has been mutated, such as wherein residue A59 has been mutated to a tyrosine, or wherein residue N57 has been mutated to a serine, or wherein both residue N57 has been mutated to a serine and residue A59 has been mutated to a tyrosine.

19. An antibody or fragment thereof comprising SEQ ID NO: 4.

20. An antibody or fragment thereof comprising SEQ ID NO: 5.

22. An antibody or fragment thereof comprising SEQ ID NO: 7.

23. An antibody or fragment thereof comprising SEQ ID NO: 8.

25. An antibody or fragment thereof comprising SEQ ID NO: 10.

26. An antibody or fragment thereof comprising SEQ ID NO: 11.

27. An antibody or fragment thereof comprising SEQ ID NO: 12.

28. An antibody or fragment thereof comprising SEQ ID NO: 13.

29. An antibody or fragment thereof comprising SEQ ID NO: 14.

30. An antibody or fragment thereof comprising SEQ ID NO: 15.

31. An antibody or fragment thereof comprising SEQ ID NO: 16.

32. An antibody or fragment thereof comprising any one of SEQ ID NOs: 4 to 16.

33. A composition comprising an antibody as defined in any of embodiments 1-32.

34. An antibody of the invention, such as of embodiment 1-32, for use as a medicament.

35. An antibody of the invention, such as of embodiment 1-32, for use in the treatment of a disease selected from an inflammatory disease or an autoimmune disease.

36. An antibody according to embodiment 35, wherein the disease is selected from the group consisting of rheumatoid arthritis and inflammatory bowel disease.
37. Use of an antibody of the invention, such as of any of embodiments 1-32, for the preparation of a medicament for the treatment of a disease selected from the group consisting of an inflammatory disease or an autoimmune disease.

38. The use according to embodiment 35 wherein the disease is selected from the group consisting of rheumatoid arthritis and inflammatory bowel disease.

39. A method of treating a disease selected from an inflammatory disease or an autoimmune disease comprising administering an antibody of the invention (such as an antibody of any of embodiments 1-32), a composition comprising the antibody of the invention, or a medicament comprising the antibody of the invention.

EXAMPLES

Example 1: Hydrodynamic radius and viscosity of mAb0170 variants

The hydrodynamic radius of mAb0170 of WO2013/120553 was found to be higher (9-10 nm) than desired (5-6 nm). The hydrodynamic radius was determined by dynamic light scattering analysis using a 96-well plate setup with a DynaPro plate reader (Wyatt Inc.). The plates used were Corning 3540 assay plates (Corning). Total sample volume was approximately 20 μL and the temperature was kept at 25 °C for the mAb0170 variants (Figure 6).

Charge patch mutations in the CDR1 and CDR3 of the variable light chain reduced the Rh to the level expected for monomeric mAbs while mutations in the Fab-Fab interaction region seemed to increase Rh. Mutations in the Fab-TREM-1 interaction site did not influence Rh.

The viscosity was determined for the mAb0170 variants 0317, 0318, 0319, 0320, 0321, 0322, 0323, 0324, 0325, 0326 and 0330 by DLS. Hydrodynamic radius was measured on a Wyatt DynaPro Platereader using Corning 3540 clear bottom, black not-treated polystyrene microplates and plain polystyrene nanospheres from Phosphorex Inc. with a mean diameter of 206.5 nm (Cat. no. 106). The protein samples were transferred to a Corning 3540 plate and covered with a top seal. The samples were centrifuged and the hydrodynamic radii of the protein samples were measured in the Wyatt DynaPro DLS plate reader. Each well was added 0.5 μL polystyrene beads and mixed gently by pipetting. The plate was centrifuged again and the hydrodynamic radii of the beads were measured in the Wyatt DynaPro DLS plate reader.

