MIGRASTATIN ANALOG COMPOSITIONS AND USES THEREOF

In one aspect, the present invention provides pharmaceutical compositions comprising a therapeutically effective amount of a compound of general formula (I), wherein R₁, R₂, R₃, R₄, Q, Y₁, Y₂ and n are as defined herein, whereby the composition is formulated for administration to a subject at a dosage between about 0.1 mg/kg to about 50 mg/kg of body weight. In another aspect, the present invention provides a method for treating breast tumor metastasis in a subject comprising administering to a subject in need thereof a therapeutically effective amount of the inventive composition described directly above and a pharmaceutically acceptable carrier, adjuvant or vehicle.

MIGRASTATIN ANALOG COMPOSITIONS
AND USES THEREOF

PRIORITY CLAIM

[0001] The present application claims priority to U.S. Provisional Application Nos.: 60/458,827, filed March 28, 2003, and 60/496,165, filed August 19, 2003; the entire contents of each of the above-referenced applications are hereby incorporated herein by reference.

GOVERNMENT SUPPORT

[0002] The invention was supported in part by Grant No.: 08748 from the National Cancer Institute; Grant Nos.: AI-16943 and GM056904 from the National Institutes of Health; and by Postdoctoral Fellowships for Christoph Gaul (Deutscher Akademischer Austauschdienst, DAAD) and Jon Tryggvi Njardarson (General Motors Cancer Research Program). The U.S. government may have certain rights in this invention.

BACKGROUND OF THE INVENTION

[0003] Migrahstatin (1) is a novel 14-membered ring macrolide natural product, that was first isolated from a cultured broth of Steptomycyces sp. MK929-43F1 by Imoto et al. (see, Nakae et al., J. Antibiot., 2000, 53, 1130-1136; and Nakae et al., J. Antibiot., 2000, 53, 1228-1230). It was recently reported that cultures of Steptomycyces platensis also produce Migrahstatin (see, Woo et al., J. Antibiot., 2002, 55, 141-146).
[0004] Migrastatin has been shown to inhibit both migration and anchorage-independent growth of human tumor cells (see, Nakae et al., J. Antibiot., 2001, 54, 1104-1107), and has sparked interest in the area of cancer research. Specifically, migration of tumor cells is part of the complex process of metastasis, which is the leading cause of death in cancer patients. Therefore, Migrastatin and derivatives thereof hold great potential as therapeutic agents for the treatment of cancer.

[0005] After initial isolation and reporting of this compound, several groups explored the possibility of preparing derivatives and/or further exploring their biological activity. Each of these groups, however, was only able to obtain Migrastatin and derivatives thereof by fermentation techniques and/or by modifications to the natural product, and thus was limited in the number and types of derivatives that could be prepared and/or evaluated for biological activity.

[0006] Clearly, there remains a need for compounds related to Migrastatin. Therefore, there is a need to develop synthetic methodologies to access a variety of novel analogues of Migrastatin, particularly those that are inaccessible by making modifications to the natural product. It would also be of particular interest to develop novel compounds that exhibit a favorable therapeutic profile in vivo (e.g., are safe and effective).

**SUMMARY OF THE INVENTION**

[0007] In one aspect, the present invention provides pharmaceutical compositions comprising a therapeutically effective amount of a compound of general formula (I),
as described generally and in subclasses herein, whereby the composition is formulated for administration to a subject at a dosage between about 0.1 mg/kg to about 50 mg/kg of body weight.

[0008] In another aspect, the present invention provides a method for treating breast tumor metastasis in a subject comprising administering to a subject in need thereof a therapeutically effective amount of the inventive composition described directly above and a pharmaceutically acceptable carrier, adjuvant or vehicle.

DEFINITIONS

[0009] The term “aliphatic”, as used herein, includes both saturated and unsaturated, straight chain (i.e., unbranched) or branched aliphatic hydrocarbons, which are optionally substituted with one or more functional groups. As will be appreciated by one of ordinary skill in the art, “aliphatic” is intended herein to include, but is not limited to, alkyl, alkenyl, alkynyl moieties. Thus, as used herein, the term “alkyl” includes straight and branched alkyl groups. An analogous convention applies to other generic terms such as “alkenyl”, “alkynyl” and the like. Furthermore, as used herein, the terms “alkyl”, “alkenyl”, “alkynyl” and the like encompass both substituted and unsubstituted groups. In certain embodiments, as used herein, “lower alkyl” is used to indicate those alkyl groups (cyclic, acyclic, substituted, unsubstituted, branched or unbranched) having about 1-6 carbon atoms.

[0010] In certain embodiments, the alkyl, alkenyl and alkynyl groups employed in the invention contain about 1-20 aliphatic carbon atoms. In certain other embodiments, the alkyl, alkenyl, and alkynyl groups employed in the invention
contain about 1-10 aliphatic carbon atoms. In yet other embodiments, the alkyl, alkenyl, and alkynyl groups employed in the invention contain about 1-8 aliphatic carbon atoms. In still other embodiments, the alkyl, alkenyl, and alkynyl groups employed in the invention contain about 1-6 aliphatic carbon atoms. In yet other embodiments, the alkyl, alkenyl, and alkynyl groups employed in the invention contain about 1-4 carbon atoms. Illustrative aliphatic groups thus include, but are not limited to, for example, methyl, ethyl, n-propyl, isopropyl, allyl, n-butyl, sec-butyl, isobutyl, tert-butyl, n-pentyl, sec-pentyl, isopentyl, tert-pentyl, n-hexyl, sec-hexyl, moieties and the like, which again, may bear one or more substituents. Alkenyl groups include, but are not limited to, for example, ethenyl, propenyl, butenyl, 1-methyl-2-buten-1-yl, and the like. Representative alkynyl groups include, but are not limited to, ethynyl, 2-propynyl (propargyl), 1-propynyl and the like.

[0011] The term “alicyclic”, as used herein, refers to compounds which combine the properties of aliphatic and cyclic compounds and include but are not limited to cyclic, or polycyclic aliphatic hydrocarbons and bridged cycloalkyl compounds, which are optionally substituted with one or more functional groups. As will be appreciated by one of ordinary skill in the art, “alicyclic” is intended herein to include, but is not limited to, cycloalkyl, cycloalkenyl, and cycloalkynyl moieties, which are optionally substituted with one or more functional groups. Illustrative alicyclic groups thus include, but are not limited to, for example, cyclopropyl, -CH₂-cyclopropyl, cyclobutyl, -CH₂-cyclobutyl, cyclopentyl, -CH₂-cyclopentyl-n, cyclohexyl, -CH₂-cyclohexyl, cyclohexenylethyl, cyclohexanylethyl, norborbyl moieties and the like, which again, may bear one or more substituents.

[0012] The terms “alkoxy” (or “alkyloxy”), and “thioalkyl” as used herein refers to an alkyl group, as previously defined, attached to the parent molecular moiety through an oxygen atom (“alkoxy”) or through a sulfur atom (“thioalkyl”). In certain embodiments, the alkyl group contains about 1-20 aliphatic carbon atoms. In certain other embodiments, the alkyl group contains about 1-10 aliphatic carbon atoms. In yet other embodiments, the alkyl group contains about 1-8 aliphatic carbon atoms. In still other embodiments, the alkyl group contains about 1-6 aliphatic carbon atoms. In yet other embodiments, the alkyl group contains about 1-
4 aliphatic carbon atoms. Examples of alkoxy groups, include but are not limited to, methoxy, ethoxy, propoxy, isoproxy, n-butoxy, tert-butoxy, neopentoxy and n-hexoxy. Examples of thioalkyl groups include, but are not limited to, methylthio, ethylthio, propylthio, isopropylthio, n-butylthio, and the like.

[0013] The term "alkylamino" refers to a group having the structure -NHR' where R' is alkyl, as defined herein. The term "aminoalkyl" refers to a group having the structure NH₂R', wherein R' is alkyl, as defined herein. In certain embodiments, the alkyl group contains about 1-20 aliphatic carbon atoms. In certain other embodiments, the alkyl group contains about 1-10 aliphatic carbon atoms. In yet other embodiments, the alkyl, alkenyl, and alkynyl groups employed in the invention contain about 1-8 aliphatic carbon atoms. In still other embodiments, the alkyl group contains about 1-6 aliphatic carbon atoms. In yet other embodiments, the alkyl group contains about 1-4 aliphatic carbon atoms. Examples of alkylamino include, but are not limited to, methylamino, ethylamino, iso-propylamino and the like.

[0014] Some examples of substituents of the above-described aliphatic (and other) moieties of compounds of the invention include, but are not limited to aliphatic; heteroaliphatic; aryl; heteroaryl; alkylaryl; alkylheteroaryl; alkoxy; aryloxy; heteroalkoxy; heteroaryloxy; alkylthio; arylthio; heteroalkylthio; heteroarylothio; F; Cl; Br; I; -OH; -NO₂; -CN; -CF₃; -CH₂CF₃; -CHC1₂; -CH₂OH; -CH₂CH₂OH; -CH₂NH₂; -CH₂SO₂CH₃; -C(O)Rₓ; -CO₂(Rₓ); -CON(Rₓ)₂; -OC(O)Rₓ; -OCO₂Rₓ; -OCON(Rₓ)₂; -N(Rₓ)₂; -S(O)₂Rₓ; -NRₓ(CO)Rₓ wherein each occurrence of Rₓ independently includes, but is not limited to, aliphatic, heteroaliphatic, aryl, heteroaryl, alkylaryl, or alkylheteroaryl, wherein any of the aliphatic, heteroaliphatic, alkylaryl, or alkylheteroaryl substituents described above and herein may be substituted or unsubstituted, branched or unbranched, cyclic or acyclic, and wherein any of the aryl or heteroaryl substituents described above and herein may be substituted or unsubstituted. Additional examples of generally applicable substituents are illustrated by the specific embodiments shown in the Examples that are described herein.
In general, the terms “aryl” and “heteroaryl”, as used herein, refer to stable mono- or polycyclic, heterocyclic, polycyclic, and polyheterocyclic unsaturated moieties having preferably 3-14 carbon atoms, each of which may be substituted or unsubstituted. It will also be appreciated that aryl and heteroaryl moieties, as defined herein may be attached via an aliphatic, alicyclic, heteroaliphatic, heteroalicyclic, alkyl or heteroalkyl moiety and thus also include - (aliphatic)aryl, -(heteroaliphatic)aryl, -(aliphatic)heteroaryl, - (heteroaliphatic)heteroaryl, and specifically -(alkyl)aryl, -(heteroalkyl)aryl, - (heteroalkyl)aryl, and -(heteroalkyl)heteroaryl moieties. Thus, as used herein, the phrases “aryl or heteroaryl” and “aryl, heteroaryl, -(aliphatic)aryl, - (heteroaliphatic)aryl, -(aliphatic)heteroaryl, -(heteroaliphatic)heteroaryl, -(alkyl)aryl, -(heteroalkyl)aryl, -(heteroalkyl)aryl, and -(heteroalkyl)heteroaryl” are often interchangeable. Substituents include, but are not limited to, any of the previously mentioned substituents, i.e., the substituents recited for aliphatic moieties, or for other moieties as disclosed herein, resulting in the formation of a stable compound. In certain embodiments of the present invention, “aryl” refers to a mono- or bicyclic carbocyclic ring system having one or two aromatic rings including, but not limited to, phenyl, naphthyl, tetrahydronaphthyl, indanyl, indenyl and the like. In certain embodiments of the present invention, the term “heteroaryl”, as used herein, refers to a cyclic aromatic radical having from about five to about ten ring atoms of which one ring atom is selected from S, O and N; zero, one or two ring atoms are additional heteroatoms independently selected from S, O and N; and the remaining ring atoms are carbon, the radical being joined to the rest of the molecule via any of the ring atoms, such as, for example, pyridyl, pyrazinyl, pyrimidinyl, pyrrolyl, pyrazolyl, imidazolyl, thiazolyl, oxazolyl, isooxazolyl, thiadiazolyl, oxadiazolyl, thiophenyl, furanyl, quinolinyl, isoquinolinyl, and the like.

It will be appreciated that aryl and heteroaryl groups (including bicyclic aryl groups) can be unsubstituted or substituted, wherein substitution includes replacement of one, two or three of the hydrogen atoms thereon independently with any one or more of the following moieties including, but not limited to: aliphatic; heteroaliphatic; aryl; heteroaryl; alkylaryl; alkylheteroaryl;
alkoxy; aryloxy; heteroalkoxy; heteroaryloxy; alkylthio; arythio; heteroalkylthio; heteroarylothio; F; Cl; Br; I; -OH; -NO2; -CN; -CF3; -CH2CF3; -CHCl2; -CH2OH; -CH2CH2OH; -CH2NH2; -CH2SO2CH3; -C(O)R; -CO2(R); -CON(R2); -OC(O)R; -OCO2R; -OCON(R2); -N(R2); -S(O)2R; -NRx(CO)Rx wherein each occurrence of Rx independently includes, but is not limited to, aliphatic, heteroaliphatic, aryl, heteroaryl, alkylaryl, or alkylheteroaryl, wherein any of the aliphatic, heteroaliphatic, alkylaryl, or alkylheteroaryl substituents described above and herein may be substituted or unsubstituted, branched or unbranched, cyclic or acyclic, and wherein any of the aryl or heteroaryl substituents described above and herein may be substituted or unsubstituted. Additional examples of generally applicable substituents are illustrated by the specific embodiments shown in the Examples that are described herein.

[0017] The term “cycloalkyl”, as used herein, refers specifically to groups having three to seven, preferably three to ten carbon atoms. Suitable cycloalkyls include, but are not limited to cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl and the like, which, as in the case of aliphatic, heteroaliphatic or heterocyclic moieties, may optionally be substituted with substituents including, but not limited to aliphatic; heteroaliphatic; aryl; heteroaryl; alkylaryl; alkylheteroaryl; alkoxy; aryloxy; heteroalkoxy; heteroaryloxy; alkylthio; arythio; heteroalkylthio; heteroarylothio; F; Cl; Br; I; -OH; -NO2; -CN; -CF3; -CH2CF3; -CHCl2; -CH2OH; -CH2CH2OH; -CH2NH2; -CH2SO2CH3; -C(O)R; -CO2(R); -CON(R2); -OC(O)R; -OCO2R; -OCON(R2); -N(R2); -S(O)2R; -NRx(CO)Rx wherein each occurrence of Rx independently includes, but is not limited to, aliphatic, heteroaliphatic, aryl, heteroaryl, alkylaryl, or alkylheteroaryl, wherein any of the aliphatic, heteroaliphatic, alkylaryl, or alkylheteroaryl substituents described above and herein may be substituted or unsubstituted, branched or unbranched, cyclic or acyclic, and wherein any of the aryl or heteroaryl substituents described above and herein may be substituted or unsubstituted. Additional examples of generally applicable substituents are illustrated by the specific embodiments shown in the Examples that are described herein.
[0018] The term “heteroaliphatic”, as used herein, refers to aliphatic moieties in which one or more carbon atoms in the main chain have been substituted with a heteroatom. Thus, a heteroaliphatic group refers to an aliphatic chain which contains one or more oxygen, sulfur, nitrogen, phosphorus or silicon atoms, e.g., in place of carbon atoms. Heteroaliphatic moieties may be branched or linear unbranched. In certain embodiments, heteroaliphatic moieties are substituted by independent replacement of one or more of the hydrogen atoms thereon with one or more moieties including, but not limited to aliphatic; alicyclic; heteroaliphatic; heteroalicyclic; aryl; heteroaryl; alkylaryl; alkylheteroaryl; alkoxy; arylxy; heteroalkoxy; heteroaryloxy; alkylthio; arylthio; heteroalkylthio; heteroarylthio; F; Cl; Br; I; -OH; -NO₂; -CN; -CF₃; -CH₂CF₃; -CH₂Cl₂; -CH₂OH; -CH₂CH₂OH; -CH₂NH₂; -CH₂SO₂CH₃; -C(O)Rₓ; -CO₂(Rₓ); -CON(Rₓ); -OC(O)Rₓ; -OCO₂Rₓ; -OCON(Rₓ); -N(Rₓ); -S(O)₂Rₓ; -NRₓ(CO)Rₓ wherein each occurrence of Rₓ independently includes, but is not limited to, aliphatic, alicyclic, heteroaliphatic, heteroaicyclic, aryl, heteroaryl, alkylaryl, or alkylheteroaryl, wherein any of the aliphatic, alicyclic, heteroaliphatic, heteroaicyclic, aryl, heteroaryl, alkylaryl, or alkylheteroaryl substituents described above and herein may be substituted or unsubstituted, branched or unbranched, cyclic or acyclic, and wherein any of the aryl or heteroaryl substituents described above and herein may be substituted or unsubstituted. Additional examples of generally applicable substituents are illustrated by the specific embodiments shown in the Examples that are described herein.

[0019] The term “heteroaicyclic”, as used herein, refers to compounds which combine the properties of heteroaliphatic and cyclic compounds and include but are not limited to saturated and unsaturated mono- or polycyclic heterocycles such as morpholino, pyrrolidinyl, furanyl, thiofuranyl, pyrrolyl etc., which are optionally substituted with one or more functional groups, as defined herein.

[0020] Additionally, it will be appreciated that any of the alicyclic or heteroaicyclic moieties described above and herein may comprise an aryl or heteroaryl moiety fused thereto. Additional examples of generally applicable substituents are illustrated by the specific embodiments shown in the Examples that are described herein.
[0021] The terms “halo” and “halogen” as used herein refer to an atom selected from fluorine, chlorine, bromine and iodine.

[0022] The term “haloalkyl” denotes an alkyl group, as defined above, having one, two, or three halogen atoms attached thereto and is exemplified by such groups as chloromethyl, bromoethyl, trifluoromethyl, and the like.

[0023] The term “acyloxy”, as used herein, does not substantially differ from the common meaning of this term in the art, and refers to a moiety of structure – OC(O)R_X, wherein R_X is a substituted or unsubstituted, cyclic or acyclic, linear or branched, saturated or unsaturated aliphatic, alicyclic, heteroaliphatic, heteroalicyclic, aryl or heteroaryl moiety.

[0024] The term “acyl”, as used herein, does not substantially differ from the common meaning of this term in the art, and refers to a moiety of structure – C(O)R_X, wherein R_X is a substituted or unsubstituted, cyclic or acyclic, linear or branched, saturated or unsaturated aliphatic, alicyclic, heteroaliphatic, heteroalicyclic, aryl or heteroaryl moiety.

[0025] The term “heterocycloalkyl” or “heterocycle”, as used herein, refers to a non-aromatic 5-, 6- or 7- membered ring or a polycyclic group, including, but not limited to a bi- or tri-cyclic group comprising fused six-membered rings having between one and three heteroatoms independently selected from oxygen, sulfur and nitrogen, wherein (i) each 5-membered ring has 0 to 1 double bonds and each 6-membered ring has 0 to 2 double bonds, (ii) the nitrogen and sulfur heteroatoms may be optionally be oxidized, (iii) the nitrogen heteroatom may optionally be quaternized, and (iv) any of the above heterocyclic rings may be fused to an aryl or heteroaryl ring. Representative heterocycles include, but are not limited to, pyrroldinyl, pyrazolinyl, pyrazolidinyl, imidazolinyl, imidazolidinyl, piperidinyl, piperazinyl, oxazolidinyl, isoxazolidinyl, morpholinyln, thiazolidinyl, isothiazolidinyl, and tetrahydrofuryl. In certain embodiments, a “substituted heterocycloalkyl or heterocycle” group is utilized and as used herein, refers to a heterocycloalkyl or heterocycle group, as defined above, substituted by the independent replacement of one, two or three of the hydrogen atoms thereon with but are not limited to aliphatic; heteroaliphatic; aryl; heteroaryl; alkylaryl;
alkylheteroaryl; alkoxy; aryloxy; heteroalkoxy; heteroaryloxy; alkylthio; arylthio; heteroalkylthio; heteroaryldithio; F; Cl; Br; I; -OH; -NO₂; -CN; -CF₃; -CH₂CF₃; -CHCl₂; -CH₂OH; -CH₂CH₂OH; -CH₂NH₂; -CH₂SO₂CH₃; -C(O)R₅; -CO₂(R₆); -CON(R₅)₂; -OC(O)R₅; -OCO₂R₅; -OCONR₅(R₆)₂; -N(R₅)₂; -SO₂R₅; -NR₅(CO)R₅, wherein each occurrence of R₅ independently includes, but is not limited to, aliphatic, heteroaliphatic, aryl, heteroaryl, alkylaryl, or alkylheteroaryl, wherein any of the aliphatic, heteroaliphatic, alkylaryl, or alkylheteroaryl substituents described above and herein may be substituted or unsubstituted, branched or unbranched, cyclic or acyclic, and wherein any of the aryl or heteroaryl substituents described above and herein may be substituted or unsubstituted. Additional examples or generally applicable substituents are illustrated by the specific embodiments shown in the Examples, which are described herein.

[0026] As used herein, the terms “aliphatic”, “heteroaliphatic”, “alkyl”, “alkenyl”, “alkynyl”, “heteroalkyl”, “heteroalkenyl”, “heteroalkynyl”, and the like encompass substituted and unsubstituted, saturated and unsaturated, and linear and branched groups. Similarly, the terms “alicyclic”, “heteroalicyclic”, “heterocycloalkyl”, “heterocycle” and the like encompass substituted and unsubstituted, and saturated and unsaturated groups. Additionally, the terms “cycloalkyl”, “cycloalkenyl”, “cycloalkynyl”, “heterocycloalkyl”, “heterocycloalkenyl”, “aryl”, “heteroaryl” and the like encompass both substituted and unsubstituted groups.

[0027] The phrase, “pharmaceutically acceptable derivative”, as used herein, denotes any pharmaceutically acceptable salt, ester, or salt of such ester, of such compound, or any other adduct or derivative which, upon administration to a patient, is capable of providing (directly or indirectly) a compound as otherwise described herein, or a metabolite or residue thereof. Pharmaceutically acceptable derivatives thus include among others pro-drugs. A pro-drug is a derivative of a compound, usually with significantly reduced pharmacological activity, which contains an additional moiety, which is susceptible to removal in vivo yielding the parent molecule as the pharmacologically active species. An example of a pro-drug is an ester, which is cleaved in vivo to yield a compound of interest. Pro-drugs of a
variety of compounds, and materials and methods for derivatizing the parent compounds to create the pro-drugs, are known and may be adapted to the present invention. Certain exemplary pharmaceutical compositions and pharmaceutically acceptable derivatives will be discussed in more detail herein below.

By the term “protecting group”, has used herein, it is meant that a particular functional moiety, e.g., O, S, or N, is temporarily blocked so that a reaction can be carried out selectively at another reactive site in a multifunctional compound. In preferred embodiments, a protecting group reacts selectively in good yield to give a protected substrate that is stable to the projected reactions; the protecting group must be selectively removed in good yield by readily available, preferably nontoxic reagents that do not attack the other functional groups; the protecting group forms an easily separable derivative (more preferably without the generation of new stereogenic centers); and the protecting group has a minimum of additional functionality to avoid further sites of reaction. As detailed herein, oxygen, sulfur, nitrogen and carbon protecting groups may be utilized. For example, in certain embodiments, as detailed herein, certain exemplary oxygen protecting groups are utilized. These oxygen protecting groups include, but are not limited to methyl ethers, substituted methyl ethers (e.g., MOM (methoxymethyl ether), MTM (methylthiomethyl ether), BOM (benzyloxyethyl ether), PMBM or MPM (p-methoxybenzylloxyethyl ether), to name a few), substituted ethyl ethers, substituted benzyl ethers, silyl ethers (e.g., TMS (trimethylsilyl ether), TES (triethylsilyl ether), TIPS (triisopropylsilyl ether), TBDMS (t-butyldimethylsilyl ether), tribenzyl silyl ether, TBDPS (t-butyldiphenyl silyl ether), to name a few), esters (e.g., formate, acetate, benzoate (Bz), trifluoroacetate, dichloroacetate, to name a few), carbonates, cyclic acetics and ketals. In certain other exemplary embodiments, nitrogen protecting groups are utilized. These nitrogen protecting groups include, but are not limited to, carbamates (including methyl, ethyl and substituted ethyl carbamates (e.g., Troc), to name a few) amides, cyclic imide derivatives, N-Alkyl and N-Aryl amines, imine derivatives, and enamine derivatives, to name a few. Certain other exemplary protecting groups are detailed herein, however, it will be appreciated that the present invention is not intended to
be limited to these protecting groups; rather, a variety of additional equivalent protecting groups can be readily identified using the above criteria and utilized in the present invention. Additionally, a variety of protecting groups are described in "Protective Groups in Organic Synthesis" Third Ed. Greene, T.W. and Wuts, P.G., Eds., John Wiley & Sons, New York: 1999, the entire contents of which are hereby incorporated by reference.

[0029] As used herein, the term "reaction vessel" denotes any container that can contain a reacting solution. For example, test tubes, petri dishes, and wells can all constitute reaction vessels. Preferably, a reaction vessel is a well in a multiwell plate or other multivessel format.

**Brief Description of the Drawing**

[0030] Figure 1A depicts a $^1$H NMR spectrum of synthetic Migrastatin.

[0031] Figure 1B depicts a $^1$H NMR spectrum of naturally occurring Migrastatin.

[0032] Figure 2 depicts effects of inventive compounds on 4T1 tumor cell migration: (A) macrolactone 48; and (B) migrastatin (1).

[0033] Figure 3 depicts effects of inventive compounds on 4T1 cell proliferation.

[0034] Figure 4 depicts effects of treatment with exemplary migrastatin analogs on 4T1 tumor lung metastasis in syngeneic mice.

[0035] Figure 5 depicts effects of migrastatin analogs on 4T1 cell tumor growth.

[0036] Figure 6 depicts effects of migrastatin analogs on wound healing. (A) no serum; (B) with serum; (C) Macrolactone 48 and serum (200 nM); and (D) Migrastatin (1) and serum (200 nM).

**Description of Certain Preferred Embodiments of the Invention**

[0037] In recognition of the need to access novel Migrastatin analogs, and this class of macrocycles in general, the present invention provides novel macrocyclic compounds, as described in more detail herein, which exhibit the ability
to inhibit cell migration. Therefore, the compounds may be useful as angiogenesis inhibitors. The invention also provides information regarding structural elements that participate in or contribute to this activity, and therefore provides insight into the biological activity of this class of compounds. Thus, the compounds of the invention, and pharmaceutical compositions thereof, are useful as antiangiogenesis agents for the treatment of cancer and/or abnormal cell proliferation. In certain embodiments, the compounds of the present invention can be used for the treatment of diseases and disorders including, but not limited to solid tumor cancers, metastasis, ocular angiogenic diseases, diabetic retinopathy, retinopathy of prematurity, corneal graft rejection, neovascular glaucoma, retrolental fibroplasias, rubeosis, solid tumors, blood born tumors, leukemias, tumor metastases, benign tumors, acoustic neuromas, neurofibromas, trachomas, pyogenic granulomas, rheumatoid arthritis, psoriasis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularization, telangiectasia, hemophiliac joints, angiofibroma, or wound granulation, to name a few.

[0038] 1) General Description of Compounds of the Invention
[0039] In certain embodiments, the compounds of the invention include compounds of the general formula (I) as further defined below:

![Chemical Structure](package://image.png)

(I)

wherein R₁ and R₂ are each independently hydrogen, halogen, -CN, -S(O)₂R₂, -NO₂, -COR₁, -CO₂R₁, -NR₁C(=O)R₂, -NR₁C(=O)OR₂, -CONR₁R₂, an aliphatic, heteroaliphatic, alicyclic, heteroaicyclic, aryl or heteroaryl moiety, or -WR₁; wherein W is independently -O-, -S- or -NR₁C-, wherein each occurrence of R₁, R₂ and R₃ is independently hydrogen, or an aliphatic, heteroaliphatic,
alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or R₁ and R₂, taken together with the carbon atoms to which they are attached, form an alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

R₃ is hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or a prodrug moiety or an oxygen protecting group;

R₄ is halogen, -OR⁴A, -OC(=O)R⁴A or -NR⁴AR⁴B, wherein R⁴A and R⁴B are independently hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; a prodrug moiety, a nitrogen protecting group or an oxygen protecting group; or R⁴A and R⁴B, taken together with the nitrogen atom to which they are attached, form a heterocyclic or heteroaryl moiety; or R₄, taken together with the carbon atom to which it is attached forms a moiety having the structure:

R₅ is hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

R₆ is hydrogen, halogen, -CN, -S(O)₂R₆A, -NO₂, -COR₆A, -CO₂R₆A, -NR₆A(=O)R₆B, -NR₆A(=O)OR₆B, -CONR₆A₆B, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR₆A, wherein W is independently -O-, -S- or -NR₆C-, wherein each occurrence of R₆A, R₆B and R₆C is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or R₆ and R₅, taken together with the carbon atoms to which they are attached, form an alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

R₇ and each occurrence of R₈ are independently hydrogen, halogen, -CN, -S(O)₂R₈₁, -NO₂, -COR₈₁, -CO₂R₈₁, -NR₈₁(=O)R₈₂, -NR₈₁(=O)OR₈₂, -CONR₈₁R₈₂, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR₈₁, wherein W is independently -O-, -S- or -NR₈₂-, wherein each occurrence of R₈₁, R₈₂ and R₈₃ is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or R₇ and the adjacent occurrence of R₈, taken together with the carbon atoms to which they are attached, form an alicyclic, heteroalicyclic, aryl or heteroaryl moiety;
Rₜ is hydrogen, halogen, -CN, -S(O)₁₂Rₑˡ, -NO₂, -CORₑˡ, -CO₂Rₑˡ, -NRₑˡC(=O)Rₑ², -NRₑˡC(=O)ORₑ², -CONRₑˡRₑ²; an aliphatic, heteroaliphatic, alicyclic, heteroa Alicyclic, aryl or heteroaryl moiety, or -WRₑˡ; wherein W is independently -O-, -S- or -NRₑˡ-, wherein each occurrence of Rₑˡ, Rₑ² and Rₑ³ is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroa Alicyclic, aryl or heteroaryl moiety; or Rₑ and Rₑₜ, taken together with the carbon atoms to which they are attached, form an alicyclic, heteroa Alicyclic, aryl or heteroaryl moiety;

u is an integer from 1 to 5;

X₁ is O, S, NRₓ₁ₓ₁ or CRₓ₁ₓ₁Rₓ₂; wherein Rₓ₁ and Rₓ₂ are independently hydrogen, halogen, an aliphatic, heteroa Alicyclic, alicyclic, heteroa Alicyclic, aryl or heteroaryl moiety, or a nitrogen protecting group;

Q is hydrogen, halogen, -CN, -S(O)₁₂R₂⁰¹, -NO₂, -COR₂⁰¹, -CO₂R₂⁰¹, -NR₂⁰¹C(=O)R₂⁰², -NR₂⁰¹C(=O)OR₂⁰², -CONR₂⁰¹R₂⁰², an aliphatic, heteroa Alicyclic, alicyclic, heteroa Alicyclic, aryl or heteroaryl moiety, or -WR₂⁰¹; wherein W is independently -O-, -S- or -NR₂⁰¹-, wherein each occurrence of R₂⁰¹, R₂⁰² and R₂⁰³ is independently hydrogen, or an aliphatic, heteroa Alicyclic, alicyclic, heteroa Alicyclic, aryl or heteroaryl moiety;

Y₁ and Y₂ are independently hydrogen, an aliphatic, heteroa Alicyclic, alicyclic, heteroa Alicyclic, aryl or heteroaryl moiety; or -WR²⁰¹; wherein W is independently -O-, -S- or -NR²⁰¹-, wherein each occurrence of R²⁰¹ and R²⁰² is independently hydrogen, or an aliphatic, heteroa Alicyclic, alicyclic, heteroa Alicyclic, aryl or heteroaryl moiety; or Y₁ and Y₂ together with the carbon atom to which they are attached form a moiety having the structure:

[0040] In certain embodiments of compounds described directly above and compounds as described in certain classes and subclasses herein, inventive compounds do not have one of the following structures:
[0041] In certain other embodiments, compounds of formula (I) have the following stereochemistry:

[0042] In certain other embodiments, compounds of formula (I) have the following stereochemistry:

[0043] In certain other embodiments, compounds of formula (I) have the following stereochemistry:
In certain other embodiments, compounds of formula (I) are defined as follows:

\( R_1 \) and \( R_2 \) are each independently hydrogen or substituted or unsubstituted lower alkyl; or \( R_1 \) and \( R_2 \), taken together with the carbon atoms to which they are attached, form an epoxide, an aziridine or a substituted or unsubstituted cyclopropyl moiety;

\( R_3 \) is hydrogen, or substituted or unsubstituted lower alkyl or aryl; a prodrug moiety or an oxygen protecting group;

\( R_4 \) is halogen, \(-\text{OR}^4\), \(-\text{OC}(\equiv\text{O})\text{R}^4\) or \(-\text{NR}^4\text{R}^4\); wherein \( \text{R}^4 \) and \( \text{R}^4 \) are independently hydrogen, or substituted or unsubstituted lower alkyl; a prodrug moiety, a nitrogen protecting group or an oxygen protecting group; or \( \text{R}^4 \) and \( \text{R}^4 \), taken together with the nitrogen atom to which they are attached, form a heterocyclic or heteroaryl moiety; or \( \text{R}_4 \), taken together with the carbon atom to which it is attached forms a moiety having the structure:

\[ \begin{array}{c}
\text{N} \quad \text{R}^4 \\
\text{N} \\
\end{array} \]

\( \text{R}_5 \) and \( \text{R}_6 \) are each independently hydrogen or substituted or unsubstituted lower alkyl; or \( \text{R}_5 \) and \( \text{R}_6 \), taken together with the carbon atoms to which they are attached, form an epoxide, an aziridine or a substituted or unsubstituted cyclopropyl moiety;

\( \text{R}_5 \) and each occurrence of \( \text{R}_6 \) are independently hydrogen, halogen, alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety, or \(-\text{WR}^5\); wherein \( \text{W} \) is independently \(-\text{O}-\), \(-\text{S}- \) or \(-\text{NR}^3\), wherein each occurrence of \( \text{R}^5 \), and \( \text{R}^3 \) is independently hydrogen, or an alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl,
aryl or heteroaryl moiety; or \( R_9 \) and the adjacent occurrence of \( R_{10} \), taken together, form an epoxide, an aziridine or a substituted or unsubstituted cyclopropyl moiety;

\( R_c \) is hydrogen, halogen, alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety, or \(-WR^{31}\), wherein \( W \) is independently \(-O-, \ -S- \) or \(-NR^{33}-\), wherein each occurrence of \( R^{31} \) and \( R^{33} \) is independently hydrogen, or an alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety; or \( R_c \) and \( R_{10} \), taken together with the carbon atoms to which they are attached, form an epoxide, an aziridine or a substituted or unsubstituted cyclopropyl moiety;

\( n \) is an integer from 1 to 5;

\( X_1 \) is \( O, S, NR^{X1} \) or \( CR^{X1}R^{X2} \); wherein \( R^{X1} \) and \( R^{X2} \) are independently hydrogen, halogen, substituted or unsubstituted alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl, or a nitrogen protecting group;

\( Q \) is hydrogen, halogen, \(-CN, -S(O)_{1-2}R^{Q1}, -NO_2, -COR^{Q1}, -CO_2R^{Q1}, -NR^{Q1}C(=O)R^{Q2}, -NR^{Q1}C(=O)OR^{Q2}, -CONR^{Q1}R^{Q2} \), an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or \(-WR^{Q1}\), wherein \( W \) is independently \(-O-, \ -S- \) or \(-NR^{Q2}-\), wherein each occurrence of \( R^{Q1}, R^{Q2} \) and \( R^{Q3} \) is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

\( Y_1 \) and \( Y_2 \) are independently hydrogen, an alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety; or \(-WR^{Y1}\); wherein \( W \) is independently \(-O-, \ -S- \) or \(-NR^{Y2}-\), wherein each occurrence of \( R^{Y1} \) and \( R^{Y2} \) is independently hydrogen, or an alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety; or \( Y_1 \) and \( Y_2 \) together with the carbon atom to which they are attached form a moiety having the structure:

\[
\begin{align*}
\text{O} & , \\
\text{R}^{Y1} & , \\
\text{N} & , \\
\text{R}^{Y1} & , \\
\text{N}^{R^{Y1}} & , \\
\end{align*}
\]

\text{or}

\[
\begin{align*}
\text{O} & , \\
\text{R}^{Y1} & , \\
\text{N} & , \\
\text{R}^{Y1} & , \\
\text{N}^{R^{Y1}} & , \\
\end{align*}
\]

[0045] In certain embodiments, the present invention defines certain classes of compounds which are of special interest. For example, one class of compounds
of special interest includes those compounds having the structure of formula (I) in which \( R_a, R_b \) and \( R_c \) are each hydrogen, and the compound has one of the following structures:

![Chemical structures](image)

wherein \( R_1-R_6, Y_2, X_1, n \) and \( Q \) are as defined in classes and subclasses herein; \( W \) is O or NH; and \( R^{Y_1} \) is hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety.

[0046] In certain exemplary embodiments, compounds of the invention shown directly above have the following stereochemistry:

![Chemical structures](image)

[0047] Another class of compounds of special interest includes those compounds having the structure of formula (I) in which \( R_a, R_b \) and \( R_c \) are each hydrogen, \( Q \) is a carbonyl-containing moiety and the compound has one of the following structures:
wherein R₁-R₆, Y₂, X₁, n and Q are as defined in classes and subclasses herein; W is O or NH; and R² is hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety.

[0048] In certain exemplary embodiments, compounds of the invention shown directly above have the following stereochemistry:
Another class of compounds of special interest includes compounds having the structure of formula (I) in which $R_a$, $R_b$, and $R_c$ are each hydrogen, $n$ is 3 and the compound has one of the following structures:

wherein $R_1 - R_6$, $Y_2$, $Q$, and $X_1$ are as defined in classes and subclasses herein; $W$ is O or NH; and $R_{Y_1}$ is hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety.

In certain exemplary embodiments, compounds of the invention shown directly above have the following stereochemistry:
Another class of compounds of special interest includes compounds having the structure of formula (I) in which \( R_a, R_b, \) and \( R_c \) are each hydrogen, \( n = 3, \) \( Q \) is a carbonyl-containing moiety, and the compound has one of the following structures:

wherein \( R_1 - R_6, \) \( X_1 \) and \( Y_2 \) are as defined in classes and subclasses herein; \( W \) is \( O \) or \( NH; \) \( R^{Y1} \) is hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalyclic, aryl or heteroaryl moiety; \( R_7 \) is a substituted or unsubstituted lower alkyl or heteroalkyl moiety; \( R_8 \) is a substituted or unsubstituted alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety; and Alk is a substituted or unsubstituted \( C_{0-6} \)alkyldene or \( C_{0-6} \)alkenylidene chain wherein up to two non-adjacent methylene units are independently optionally replaced by \( CO, CO_2, \) COCO,
CONR^{Z1}, OCONR^{Z1}, NR^{Z1}NR^{Z2}, NR^{Z1}NR^{Z2}CO, NR^{Z1}CO, NR^{Z1}CO_2, NR^{Z1}CONR^{Z2},
SO, SO_2, NR^{Z1}SO_2, SO_2NR^{Z1}, NR^{Z1}SO_2NR^{Z2}, O, S, or NR^{Z1}; wherein each occurrence of R^{Z1} and R^{Z2} is independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl.

[0052] In certain exemplary embodiments, compounds of the invention shown directly above have the following stereochemistry:

![Chemical Structure](image)

[0053] Another class of compounds of special interest includes those compounds having the structure of formula (I) in which R_a, R_b and R_c are each hydrogen, Q is hydrogen and the compound has the following structure:

![Chemical Structure](image)

wherein R_1-R_6, Y_1, Y_2, X_1, and n are as defined in classes and subclasses herein.
[0054] In certain exemplary embodiments, compounds of the invention shown directly above have the following stereochemistry:

[0055] Another class of compounds of special interest includes compounds having the structure of formula (I) in which R₃b, R₂, and R₁c are each hydrogen, Q is hydrogen, n is 3 and the compound has the following structure:

wherein R₁-R₆, Y₁, Y₂, and X₁ are as defined in classes and subclasses herein.