The viscosities of the protein samples were calculated as
viscosity(protein) = (hydrodynamic radius(beads, meas)xviscosity(buffer))/hydrodynamic radius(beads, real)
where viscosity(protein) is the calculated viscosity of the protein solution, hydrodynamic radius(beads, meas) is the measured hydrodynamic radius of the polystyrene beads in the protein solution, viscosity(buffer) is the viscosity of the buffer and hydrodynamic radius(beads, real) is the real mean diameter of the beads [He et al., Anal Biochem, 399, 141-143, 2010].

The viscosity was determined by micro-rheology for the mAb0170 variants 0332 and 0333. For the rheological analysis, a 250 μl Hamilton LT syringe (Hamilton-Bonaduz Inc) with a 30G Novofline needle attached was used. The syringe was placed in a custom made aluminium holder fastened to a platform. The plunger of the syringe was driven by a TAXTPlus Texture Analyzer, which measured the resulting force on the plunger with a pre-determined injection speed. Each sample was tested with three different injection speeds. The cross-head speed and the measured force were used to calculate the shear rate and the shear stress respectively. Viscosity can be expressed in relation to shear rate as:

$$\eta_{\text{protein}} = \frac{\gamma}{\eta_w} = \frac{\Delta P D/41}{((320_\pi)/D^3)}$$

where \(\eta_{\text{protein}}\) is the viscosity of the protein solution, \(\gamma\) is the apparent shear rate, \(\eta_w\) is the shear stress, \(P\) is the pressure resulting from driving the plunger, \(Q\) is the volumetric flow rate of the fluid passing through the capillary needle and \(D\) and \(L\) are the internal diameter and length, respectively of the capillary (Allahham et al., 2004; Intl J Pharm 270, 139-148). The viscosity, \(\eta_{\text{protein}}\) was calculated from the know values of \(D\), \(L\) and \(Q\) and the measured value of \(P\).

The analysis showed that both "charge patch" mutations and "Fab-Fab interaction" mutations reduced the viscosity (Figure 1). The mAb variant SEQ ID NO: 5, which comprises the charge patch mutations E27Q and E97Q was found to have the lowest viscosity.

**Example 2: Kinetics of mAb0170 variants**

The binding kinetics of the mAb 0170 variants towards human TREM-I-Fc and cynomolgus TREM-I-Fc were determined, respectively. Binding studies were performed on a ProteOn Analyzer (BioRad) that measures molecular interactions in real time through surface plasmon resonance. Experiments were run at 25°C and the samples were stored at 15 °C in the sample compartment. The signal (RU, response units) reported by the ProteOn is directly correlated to the mass on the individual sensor chip surfaces in the six parallel flow cells. Anti-human Fc monoclonal or anti-murine Fc polyclonal antibody from Biacore human or mouse Fc capture kits were immobilized in horizontal direction onto flow cells of a GLM sensor chip according to the manufacturer's instructions. The final immobilization level of capture antibody was approximately 2600-6000 RU in each experiment. The capture of purified monoclonal mouse or recombinantly
expressed anti-hTREM-1 antibodies was conducted by diluting the antibodies to 5-10 nM into running buffer (10 mM Heps, 0.15 M NaCl, 5 mM EDTA, 0.05% surfactant P20, pH 7.4) followed by injection in vertical direction at 30 μl/μln for 60 sec, creating reference interspots adjacent to all flow cells with only anti-Fc antibody immobilized. This typically resulted in final capture levels of test antibodies of approximately 100-300 RU and Rmax values of analyte of 30-90 RU. Binding of hTREM-1 or cTREM-1 proteins was conducted by injecting analyte (antigen) over all flow cells in horizontal direction to allow for comparative analyses of binding to different captured anti-TREM-1 antibodies relative to binding to the reference interspot. hTREM-1 or cTREM-1 proteins were diluted serially 1:3 to 1.2-100 nM or into running buffer, injected at 100 μl/μln for 250 s and allowed to dissociate for 600s. The GLM surface was regenerated after each injection cycle of analyte via two 18 s injections of 10 mM Glycine, pH 1.7 and 50 mM NaOH at 100 μl/μln. This regeneration step removed the anti-TREM-1 antibody and any bound TREM-1 protein from the immobilized capture antibody surface and allowed for the subsequent binding of the next interaction sample pair. The regeneration procedure did not remove the directly immobilized anti-Fc capture antibody from the chip surface.