[0056] In certain exemplary embodiments, compounds of the invention shown directly above have the following stereochemistry:

[0057] The following structures illustrate several exemplary types of compounds of these classes. Additional compounds are described in the Exemplification herein. Other compounds of the invention will be readily apparent to the reader:
[0058] A number of important subclasses of each of the foregoing classes deserve separate mention; these subclasses include subclasses of the foregoing classes in which:

[0059] i) \( R_1 \) is hydrogen, halogen, -CN, -S(O)\(_{1-2}\)R\(^{1A} \), -NO\(_2 \), -COR\(^{1A} \), -CO\(_2\)R\(^{1A} \), -NR\(^{1A} \)C(=O)R\(^{1B} \), -NR\(^{1A} \)C(=O)OR\(^{1B} \), -CONR\(^{1A} \)R\(^{1B} \), an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR\(^{1A} \), wherein \( W \) is independently -O-, -S- or -NR\(^{1C} \)-, wherein each occurrence of R\(^{1A} \), R\(^{1B} \) and R\(^{1C} \) is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

[0060] ii) \( R_1 \) is hydrogen, halogen, -CN, -S(O)\(_{1-2}\)R\(^{1A} \), -NO\(_2 \), -COR\(^{1A} \), -CO\(_2\)R\(^{1A} \), -NR\(^{1A} \)C(=O)R\(^{1B} \), -NR\(^{1A} \)C(=O)OR\(^{1B} \), -CONR\(^{1A} \)R\(^{1B} \), an alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety, or -WR\(^{1A} \), wherein \( W \) is independently -O-, -S- or -NR\(^{1C} \)-, wherein each occurrence of R\(^{1A} \), R\(^{1B} \) and R\(^{1C} \) is independently hydrogen, or an alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety;

[0061] iii) \( R_1 \) is hydrogen or lower alkyl;
iv) R₁ is hydrogen;

v) R₂ is hydrogen, halogen, -CN, -S(O)₁₂R₁⁺, -NO₂, -COR₁⁺, -CO₂R₁⁺, -NR₁⁺C(=O)OR₁⁺, -NR₁⁺C(=O)OR₂⁺, -CONR₁⁺R₂⁺, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR₁⁺;

wherein W is independently -O-, -S- or -NR₂⁺, wherein each occurrence of R₁⁺, R₂⁺ and R₂⁺ is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

vi) R₂ is hydrogen, halogen, -CN, -S(O)₁₂R₁⁺, -NO₂, -COR₁⁺, -CO₂R₁⁺, -NR₁⁺C(=O)OR₁⁺, -NR₁⁺C(=O)OR₂⁺, -CONR₁⁺R₂⁺, an alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety, or -WR₁⁺; wherein W is independently -O-, -S- or -NR₂⁺, wherein each occurrence of R₁⁺, R₂⁺ and R₂⁺ is independently hydrogen, or an alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety;

vii) R₂ is hydrogen or lower alkyl;

viii) R₂ is hydrogen;

ix) R₁ and R₂ are each hydrogen;

x) R₁ and R₂, taken together with the carbon atoms to which they are attached, form an alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

xi) R₁ and R₂, taken together with the carbon atoms to which they are attached, form a cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety;

xii) R₁ and R₂, taken together with the carbon atoms to which they are attached, form an epoxide;

xiii) R₁ and R₂, taken together with the carbon atoms to which they are attached, form an aziridine;

xiv) R₁ and R₂, taken together with the carbon atoms to which they are attached, form a substituted or unsubstituted cyclopropyl;

xv) R₃ is hydrogen, alkyl, alkenyl, alkynyl, heteroalkyl, heteroalkenyl, heterocycloalkynyl, aryl, heteroaryl, silyl, -C(=O)Rₓ⁺, -C(=S)Rₓ⁺, -C(=NRₓ⁺)Rₓ⁺, -SO₂Rₓ⁺, wherein Rₓ⁺ and Rₓ⁺ are each independently hydrogen, alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkenyl, cycloalkynyl, heteroalkyl, heteroalkenyl,
heteroalkynyl, heterocycloalkyl, heterocycloalkenyl, heterocycloalkynyl, heteroaliphatic, heteroalicyclic, aryl, heteroaryl, -C(=O)R^A or -ZR^A, wherein Z is -O-, -S-, -NR^B, wherein each occurrence of R^A and R^B is independently hydrogen, or an alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkenyl, cycloalkynyl, heteroalkyl, heteroalkenyl, heteroalkynyl, heterocycloalkyl, heterocycloalkenyl, heterocycloalkynyl, heteroaliphatic, heteroalicyclic, aryl or heteroaryl moiety;

[0074] xvi) R_3 is hydrogen, an alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety; or a prodrug moiety or an oxygen protecting group;

[0075] xvii) R_3 is hydrogen, lower alkyl, aryl, a prodrug moiety or an oxygen protecting group;

[0076] xviii) R_3 is hydrogen, lower alkyl, aryl or an oxygen protecting group;

[0077] xix) R_3 is methyl;

[0078] xxi) the carbon atom bearing R_4 is of R-configuration;

[0079] xxii) the carbon atom bearing R_4 is of S-configuration

[0080] xxiii) R_4 is halogen, -OR^{4A}, -OC(=O)R^{4A} or -NR^{4A}R^{4B}, wherein R^{4A} and R^{4B} are independently hydrogen, or substituted or unsubstituted lower alkyl; a prodrug moiety, a nitrogen protecting group or an oxygen protecting group; or R^{4A} and R^{4B}, taken together with the nitrogen atom to which they are attached, form a heterocyclic or heteroaryl moiety; or R_4, taken together with the carbon atom to which it is attached forms a moiety having the structure:

\[
\begin{align*}
\text{[0081]} & \quad xxiv) R_4 \text{ is a halogen selected from fluorine, chlorine, bromine, and iodine;} \\
\text{[0082]} & \quad xxv) R_4 \text{ is fluorine;} \\
\text{[0083]} & \quad xxvi) \text{ the carbon atom bearing } R_4 \text{ is of } R\text{-configuration, and } R_4 \text{ is a halogen selected from fluorine, chlorine, bromine, and iodine;}
\end{align*}
\]
xxvii) the carbon atom bearing R₄ is of R-configuration, and R₄ is fluorine;

xxviii) R₄ is OR⁴A, wherein R⁴A is hydrogen, a substituted or unsubstituted lower alkyl; acyl; a prodrug moiety or an oxygen protecting group;

xxix) R₄ is OH;

xxx) R₄ is -OC(=O)R⁴A wherein R⁴A is hydrogen, lower alkyl, aryl or heteroaryl;

xxxi) R₄ is OAc;

xxxii) R₄ is NR⁴AR⁴B, wherein R⁴A and R⁴B are independently hydrogen, a substituted or unsubstituted lower alkyl; a prodrug moiety or a nitrogen protecting group; or R⁴A and R⁴B, taken together with the nitrogen atom to which they are attached, form a heterocyclic or heteroaryl moiety;

xxxiii) R₄ is NR⁴AR⁴B, wherein R⁴A and R⁴B are independently hydrogen, alkyl, alkenyl, –C(=O)R⁴, –C(=O)OR⁴, –SR⁴, SO₂R⁴, or R⁴A and R⁴B, taken together with the nitrogen atom to which they are attached form a moiety having the structure =CR⁴R⁴, wherein R⁴A and R⁴B are not simultaneously hydrogen and R⁴ and R⁴ are each independently hydrogen, alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkenyl, cycloalkynyl, heteroalkyl, heteroalkenyl, heteroalkynyl, heterocycloalkyl, heterocycloalkenyl, heterocycloalkynyl, heteroaliphatic, heteroalicyclic, aryl, heteroaryl, -C(=O)R⁴A or –ZR⁴A, wherein Z is =O-, =S-, -NR⁴B, wherein each occurrence of R⁴A and R⁴B is independently hydrogen, or an alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkenyl, cycloalkynyl, heteroalkyl, heteroalkenyl, heteroalkynyl, heterocycloalkyl, heterocycloalkenyl, heterocycloalkynyl, heteroaliphatic, heteroalicyclic, aryl or heteroaryl moiety;

xxxiv) R₄ is NH₂;

xxxv) R₄ together with the carbon atom to which it is attached forms a moiety having the structure:
xxxvi) \( R_4 \) together with the carbon atom to which it is attached forms a moiety having the structure:

\[ \begin{array}{c}
\end{array} \]

xxxvii) \( R_5 \) is hydrogen or an alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety;

xxxviii) \( R_5 \) is hydrogen or substituted or unsubstituted lower alkyl;

xxxix) \( R_5 \) is methyl;

xl) \( R_6 \) is hydrogen, halogen, -CN, -S(O)\(_{1-2}\)R\(^{6A}\), -NO\(_2\), -COR\(^{6A}\), -CO\(_2\)R\(^{6A}\), -NR\(^{6A}\)C(=O)R\(^{6B}\), -NR\(^{6A}\)C(=O)OR\(^{6B}\), -CONR\(^{6A}\)R\(^{6B}\), an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR\(^{6A}\), wherein W is independently -O-, -S- or -NR\(^{1C}\)-, wherein each occurrence of R\(^{6A}\), R\(^{6B}\) and R\(^{6C}\) is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

xli) \( R_6 \) is hydrogen, halogen, -CN, -S(O)\(_{1-2}\)R\(^{6A}\), -NO\(_2\), -COR\(^{6A}\), -CO\(_2\)R\(^{6A}\), -NR\(^{6A}\)C(=O)R\(^{6B}\), -NR\(^{6A}\)C(=O)OR\(^{6B}\), -CONR\(^{6A}\)R\(^{6B}\), an alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety, or -WR\(^{6A}\); wherein W is independently -O-, -S- or -NR\(^{1C}\)-, wherein each occurrence of R\(^{6A}\), R\(^{6B}\) and R\(^{6C}\) is independently hydrogen, or an alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety;

xlii) \( R_6 \) is hydrogen or substituted or unsubstituted lower alkyl;

xliii) \( R_6 \) is methyl;

xxliv) \( R_5 \) and \( R_6 \) are each methyl;

xlv) \( R_5 \) is hydrogen, halogen, -CN, -S(O)\(_{1-2}\)R\(^{al}\), -NO\(_2\), -COR\(^{al}\), -CO\(_2\)R\(^{al}\), -NR\(^{al}\)C(=O)R\(^{a2}\), -NR\(^{al}\)C(=O)OR\(^{a2}\), -CONR\(^{al}\)R\(^{a2}\), an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR\(^{al}\); wherein W is independently -O-, -S- or -NR\(^{1C}\)-, wherein each occurrence of R\(^{al}\), R\(^{a2}\) and R\(^{a3}\) is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

xlv) \( R_5 \) is hydrogen, halogen, -CN, -S(O)\(_{1-2}\)R\(^{al}\), -NO\(_2\), -COR\(^{al}\), -CO\(_2\)R\(^{al}\), -NR\(^{al}\)C(=O)R\(^{a2}\), -NR\(^{al}\)C(=O)OR\(^{a2}\), -CONR\(^{al}\)R\(^{a2}\), an alkyl, heteroalkyl, cycloalkyl,
heterocycloalkyl, aryl or heteroaryl moiety, or –WR\(^{a1}\); wherein W is independently -O-, -S- or -NR\(^{1C}\)-, wherein each occurrence of R\(^{a1}\), R\(^{a2}\) and R\(^{a3}\) is independently hydrogen, or an alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety;

[0104]  xlvi) R\(_a\) is hydrogen or lower alkyl;
[0105]  xlvii) R\(_a\) is hydrogen;
[0106]  xlviii) R\(_a\) is hydrogen, halogen, -CN, -S(O)\(_{1-2}\)R\(^{a1}\), -NO\(_2\), -COR\(^{a1}\), -CO\(_2\)R\(^{a1}\), -NR\(^{a1}\)C(=O)R\(^{a2}\), -NR\(^{a1}\)C(=O)OR\(^{a2}\), -CONR\(^{a1}\)R\(^{a2}\), an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or –WR\(^{a1}\); wherein W is independently -O-, -S- or -NR\(^{1C}\)-, wherein each occurrence of R\(^{a1}\), R\(^{a2}\) and R\(^{a3}\) is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

[0107]  li) R\(_b\) is hydrogen, halogen, -CN, -S(O)\(_{1-2}\)R\(^{a1}\), -NO\(_2\), -COR\(^{a1}\), -CO\(_2\)R\(^{a1}\), -NR\(^{a1}\)C(=O)R\(^{a2}\), -NR\(^{a1}\)C(=O)OR\(^{a2}\), -CONR\(^{a1}\)R\(^{a2}\); an alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety, or –WR\(^{a1}\); wherein W is independently -O-, -S- or -NR\(^{1C}\)-, wherein each occurrence of R\(^{a1}\), R\(^{a2}\) and R\(^{a3}\) is independently hydrogen, or an alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety;

[0108]  li) R\(_b\) is hydrogen or lower alkyl;
[0109]  lii) R\(_b\) is hydrogen;
[0110]  liii) R\(_a\) and R\(_b\) are each hydrogen;
[0111]  liv) R\(_a\) and R\(_b\), taken together with the carbon atoms to which they are attached, form a cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety;
[0112]  lv) R\(_a\) and R\(_b\), taken together with the carbon atoms to which they are attached, form an epoxide;
[0113]  lvii) R\(_a\) and R\(_b\), taken together with the carbon atoms to which they are attached, form an aziridine;
[0114]  lviii) R\(_a\) and R\(_b\), taken together with the carbon atoms to which they are attached, form a substituted or unsubstituted cyclopropyl;
lvi) $R_e$ is hydrogen, halogen, -CN, -S(=O)$_2$, -NO$_2$, -COR$^e$, -CO$_2R^e$, -NR$^e$C(=O)R$^e$, -NR$^e$C(=O)OR$^e$, -CONR$^e$R$^e$, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR$^e$; wherein W is independently -O-, -S- or -NR$_1^c$-, wherein each occurrence of R$^e$, R$^2$ and R$^3$ is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

lix) $R_e$ is hydrogen, halogen, -CN, -S(=O)$_2$, -NO$_2$, -COR$^e$, -CO$_2R^e$, -NR$^e$C(=O)R$^e$, -NR$^e$C(=O)OR$^e$, -CONR$^e$R$^e$, an alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety, or -WR$^e$; wherein W is independently -O-, -S- or -NR$_1^c$-, wherein each occurrence of R$^e$, R$^2$ and R$^3$ is independently hydrogen, or an alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety;

lxi) $R_e$ is hydrogen or lower alkyl;

lx) $R_e$ is hydrogen;

lxi) $R_e$ and $R_s$, taken together with the carbon atoms to which they are attached, form a cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety;

lxii) $R_e$ and $R_s$, taken together with the carbon atoms to which they are attached, form an epoxide;

lxiii) $R_e$ and $R_s$, taken together with the carbon atoms to which they are attached, form an aziridine;

lxiv) $R_e$ and $R_s$, taken together with the carbon atoms to which they are attached, form a substituted or unsubstituted cyclopropyl;

lxv) $X_1$ is O, S, NR$^{X_1}$ or CR$^{X_1}$R$^{X_2}$; wherein R$^{X_1}$ and R$^{X_2}$ are independently hydrogen, halogen, substituted or unsubstituted alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl, or a nitrogen protecting group;

lxvi) $X_1$ is O, NR$^{X_1}$ or CR$^{X_1}$R$^{X_2}$; wherein R$^{X_1}$ and R$^{X_2}$ are independently hydrogen, halogen, substituted or unsubstituted alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl, or a nitrogen protecting group;

lxvii) $X_1$ is O;

lxviii) $X_1$ is NH;

lxx) $X_1$ is CH$_2$;
[0128] lxxi) n is an integer from 1 to 5;
[0129] lxxii) n is 3;
[0130] lxxiii) Q is hydrogen, halogen, -CN, -S(O)_{1-2}R^Q1, -NO_2, -CO_{R1}, -CO_2R^Q1, -NR^Q1C(=O)R^Q2, -NR^Q1C(=O)OR^Q2, -CONR^Q1R^Q2, a substituted or unsubstituted alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl; or -WR^Q1; wherein W is independently -O-, -S- or -NR^Q3-, wherein each occurrence of R^Q1, R^Q2 and R^Q3 is independently hydrogen, or an alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety.
[0131] lxxiv) Q is a substituted or unsubstituted carbonyl-containing alkyl or heteroalkyl moiety;
[0132] lxxv) Q comprises a carbonyl linked to a carbocyclic, heterocyclic, aryl or heteroaryl moiety through a C_0-alkylidene or C_0-alkenylidene chain wherein up to two non-adjacent methylene units are independently optionally replaced by CO, CO_2, COCO, CONR^Z1, OCONR^Z1, NR^Z1NR^Z2, NR^Z1NR^Z2CO, NR^Z1CO, NR^Z1CO_2, NR^Z1CONR^Z2, SO, SO_2, NR^Z1SO_2, SO_2NR^Z1, NR^Z1SO_2NR^Z2, O, S, or NR^Z1; wherein each occurrence of R^Z1 and R^Z2 is independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl;
[0133] lxxvi) Q has the structure:

![Structure Image]

wherein R_7 is a substituted or unsubstituted lower alkyl or heteroalkyl moiety; R_8 is a substituted or unsubstituted alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety; and Alk is a substituted or unsubstituted C_0-alkylidene or C_0-alkenylidene chain wherein up to two non-adjacent methylene units are independently optionally replaced by CO, CO_2, COCO, CONR^Z1, OCONR^Z1, NR^Z1NR^Z2, NR^Z1NR^Z2CO, NR^Z1CO, NR^Z1CO_2, NR^Z1CONR^Z2, SO, SO_2, NR^Z1SO_2, SO_2NR^Z1, NR^Z1SO_2NR^Z2, O, S, or NR^Z1; wherein each occurrence of R^Z1 and R^Z2 is independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl;
wherein R₇ is a substituted or unsubstituted, linear or branched, cyclic or acyclic lower alkyl moiety; R₈ is a substituted or unsubstituted carbocyclic, heterocyclic, aryl or heteroaryl moiety; and Alk is a substituted or unsubstituted C₀₆alkylidene or C₀₆alkenyldene chain wherein up to two non-adjacent methylene units are independently optionally replaced by CO, CO₂, COCO, CONR₂¹, OCONR²¹, NR₂¹NR₂², NR₂¹NR₂²CO, NR₂¹CO, NR₂¹CO₂, NR₂¹CONR₂², SO, SO₂, NR₂¹SO₂, SO₂NR₂¹, NR₂¹SO₂NR₂², O, S, or NR₂¹, wherein each occurrence of R₂¹ and R₂² is independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl;

[0135] lxxviii) Q has the structure:

wherein R₇ is a substituted or unsubstituted, linear or branched, cyclic or acyclic lower alkyl moiety; R₈ is a substituted or unsubstituted carbocyclic, heterocyclic, aryl or heteroaryl moiety; and X, Y and Z are independently a bond, -O-, -S-, -C(=O)-, -NR₂¹-, -CHOR₂¹, -CHNR₂¹R₂², C=S, C=N(R₂¹Y) or -CH(Hal); or a substituted or unsubstituted C₀₆alkylidene or C₀₆alkenyldene chain wherein up to two non-adjacent methylene units are independently optionally replaced by CO, CO₂, COCO, CONR₂¹, OCONR₂¹, NR₂¹NR₂², NR₂¹NR₂²CO, NR₂¹CO, NR₂¹CO₂, NR₂¹CONR₂², SO, SO₂, NR₂¹SO₂, SO₂NR₂¹, NR₂¹SO₂NR₂², O, S, or NR₂¹, wherein Hal is a halogen selected from F, Cl, Br and I; and each occurrence of R₂¹ and R₂² is independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl; or R₂¹ and R₂², taken together with the nitrogen atom to which they are attached, for a heterocyclic or heteroaryl moiety;

[0136] lxxix) Q has the structure:
wherein \( R_7 \) is a substituted or unsubstituted, linear or branched, cyclic or acyclic lower alkyl moiety; \( R_8 \) is a substituted or unsubstituted carbocyclic, heterocyclic, aryl or heteroaryl moiety; and \( Y \) is a bond, \( -O-,\ -S-,\ -C(=O)-,\ -NR^{Z_1}-,\ -CHOR^{Z_1},\ -CHNR^{Z_1}R^{Z_2},\ C=S,\ C=N(R^{Y_1})\) or \( -CH(Hal)\); or a substituted or unsubstituted \( C_{0-4} \)alkylidene or \( C_{0-4} \)alkenyldiene chain wherein up to two non-adjacent methylene units are independently optionally replaced by \( CO,\ CO_2,\ COCO,\ CONR^{Z_1},\ OCN\)R\(^{Z_1},\ NR^{Z_1}NR^{Z_2},\ NR^{Z_1}NR^{Z_2}CO,\ NR^{Z_1}CO,\ NR^{Z_1}CO_2,\ NR^{Z_1}CONR^{Z_2},\ SO,\ SO_2,\ NR^{Z_1}SO_2,\ SO_2NR^{Z_1},\ NR^{Z_1}SO_2NR^{Z_2},\ O,\ S,\) or \( NR^{Z_1}\); wherein \( Hal \) is a halogen selected from \( F,\ Cl,\ Br \) and \( I\); and each occurrence of \( R^{Z_1} \) and \( R^{Z_2} \) is independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl; or \( R^{Z_1} \) and \( R^{Z_2} \), taken together with the nitrogen atom to which they are attached, for a heterocyclic or heteroaryl moiety;

[0137] lxxx) \( Q \) has the structure:

\[
\begin{align*}
R^{Z_1} & \quad \text{O} \\
& \quad R^{Y} \\
& \quad R^{Z_2}
\end{align*}
\]

wherein \( R_7 \) is a substituted or unsubstituted, linear or branched, cyclic or acyclic lower alkyl moiety; \( R_8 \) is a substituted or unsubstituted carbocyclic, heterocyclic, aryl or heteroaryl moiety; and \( Y \) is hydrogen, halogen, \( -OR^{Y_1} \) or \( -NR^{Y_1}NR^{Y_2} \); wherein \( R^{Y_1} \) and \( R^{Y_2} \) are independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl, or \( R^{Y_1} \) and \( R^{Y_2} \), taken together with the nitrogen atom to which they are attached, for a heterocyclic or heteroaryl moiety;

[0138] lxxxii) \( Q \) is hydrogen;
[0139] lxxxiii) compounds of subsets lxxvi)-lxxx) wherein \( R_7 \) is substituted or unsubstituted lower alkyl;
[0140] lxxxiv) compounds of subsets lxxvi)-lxxx) wherein \( R_7 \) is methyl;
[0141] lxxxv) compounds of subset lxxx) wherein \( Y \) is hydrogen;
[0142] lxxxvi) compounds of subset lxxx) wherein \( Y \) is a halogen selected from fluorine, chlorine, bromine, and iodine;
[0143] lxxxvii) compounds of subset lxxx) wherein \( Y \) is fluorine;
[0144] lxxvii) compounds of subset lxxx) wherein \( R^Y \) is OR\(^{Y1} \), wherein \( R^{Y1} \) is hydrogen, a substituted or unsubstituted lower alkyl; a prodrug moiety or an oxygen protecting group;

[0145] lxxviii) compounds of subset lxxx) wherein \( R^Y \) is OH;

[0146] lxxix) compounds of subset lxxx) wherein \( R^Y \) is NR\(^{Y1}R^{Y2} \); wherein \( R^{Y1} \) and \( R^{Y2} \) are independently hydrogen, a substituted or unsubstituted lower alkyl; a prodrug moiety or a nitrogen protecting group; or \( R^{Y1} \) and \( R^{Y2} \), taken together with the nitrogen atom to which they are attached, form a heterocyclic or heteroaryl moiety;

[0147] xc) compounds of subset lxxx) wherein \( R^Y \) is NH\(_2\);