Binding affinity between antibodies and the antigen was quantified by determination of the equilibrium dissociation constant (K_D) determined by measurement of the kinetics of complex formation and dissociation. The rate constants corresponding to the association and the dissociation of a monovalent complex such as k_a (association rate) and k_d (dissociation rate) were retrieved by fitting data to 1:1 Langmuir model using the ProteOn evaluation software for data analysis. K_D is related to k_a and k_d through the equation K_D = k_d / k_a.

Binding curves were processed by double referencing (subtraction of reference surface signals as well as blank buffer injections over captured anti-TREM-1 antibodies) prior to data analysis. This allowed correction for instrument noise, bulk shift and drift during sample injections.

The mAb 0170 variants were all found to have similar affinity towards human TREM-1-Fc as mAb 0170. Interestingly, mAb variants comprising a "Fab-TREM-1 interaction" mutation, such as mAb 0322, had increased affinity towards cynomolgus TREM-1-Fc (Table 2).

Example 3: Kinetics and viscosity of mAb 0330 and mAb 0333
In the attempt to generate a mAb with both improved affinity towards cynomolgus TREM-1 and having low viscosity, the mutations from SEQ ID NO 9 was combined with the mutations in SEQ ID NO 5, which was found to have the lowest viscosity among the mAb0170 variants and with SEQ ID NO: 11, which was found to have a modest effect on the viscosity. The increased affinity towards cynomolgus TREM-1-Fc was retained for the mAb variant comprising the combined mutations (mAb 0330 and mAb 0333) and the
mutations did not affect the affinity towards human TREM-l-Fc. The viscosity of mAb0330 and mAb 0333 were markedly reduced compared to mAb 0170 of WO2013/120553 (Figure 1).

Example 4: Cultivation of a BWZ’36/hTREM-l stable cell line
BWZ/hTREM-1 reporter cell were cultured in RPMI 1640 w/o phenol red (Cat# 11835, Gibco, Carlsbad CA, USA), supplemented with 10% FCS (Cat# 16140-071, Gibco, New York, USA), 1% Pen/Strep (Cat# 15070-06, Gibco), 1 mM Sodium Pyruvate (Cat #11360, Gibco), 5 μM -2ME (Cat# 31350-010, Gibco) and 2 mM L-Glutamine (Cat # 25030, Gibco). No special plates or coating was required. 10 ml Versene (Cat # 15040, Gibco) was added to detach the cells which then were transferred to tubes, centrifuged 1200 rpm 5 min and washed in fresh RPMI 1640 w/o phenol red. These cells were then ready to use in an assay or re-culture for further propagation.

Example 5: Functional characterization mAb 0170 variants
The ability of the anti-TREM-1 mAb 0170 variants to inhibit human TREM-1 signalling was determined using a reporter cell line (BWZ’36/hTREM-l) provided by Bioxell. The reporter cell line was stimulated with PGN and TREM-1 ligand PGLYRP1 either as recombinant protein or expressed by activated neutrophils prior to incubation with mAbs. The potency of the variants to inhibit TREM-1 signalling was found to be clinical relevant and on par with that of the mAb 0170 of WO2013/120553 (Figure 2A and B).

Likewise, the ability to inhibit cynomolgus TREM-1 signalling was determined for the three mAb0170 variants with the lowest viscosity and two variants observed to have increased affinity towards cynomolgus TREM-1. In this assay using an established reporter cell line TE 426.27, similar potencies of the mAb variants and mAb0170 of WO2013/120553 was observed (Figure 3).