[0148] xci) compounds of subsets lxxvi)-lxxx) wherein \( R_8 \) is one of:

\[
\begin{align*}
&\text{\includegraphics[width=\textwidth]{diagram.png}}
\end{align*}
\]

wherein \( p \) is an integer from 0 to 5; \( q \) is 1 or 2, \( r \) is an integer from 1 to 6; each occurrence of \( R^{SA} \) is independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl, -(alkyl)aryl or -(alkyl)heteroaryl, -OR\(^{SC} \), -SR\(^{SC} \), -N(R\(^{SC} \))\(_2\), -SO\(_2\)N(R\(^{SC} \))\(_2\), -(C=O)N(R\(^{SC} \))\(_2\), halogen, -CN, -NO\(_2\), -(C=O)OR\(^{SC} \), -N(R\(^{SC} \))(C=O)R\(^{SD} \), wherein each occurrence of \( R^{SC} \) and \( R^{SD} \) is independently hydrogen, lower alkyl, lower heteroalkyl, aryl, heteroaryl, -(alkyl)aryl or -(alkyl)heteroaryl; and each occurrence of \( R^{SB} \) is independently hydrogen or lower alkyl;
[0149] xcii) compounds of subsets lxxvi)-lxxx) wherein R₈ is substituted or unsubstituted cycloalkyl;
[0150] xciii) compounds of subsets lxxvi)-lxxx) wherein R₈ is substituted or unsubstituted cyclohexyl;
[0151] xciv) compounds of subsets lxxvi)-lxxx) wherein R₈ has the structure:

\[
\begin{align*}
\text{O} & \quad \text{N} \\
\text{R}^{8B} & \quad \quad \quad \quad \\
\end{align*}
\]

wherein R₈ is hydrogen or lower alkyl;
[0152] xcv) compounds of subsets lxxvi)-lxxx) wherein R₈ has the structure:

\[
\begin{align*}
\text{O} & \quad \quad \quad \quad \\
\text{N} & \quad \quad \quad \quad \\
\text{R}^{8B} & \quad \quad \\
\end{align*}
\]

wherein R₈ is hydrogen or methyl;
[0153] xcvii) X₁ is O, CH₂ or NH; Q is as described in subsets lxxvi)-lxxx) wherein R₈ has the structure:

[0154] xcvii) X₁ is O, CH₂ or NH; Q is as described in subsets lxxvi)-lxxx)
wherein R₈ has the structure:

[0155] xcviii) Y₁ is OR₇ and Y₂ is lower alkyl; wherein R₇ is hydrogen or lower alkyl;
[0156] xcix) Y₁ is OR₇ and Y₂ is lower alkyl substituted with one or more halogen atoms selected from F, Cl, Br and I; wherein R₇ is hydrogen or lower alkyl;
[0157] c) Y₁ is OH and Y₂ is CF₃;
ci) $X_1$ is CH$_2$; $Y_1$ is OR$^{Y_1}$ and $Y_2$ is lower alkyl; wherein R$^{Y_1}$ is hydrogen or lower alkyl;

cii) $X_1$ is CH$_2$; $Y_1$ is OR$^{Y_1}$ and $Y_2$ is lower alkyl substituted with one or more halogen atoms selected from F, Cl, Br and I; wherein R$^{Y_1}$ is hydrogen or lower alkyl;

ciii) $X_1$ is CH$_2$; $Y_1$ is OH and $Y_2$ is CF$_3$;

civ) $Y_1$ and $Y_2$ together with the carbon atom to which they are attached form a moiety having the structure:

\[
\begin{array}{c}
\text{O} \\
\end{array}
\]

cv) $Y_1$ and $Y_2$ together with the carbon atom to which they are attached form a moiety having the structure:

\[
\begin{array}{c}
\text{R}^{Y_1} \\
\text{R}^{Y_2} \\
\end{array}
\]

wherein R$^{Y_1}$ and R$^{Y_2}$ are independently hydrogen or lower alkyl;

cvi) $Y_1$ and $Y_2$ together with the carbon atom to which they are attached form a moiety having the structure:

\[
\begin{array}{c}
\text{N} \\
\text{R}^{Y_1} \\
\end{array}
\]

wherein R$^{Y_1}$ is hydrogen or lower alkyl;

cvii) $Y_1$ and $Y_2$ together with the carbon atom to which they are attached form a moiety having the structure:

\[
\begin{array}{c}
\text{N} \\
\text{OR}^{Y_1} \\
\end{array}
\]

wherein R$^{Y_1}$ is hydrogen or lower alkyl;

cviii) $Y_1$ and $Y_2$ together with the carbon atom to which they are attached form a moiety having the structure:

\[
\begin{array}{c}
\text{N} \\
\text{NHR}^{Y_1} \\
\end{array}
\]

wherein R$^{Y_1}$ is hydrogen or lower alkyl;

cix) $X_1$ is O; and $Y_1$ and $Y_2$ together with the carbon atom to which they are attached form a moiety having the structure:

\[
\begin{array}{c}
\text{O} \\
\end{array}
\]
[0167]  cx) $X_1$ is NH; and $Y_1$ and $Y_2$ together with the carbon atom to which they are attached form a moiety having the structure:

[0168]  cxii) $X_1$ is CH$_2$; and $Y_1$ and $Y_2$ together with the carbon atom to which they are attached form a moiety having the structure:

[0169]  cxii) $X_1$ is CH$_2$; and $Y_1$ and $Y_2$ together with the carbon atom to which they are attached form a moiety having the structure: \[\text{OR}^{Y_1}\]; wherein $R^{Y_1}$ is hydrogen or lower alkyl;

[0170]  cxiii) $X_1$ is CH$_2$; and $Y_1$ and $Y_2$ together with the carbon atom to which they are attached form a moiety having the structure: \[\text{NHR}^{Y_1}\]; wherein $R^{Y_1}$ is hydrogen or lower alkyl;

[0171]  cxiv) compounds as described in classes and subclasses herein wherein the stereocenter has the following stereochemistry; and/or

[0172]  cxv) compounds as described in classes and subclasses herein wherein the stereocenter has the following stereochemistry.

[0173]  It will be appreciated that for each of the classes and subclasses described above and herein, any one or more occurrences of groups such as aliphatic, heteroaliphatic, alkyl, heteroalkyl may independently be substituted or unsubstituted, linear or branched, saturated or unsaturated; and any one or more occurrences of alicyclic, heterocyclic, cycloalkyl, aryl, heteroaryl, cycloaliphatic, cycloheteroaliphatic may be substituted or unsubstituted.

[0174]  The reader will also appreciate that all possible combinations of the variables described in i) through cxv) above (e.g., $R_1$-$R_6$, $R_{3-5}$, n, Q, $X_1$, $Y_1$ and $Y_2$, among others) are considered part of the invention. Thus, the invention
encompasses any and all compounds of formula I, and subclasses thereof, generated
by taking any possible permutation of variables R₁-R₆, a-e, n, Q, X₁, Y₁ and Y₂, and
other variables/substituents (e.g., X, Y, Z, R, etc.) as further defined for R₁-R₆, a-e,
n, Q, X₁, Y₁ and Y₂, described in i)- through xiv) above.

[0175] As the reader will appreciate, compounds of particular interest include,
among others, those which share the attributes of one or more of the foregoing
subclasses. Some of those subclasses are illustrated by the following sorts of
compounds:

[0176] 1) **Compounds of the formula (and pharmaceutically acceptable
derivatives thereof):**

![Chemical structures]

wherein R₃-R₆, n and Q are as defined in classes and subclasses herein; and
Y₂ and R² are independently hydrogen or lower alkyl. In certain embodiments, R₃
is hydrogen, lower alkyl or an oxygen protecting group. In certain exemplary
embodiments, R₃ is methyl. In certain other embodiments, R₅ and R₆ are
independently lower alkyl. In certain exemplary embodiments, R₅ and R₆ are each
methyl. In certain embodiments, n is 3. In certain embodiments, R₄ is halogen,
hydroxyl, lower alkoxy, acyloxy or NR₄R₄B, wherein R₄A and R₄B are
independently hydrogen, lower alkyl, aryl, acyl or a nitrogen protecting group, or
R₄A and R₄B, taken together with the nitrogen atom to which they are attached, form
a substituted or unsubstituted heterocyclic or heteroaryl moiety; or R₄, taken
together with the carbon atom to which it is attached forms a moiety having the structure: \( \text{C} = \text{O} \). In certain embodiments, \( R_4 \) is a halogen selected from fluorine, chlorine, bromine and iodine. In certain exemplary embodiments, \( R_4 \) is fluorine. In certain other embodiments, \( R_4 \) is F, OH, OAc, NH\(_2\) or R\(_4\), taken together with the carbon atom to which it is attached forms a moiety having the structure: \( \text{C} = \text{O} \). In certain exemplary embodiments, Q is hydrogen or a carbonyl-containing moiety. In certain exemplary embodiments, Q is hydrogen. In certain exemplary embodiments, \( Y_2 \) is hydrogen or lower alkyl substituted with one or more halogen atoms selected from F, Cl, Br and I. In certain exemplary embodiments, \( Y_2 \) is hydrogen or methyl substituted with one or more halogen atoms selected from F, Cl, Br and I. In certain exemplary embodiments, \( Y_2 \) is hydrogen or CF\(_3\). In certain exemplary embodiments, \( Y_2 \) is hydroxyl or lower alkoxy. In certain exemplary embodiments, \( R^{Y_1} \) is hydroxyl or methoxy. In certain exemplary embodiments, \( Y_2 \) is CF\(_3\) and \( R^{Y_1} \) is methoxy.

[0177] **II) Compounds of the formula (and pharmaceutically acceptable derivatives thereof):**

![Chemical structures](image)

wherein \( R_3-R_6 \) and Q are as defined in classes and subclasses herein; and \( Y_2 \) and \( R^{Y_1} \) are independently hydrogen or lower alkyl. In certain embodiments,
R₃ is hydrogen, lower alkyl or an oxygen protecting group. In certain exemplary embodiments, R₃ is methyl. In certain other embodiments, R₅ and R₆ are independently lower alkyl. In certain exemplary embodiments, R₅ and R₆ are each methyl. In certain embodiments, R₄ is halogen, hydroxyl, lower alkoxy, acyloxy or NR₄⁺₄R₄⁻⁴, wherein R₄⁺₄ and R₄⁻⁴ are independently hydrogen, lower alkyl, aryl, acyl or a nitrogen protecting group, or R₄⁺₄ and R₄⁻⁴, taken together with the nitrogen atom to which they are attached, form a substituted or unsubstituted heterocyclic or heteroaryl moiety; or R₄, taken together with the carbon atom to which it is attached forms a moiety having the structure: \( \text{\textbullet} = \text{\textbullet} \). In certain embodiments, R₄ is a halogen selected from fluorine, chlorine, bromine and iodine. In certain exemplary embodiments, R₄ is fluorine. In certain other embodiments, R₄ is F, OH, OAc, NH₂ or R₄, taken together with the carbon atom to which it is attached forms a moiety having the structure: \( \text{\textbullet} = \text{\textbullet} \). In certain exemplary embodiments, Q is hydrogen or a carbonyl-containing moiety. In certain exemplary embodiments, Q is hydrogen. In certain exemplary embodiments, Y₂ is hydrogen or lower alkyl substituted with one or more halogen atoms selected from F, Cl, Br and I. In certain exemplary embodiments, Y₂ is hydrogen or methyl substituted with one or more halogen atoms selected from F, Cl, Br and I. In certain exemplary embodiments, Y₂ is hydrogen or CF₃. In certain exemplary embodiments, R₄⁺¹ is hydroxyl or lower alkoxy. In certain exemplary embodiments, R₄⁺¹ is hydroxyl or methoxy. In certain exemplary embodiments, Y₂ is CF₃ and R₄⁺¹ is methoxy.

[0178] In certain other embodiments, for compounds of classes I)-II) above, Q is a substituted or unsubstituted carbonyl-containing alkyl or heteroalkyl moiety. In certain exemplary embodiments, Q comprises a carbonyl linked to a carbocyclic, heterocyclic, aryl or heteroaryl moiety through a Cₐ₋ₐalkylidene or Cₐ₋ₐalkenylidene moiety. In certain embodiments, Q has the structure:
wherein R₇ is a substituted or unsubstituted, linear or branched, cyclic or acyclic lower alkyl moiety; R₈ is a substituted or unsubstituted carbocyclic, heterocyclic, aryl or heteroaryl moiety; and Alk is a substituted or unsubstituted C₀₋₆alkylidene or C₀₋₆alkenylidene chain wherein up to two non-adjacent methylene units are independently optionally replaced by CO, CO₂, COCO, CONR²¹, OCONR²¹, NR²¹NR²², NR²¹NR²²CO, NR²¹CO, NR²¹CO₂, NR²¹CONR²², SO, SO₂, NR²¹SO₂, SO₂NR²¹, NR²¹SO₂NR²², O, S, or NR²¹; wherein each occurrence of R²¹ and R²² is independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl; and R₈ is a substituted or unsubstituted alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety. In certain embodiments, R₇ is lower alkyl. In certain other embodiments, Alk is a C₃ alkylidene moiety. In yet other embodiments, R₈ is one of:

[0179] wherein p is an integer from 0 to 5; q is 1 or 2, r is an integer from 1 to 6; each occurrence of R₈ᵢ is independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl, -(alkyl)aryl or -(alkyl)heteroaryl, -ORᵢ, -SRᵢ, -N(Rᵢ)ᵢ, -SO₂N(Rᵢ)ᵢ, -(C=O)N(Rᵢ)ᵢ, halogen, -CN, -NO₂, -(C=O)ORᵢ, -N(Rᵢ)(C=O)Rᵢ, wherein each
occurrence of $R_8^{SC}$ and $R_8^{BD}$ is independently hydrogen, lower alkyl, lower heteroalkyl, aryl, heteroaryl, -(alkyl)aryl or -(alkyl)heteroaryl; and each occurrence of $R_8^{SB}$ is independently hydrogen or lower alkyl. In certain exemplary embodiments, $R_8$ has the structure:

$$
\begin{array}{c}
\text{O} \\
\text{R}^{SB}
\end{array}
$$

wherein $R_8^{SB}$ is hydrogen or lower alkyl. In certain exemplary embodiments, $R_8^{SB}$ is hydrogen. In certain exemplary embodiments, $Q$ has the following stereochemistry:

$$
\begin{array}{c}
\text{O} \\
\text{R}_{pharm} \\
\text{Alk} \\
\text{R}_8
\end{array}
$$

[0180] III) **Compounds of the formula (and pharmaceutically acceptable derivatives thereof):**
wherein R₃-R₆ and n are as defined in classes and subclasses herein; Y₂ and R²¹ are independently hydrogen or lower alkyl; R₇ is a substituted or unsubstituted, linear or branched, cyclic or acyclic lower alkyl moiety; R²² is hydrogen or lower alkyl; and X, Y and Z are independently a bond, -O-, -S-, -C(=O)-, -NR²¹-, -CHOR²¹, -CHNR²¹R²², C=S, C=N(R²¹) or -CH(Hal); or a substituted or unsubstituted C₅₋₆alkylidene or C₅₋₆alkenyldiene chain wherein up to two non-adjacent methylene units are independently optionally replaced by CO, CO₂, COCO, CONR²¹, OCONR²¹, NR²¹NR²², NR²¹NR²¹CO, NR²¹CO, NR²¹CO₂, NR²¹CONR²², SO, SO₂, NR²¹SO₂, SO₂NR²¹, NR²¹SO₂NR²², O, S, or NR²¹; wherein Hal is a halogen selected from F, Cl, Br and I; and each occurrence of R²¹ and R²² is independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl; or R²¹ and R²², taken together with the nitrogen atom to which they are attached, for a heterocyclic or heteroaryl moiety; and pharmaceutically acceptable derivatives thereof. In certain embodiments, R₃ is hydrogen, lower alkyl or an oxygen protecting group. In certain
exemplary embodiments, R₃ is methyl. In certain other embodiments, R₄ and R₅ are independently lower alkyl. In certain exemplary embodiments, R₅ and R₆ are each methyl. In certain embodiments, n is 3. In certain embodiments, R₄ is halogen, hydroxyl, lower alkoxy, acyloxy or NR⁴A⁺R⁴B⁺, wherein R⁴A⁺ and R⁴B⁺ are independently hydrogen, lower alkyl, aryl, acyl or a nitrogen protecting group, or R⁴A⁺ and R⁴B⁺, taken together with the nitrogen atom to which they are attached, form a substituted or unsubstituted heterocyclic or heteroaryl moiety; or R₄, taken together with the carbon atom to which it is attached forms a moiety having the structure: . In certain embodiments, R₄ is a halogen selected from fluorine, chlorine, bromine and iodine. In certain exemplary embodiments, R₄ is fluorine. In certain other embodiments, R₄ is F, OH, OAc, NH₂ or R₄, taken together with the carbon atom to which it is attached forms a moiety having the structure: . In certain other embodiments, R₇ is methyl. In certain other embodiments, X and Z are each CH₂ and Y is –CHOH, -CHNH₂ or -CHF. In certain other embodiments, R⁸B⁺ is hydrogen, methyl or ethyl. In certain exemplary embodiments, Y₂ is hydrogen or lower alkyl substituted with one or more halogen atoms selected from F, Cl, Br and I. In certain exemplary embodiments, Y₂ is hydrogen or methyl substituted with one or more halogen atoms selected from F, Cl, Br and I. In certain exemplary embodiments, Y₂ is hydrogen or CF₃. In certain exemplary embodiments, R⁸Y₁ is hydroxyl or lower alkoxy. In certain exemplary embodiments, R⁸Y₁ is hydroxyl or methoxy. In certain exemplary embodiments, Y₂ is CF₃ and R⁸Y₁ is methoxy.

[0181] IV) Compounds of the formula (and pharmaceutically acceptable derivatives thereof):
wherein R₃-R₆ are as defined in classes and subclasses herein; Y₂ and R'Y₁ are independently hydrogen or lower alkyl; R₇ is a substituted or unsubstituted, linear or branched, cyclic or acyclic lower alkyl moiety; R'^B is hydrogen or lower alkyl; and X, Y and Z are independently a bond, -O-, -S-, -C(=O)-, -NR'Z₁, -CHOR'Z₁, -CHNR'Z₁R'Z₂, C=S, C=N(R'Y₁) or -CH(Hal); or a substituted or unsubstituted C₀₋₆ alkylidene or C₀₋₆ alkenylidene chain wherein up to two non-adjacent methylene
units are independently optionally replaced by CO, CO₂, COCO, CONR²₁, OCONR²₁, NR²₁NR²₂, NR²₁NR²₂CO, NR²₁CO, NR²₁CO₂, NR²₁CONR²₂, SO, SO₂, NR²₁SO₂, SO₂NR²₁, NR²₁SO₂NR²₂, O, S, or NR²₁; wherein Hal is a halogen selected from F, Cl, Br and I; and each occurrence of R²₁ and R²₂ is independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl; or R²₁ and R²₂, taken together with the nitrogen atom to which they are attached, for a heterocyclic or heteroaryl moiety; and pharmaceutically acceptable derivatives thereof. In certain embodiments, R₃ is hydrogen, lower alkyl or an oxygen protecting group. In certain exemplary embodiments, R₃ is methyl. In certain other embodiments, R₅ and R₆ are independently lower alkyl. In certain exemplary embodiments, R₅ and R₆ are each methyl. In certain embodiments, R₄ is halogen, hydroxyl, lower alkoxy, acyloxy or NR⁴A³R⁴B³, wherein R⁴A³ and R⁴B³ are independently hydrogen, lower alkyl, aryl, acyl or a nitrogen protecting group, or R⁴A³ and R⁴B³, taken together with the nitrogen atom to which they are attached, form a substituted or unsubstituted heterocyclic or heteroaryl moiety; or R₄, taken together with the carbon atom to which it is attached forms a moiety having the structure: \(\text{O} \). In certain embodiments, R₄ is a halogen selected from fluorine, chlorine, bromine and iodine. In certain exemplary embodiments, R₄ is fluorine. In certain other embodiments, R₄ is F, OH, OAc, NH₂ or R₄, taken together with the carbon atom to which it is attached forms a moiety having the structure: \(\text{O} \). In certain other embodiments, R₇ is methyl. In certain other embodiments, X and Z are each CH₂ and Y is –CHOH, –CHNH₂ or –CHF. In certain other embodiments, R⁸B³ is hydrogen, methyl or ethyl. In certain exemplary embodiments, Y₂ is hydrogen or lower alkyl substituted with one or more halogen atoms selected from F, Cl, Br and I. In certain exemplary embodiments, Y₂ is hydrogen or methyl substituted with one or more halogen atoms selected from F, Cl, Br and I. In certain exemplary embodiments, Y₂ is hydrogen or CF₃. In certain exemplary embodiments, R⁷Y₁ is hydroxyl or lower alkoxy. In certain exemplary embodiments, R⁷Y₁ is hydroxyl or methoxy. In certain exemplary embodiments, Y₂ is CF₃ and R⁷Y₁ is methoxy.
[0182] In certain embodiments, for compounds of classes III-IV above, \(-X-Y-Z\) together represents the moiety \(-\text{CH}_2-Y-\text{CH}_2-\); wherein \(Y\) is \(-\text{CHOR}^{Y_1}, -\text{CHNR}^{Y_1}\text{R}^{Y_2}, \text{C} = \text{O}, \text{C} = \text{S}, \text{C} = \text{N(}\text{R}^{Y_1})\) or \(-\text{CH(Hal)}\); wherein \(\text{Hal}\) is a halogen selected from \(\text{F}, \text{Cl}, \text{Br}\) and \(\text{I}\); and \(\text{R}^{Y_1}\) and \(\text{R}^{Y_2}\) are independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl, or \(\text{R}^{Y_1}\) and \(\text{R}^{Y_2}\), taken together with the nitrogen atom to which they are attached, for a heterocyclic or heteroaryl moiety.

[0183] V) Compounds of the formula (and pharmaceutically acceptable derivatives thereof):

\[\text{Diagram of chemical structures}\]
wherein $R_3$-$R_6$ and $n$ are as defined in classes and subclasses herein; $Y_2$ and $R^{Y_1}$ are independently hydrogen or lower alkyl; $R_7$ is a substituted or unsubstituted, linear or branched, cyclic or acyclic lower alkyl moiety; $R^{88}$ is hydrogen or lower alkyl; and $Y$ is $-\text{CHOR}^{Y_1}$, $-\text{CHNR}^{Y_1}R^{Y_2}$, $C=O$, $C=S$, $C=N(R^{Y_1})$ or $-\text{CH(Hal)}$; wherein Hal is a halogen selected from F, Cl, Br and I; and $R^{Y_1}$ and $R^{Y_2}$ are independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl, or $R^{Y_1}$ and $R^{Y_2}$, taken together with the nitrogen atom to which they are attached, for a heterocyclic or heteroaryl moiety. In certain embodiments, $R_3$ is hydrogen, lower alkyl or an oxygen protecting group. In certain exemplary embodiments, $R_3$ is methyl. In certain other embodiments, $R_5$ and $R_6$ are independently lower alkyl. In certain exemplary embodiments, $R_5$ and $R_6$ are each methyl. In certain embodiments, $n$ is 3. In certain embodiments, $R_4$ is halogen, hydroxy, lower alkoxy, acyloxy or
NR<sup>4A</sup>R<sup>4B</sup>, wherein R<sup>4A</sup> and R<sup>4B</sup> are independently hydrogen, lower alkyl, aryl, acyl or a nitrogen protecting group, or R<sup>4A</sup> and R<sup>4B</sup>, taken together with the nitrogen atom to which they are attached, form a substituted or unsubstituted heterocyclic or heteroaryl moiety; or R<sub>4</sub>, taken together with the carbon atom to which it is attached forms a moiety having the structure: \[ \begin{array}{c} \text{R} \\ \text{NR} \\ \text{O} \end{array} \]. In certain embodiments, R<sub>4</sub> is a halogen selected from fluorine, chlorine, bromine and iodine. In certain exemplary embodiments, R<sub>4</sub> is fluorine. In certain other embodiments, R<sub>4</sub> is F, OH, OAc, NH<sub>2</sub> or R<sub>4</sub>, taken together with the carbon atom to which it is attached forms a moiety having the structure: \[ \begin{array}{c} \text{R} \\ \text{NR} \\ \text{O} \end{array} \]. In certain other embodiments, R<sub>7</sub> is methyl. In certain other embodiments, Y is –CHOH, –CHNH<sub>2</sub> or –CHF. In certain other embodiments, R<sup>8B</sup> is hydrogen, methyl or ethyl. In certain exemplary embodiments, Y<sub>2</sub> is hydrogen or lower alkyl substituted with one or more halogen atoms selected from F, Cl, Br and I. In certain exemplary embodiments, Y<sub>2</sub> is hydrogen or methyl substituted with one or more halogen atoms selected from F, Cl, Br and I. In certain exemplary embodiments, Y<sub>2</sub> is hydrogen or CF<sub>3</sub>. In certain exemplary embodiments, Y<sub>1</sub> is hydroxyl or lower alkoxy. In certain exemplary embodiments, Y<sub>1</sub> is hydroxyl or methoxy. In certain exemplary embodiments, Y<sub>2</sub> is CF<sub>3</sub> and Y<sub>1</sub> is methoxy.

[0184] VI) Compounds of the formula (and pharmaceutically acceptable derivatives thereof):
wherein R₃-R₆ are as defined in classes and subclasses herein; Y₂ and R⁴ are independently hydrogen or lower alkyl; R₇ is a substituted or unsubstituted, linear or branched, cyclic or acyclic lower alkyl moiety; R⁵ is hydrogen or lower alkyl; and Y is –CHOR⁴, –CHNR⁴R⁵, C=O, C=S, C=N(R⁴) or –CH(Hal); wherein Hal is a halogen selected from F, Cl, Br and I; and R⁴ and R⁵ are independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl, or R⁴ and R⁵, taken together with the nitrogen atom to which they are attached, for a heterocyclic or heteroaryl moiety. In certain embodiments, R₃ is hydrogen, lower alkyl or an oxygen protecting group. In certain exemplary embodiments, R₃ is methyl. In certain other embodiments, R₅ and R₆ are independently lower alkyl. In certain exemplary embodiments, R₅ and R₆ are each methyl. In certain embodiments, R₄ is halogen, hydroxyl, lower alkoxy, acyloxy or NR⁴R⁵, wherein R⁴ is hydrogen, lower alkyl, aryl, acyl or a nitrogen protecting group, or R⁴ and R⁵, taken together with the
nitrogen atom to which they are attached, form a substituted or unsubstituted heterocyclic or heteroaryl moiety; or R₄, taken together with the carbon atom to which it is attached forms a moiety having the structure: \( \text{O} \). In certain embodiments, R₄ is a halogen selected from fluorine, chlorine, bromine and iodine. In certain exemplary embodiments, R₄ is fluorine. In certain other embodiments, R₄ is F, OH, OAc, NH₂ or R₄, taken together with the carbon atom to which it is attached forms a moiety having the structure: \( \text{O} \). In certain other embodiments, R₇ is methyl. In certain other embodiments, Y is \(-\text{CHOH}, -\text{CHNH₂} \) or \(-\text{CHF} \). In certain other embodiments, Rᴮ is hydrogen, methyl or ethyl. In certain exemplary embodiments, Y₂ is hydrogen or lower alkyl substituted with one or more halogen atoms selected from F, Cl, Br and I. In certain exemplary embodiments, Y₂ is hydrogen or methyl substituted with one or more halogen atoms selected from F, Cl, Br and I. In certain exemplary embodiments, Y₂ is hydrogen or CF₃. In certain exemplary embodiments, R¹ is hydroxyl or lower alkoxy. In certain exemplary embodiments, R¹ is hydroxyl or methoxy. In certain exemplary embodiments, Y₂ is CF₃ and R¹ is methoxy.

[0185] VII) Compounds of the formula (and pharmaceutically acceptable derivatives thereof):
wherein n, R₃ and R₄ are as defined in classes and subclasses herein; Y₂ and RY₁ are independently hydrogen or lower alkyl; R₄B is hydrogen or lower alkyl; and RY is hydrogen, halogen, ORY₁ or NR₄YN₄Y₂; wherein RY₁ and RY₂ are independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl, or RY₁ and RY₂, taken together with the nitrogen atom to which they are attached, for a heterocyclic or heteroaryl moiety. In certain embodiments, R₃ is hydrogen, lower alkyl or an oxygen protecting group. In certain exemplary embodiments, R₃ is methyl. In certain embodiments, n is 3. In certain embodiments, R₄ is halogen, hydroxyl, lower alkoxy, acyloxy or NR₄₁₄₄B, wherein R₄₁ and R₄B are independently hydrogen, lower alkyl, aryl, acyl or a nitrogen protecting group, or R₄₁ and R₄B, taken together with the nitrogen atom to which they are attached, form a substituted or unsubstituted heterocyclic or heteroaryl moiety; or R₄, taken together with the carbon atom to which it is attached forms a moiety having the structure: \( \text{\textsuperscript{14}}\text{C} \text{O} \).
certain embodiments, $R_4$ is a halogen selected from fluorine, chlorine, bromine and iodine. In certain exemplary embodiments, $R_4$ is fluorine. In certain other embodiments, $R_4$ is F, OH, OAc, NH$_2$ or $R_4$, taken together with the carbon atom to which it is attached forms a moiety having the structure: \[ \begin{array}{c}
\text{O} \\
\text{C} \\
\text{H} \\
\text{R}_4
\end{array} \]. In certain other embodiments, $R^Y$ is OH, NH$_2$ or halogen (e.g., F). In certain other embodiments, $R^{8B}$ is hydrogen, methyl or ethyl. In certain exemplary embodiments, $Y_2$ is hydrogen or lower alkyl substituted with one or more halogen atoms selected from F, Cl, Br and I. In certain exemplary embodiments, $Y_2$ is hydrogen or methyl substituted with one or more halogen atoms selected from F, Cl, Br and I. In certain exemplary embodiments, $Y_2$ is hydrogen or CF$_3$. In certain exemplary embodiments, $R^{Y_1}$ is hydroxyl or lower alkoxy. In certain exemplary embodiments, $R^{Y_1}$ is hydroxyl or methoxy. In certain exemplary embodiments, $Y_2$ is CF$_3$ and $R^{Y_1}$ is methoxy.

[0186] **VIII) Compounds of the formula (and pharmaceutically acceptable derivatives thereof):**
wherein $R_3$ and $R_4$ are as defined in classes and subclasses herein; $Y_2$ and $R^{Y_1}$ are independently hydrogen or lower alkyl; $R^{SB}$ is hydrogen or lower alkyl; and $R^Y$ is hydrogen, halogen, $-OR^{Y_1}$ or $-NR^{Y_1}NR^{Y_2}$, wherein $R^{Y_1}$ and $R^{Y_2}$ are independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl, or $R^{Y_1}$ and $R^{Y_2}$, taken together with the nitrogen atom to which they are attached, for a heterocyclic or heteroaryl moiety. In certain embodiments, $R_3$ is hydrogen, lower alkyl or an
oxygen protecting group. In certain exemplary embodiments, R₃ is methyl. In certain embodiments, R₄ is halogen, hydroxyl, lower alkoxy, acyloxy or NR⁴ₐR⁴ₐ, wherein R⁴ₐ and R⁴ₐ are independently hydrogen, lower alkyl, aryl, acyl or a nitrogen protecting group, or R⁴ₐ and R⁴ₐ, taken together with the nitrogen atom to which they are attached, form a substituted or unsubstituted heterocyclic or heteroaryl moiety; or R₄, taken together with the carbon atom to which it is attached forms a moiety having the structure: \( \text{O} \). In certain embodiments, R₄ is a halogen selected from fluorine, chlorine, bromine and iodine. In certain exemplary embodiments, R₄ is fluorine. In certain other embodiments, R₄ is F, OH, OAc, NH₂ or R₄, taken together with the carbon atom to which it is attached forms a moiety having the structure: \( \text{O} \). In certain other embodiments, R⁴ is OH, NH₂ or halogen (e.g., F). In certain other embodiments, R⁴ is hydrogen, methyl or ethyl.

In certain exemplary embodiments, Y₂ is hydrogen or lower alkyl substituted with one or more halogen atoms selected from F, Cl, Br and I. In certain exemplary embodiments, Y₂ is hydrogen or methyl substituted with one or more halogen atoms selected from F, Cl, Br and I. In certain exemplary embodiments, Y₂ is hydrogen or CF₃. In certain exemplary embodiments, R⁴ is hydroxyl or lower alkoxy. In certain exemplary embodiments, R⁴ is hydroxyl or methoxy. In certain exemplary embodiments, Y₂ is CF₃ and R⁴ is methoxy.

[0187] IX) Compounds of the formula (and pharmaceutically acceptable derivatives thereof):
wherein R₃-R₆ and n are as defined in classes and subclasses herein; Y₂ and \( R^{Y₁} \) are independently hydrogen or lower alkyl; \( R₇ \) is a substituted or unsubstituted, linear or branched, cyclic or acyclic lower alkyl moiety; and \( R^{8B} \) is hydrogen or lower alkyl. In certain embodiments, \( R₃ \) is hydrogen, lower alkyl or an oxygen protecting group. In certain exemplary embodiments, \( R₃ \) is methyl. In certain other embodiments, \( R₅ \) and \( R₆ \) are independently lower alkyl. In certain exemplary embodiments, \( R₅ \) and \( R₆ \) are each methyl. In certain embodiments, n is 3. In certain embodiments, \( R₄ \) is halogen, hydroxyl, lower alkoxy, acyloxy or \( NR₄^A R₄^B \), wherein \( R₄^A \) and \( R₄^B \) are independently hydrogen, lower alkyl, aryl, acyl or a nitrogen protecting group, or \( R₄^A \) and \( R₄^B \), taken together with the nitrogen atom to which they are attached, form a substituted or unsubstituted heterocyclic or heteroaryl moiety; or \( R₄ \), taken together with the carbon atom to which it is attached forms a moiety having the structure: \( =\) . In certain embodiments, \( R₄ \) is a halogen...
selected from fluorine, chlorine, bromine and iodine. In certain exemplary embodiments, R₄ is fluorine. In certain other embodiments, R₄ is F, OH, OAc, NH₂ or R₄, taken together with the carbon atom to which it is attached forms a moiety having the structure: \( \text{\textbullet} \). In certain other embodiments, R₇ is methyl. In certain other embodiments, R²₃ is hydrogen, methyl or ethyl. In certain exemplary embodiments, Y₂ is hydrogen or lower alkyl substituted with one or more halogen atoms selected from F, Cl, Br and I. In certain exemplary embodiments, Y₂ is hydrogen or methyl substituted with one or more halogen atoms selected from F, Cl, Br and I. In certain exemplary embodiments, Y₂ is hydrogen or CF₃. In certain exemplary embodiments, R⁴ᵀ is hydroxyl or lower alkoxy. In certain exemplary embodiments, R⁴ᵀ is hydroxyl or methoxy. In certain exemplary embodiments, Y₂ is CF₃ and R⁴ᵀ is methoxy.

[0188] X) Compounds of the formula (and pharmaceutically acceptable derivatives thereof):
wherein $R_3$-$R_6$ are as defined in classes and subclasses herein; $Y_2$ and $R^{Y_1}$ are independently hydrogen or lower alkyl; $R_7$ is a substituted or unsubstituted, linear or branched, cyclic or acyclic lower alkyl moiety; and $R^{88}$ is hydrogen or lower alkyl. In certain embodiments, $R_3$ is hydrogen, lower alkyl or an oxygen protecting group. In certain exemplary embodiments, $R_3$ is methyl. In certain other embodiments, $R_5$ and $R_6$ are independently lower alkyl. In certain exemplary embodiments, $R_5$ and $R_6$
are each methyl. In certain embodiments, $R_4$ is halogen, hydroxyl, lower alkoxy, acyloxy or $NR_{\text{R}}^{A}R_{\text{R}}^{B}$, wherein $R_{\text{R}}^{A}$ and $R_{\text{R}}^{B}$ are independently hydrogen, lower alkyl, aryl, acyl or a nitrogen protecting group, or $R_{\text{R}}^{A}$ and $R_{\text{R}}^{B}$, taken together with the nitrogen atom to which they are attached, form a substituted or unsubstituted heterocyclic or heteroaryl moiety; or $R_4$, taken together with the carbon atom to which it is attached forms a moiety having the structure: $\text{R}_4\text{N}^\ominus$. In certain embodiments, $R_4$ is a halogen selected from fluorine, chlorine, bromine and iodine. In certain exemplary embodiments, $R_4$ is fluorine. In certain other embodiments, $R_4$ is $F$, $OH$, $OAc$, $NH_2$ or $R_4$, taken together with the carbon atom to which it is attached forms a moiety having the structure: $\text{R}_4\text{N}^\ominus$. In certain other embodiments, $R_7$ is methyl. In certain other embodiments, $R_{\text{R}}^{B}$ is hydrogen, methyl or ethyl. In certain exemplary embodiments, $Y_2$ is hydrogen or lower alkyl substituted with one or more halogen atoms selected from $F$, $Cl$, $Br$ and $I$. In certain exemplary embodiments, $Y_2$ is hydrogen or methyl substituted with one or more halogen atoms selected from $F$, $Cl$, $Br$ and $I$. In certain exemplary embodiments, $Y_2$ is hydrogen or $CF_3$. In certain exemplary embodiments, $Y_{\text{R}}^{Y_1}$ is hydroxyl or lower alkoxy. In certain exemplary embodiments, $Y_{\text{R}}^{Y_1}$ is hydroxyl or methoxy. In certain exemplary embodiments, $Y_2$ is $CF_3$ and $Y_{\text{R}}^{Y_1}$ is methoxy.

[0189] XI Compounds of the formula (and pharmaceutically acceptable derivatives thereof):

![Chemical structures](image)

wherein $R_3$-$R_6$ and $n$ are as defined in classes and subclasses herein; and $Y_2$ and $Y_{\text{R}}^{Y_1}$ are independently hydrogen or lower alkyl. In certain embodiments, $R_3$ is hydrogen, lower alkyl or an oxygen protecting group. In certain exemplary...
embodiments, R₃ is methyl. In certain other embodiments, R₅ and R₆ are independently lower alkyl. In certain exemplary embodiments, R₅ and R₆ are each methyl. In certain embodiments, n is 3. In certain embodiments, R₄ is halogen, hydroxy, lower alkoxy, acyloxy or NR₄⁺R₄⁻, wherein R₄⁺ and R₄⁻ are independently hydrogen, lower alkyl, aryl, acyl or a nitrogen protecting group, or R₄⁺ and R₄⁻, taken together with the nitrogen atom to which they are attached, form a substituted or unsubstituted heterocyclic or heteroaryl moiety; or R₄, taken together with the carbon atom to which it is attached forms a moiety having the structure: \[ \text{\textbullet} \text{O} \text{\textbullet} \]. In certain embodiments, R₄ is a halogen selected from fluorine, chlorine, bromine and iodine. In certain exemplary embodiments, R₄ is fluorine. In certain other embodiments, R₄ is F, OH, OAc, NH₂ or R₄, taken together with the carbon atom to which it is attached forms a moiety having the structure: \[ \text{\textbullet} \text{O} \text{\textbullet} \]. In certain exemplary embodiments, Y₂ is hydrogen or lower alkyl substituted with one or more halogen atoms selected from F, Cl, Br and I. In certain exemplary embodiments, Y₂ is hydrogen or methyl substituted with one or more halogen atoms selected from F, Cl, Br and I. In certain exemplary embodiments, Y₂ is hydrogen or CF₃. In certain exemplary embodiments, R₃ is hydroxyl or lower alkoxy. In certain exemplary embodiments, R₃ is hydroxyl or methoxy. In certain exemplary embodiments, Y₂ is CF₃ and R₃ is methoxy.

[0190] XII) Compounds of the formula (and pharmaceutically acceptable derivatives thereof):
wherein R₃-R₆ are as defined in classes and subclasses herein; and Y₂ and R⁰ are independently hydrogen or lower alkyl. In certain embodiments, R₃ is hydrogen, lower alkyl or an oxygen protecting group. In certain exemplary embodiments, R₃ is methyl. In certain other embodiments, R₅ and R₆ are independently lower alkyl. In certain exemplary embodiments, R₅ and R₆ are each methyl. In certain embodiments, R₄ is halogen, hydroxyl, lower alkoxy, acyloxy or NR⁴⁻R⁴⁺⁻, wherein R⁴⁻ and R⁴⁺ are independently hydrogen, lower alkyl, aryl, acyl or a nitrogen protecting group, or R⁴⁻ and R⁴⁺, taken together with the nitrogen atom to which they are attached, form a substituted or unsubstituted heterocyclic or heteroaryl moiety; or R₄, taken together with the carbon atom to which it is attached forms a moiety having the structure: \[ \begin{array}{c} \text{R} \\ \text{O} \end{array} \]. In certain embodiments, R₄ is a halogen selected from fluorine, chlorine, bromine and iodine. In certain exemplary embodiments, R₄ is fluorine. In certain other embodiments, R₄ is F, OH, OAc, NH₂ or R₄, taken together with the carbon atom to which it is attached forms a moiety having the structure: \[ \begin{array}{c} \text{R} \\ \text{O} \end{array} \]. In certain exemplary embodiments, Y₂ is hydrogen or lower alkyl substituted with one or more halogen atoms selected from F, Cl, Br and I. In certain exemplary embodiments, Y₂ is hydrogen or methyl substituted with one or more halogen atoms selected from F, Cl, Br and I. In certain exemplary
embodiments, \( Y_2 \) is hydrogen or \( \text{CF}_3 \). In certain exemplary embodiments, \( R^{Y_1} \) is hydroxyl or lower alkoxy. In certain exemplary embodiments, \( R^{Y_1} \) is hydroxyl or methoxy. In certain exemplary embodiments, \( Y_2 \) is \( \text{CF}_3 \) and \( R^{Y_1} \) is methoxy.

[0191] XIII) Compounds of the formula (and pharmaceutically acceptable derivatives thereof):

\[
\begin{align*}
\text{wherein } R_3-R_6 \text{ and } n \text{ are as defined in classes and subclasses herein; and } Y_2 \\
\text{and } R^{Y_1} \text{ are independently hydrogen or lower alkyl. In certain embodiments, } R_3 \text{ is} \\
\text{hydrogen, lower alkyl or an oxygen protecting group. In certain exemplary} \\
\text{embodiments, } R_3 \text{ is methyl. In certain other embodiments, } R_5 \text{ and } R_6 \text{ are} \\
\text{independently lower alkyl. In certain exemplary embodiments, } R_5 \text{ and } R_6 \text{ are each} \\
methyl. \text{In certain embodiments, } n \text{ is } 3. \text{In certain embodiments, } R_4 \text{ is halogen,} \\
\text{hydroxyl, lower alkoxy, acyloxy or } NR^{A_1}R^{A_2}, \text{wherein } R^{A_1} \text{ and } R^{A_2} \text{ are} \\
\text{independently hydrogen, lower alkyl, aryl, acyl or a nitrogen protecting group, or} \\
R^{A_1} \text{ and } R^{A_2}, \text{taken together with the nitrogen atom to which they are attached, form} \\
a substituted or unsubstituted heterocyclic or heteroaryl moiety; or } R_4, \text{ taken} \\
together with the carbon atom to which it is attached forms a moiety having the} \\
\text{structure:} \\
\end{align*}
\]

In certain embodiments, \( R_4 \) is a halogen selected from fluorine, chlorine, bromine and iodine. In certain exemplary embodiments, \( R_4 \) is fluorine. In certain other embodiments, \( R_4 \) is \( \text{F, OH, OAc, NH}_2 \) or \( R_4 \), taken together with the

carbon atom to which it is attached forms a moiety having the structure:

In certain exemplary embodiments, \( Y_2 \) is hydrogen or lower alkyl substituted with one or more halogen atoms selected from \( \text{F, Cl, Br and I} \). In certain exemplary embodiments, \( Y_2 \) is hydrogen or methyl substituted with one or more halogen atoms
selected from F, Cl, Br and I. In certain exemplary embodiments, $Y_2$ is hydrogen or CF$_3$. In certain exemplary embodiments, $R^Y_1$ is hydroxyl, lower alkyl or lower alkoxy. In certain exemplary embodiments, $R^Y_1$ is hydroxyl, methyl or methoxy. In certain exemplary embodiments, $Y_2$ is CF$_3$ and $R^Y_1$ is methoxy.