Also, the potency of the mAb variants to block TNFa release from primary cells from healthy donors was assessed. In this assay monocytes were differentiated to M2 macrophages under hypoxic conditions in order to increase TREM-1 expression and activated with PGN and recombinant PGLYRP1 prior to incubation with mAb. The mAb variants were found to be as potent as 0170 at inhibiting TREM-1-mediated TNFa release from hypoxic M2 macrophages (Figure 4).

Example 6 Crystal structure of a Fab 0170-Fab 0170 complex
The potential of mAb 0170 molecules to interact by specific self-interactions were evaluated from by crystallographic analysis of a Fab 0170-Fab 0170 crystal structure. Materials: The Fab region of mAb 0170 (SEQ ID NO: 18 and SEQ ID NO: 19) in a buffer consisting of 10 mM phosphate, 2.68 mM KCl, 140 mM NaCl, pH 7.4 at a protein concentration of 8.5 mg/mL.
**Methods:** The Fab region of mAb 0170 was crystallized in a hanging drop vapour diffusion experiment by equilibration of a droplet consisting of 2 μL protein solution mixed with 2 μL reservoir solution against a 0.5 mL reservoir composed of 20%(w/v) PEG 8000, 200 mM K₂HPo₄. The crystal was transferred to a drop consisting of 2 μL 35% (w/v) PEG3350, 200 mM K₂HPo₄ and mounted in a 0.2 mm diameter litholooop (Molecular Dimensions Limited) and flash-cooled in liquid nitrogen.

X-ray diffraction data was collected at MAXLAB 911-2, Lund University, Sweden using a Cryo-stream operated at 100 K. The raw data images were indexed, integrated and scaled using the XDS program package (Kabsch, Acta Crystallogr. D66, 133-144 (2010)). The space group of the crystal was P2₁(1)2₁(1)2₁(1), with unit cell parameters, a = 62.4 A, b = 110.9 A, c = 158.4 A. Data were collected to a resolution of 2.40 Å. The structure was solved by molecular replacement using the Phenix software (Adams et al., Acta Crystallogr. D66, 213—221 (2010)) as implemented in the CCP4i program suite (Potterton et al., Acta Crystallogr. D59, 1131-1137 (2003)). The search models were structures of the heavy chain from the pdb entry IADO.pdb (85% identity) and the light chain from the pdb entry 2QRG (94% identity). Structure refinement was carried out using Refmac5 (Murshudov et al., Acta Crystallogr. D53, 240-255 (1997)) from the CCP4i program suite. Coot version 7 (Emsley et al., Acta Crystallogr. D66, 486-501 (2010)) was used for manual structure rebuilding and validation.

**Results and discussion**

The crystal structure of the mAb 170 Fab region contained four Fab molecules in the asymmetric unit (heavy chains were labelled A and C, light chains were labelled B and D). The Fab molecules were packed as dimers with the antigen binding region of one Fab molecule interacting with the antigen binding region of another Fab molecule. It was not possible to include and refine the last cysteine from the SEQ ID NO: 19 in the crystal structure although it would be expected to be in disulphide bond with a Cys from SEQ ID NO: 18 from the heavy chain. There was some indication of excess 2Fo-Fc and Fo-Fc electron density in the area, and it is possible that the disulphide bond is present in a subset of the Fab molecules. There was not significant sigamaa weighted 2Fo-Fc electron density for residues G26, K78-N79, I104-R105 and S138-E141 from SEQ ID NO: 18 in chain A in the asymmetric unit and for E1, G26-F 27, M102-R105, S136-E141, S195-K200 from SEQ ID NO: 18 chain C in the other Fab molecule in the asymmetric unit. Significant sigamaa weighted 2Fo-Fc electron density was also missing for residues D30-Y34 from SEQ ID NO: 19 in chain D. These residues were not included in the crystal structure but were included in molecular interaction analysis of the Fab-Fab interface by superposition with the mAb 0170 fragment crystal structure from the WO2013/120553 disclosed humanized anti-TREM-1 mAb 0170 crystal structure.