[0192] XIV Compounds of the formula (and pharmaceutically acceptable derivatives thereof):

\[ \text{Chemical Structures} \]

wherein $R_3$-$R_6$ are as defined in classes and subclasses herein; and $Y_2$ and $R^Y_1$ are independently hydrogen or lower alkyl. In certain embodiments, $R_3$ is hydrogen, lower alkyl or an oxygen protecting group. In certain exemplary embodiments, $R_3$ is methyl. In certain other embodiments, $R_5$ and $R_6$ are independently lower alkyl. In certain exemplary embodiments, $R_5$ and $R_6$ are each methyl. In certain embodiments, $R_4$ is halogen, hydroxyl, lower alkoxy, acyloxy or NR$_4^A$R$_4^B$, wherein $R^A_4$ and $R^B_4$ are independently hydrogen, lower alkyl, aryl, acyl or a nitrogen protecting group, or $R^A_4$ and $R^B_4$, taken together with the nitrogen atom to which they are attached, form a substituted or unsubstituted heterocyclic or heteroaryl moiety; or $R_4$, taken together with the carbon atom to which it is attached

forms a moiety having the structure: $\text{Chemical Structure}$. In certain embodiments, $R_4$ is a
halogen selected from fluorine, chlorine, bromine and iodine. In certain exemplary embodiments, R₄ is fluorine. In certain other embodiments, R₄ is F, OH, OAc, NH₂ or R₄, taken together with the carbon atom to which it is attached forms a moiety having the structure: \[ -\overset{\text{X}}{\text{O}} \]. In certain exemplary embodiments, Y₂ is hydrogen or lower alkyl substituted with one or more halogen atoms selected from F, Cl, Br and I. In certain exemplary embodiments, Y₂ is hydrogen or methyl substituted with one or more halogen atoms selected from F, Cl, Br and I. In certain exemplary embodiments, Y₂ is hydrogen or CF₃. In certain exemplary embodiments, R₇ is hydroxyl, lower alkyl or lower alkoxy. In certain exemplary embodiments, R₇ is hydroxyl, methyl or methoxy. In certain exemplary embodiments, Y₂ is CF₃ and R₇ is methoxy.

[0193] XV) **Compounds of the formula (and pharmaceutically acceptable derivatives thereof):**

![Chemical Structure Image]

wherein R₃-R₆ are as defined in classes and subclasses herein; X₁ is O, NH or CH₂; and Y₁ and Y₂ are independently OH, C(R₇)₃ or Y₁ and Y₂ taken together with the carbon atom to which they are attached are –C=O; wherein R₇ is halo. In certain embodiments, R₆ is H or lower alkyl. In certain other embodiments, R₅ is H or lower alkyl. In yet other embodiments, R₄ is OH. In other embodiments, R₃ is alkyl. In certain exemplary embodiments, X₁ is CH₂, NH or O; Y₁ and Y₂ are independently OH, C(R₇)₃ or Y₁ and Y₂ taken together with the carbon atom to which they are attached are –C=O, wherein R₇ is halo; R₆ is H or lower alkyl; R₅ is H or lower alkyl; R₄ is OH; and R₃ is alkyl.
[0194] It will also be appreciated that for each of the subgroups I-XV described above, a variety of other subclasses are of special interest, including, but not limited to those classes described above i)-cXv) and classes, subclasses and species of compounds described above and in the examples herein.

[0195] Some of the foregoing compounds can comprise one or more asymmetric centers, and thus can exist in various isomeric forms, e.g., stereoisomers and/or diastereomers. Thus, inventive compounds and pharmaceutical compositions thereof may be in the form of an individual enantiomer, diastereomer or geometric isomer, or may be in the form of a mixture of stereoisomers. In certain embodiments, the compounds of the invention are enantiopure compounds. In certain other embodiments, mixtures of stereoisomers or diastereomers are provided.

[0196] Furthermore, certain compounds, as described herein may have one or more double bonds that can exist as either the Z or E isomer, unless otherwise indicated. The invention additionally encompasses the compounds as individual isomers substantially free of other isomers and alternatively, as mixtures of various isomers, e.g., racemic mixtures of stereoisomers. In addition to the above-mentioned compounds per se, this invention also encompasses pharmaceutically acceptable derivatives of these compounds and compositions comprising one or more compounds of the invention and one or more pharmaceutically acceptable excipients or additives.

[0197] Compounds of the invention may be prepared by crystallization of compound of formula (I) under different conditions and may exist as one or a combination of polymorphs of compound of general formula (I) forming part of this invention. For example, different polymorphs may be identified and/or prepared using different solvents, or different mixtures of solvents for recrystallization; by performing crystallizations at different temperatures; or by using various modes of cooling, ranging from very fast to very slow cooling during crystallizations. Polymorphs may also be obtained by heating or melting the compound followed by gradual or fast cooling. The presence of polymorphs may be determined by solid probe NMR spectroscopy, IR spectroscopy, differential scanning calorimetry, powder X-ray diffractogram and/or other techniques. Thus, the present invention
encompasses inventive compounds, their derivatives, their tautomeric forms, their stereoisomers, their polymorphs, their pharmaceutically acceptable salts their pharmaceutically acceptable solvates and pharmaceutically acceptable compositions containing them.

As discussed above, this invention provides novel compounds with a range of biological properties. Preferred compounds of this invention have biological activities relevant for the treatment of cancer and angiogenesis-related disorders.

Compounds of this invention include those specifically set forth above and described herein, and are illustrated in part by the various classes, subgenera and species disclosed elsewhere herein.

Additionally, the present invention provides pharmaceutically acceptable derivatives of the inventive compounds, and methods of treating a subject using these compounds, pharmaceutical compositions thereof, or either of these in combination with one or more additional therapeutic agents. Certain compounds of the present invention are described in more detail below. For purposes of this invention, the chemical elements are identified in accordance with the Periodic Table of the Elements, CAS version, Handbook of Chemistry and Physics, 75th Ed., inside cover, and specific functional groups are generally defined as described therein. Additionally, general principles of organic chemistry, as well as specific functional moieties and reactivity, are described in “Organic Chemistry”, Thomas Sorrell, University Science Books, Sausalito: 1999, the entire contents of which are incorporated herein by reference. Furthermore, it will be appreciated by one of ordinary skill in the art that the synthetic methods, as described herein, utilize a variety of protecting groups. It will be appreciated that the compounds, as described herein, may be substituted with any number of substituents or functional moieties. In general, the term “substituted” whether preceded by the term “optionally” or not, and substituents contained in formulas of this invention, refer to the replacement of hydrogen radicals in a given structure with the radical of a specified substituent. When more than one position in any given structure may be substituted with more than one substituent selected from a specified group, the substituent may be either
the same or different at every position. As used herein, the term "substituted" is contemplated to include all permissible substituents of organic compounds. In a broad aspect, the permissible substituents include acyclic and cyclic, branched and unbranched, carbocyclic and heterocyclic, aromatic and nonaromatic substituents of organic compounds. For purposes of this invention, heteroatoms such as nitrogen may have hydrogen substituents and/or any permissible substituents of organic compounds described herein which satisfy the valencies of the heteroatoms. Furthermore, this invention is not intended to be limited in any manner by the permissible substituents of organic compounds. Combinations of substituents and variables envisioned by this invention are preferably those that result in the formation of stable compounds useful in the treatment, for example of proliferative disorders, including, but not limited to cancer. The term "stable", as used herein, preferably refers to compounds which possess stability sufficient to allow manufacture and which maintain the integrity of the compound for a sufficient period of time to be detected and preferably for a sufficient period of time to be useful for the purposes detailed herein.

[0201] It will also be appreciated that certain of the compounds of present invention can exist in free form for treatment, or where appropriate, as a pharmaceutical acceptable derivative thereof. According to the present invention, a pharmaceutical acceptable derivative includes, but is not limited to, pharmaceutically acceptable salts, esters, salts of such esters, or a prodrug or other adduct or derivative of a compound of this invention which upon administration to a patient in need is capable of providing, directly or indirectly, a compound as otherwise described herein, or a metabolite or residue thereof.

[0202] As used herein, the term "pharmaceutically acceptable salt" refers to those salts which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and lower animals without undue toxicity, irritation, allergic response and the like, and are commensurate with a reasonable benefit/risk ratio. Pharmaceutically acceptable salts of amines, carboxylic acids, and other types of compounds, are well known in the art. For example, S.M. Berge, et al. describe pharmaceutically acceptable salts in detail in J. Pharmaceutical
Sciences, 66: 1-19 (1977), incorporated herein by reference. The salts can be prepared in situ during the final isolation and purification of the compounds of the invention, or separately by reacting a free base or free acid function with a suitable reagent, as described generally below. For example, a free base function can be reacted with a suitable acid. Furthermore, where the compounds of the invention carry an acidic moiety, suitable pharmaceutically acceptable salts thereof may, include metal salts such as alkali metal salts, e.g. sodium or potassium salts; and alkaline earth metal salts, e.g. calcium or magnesium salts. Examples of pharmaceutically acceptable, nontoxic acid addition salts are salts of an amino group formed with inorganic acids such as hydrochloric acid, hydrobromic acid, phosphoric acid, sulfuric acid and perchloric acid or with organic acids such as acetic acid, oxalic acid, maleic acid, tartaric acid, citric acid, succinic acid or malonic acid or by using other methods used in the art such as ion exchange. Other pharmaceutically acceptable salts include adipate, alginate, ascorbate, aspartate, benzenesulfonate, benzoate, bisulfate, borate, butyrate, camphorate, camphorsulfonate, citrate, cyclopentanepropionate, digluconate, dodecylsulfate, ethanesulfonate, formate, fumarate, glucoheptonate, glycerophosphate, gluconate, hernisulfate, heptanoate, hexanoate, hydroiodide, 2-hydroxy-ethanesulfonate, lactobionate, lactate, laurate, lauryl sulfate, malate, maleate, malonate, methanesulfonate, 2-naphthalenesulfonate, nicotinate, nitrate, oleate, oxalate, palmitate, pamoate, pectinate, persulfate, 3-phenylpropionate, phosphate, pircate, pivalate, propionate, stearate, succinate, sulfate, tartrate, thiocyanate, p-toluenesulfonate, undecanoate, valerate salts, and the like. Representative alkali or alkaline earth metal salts include sodium, lithium, potassium, calcium, magnesium, and the like. Further pharmaceutically acceptable salts include, when appropriate, nontoxic ammonium, quaternary ammonium, and amine cations formed using counterions such as halide, hydroxide, carboxylate, sulfate, phosphate, nitrate, loweralkyl sulfonate and aryl sulfonate.

[0203] Additionally, as used herein, the term “pharmacaceutically acceptable ester” refers to esters that hydrolyze in vivo and include those that break down readily in the human body to leave the parent compound or a salt thereof. Suitable
ester groups include, for example, those derived from pharmaceutically acceptable aliphatic carboxylic acids, particularly alkanoic, alkenoic, cycloalkanoic and alkanedioic acids, in which each alkyl or alkenyl moiety advantageously has not more than 6 carbon atoms. Examples of particular esters include formates, acetates, propionates, butyrates, acrylates and ethylsuccinates.

Furthermore, the term “pharmaceutically acceptable prodrugs” as used herein refers to those prodrugs of the compounds of the present invention which are, within the scope of sound medical judgment, suitable for use in contact with the issues of humans and lower animals with undue toxicity, irritation, allergic response, and the like, commensurate with a reasonable benefit/risk ratio, and effective for their intended use, as well as the zwitterionic forms, where possible, of the compounds of the invention. The term “prodrug” refers to compounds that are rapidly transformed in vivo to yield the parent compound of the above formula, for example by hydrolysis in blood. A thorough discussion is provided in T. Higuchi and V. Stella, Pro-drugs as Novel Delivery Systems, Vol. 14 of the A.C.S. Symposium Series, and in Edward B. Roche, ed., Bioreversible Carriers in Drug Design, American Pharmaceutical Association and Pergamon Press, 1987, both of which are incorporated herein by reference.

2) Synthetic Methodology

In another aspect, the present invention provides methods for preparing novel macrocycles having formula (I) as described above and in certain classes and subclasses herein. An overview of exemplary synthetic approaches to the inventive compounds is provided below, as detailed in Schemes 1-15, and in the Exemplification herein. It will be appreciated that the methods as described herein can be applied to each of the compounds as disclosed herein and equivalents thereof. Additionally, the reagents and starting materials are well known to those skilled in the art. Although the following schemes describe certain exemplary compounds, it will be appreciated that the use of alternate starting materials will yield other analogs of the invention. For example, compounds are described below where X is O; however, it will be appreciated that alternate starting materials and/or
intermediates can be utilized to generate compounds where X is NH, N-alkyl, S, CH₂, etc.

[0207] In certain embodiments, compounds as provided herein, for example those where n is 3, X is O, and R₁ and R₂ are each hydrogen, are prepared from assembly of three segments, as depicted in Scheme 1A below:

![Scheme 1A](image)

(a) Nucleophilic addition  
(b) Ester bond formation  
(c) Ring-closing metathesis

[Scheme 1A]

[0208] In certain other embodiments, compounds as provided herein, for example those where n is 3, X is O, R₁ and R₂ are each hydrogen, and Q is a moiety having the structure , are prepared from assembly of five segments, as depicted in Scheme 1B below:

![Scheme 1B](image)

[Scheme 1B]

[0209] In certain embodiments, compounds of the invention where Q is a carbonyl-containing moiety having the structure:
are prepared from assembly of three segments, as depicted in Scheme 2 below:

Scheme 2

[0210] In certain embodiments, compounds where –Alk-R₈ represents a glutarimide-containing side chain, having the structure:

wherein X, Y, Z and R are as defined in classes and subclasses herein;
are prepared from assembly of three segments, as depicted in Scheme 3 below:

Scheme 3
wherein G represents a group suitable for effecting the Horner-Wadsworth-Emmons-type coupling.

[0211] In certain embodiments, the preparation of fragment A may be accomplished as depicted in Scheme 4 below:

![Chemical反应图示]

Scheme 4

[0212] For example, reduction of commercially available dimethyl 2,3-\textit{O}-isopropylidene-\textit{L}-tartrate i, followed by diastereoselective divinylzine addition to the \textit{in situ} generated dialdehyde produces the desired vinyl carbinol ii (see, Jorgensen et al., \textit{J. Org. Chem.}, 2001, 66, 4630). Alkylation (or arylation) of the two hydroxyl groups and removal of the acetonide protecting group yields diol iii. Glycol cleavage of iii affords \textgreek{a}-alkoxy-\textgreek{b}-vinyl aldehyde iv. Subjecting iv to a Lewis acid catalyzed diene aldehyde condensation (LACDAC) sequence with the synergistically activated diene v in the presence of TiCl$_4$, yields the \textgreek{a}-chelation controlled dihydropyrones vi (for chelation-controlled cyclocondensations of \textgreek{a}-alkoxy aldehydes with synergistically activated dienes, see: Danishefsky et al., \textit{J.}
*Am. Chem. Soc.*, 1985, 107, 1256). The cyclocondensation allows the construction of the three contiguous stereocenters of the macrolide and sets the stage for establishing the trisubstituted (Z)-alkene C11-C12. Luche reduction of enone vi affords the corresponding allylic alcohol, which can be made to undergo an aqueous Ferrier rearrangement to give alcohol vii (for a reference on the Luche reduction, see: Luche et al., *J. Am. Chem. Soc.*, 1979, 101, 5345; for a reference on the Ferrier rearrangement, see: Ferrier, *J. Chem. Soc.*, 1964, 5443). Reductive opening of lactol vii, protection of the secobdary hydroxyl group, and oxidation of the primary alcohol yields the C7-C13 core fragment A.

[0213] One of ordinary skill in the art will recognize that the protected hydroxyl (OPG) may be converted to a variety of functional groups, including, but not limited to OH, NH₂ and F, thus allowing access to compounds where R₄ is OH, OAc, NH₂, F, or R₄, taken together with the carbon atom to which it is attached forms a moiety having the structure: ; among others.

[0214] In certain embodiments, coupling of fragment A with a glutarimide moiety may be accomplished as exemplified in Scheme 5 below:
For example, addition of x to fragment A in the presence of MgCl₂ and TMSCl produces alcohol xi (for a reference reporting a suitable protocol for anti-selective aldol coupling, see: Evans et al., J. Am. Chem. Soc., 2002, 124, 392). Protection of the resulting secondary hydroxyl group and reductive cleavage of the chiral auxiliary affords alcohol xii. Coupling of compound xii with the glutarimide side chain may be effected, for example, via a Horner-Wadsworth-Emmons reaction. For example, the Masamune-Roush variant of the Horner-Wadsworth-Emmons reaction may be used (see: Blanchette et al., Tet. Lett., 1984, 25, 2183). Thus, conversion of xii via an oxidation/nucleophilic addition/oxidation sequence gives β-ketophosphonate xiii. Treatment of the phosphonate with LiCl and DBU in the presence of glutarimide aldehyde xiv results in efficient formation of the desired enone xv.

In certain embodiments, formation of the macrolide ring is effected as shown in Scheme 6 below:
Scheme 6

For example, removal of the TES protecting group of enone \( \text{xv} \) yields seco-alcohol \( \text{xvi} \). A variety of methods for effecting acylation of \( \text{xvi} \) with dienoic acid may be utilized. For example, a modified Yamaguchi procedure may be used to give the metathesis precursor \( \text{xvii} \) (see, Inanaga et al., Bull. Chem. Soc. Jpn., 1979, 52, 1989; and Song et al., Org. Lett., 2002, 4, 647). A variety of methods for effecting ring-closure metathesis of \( \text{xvii} \) to the desired (\( E \))-isomer may be utilized. For example, subjecting tetrane \( \text{xvii} \) to ring-closure metathesis conditions using the second generation Grubbs catalyst gives the desired macrocyclic (\( E \))-isomer \( \text{xviii} \) in high yield (see, Scholl et al., Org. Lett., 1999, 1, 953).

Methods for converting the protected hydroxyl group (OPG) into a variety of functionalities are known in the art. The practitioner skilled in the relevant art will know how to select reagents and reaction conditions to effect transformation of the protected hydroxyl group (OPG) into a desired functionality FG. In certain embodiments, FG represents OH, NH\(_2\) or halogen (e.g., F).
[0219] In certain other embodiments, the conjugate ester group present in compound xviii (i.e., at C$_2$-C$_3$) may be reduced to the corresponding saturated ester xix. The practitioner skilled in the relevant art will know how to select reagents and reaction conditions to effect this transformation. For example, the Stryker copper hydride may be used (see, Mahoney et al., J. Am. Chem. Soc., 1988, 110, 291), as depicted in Scheme 7 below:

![Scheme 7](image)

[0220] In certain embodiments, in Schemes 5-7 above, -X-Y-Z- represents -CH=CH-(CH$_2$)$_v$- where v is an integer from 1-4. Thus, compound xv depicted in scheme 5 may have the following structure (xv$^3$):

![xv$^3$](image)

[0221] In certain embodiments, conjugate reduction of this intermediate may be effected using the stryker reagent, as shown in scheme 8 below:
Scheme 8

In certain other embodiments, where further functionalization at C$_{17}$ of the alkyl-glutarimide side chain of xv is desired, coupling of fragment xii with a glutarimide moiety may be accomplished as shown in Scheme 9 below:

Scheme 9

For example, ephedrine ester xx may be converted to the corresponding Weinreb amide, which is then transformed into the corresponding methyl ketone upon treatment with MeMgBr. Aldol reaction of ketone xxi with protected glutarimide aldehyde xxii yields the formation of the C$_{17}$-hydroxylated adduct xxiii. The practitioner skilled in the relevant art will know how to select reagents and
reaction conditions to effect transformation of this C-17 hydroxyl group into functionalities of interest (e.g., alkoxyl, arylxy, NH₂ or halogen (e.g., F)).

[0224] One of ordinary skill in the art will recognize that the ring closing metathesis coupling may be effected with fragments where at least one of R₁ and R₂ is not hydrogen, to introduce functionalization at C₅ and/or C₇, as shown in Scheme 10 below. In addition, metathesis reaction conditions may be adjusted so that the (Z)-isomer is predominantly formed, rather than the (E)-isomer.

Scheme 10

[0225] One of ordinary skill in the art will also recognize that the inventive methods for assembling the macrocyclic structure are not limited by the order in which the different fragments may be put together. Exemplary synthetic approaches were described in Schemes 1-10 above, whereby the inventive compounds are prepared by (i) nucleophilic addition of Q on fragment A, followed by (ii) ester bond formation between the A-Q adduct with a suitable dienoic acid and (iii) ring closing ring closure to give the desired macrocyclic scaffold. Other approaches may be used. For example, inventive compounds may be prepared by (i) nucleophilic addition of Q on fragment A, followed by (ii) cross-metathesis reaction of the A-Q adduct obtained in (i) with a suitable dienoic acid and (iii) macrolactonization (i.e., intramolecular ester bond formation) to give the desired macrocyclic scaffold (See Scheme 11).
Scheme 11

[0226] Alternatively, inventive compounds may be prepared by (i) nucleophilic addition of Q on fragment A, followed by (ii) cross-metathesis reaction of the A-Q adduct obtained in (i) with a suitable enone, (iii) acylation of the adduct obtained in (ii) with a suitable reagent and (iv) intramolecular Horner-Wadsworth-Emmons olefination to give the desired macrocyclic scaffold (See Scheme 12).

Scheme 12

[0227] In certain embodiments, the invention provides methods of preparing compounds where X₁ is NH. Schemes 1-12 above detail exemplary synthetic approaches for preparing inventive compounds where X₁ is O. A similar approach may be used to access compounds where X₁ is NH (i.e., macrolactams). For example, inventive compounds may be prepared by (i) nucleophilic addition of Q on fragment A, followed by (ii) conversion of the resulting alcohol to an amine, (iii)
amide bond formation between the A-Q adduct formed in (ii) with a suitable dienoic acid and (iv) ring closing metathesis to give the desired macro lactam scaffold (Scheme 13).

Scheme 13

[0228] In certain embodiments, inventive compounds may be prepared by (i) nucleophilic addition of Q on fragment A, followed by (ii) conversion of the resulting alcohol to the corresponding amine, (iii) cross-metathesis reaction of the A-Q adduct obtained in (ii) with a suitable dienoic acid and (iv) intramolecular amide bond formation to give the desired macro lactam scaffold (See Scheme 14).

Scheme 14

[0229] Alternatively, inventive compounds may be prepared by (i) nucleophilic addition of Q on fragment A, followed by (ii) conversion of the resulting alcohol to the corresponding amine, (iii) cross-metathesis reaction of the A-Q adduct obtained in (ii) with a suitable enone, (iv) acylation of the adduct obtained in (iii) with a
suitable reagent and (v) intramolecular Horner-Wadsworth-Emmons olefination to
give the desired macrocyclic scaffold (See Scheme 15).

\[ \text{Scheme 15} \]

[0230] Other approaches to prepare inventive compounds will be readily
apparent to the practitioner skilled in the relevant art.

[0231] Diversification:

[0232] It will also be appreciated that each of the components used in the
synthesis of Migrastatin analogues can be diversified either before synthesis or
alternatively after the construction of the macrocycle. As used herein, the term
"diversifying" or "diversify" means reacting an inventive compound (I) or any of the
precursor fragments (e.g., (A) etc.) as defined herein (or any classes or subclasses
thereof) at one or more reactive sites to modify a functional moiety or to add a
functional moiety (e.g., nucleophilic addition of a substrate). Described generally
herein are a variety of schemes to assist the reader in the synthesis of a variety of
analogues, either by diversification of the intermediate components or by
diversification of the macrocyclic structures as described herein, and classes and
subclasses thereof. It will also be appreciated that although many of the schemes
herein depict 14-membered macrocycles, the reactions described herein may also be
applied to other ring structures (for example to 12-, 13- and 15-membered ring
structures). It will be appreciated that a variety of diversification reactions can be
employed to generate novel analogues. As but a few examples, epoxidation and
aziridination can be conducted to generate epoxide and aziridine analogues of
compounds described herein. Additionally, addition across either double bond will generate additional diversity. In addition to diversification after macrocyclization, it will be understood that diversification can occur prior to macrocyclization (e.g., epoxidation, aziridination, reduction at a C_{2-3} and/or C_{12-13} double bond(s) could occur prior to metathesis ring-closure, or other means known in the art to effect macrocyclic ring closure, to describe just one example). For additional guidance available in the art, the practitioner is directed to “Advanced Organic Chemistry”, March, J. John Wiley & Sons, 2001, 5th ed., the entire contents of which are hereby incorporated by reference.

[0233] In certain embodiments, the present invention provides a method for preparing a Migrastatin analog having the structure:

![Chemical Structure](image)

said method comprising steps of:

a. reacting a fragment Q with a compound having the structure:

![Chemical Structure](image)

under suitable conditions to effect formation of an A-Q adduct having the structure:

![Chemical Structure](image)

b. reacting A-Q formed in step a with a dienoic acid having the structure:
under suitable conditions to effect formation of an ester having the structure:

and

c. subjecting the ester formed in step b to ring closing metathesis reaction

conditions to effect formation of the macrolide having the structure:

wherein $R_1$ and $R_2$ are each independently hydrogen, halogen, -CN, -S(O)$_2$,
$-\text{COR}^1A$, -CO$_2$R$^1A$, -NR$^1A$C(=O)R$^1B$, -NR$^1A$C(=O)OR$^1B$, -CONR$^1A$R$^1B$,
an aliphatic, hetearaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or
-WR$^1A$, wherein W is independently -O-, -S- or -NR$^1C$-, wherein each occurrence of
R$^1A$, R$^1B$ and R$^1C$ is independently hydrogen, or an aliphatic, hetearaliphatic,
alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or $R_1$ and $R_2$, taken together,
form an alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

$R_3$ is hydrogen, an aliphatic, hetearaliphatic, alicyclic, heteroalicyclic, aryl or
heteararyl moiety; or a prodrug moiety or an oxygen protecting group;

$R_4$ is , -OR$^4A$, -OC(=O)R$^4A$ or -NR$^4A$R$^4B$, wherein R$^4A$ and R$^4B$ are
independently hydrogen, an aliphatic, hetearaliphatic, alicyclic, heteroalicyclic, aryl
or heteararyl moiety; a prodrug moiety, a nitrogen protecting group or an oxygen
protecting group; or R$^4A$ and R$^4B$, taken together with the nitrogen atom to which
they are attached, form a heterocyclic or heteararyl moiety; or $R_4$, taken together
with the carbon atom to which it is attached forms a moiety having the structure:

\( R_5 \) is hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

\( R_6 \) is hydrogen, halogen, -CN, -S(O)\(_{1-2}\)\( R^{6A} \), -NO\(_2\), -COR\(^{6A}\), -CO\(_2\)R\(^{6A}\), -NR\(^{6A}\)C(=O)R\(^{6B}\), -NR\(^{6A}\)C(=O)OR\(^{6B}\), -CONR\(^{6A}\)R\(^{6B}\), an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR\(^{6A}\), wherein W is independently -O-, -S- or -NR\(^{6C}\), wherein each occurrence of R\(^{6A}\), R\(^{6B}\) and R\(^{6C}\) is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or \( R_6 \) and \( R_6 \) taken together with the carbon atoms to which they are attached, form an alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

\( R_8 \) and each occurrence of \( R_6 \) are independently hydrogen, halogen, -CN, -S(O)\(_{1-2}\)R\(^{1\text{al}}\), -NO\(_2\), -COR\(^{1\text{al}}\), -CO\(_2\)R\(^{1\text{al}}\), -NR\(^{1\text{al}}\)C(=O)R\(^{2\text{al}}\), -NR\(^{1\text{al}}\)C(=O)OR\(^{2\text{al}}\), -CONR\(^{1\text{al}}\)R\(^{2\text{al}}\), an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR\(^{1\text{al}}\), wherein W is independently -O-, -S- or -NR\(^{3\text{al}}\), wherein each occurrence of R\(^{1\text{al}}\), R\(^{2\text{al}}\) and R\(^{3\text{al}}\) is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or \( R_8 \) and the adjacent occurrence of \( R_6 \), taken together with the carbon atoms to which they are attached, form an alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

\( R_6 \) is hydrogen, halogen, -CN, -S(O)\(_{1-2}\)R\(^{6\text{al}}\), -NO\(_2\), -COR\(^{6\text{al}}\), -CO\(_2\)R\(^{6\text{al}}\), -NR\(^{6\text{al}}\)C(=O)R\(^{7\text{al}}\), -NR\(^{6\text{al}}\)C(=O)OR\(^{7\text{al}}\), -CONR\(^{6\text{al}}\)R\(^{7\text{al}}\); an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR\(^{6\text{al}}\), wherein W is independently -O-, -S- or -NR\(^{3\text{al}}\), wherein each occurrence of R\(^{6\text{al}}\), R\(^{7\text{al}}\) and R\(^{3\text{al}}\) is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or \( R_6 \) and \( R_6 \), taken together with the carbon atoms to which they are attached, form an alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

\( n \) is an integer from 1 to 5; and

\( Q \) is hydrogen, halogen, -CN, -S(O)\(_{1-2}\)R\(^{Q1}\), -NO\(_2\), -COR\(^{Q1}\), -CO\(_2\)R\(^{Q1}\), -NR\(^{Q1}\)C(=O)R\(^{Q2}\), -NR\(^{Q1}\)C(=O)OR\(^{Q2}\), -CONR\(^{Q1}\)R\(^{Q2}\); an aliphatic, heteroaliphatic,
alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR\textsuperscript{Q1}; wherein W is independently -O-, -S- or -NR\textsuperscript{Q3}, wherein each occurrence of R\textsuperscript{Q1}, R\textsuperscript{Q2} and R\textsuperscript{Q3} is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; and pharmaceutical acceptably acceptable derivatives thereof.

[0234] In certain embodiments, the method further comprises steps of diversifying the macrolide obtained in step c to form a Migrastatin analog with the desired functionalization.

[0235] In certain embodiments, the present invention provides a method for preparing a Migrastatin analog having the structure:

\[
\begin{align*}
\text{said method comprising steps of:} \\
\text{a. reacting a fragment Q with a compound having the structure:} \\
\text{under suitable conditions to effect formation of an A-Q adduct having the structure:} \\
\text{b. reacting A-Q formed in step a with a dienoic acid having the structure:}
\end{align*}
\]
under suitable conditions to effect formation of an olefin having the structure:

\[
\begin{align*}
\text{structure:} \\
\text{subjecting the olefin formed in step b to suitable conditions to effect formation of the macrolide having the structure:}
\end{align*}
\]

wherein \( R_1 \) and \( R_2 \) are each independently hydrogen, halogen, -CN, -S(O)\(_2\)R\(_{1A}\), -NO\(_2\), -COR\(_{1A}\), -CO\(_2\)R\(_{1A}\), -NR\(_{1A}\)C(=O)R\(_{1B}\), -NR\(_{1A}\)C(=O)OR\(_{1B}\), -CONR\(_{1A}\)R\(_{1B}\), an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR\(_{1A}\); wherein W is independently -O-, -S- or -NR\(_{1C}\)-, wherein each occurrence of R\(_{1A}\), R\(_{1B}\) and R\(_{1C}\) is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or R\(_1\) and R\(_2\), taken together with the carbon atoms to which they are attached, form an alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

\( R_3 \) is hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or a prodrug moiety or an oxygen protecting group;

\( R_4 \) is halogen, -OR\(_{4A}\), -OC(=O)R\(_{4A}\) or -NR\(_{4A}\)R\(_{4B}\); wherein R\(_{4A}\) and R\(_{4B}\) are independently hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl
or heteroaryl moiety; a prodrug moiety, a nitrogen protecting group or an oxygen protecting group; or \( R^4 A \) and \( R^4 B \), taken together with the nitrogen atom to which they are attached, form a heterocyclic or heteroaryl moiety; or \( R_4 \), taken together with the carbon atom to which it is attached forms a moiety having the structure:

\[
\begin{align*}
\text{R}_5 & \text{ is hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicylic, aryl or heteroaryl moiety; } \\
\text{R}_6 & \text{ is hydrogen, halogen, -CN, -S(O)_{1-2}R^6A, -NO}_2, -\text{COR}^6A, -\text{CO}_2\text{R}^6A, -\text{NR}^6A\text{C(=O)R}^6B, -\text{NR}^6A\text{C(=O)OR}^6B, -\text{CONR}^6A\text{R}^6B, \text{ an aliphatic, heteroaliphatic, alicyclic, heteroalicylic, aryl or heteroaryl moiety, or } -\text{WR}^6A; \text{ wherein W is independently } -\text{O}, -\text{S- or -NR}^6C-, \text{ wherein each occurrence of } R^6A, R^6B \text{ and } R^6C \text{ is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicylic, aryl or heteroaryl moiety; or } R_6 \text{ and } R_{c}; \text{ taken together with the carbon atoms to which they are attached, form an alicyclic, heteroalicylic, aryl or heteroaryl moiety; } \\
\text{R}_4 \text{ and each occurrence of } R_b \text{ are independently hydrogen, halogen, -CN, -S(O)_{1-2}R^b, -NO}_2, -\text{COR}^b, -\text{CO}_2\text{R}^b, -\text{NR}^bA\text{C(=O)R}^b, -\text{NR}^bA\text{C(=O)OR}^b, -\text{CONR}^bA\text{R}^b, \text{ an aliphatic, heteroaliphatic, alicyclic, heteroalicylic, aryl or heteroaryl moiety, or } -\text{WR}^bA; \text{ wherein W is independently } -\text{O}, -\text{S- or -NR}^bA-, \text{ wherein each occurrence of } R^b, R^bA \text{ and } R^bC \text{ is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicylic, aryl or heteroaryl moiety; or } R_4 \text{ and the adjacent occurrence of } R_b; \text{ taken together with the carbon atoms to which they are attached, form an alicyclic, heteroalicylic, aryl or heteroaryl moiety; } \\
\text{R}_c \text{ is hydrogen, halogen, -CN, -S(O)_{1-2}R^c, -NO}_2, -\text{COR}^c, -\text{CO}_2\text{R}^c, -\text{NR}^cA\text{C(=O)R}^c, -\text{NR}^cA\text{C(=O)OR}^c, -\text{CONR}^cA\text{R}^c; \text{ an aliphatic, heteroaliphatic, alicyclic, heteroalicylic, aryl or heteroaryl moiety, or } -\text{WR}^cA; \text{ wherein W is independently } -\text{O}, -\text{S- or -NR}^cA-, \text{ wherein each occurrence of } R^c, R^cA \text{ and } R^cC \text{ is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicylic, aryl or heteroaryl moiety; or } R_c \text{ and } R_b; \text{ taken together with the carbon atoms to which they are attached, form an alicyclic, heteroalicylic, aryl or heteroaryl moiety; } \end{align*}
\]
n is an integer from 1 to 5; and

Q is hydrogen, halogen, -CN, -S(O)_{1-2}R^{Q1}, -NO_{2}, -COR^{Q1}, -CO_{2}R^{Q1}, -NR^{Q1}C(=O)R^{Q2}, -NR^{Q1}C(=O)OR^{Q2}, -CONR^{Q1}R^{Q2}, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR^{Q1}; wherein W is independently -O-, -S- or -NR^{Q3}, wherein each occurrence of R^{Q1}, R^{Q2} and R^{Q3} is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; and

pharmaceutically acceptable derivatives thereof.

[0236] In certain embodiments, the method further comprises steps of diversifying the macrolide obtained in step c to form a Migrastatin analog with the desired functionalization.

[0237] In certain embodiments, the present invention provides a method for preparing a Migrastatin analog having the structure:

![Diagram of molecular structure]

said method comprising steps of:

a. reacting a fragment Q with a compound having the structure:

![Diagram of compound structure]

under suitable conditions to effect formation of an A-Q adduct having the structure:
b. reacting A-Q formed in step a with n enone having the structure:

under suitable conditions to effect formation of an olefin having the structure:

c. acylating the olefin formed in step b with a suitable reagent under suitable conditions to effect formation of an intermediate having the structure:

wherein G is a group suitable to effect ring closure; and

d. subjecting the intermediate formed in step c to suitable conditions to effect formation of the macrolide having the structure:
wherein $R_1$ and $R_2$ are each independently hydrogen, halogen, -CN, -S(O)$_2$, $\cdot$-NO$_2$, -COR$^A$, -CO$_2$R$^A$, -NR$^A$C(=O)R$^B$, -NR$^A$C(=O)OR$^B$, -CONR$^A$R$^B$, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR$^A$; wherein W is independently -O-, -S- or -NR$^C$-, wherein each occurrence of $R^A$, $R^B$ and $R^C$ is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or $R_1$ and $R_2$, taken together with the carbon atoms to which they are attached, form an alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

$R_3$ is hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or a prodrug moiety or an oxygen protecting group;

$R_4$ is halogen, -OR$^A$, -OC(=O)R$^A$ or -NR$^A$R$^B$; wherein R$^A$ and R$^B$ are independently hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; a prodrug moiety, a nitrogen protecting group or an oxygen protecting group; or R$^A$ and R$^B$, taken together with the nitrogen atom to which they are attached, form a heterocyclic or heteroaryl moiety;

$R_5$ is hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

$R_6$ is hydrogen, halogen, -CN, -S(O)$_2$R$^A$, -NO$_2$, -COR$^A$, -CO$_2$R$^A$, -NR$^A$C(=O)R$^B$, -NR$^A$C(=O)OR$^B$, -CONR$^A$R$^B$, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR$^A$; wherein W is independently -O-, -S- or -NR$^C$-, wherein each occurrence of R$^A$, R$^B$ and R$^C$ is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or $R_6$ and $R_\circ$, taken together with the carbon atoms to which they are attached, form an alicyclic, heteroalicyclic, aryl or heteroaryl moiety;
\( R_a \) and each occurrence of \( R_b \) are independently hydrogen, halogen, -CN, -S(O)\(_{1-2}\)R\(^{a1}\), -NO\(_2\), -COR\(^{a1}\), -CO\(_2\)R\(^{a1}\), -NR\(^{a1}\)C(=O)R\(^{a2}\), -NR\(^{a1}\)C(=O)OR\(^{a2}\), -CONR\(^{a1}\)R\(^{a2}\), an aliphatic, heteroaliphatic, alicyclic, heteroaiclicyclic, aryl or heteroaryl moiety, or -WR\(^{a1}\), wherein \( W \) is independently -O-, -S- or -NR\(^{a2}\), wherein each occurrence of \( R^{a1}, R^{a2} \) and \( R^{a3} \) is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroaiclicyclic, aryl or heteroaryl moiety; or \( R_a \) and the adjacent occurrence of \( R_b \), taken together with the carbon atoms to which they are attached, form an alicyclic, heteroaiclicyclic, aryl or heteroaryl moiety;

\( R_c \) is hydrogen, halogen, -CN, -S(O)\(_{1-2}\)R\(^{c1}\), -NO\(_2\), -COR\(^{c1}\), -CO\(_2\)R\(^{c1}\), -NR\(^{c1}\)C(=O)R\(^{c2}\), -NR\(^{c1}\)C(=O)OR\(^{c2}\), -CONR\(^{c1}\)R\(^{c2}\); an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR\(^{c1}\), wherein \( W \) is independently -O-, -S- or -NR\(^{c2}\), wherein each occurrence of \( R^{c1}, R^{c2} \) and \( R^{c3} \) is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroaiclicyclic, aryl or heteroaryl moiety; or \( R_c \) and \( R_h \), taken together with the carbon atoms to which they are attached, form an alicyclic, heteroaiclicyclic, aryl or heteroaryl moiety;

\( n \) is an integer from 1 to 5; and

\( Q \) is hydrogen, halogen, -CN, -S(O)\(_{1-2}\)R\(^{q1}\), -NO\(_2\), -COR\(^{q1}\), -CO\(_2\)R\(^{q1}\), -NR\(^{q1}\)C(=O)R\(^{q2}\), -NR\(^{q1}\)C(=O)OR\(^{q2}\), -CONR\(^{q1}\)R\(^{q2}\); an aliphatic, heteroaliphatic, alicyclic, heteroaiclicyclic, aryl or heteroaryl moiety, or -WR\(^{q1}\); wherein \( W \) is independently -O-, -S- or -NR\(^{q2}\), wherein each occurrence of \( R^{q1}, R^{q2} \) and \( R^{q3} \) is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroaiclicyclic, aryl or heteroaryl moiety; and

pharmaceutically acceptable derivatives thereof.

[0238] In certain embodiments, \( G \) is \(-P(=O)R^2 \) and step \( d \) involves subjecting the intermediate formed in step \( c \) to Horner-Wadsworth-Emmons reaction conditions to effect formation of the macrolide. In certain other embodiments, the method further comprises steps of diversifying the macrolide obtained in step \( d \) to form a Migrastatin analog with the desired functionalization.

[0239] In certain embodiments, the present invention provides a method for preparing a Migrastatin analog having the structure:
said method comprising steps of:

a. reacting a fragment Q with a compound having the structure:

under suitable conditions to effect formation of an alcohol adduct having the structure:

b. converting the alcohol adduct formed in step a under suitable conditions to form an amine having the structure:

c. reacting the amine formed in step b with a dienoic acid having the structure:
under suitable conditions to effect formation of an amide having the structure:

\[
\text{structure:}
\]

; and

d. subjecting the amide formed in step c to ring closing metathesis reaction conditions to effect formation of the macrolide having the structure:

\[
\text{structure:}
\]

wherein \( R_1 \) and \( R_2 \) are each independently hydrogen, halogen, \(-\text{CN}, -\text{S(O)}_2\text{R}^\text{A}, -\text{NO}_2, -\text{COR}^\text{A}, -\text{CO}_2\text{R}^\text{A}, -\text{NR}_2^\text{A} \text{C} (=\text{O})\text{R}^\text{B}, -\text{NR}_2^\text{A} \text{C} (=\text{O})\text{OR}^\text{B}, -\text{CONR}_2^\text{A} \text{R}^\text{B}, \)
an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or \(-\text{WR}^\text{A} \); wherein \( W \) is independently \(-\text{O}, -\text{S} \) or \(-\text{NR}_2^\text{C} \), wherein each occurrence of \( R_1^\text{A}, R_1^\text{B} \) and \( R_1^\text{C} \) is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or \( R_1 \) and \( R_2 \), taken together with the carbon atoms to which they are attached, form an alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

\( R_3 \) is hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or a prodrug moiety or an oxygen protecting group;

\( R_4 \) is halogen, \(-\text{OR}_2^\text{A}, -\text{OC} (=\text{O})\text{R}_2^\text{A} \) or \(-\text{NR}_2^\text{A} \text{R}^\text{B} \); wherein \( R_2^\text{A} \) and \( R_2^\text{B} \) are independently hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; a prodrug moiety, a nitrogen protecting group or an oxygen protecting group; or \( R_2^\text{A} \) and \( R_2^\text{B} \), taken together with the nitrogen atom to which they are attached, form a heterocyclic or heteroaryl moiety;
\( R_5 \) is hydrogen, an aliphatic, heteroaliphatic, acyclic, heteroalicyclic, aryl or heteroaryl moiety;

\( Q \) is hydrogen, halogen, -CN, -S(O)\(_{1-2} R^{Q1} \), -NO\(_2\), -COR\(^{Q1}\), -CO\(_2\)R\(^{Q1}\), -NR\(^{Q1}\)C(=O)R\(^{Q2}\), -NR\(^{Q1}\)C(=O)OR\(^{Q2}\), -CONR\(^{Q1}\)R\(^{Q2}\) an aliphatic, heteroaliphatic, acyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR\(^{Q1}\); wherein W is independently -O-, -S- or -NR\(^{Q3}\), wherein each occurrence of R\(^{Q1}\), R\(^{Q2}\) and R\(^{Q3}\) is
independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; and
pharmaceutically acceptable derivatives thereof.