The quality parameters of the mAb 0170 Fab fragment structure showed an overall R-factor of the structure = 24% and the Free R-factor = 30%. The overall correlation
coefficient was 0.93 and the diffraction-component precision index, DPI = 0.3 Å (Cruickshank, Acta Crystallogr. D55, 583-601 (1999)). The root-mean-square deviation of the bond lengths in the structure from ideal bond lengths = 0.025 Å and the root-mean-square deviation from ideal bond angles =2.326° (Engh and Huber, Acta Crystallogr. A47, 392-400 (1991)).

Analysis of intermolecular distances was carried out using the program NCONT in the CCP4 program suite (Potterton et al., Acta Crystallogr. D59, 1131-1137 (2003)) with a cutoff of 4Å for intermolecular distances (Table 4). The analysis showed amino acid residues N57 and A59 from SEQ ID NO: 2 to belong to the group of amino acids involved in Fab-Fab interactions in the crystal structure.

Table 4. Predicted Fab-Fab interactions based on superposition of the WO2013/120553 disclosed humanized anti-TREM-1 mAb 0170 crystal structure with the present observed mAb 0170 Fab region crystal structure.
CLAIMS

1. An antibody or fragment thereof that is capable of binding to and blocking TREM-1, characterized in that the antibody or fragment has a viscosity of less than 5 cP at a concentration of 80 mg/mL, preferably less than 4 cP.

2. An antibody or fragment thereof wherein one or more of the negatively charged residues in the CDR1 and CDR3 region of SEQ ID NO: 3 are substituted with uncharged amino acid residues.

3. An antibody or fragment thereof according to claim 1 or 2, comprising a variant of SEQ ID NO: 3 wherein any one or more of residues D1, D30, D33, D74, D98, E27, E97 ("charge patch" mutations) of SEQ ID NO: 3 is mutated to an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine.

4. An antibody or fragment thereof according to claim 3 wherein at least one or both of E27 and E97 of the CDR1 and CDR3 regions of SEQ ID NO: 3 are substituted with uncharged amino acid residues, such as an amino acid selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine.

5. An antibody or fragment thereof according to claim 3 or 4, wherein E27 of SEQ ID NO: 3 is mutated to glutamine and E97 is substituted with an amino acid selected from the group consisting of glycine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine, more preferably with an amino acid selected from the group consisting of serine and glutamine.

6. An antibody or fragment thereof according to claim 3 or 4, wherein E97 of SEQ ID NO: 3 is mutated to glutamine and E27 is substituted with an amino acid selected from the group consisting of glycine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine, more preferably with an amino acid selected from the group consisting of serine and glutamine.

7. An antibody or fragment thereof according to claim 3 or 4, wherein E27 and E97 of SEQ ID NO: 3 are mutated to glutamine.

8. An antibody or fragment thereof according to claim 3 or 4, wherein E27 of SEQ ID NO: 3 remains unmutated and E97 is mutated with an amino acid selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine,
cysteine, and tyrosine, more preferably with an amino acid selected from the group consisting of serine and glutamine.

9. An antibody or fragment thereof according to claim 3 or 4, wherein residue E97 of SEQ ID NO: 3 remains unmutated and E27 is substituted with an amino acid selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine, more preferably with an amino acid selected from the group consisting of serine and glutamine.

10. An antibody or fragment thereof comprising a variant of SEQ ID NO: 2 wherein any one of residues Y32, R52, S55, S56, N57, A59, M102, 1104 and R106 of SEQ ID NO: 2 or F32, D33, Y34, Y53, R54, D98 of SEQ. ID NO 3 ("Fab-Fab interaction" mutations) is substituted with another amino acid, such as natural amino acid, preferably an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, lysine, arginine, tryptophan, histidine and tyrosine.

11. An antibody or fragment thereof according to claim 10, wherein at least one of residues A59 and N57 of SEQ ID NO: 2 is mutated to an amino acid residue, such as a natural amino acid, preferably an amino acid selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, lysine, arginine, tryptophan, histidine and tyrosine, more preferably serine or tyrosine.

12. An antibody or fragment thereof according to claim 10, wherein A59 of SEQ ID NO: 2 remains unmutated and N57 is mutated to another amino acid residue, such as natural amino acid, preferably selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, lysine, arginine, tryptophan, histidine and tyrosine, more preferably serine or tyrosine.

13. An antibody or fragment thereof according to claim 10, wherein N57 of SEQ ID NO: 2 remains unmutated and A59 of SEQ ID NO: 2 is mutated to another amino acid residue, such as natural amino acid, preferably selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, lysine, arginine, tryptophan, histidine and tyrosine, more preferably serine or tyrosine.
14. An antibody or fragment thereof according to claim 10, wherein both A59 and N57 of SEQ ID NO: 2 are mutated to another amino acid residue, such as natural amino acid, preferably selected from the group consisting glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, lysine, arginine, tryptophan, histidine and tyrosine, more preferably serine or tyrosine.

15. An antibody or fragment thereof according to any one of the preceding claims, wherein:
   i) at least one negatively charged residue of the CDR1 and CDR3 regions of SEQ ID NO: 3 is mutated to an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine and
   ii) at least one residue of residues Y32, R52, S55, S56, N57, A59, M102, 1104 and R106 of SEQ ID NO: 2 or F32, D33, Y34, Y53, R54, D98 of SEQ. ID NO 3 ("Fab-Fab interaction" mutations) is mutated to an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, lysine, arginine, and tryptophan, histidine and tyrosine.

16. An antibody or fragment thereof according to any one of the preceding claims, wherein:
   one or both of E27 and E97 of SEQ ID NO: 3 is/are mutated to an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, and tyrosine; and
   one or both of A59 and N57 of SEQ ID NO: 2 is/are mutated to an amino acid residue selected from the group consisting of glycine, alanine, serine, asparagine, glutamine, threonine, cysteine, lysine, arginine, tryptophan, histidine and tyrosine, more preferably serine or tyrosine.

17. An antibody or fragment thereof comprising a variant of SEQ ID NO: 3 wherein phenylalanine at position 32 of SEQ ID NO: 3 is mutated to an amino acid selected from amino acid residues glycine, serine, threonine, cysteine, alanine, valine, leucine, isoleucine and methionine, preferably selected from alanine, glycine, serine valine and leucine, more preferably wherein F32 of SEQ ID NO: 3 is mutated to alanine or serine.

18. An antibody or fragment thereof comprising any one of SEQ ID NOs: 4 to 16.

INTERNATIONAL SEARCH REPORT

A. CLASSIFICATION OF SUBJECT MATTER

INV. C07K16/28

ADD.

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)
C07K

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal, EMBASE, WPI Data

C. DOCUMENTS CONSIDERED TO BE RELEVANT

<table>
<thead>
<tr>
<th>Category</th>
<th>Citation of document, with indication, where appropriate, of the relevant passages</th>
<th>Relevant to claim No.</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>WO 2013/120553 Al (NOVO NORDISK AS [DK]) 22 August 2013 (2013-08-22) cited in the application abstract</td>
<td>1-18</td>
</tr>
</tbody>
</table>

Further documents are listed in the continuation of Box C.

See patent family annex.

* Special categories of cited documents:
  - "A" document defining the general state of the art which is not considered to be of particular relevance
  - "E" earlier application or patent but published on or after the international filing date
  - "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
  - "O" document referring to an oral disclosure, use, exhibition or other means
  - "P" document published prior to the international filing date but later than the priority date claimed
  - "T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
  - "X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
  - "Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
  - "A" member of the same patent family

Date of the actual completion of the international search

2 October 2015

Date of mailing of the international search report

12/10/2015

Name and mailing address of the ISA

European Patent Office, P.B. 5818 Patentlaan 2 NL - 2280 HV Rijswijk
Tel. (+31-70) 340-2040, Fax: (+31-70) 340-3016

Authorized officer