[0240] In certain embodiments, the method further comprises steps of diversifying the macrolide obtained in step d to form a macrolactam (i.e., Migrastatin analog) with the desired functionalization.

[0241] In certain embodiments, the present invention provides a method for preparing a Migrastatin analog having the structure:

\[
\begin{align*}
\text{Structure Image}
\end{align*}
\]

said method comprising steps of:

b. reacting a fragment Q with a compound having the structure:

\[
\begin{align*}
\text{Structure Image}
\end{align*}
\]

under suitable conditions to effect formation of an alcohol adduct having the structure:

\[
\begin{align*}
\text{Structure Image}
\end{align*}
\]

b. converting the alcohol adduct formed in step a under suitable conditions to form an amine having the structure:
d. reacting the amine formed in step b with a dienoic acid having the structure:

under suitable conditions to effect formation of an olefin having the structure:

; and

e. subjecting the olefin formed in step c to suitable conditions to effect formation of the macrolactam having the structure:

wherein R₁ and R₂ are each independently hydrogen, halogen, -CN, -S(O)₂,
R₁₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋╴

with the carbon atoms to which they are attached, form an alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

R₃ is hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or a prodrug moiety or an oxygen protecting group;

R₄ is halogen, -OR⁴A, -OC(=O)R⁴A or -NR⁴AR⁴B, wherein R⁴A and R⁴B are independently hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; a prodrug moiety, a nitrogen protecting group or an oxygen protecting group; or R⁴A and R⁴B, taken together with the nitrogen atom to which they are attached, form a heterocyclic or heteroaryl moiety;

R₅ is hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

R₆ is hydrogen, halogen, -CN, -S(O)ₓ₂R⁶A, -NO₂, -COR⁶A, -CO₂R⁶A, -NR⁶A(C(=O))R⁶B, -NR⁶A(C(=O)OR⁶B, -CONR⁶AR⁶B, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR⁶A, wherein W is independently -O-, -S- or -NR⁶C-, wherein each occurrence of R⁶A, R⁶B and R⁶C is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or R₆ and R₇, taken together with the carbon atoms to which they are attached, form an alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

R₇ and each occurrence of R₈ are independently hydrogen, halogen, -CN, -S(O)ₓ₂R₈A, -NO₂, -COR₈A, -CO₂R₈A, -NR₈A(C(=O))R₈B, -NR₈A(C(=O)OR₈B, -CONR₈AR₈B, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR₈A, wherein W is independently -O-, -S- or -NR₈C-, wherein each occurrence of R₈A, R₈B and R₈C is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or R₈ and the adjacent occurrence of R₉, taken together with the carbon atoms to which they are attached, form an alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

R₉ is hydrogen, halogen, -CN, -S(O)ₓ₂R₉A, -NO₂, -COR₉A, -CO₂R₉A, -NR₉A(C(=O))R₉B, -NR₉A(C(=O)OR₉B, -CONR₉AR₉B; an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR₉A, wherein W is independently -O-, -S- or -NR₉C-, wherein each occurrence of R₉A, R₉B and R₉C is
independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or \( R_c \) and \( R_d \), taken together with the carbon atoms to which they are attached, form an alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

\( n \) is an integer from 1 to 5;

\( Q \) is hydrogen, halogen, \(-\text{CN}\), \(-\text{S(O)}_2\text{R}^{Q_1}\), \(-\text{NO}_2\), \(-\text{COR}^{Q_1}\), \(-\text{CO}_2\text{R}^{Q_1}\), \(-\text{NR}^{Q_1}\text{C}(=\text{O})\text{R}^{Q_2}\), \(-\text{NR}^{Q_1}\text{C}(=\text{O})\text{OR}^{Q_2}\), \(-\text{CONR}^{Q_1}\text{R}^{Q_2}\), an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or \(-\text{WR}^{Q_1}\); wherein \( W \) is independently \(-\text{O}-\), \(-\text{S}-\) or \(-\text{NR}^{Q_3}-\), wherein each occurrence of \( R^{Q_1} \), \( R^{Q_2} \) and \( R^{Q_3} \) is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; and

pharmaceutically acceptable derivatives thereof.

[0242] In certain embodiments, the method further comprises steps of diversifying the macrolide obtained in step e to form a macrolactam (i.e., Migrastatin analog) with the desired functionalization.

[0243] In certain embodiments, the present invention provides a method for preparing a Migrastatin analog having the structure:

![Migrastatin analog structure](image-url)

said method comprising steps of:

a. reacting a fragment \( Q \) with a compound having the structure:

![Fragment Q](image-url)

under suitable conditions to effect formation of an A-Q adduct having the structure:
b. converting the alcohol adduct formed in step a under suitable conditions to form an amine having the structure:

![Amine Structure](image1)

c. reacting the amine formed in step b with an enone having the structure:

![Enone Structure](image2)

under suitable conditions to effect formation of an olefin having the structure:

![Olefin Structure](image3)

d. acylating the olefin formed in step c with a suitable reagent under suitable conditions to effect formation of an intermediate having the structure:
wherein \( G \) is a group suitable to effect ring closure; and

subjecting the intermediate formed in step \( d \) to suitable conditions to effect formation of the macrolide having the structure:

\[
\begin{align*}
\text{wherein } R_1 \text{ and } R_2 \text{ are each independently hydrogen, halogen, } & -\text{CN}, -\text{S(O)\( _2 \)}, \\
& -\text{NO}_2, -\text{COR\( _A \)}, -\text{CO}_2\text{R\( _A \)}, -\text{NR\( _A \text{C(=O)}R\( _B \)),} \\
& -\text{NR\( _A \text{C(=O)OR\( _B \)),}} -\text{CONR\( _A \text{R\( _B \)),} \\
& \text{an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or } -\text{WR\( _A \))}, \\
& \text{wherein } W \text{ is independently } -\text{O}, -\text{S, or } -\text{NR\( _C \)),} \\

& \text{alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or } R_1 \text{ and } R_2, \text{ taken together} \\
& \text{with the carbon atoms to which they are attached, form an alicyclic, heteroalicyclic,} \\
& \text{aryl or heteroaryl moiety;}
\end{align*}
\]

\( R_3 \) is hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or a prodrug moiety or an oxygen protecting group;

\( R_4 \) is halogen, -OR\( ^A \), -OC(=O)R\( ^A \) or -NR\( ^A \text{R\( ^B \))}, \text{ wherein } R\( ^A \) \text{ and } R\( ^B \) \text{ are} \\
\text{independently hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl} \\
or heteroaryl moiety; a prodrug moiety, a nitrogen protecting group or an oxygen protecting group; \text{ or } R\( ^A \) \text{ and } R\( ^B \), \text{ taken together with the nitrogen atom to which} \\
\text{they are attached, form a heterocyclic or heteroaryl moiety;}

$R_5$ is hydrogen, an aliphatic, heteroaliphatic, acyclic, heteroalicyclic, aryl or heteroaryl moiety;

$R_6$ is hydrogen, halogen, -CN, -S(O)$_{1-2}$R$^{5A}$, -NO$_2$, -COR$^{6A}$, -CO$_2$R$^{6A}$, -NR$^{6A}$C(=O)R$^{6B}$, -NR$^{6A}$C(=O)OR$^{6B}$, -CONR$^{6A}$R$^{6B}$, an aliphatic, heteroaliphatic, acyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR$^{6A}$, wherein W is independently -O-, -S- or -NR$^{6C}$-, wherein each occurrence of R$^{5A}$, R$^{6B}$ and R$^{6C}$ is independently hydrogen, or an aliphatic, heteroaliphatic, acyclic, heteroalicyclic, aryl or heteroaryl moiety; or $R_6$ and $R_6$, taken together with the carbon atoms to which they are attached, form an acyclic, heteroalicyclic, aryl or heteroaryl moiety;

$R_8$ and each occurrence of $R_8$ are independently hydrogen, halogen, -CN, -S(O)$_{1-2}$R$^{8A}$, -NO$_2$, -COR$^{8A}$, -CO$_2$R$^{8A}$, -NR$^{8A}$C(=O)R$^{8B}$, -NR$^{8A}$C(=O)OR$^{8B}$, -CONR$^{8A}$R$^{8B}$, an aliphatic, heteroaliphatic, acyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR$^{8A}$; wherein W is independently -O-, -S- or -NR$^{8A}$-, wherein each occurrence of R$^{8A}$, R$^{8B}$ and R$^{8C}$ is independently hydrogen, or an aliphatic, heteroaliphatic, acyclic, heteroalicyclic, aryl or heteroaryl moiety; or $R_8$ and the adjacent occurrence of $R_8$, taken together with the carbon atoms to which they are attached, form an acyclic, heteroalicyclic, aryl or heteroaryl moiety;

$R_9$ is hydrogen, halogen, -CN, -S(O)$_{1-2}$R$^{9A}$, -NO$_2$, -COR$^{9A}$, -CO$_2$R$^{9A}$, -NR$^{9A}$C(=O)R$^{9B}$, -NR$^{9A}$C(=O)OR$^{9B}$, -CONR$^{9A}$R$^{9B}$, an aliphatic, heteroaliphatic, acyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR$^{9A}$; wherein W is independently -O-, -S- or -NR$^{9A}$-, wherein each occurrence of R$^{9A}$, R$^{9B}$ and R$^{9C}$ is independently hydrogen, or an aliphatic, heteroaliphatic, acyclic, heteroalicyclic, aryl or heteroaryl moiety; or $R_9$ and $R_9$, taken together with the carbon atoms to which they are attached, form an acyclic, heteroalicyclic, aryl or heteroaryl moiety;

$R_9$ is an integer from 1 to 5; and

Q is hydrogen, halogen, -CN, -S(O)$_{1-2}$R$^{Q_1}$, -NO$_2$, -COR$^{Q_1}$, -CO$_2$R$^{Q_1}$, -NR$^{Q_1}$C(=O)R$^{Q_2}$, -NR$^{Q_1}$C(=O)OR$^{Q_2}$, -CONR$^{Q_1}$R$^{Q_2}$, an aliphatic, heteroaliphatic, acyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR$^{Q_1}$; wherein W is independently -O-, -S- or -NR$^{Q_3}$-, wherein each occurrence of R$^{Q_1}$, R$^{Q_2}$ and R$^{Q_3}$ is
independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; and
pharmaceutically acceptable derivatives thereof.

[0245] In certain embodiments, G is \(-P(=O)R^\prime_2\) and step e involves subjecting the intermediate formed in step d to Horner-Wadsworth-Emmons reaction conditions to effect formation of the macrolide. In certain other embodiments, the method further comprises steps of diversifying the macrolide obtained in step e to form a Miglitolan analog with the desired functionalization.

[0246] 3) Pharmaceutical Compositions

In another aspect of the present invention, pharmaceutical compositions are provided, which comprise any one of the compounds described herein (or a prodrug, pharmaceutically acceptable salt or other pharmaceutically acceptable derivative thereof), and optionally comprise a pharmaceutically acceptable carrier, adjuvant or vehicle. In certain other embodiments, the compositions of the invention are useful for the treatment of cancer and disorders associated with metastasis and/or angiogenesis. In certain embodiments, the inventive compositions optionally further comprise one or more additional therapeutic agents. In certain other embodiments, the additional therapeutic agent is a cytotoxic agent, as discussed in more detail herein. In certain other embodiments, the additional therapeutic agent is an anticancer agent. In certain embodiments, the anticancer agent is an epothilone, taxol, radicicol or TMC-95A/B. In certain embodiments, the epothilone is 12,13-desoxyepothilone B, (E)-9,10-dehydro-12,13-desoxyEpoB and 26-CF3-(E)-9,10-dehydro-12,13-desoxyEpoB. Alternatively, a compound of this invention may be administered to a patient in need thereof in combination with the administration of one or more other therapeutic agents. For example, additional therapeutic agents for conjoint administration or inclusion in a pharmaceutical composition with a compound of this invention may be an antiangiogenesis agent or anticancer agent approved for the treatment of cancer, as discussed in more detail herein, or it may be any one of a number of agents undergoing approval in the Food and Drug Administration that ultimately obtain approval for the treatment of cancer.
As described above, the pharmaceutical compositions of the present invention additionally comprise a pharmaceutically acceptable carrier, adjuvant or vehicle, which, as used herein, includes any and all solvents, diluents, or other liquid vehicle, dispersion or suspension aids, surface active agents, isotonic agents, thickening or emulsifying agents, preservatives, solid binders, lubricants and the like, as suited to the particular dosage form desired. Remington’s Pharmaceutical Sciences, Sixteenth Edition, E. W. Martin (Mack Publishing Co., Easton, Pa., 1980) discloses various carriers used in formulating pharmaceutical compositions and known techniques for the preparation thereof. Except insofar as any conventional carrier medium is incompatible with the compounds of the invention, such as by producing any undesirable biological effect or otherwise interacting in a deleterious manner with any other component(s) of the pharmaceutical composition, its use is contemplated to be within the scope of this invention. Some examples of materials which can serve as pharmaceutically acceptable carriers include, but are not limited to, sugars such as lactose, glucose and sucrose; starches such as corn starch and potato starch; cellulose and its derivatives such as sodium carboxymethyl cellulose, ethyl cellulose and cellulose acetate; powdered tragacanth; malt; gelatine; talc; excipients such as cocoa butter and suppository waxes; oils such as peanut oil, cottonseed oil; safflower oil, sesame oil; olive oil; corn oil and soybean oil; glycols; such as propylene glycol; esters such as ethyl oleate and ethyl laurate; agar; buffering agents such as magnesium hydroxide and aluminum hydroxide; alginic acid; pyrogenfree water; isotonic saline; Ringer’s solution; ethyl alcohol, and phosphate buffer solutions, as well as other non-toxic compatible lubricants such as sodium lauryl sulfate and magnesium stearate, as well as coloring agents, releasing agents, coating agents, sweetening, flavoring and perfuming agents, preservatives and antioxidants can also be present in the composition, according to the judgment of the formulator.

Liquid dosage forms for oral administration include, but are not limited to, pharmaceutically acceptable emulsions, microemulsions, solutions, suspensions, syrups and elixirs. In addition to the active compounds, the liquid dosage forms may contain inert diluents commonly used in the art such as, for example, water or
other solvents, solubilizing agents and emulsifiers such as ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butylene glycol, dimethylformamide, oils (in particular, cottonseed, groundnut, corn, germ, olive, castor, and sesame oils), glycerol, tetrahydrofurfuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan, and mixtures thereof. Besides inert diluents, the oral compositions can also include adjuvants such as wetting agents, emulsifying and suspending agents, sweetening, flavoring, and perfuming agents.

[0249] Injectable preparations, for example, sterile injectable aqueous or oleaginous suspensions may be formulated according to the known art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution, suspension or emulsion in a nontoxic parenterally acceptable diluent or solvent, for example, as a solution in 1,3-butanol. Among the acceptable vehicles and solvents that may be employed are water, Ringer’s solution, U.S.P. and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil can be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid are used in the preparation of injectables.

[0250] The injectable formulations can be sterilized, for example, by filtration through a bacterial-retaining filter, or by incorporating sterilizing agents in the form of sterile solid compositions which can be dissolved or dispersed in sterile water or other sterile injectable medium prior to use.

[0251] In order to prolong the effect of a drug, it is often desirable to slow the absorption of the drug from subcutaneous or intramuscular injection. This may be accomplished by the use of a liquid suspension or crystalline or amorphous material with poor water solubility. The rate of absorption of the drug then depends upon its rate of dissolution that, in turn, may depend upon crystal size and crystalline form. Alternatively, delayed absorption of a parenterally administered drug form is accomplished by dissolving or suspending the drug in an oil vehicle. Injectable depot forms are made by forming microencapsule matrices of the drug in
biodegradable polymers such as polylactide-polyglycolide. Depending upon the ratio of drug to polymer and the nature of the particular polymer employed, the rate of drug release can be controlled. Examples of other biodegradable polymers include (poly(orthoesters) and poly(anhydrides). Depot injectable formulations are also prepared by entrapping the drug in liposomes or microemulsions, which are compatible with body tissues.

[0252] Compositions for rectal or vaginal administration are preferably suppositories which can be prepared by mixing the compounds of this invention with suitable non-irritating excipients or carriers such as cocoa butter, polyethylene glycol or a suppository wax which are solid at ambient temperature but liquid at body temperature and therefore melt in the rectum or vaginal cavity and release the active compound.

[0253] Solid dosage forms for oral administration include capsules, tablets, pills, powders, and granules. In such solid dosage forms, the active compound is mixed with at least one inert, pharmaceutically acceptable excipient or carrier such as sodium citrate or dicalcium phosphate and/or a) fillers or extenders such as starches, lactose, sucrose, glucose, mannitol, and silicic acid, b) binders such as, for example, carboxymethylcellulose, alginates, gelatin, polyvinylpyrrolidinone, sucrose, and acacia, c) humectants such as glycerol, d) disintegrating agents such as agar–agar, calcium carbonate, potato or tapioca starch, alginic acid, certain silicates, and sodium carbonate, e) solution retarding agents such as paraffin, f) absorption accelerators such as quaternary ammonium compounds, g) wetting agents such as, for example, cetyl alcohol and glycerol monostearate, h) absorbents such as kaolin and bentonite clay, and i) lubricants such as talc, calcium stearate, magnesium stearate, solid polyethylene glycols, sodium lauryl sulfate, and mixtures thereof. In the case of capsules, tablets and pills, the dosage form may also comprise buffering agents.

[0254] Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using such excipients as lactose or milk sugar as well as high molecular weight polyethylene glycols and the like. The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings
and shells such as enteric coatings and other coatings well known in the pharmaceutical formulating art. They may optionally contain opacifying agents and can also be of a composition that they release the active ingredient(s) only, or preferentially, in a certain part of the intestinal tract, optionally, in a delayed manner. Examples of embedding compositions that can be used include polymeric substances and waxes. Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using such excipients as lactose or milk sugar as well as high molecular weight polyethylene glycols and the like.

[0255] The active compounds can also be in microencapsulated form with one or more excipients as noted above. The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells such as enteric coatings, release controlling coatings and other coatings well known in the pharmaceutical formulating art. In such solid dosage forms the active compound may be admixed with at least one inert diluent such as sucrose, lactose and starch. Such dosage forms may also comprise, as in normal practice, additional substances other than inert diluents, e.g., tableting lubricants and other tableting aids such as magnesium stearate and microcrystalline cellulose. In the case of capsules, tablets and pills, the dosage forms may also comprise buffering agents. They may optionally contain opacifying agents and can also be of a composition that they release the active ingredient(s) only, or preferentially, in a certain part of the intestinal tract, optionally, in a delayed manner. Examples of embedding compositions, which can be used, include polymeric substances and waxes.

[0256] The present invention encompasses pharmaceutically acceptable topical formulations of inventive compounds. The term "pharmaceutically acceptable topical formulation", as used herein, means any formulation which is pharmaceutically acceptable for intradermal administration of a compound of the invention by application of the formulation to the epidermis. In certain embodiments of the invention, the topical formulation comprises a carrier system. Pharmaceutically effective carriers include, but are not limited to, solvents (e.g., alcohols, poly alcohols, water), creams, lotions, ointments, oils, plasters, liposomes, powders, emulsions, microemulsions, and buffered solutions (e.g., hypotonic or
buffered saline) or any other carrier known in the art for topically administering pharmaceuticals. A more complete listing of art-known carriers is provided by reference texts that are standard in the art, for example, Remington's Pharmaceutical Sciences, 16th Edition, 1980 and 17th Edition, 1985, both published by Mack Publishing Company, Easton, Pa., the disclosures of which are incorporated herein by reference in their entireties. In certain other embodiments, the topical formulations of the invention may comprise excipients. Any pharmaceutically acceptable excipient known in the art may be used to prepare the inventive pharmaceutically acceptable topical formulations. Examples of excipients that may be included in the topical formulations of the invention include, but are not limited to, preservatives, antioxidants, moisturizers, emollients, buffering agents, solubilizing agents, other penetration agents, skin protectants, surfactants, and propellants, and/or additional therapeutic agents used in combination to the inventive compound. Suitable preservatives include, but are not limited to, alcohols, quaternary amines, organic acids, parabens, and phenols. Suitable antioxidants include, but are not limited to, ascorbic acid and its esters, sodium bisulfite, butylated hydroxytoluene, butylated hydroxyanisole, tocopherols, and chelating agents like EDTA and citric acid. Suitable moisturizers include, but are not limited to, glycerine, sorbitol, polyethylene glycols, urea, and propylene glycol. Suitable buffering agents for use with the invention include, but are not limited to, citric, hydrochloric, and lactic acid buffers. Suitable solubilizing agents include, but are not limited to, quaternary ammonium chlorides, cyclodextrins, benzyl benzoate, lecithin, and polysorbates. Suitable skin protectants that can be used in the topical formulations of the invention include, but are not limited to, vitamin E oil, allatoin, dimethicone, glycerin, petrolatum, and zinc oxide.

[0257] In certain embodiments, the pharmaceutically acceptable topical formulations of the invention comprise at least a compound of the invention and a penetration enhancing agent. The choice of topical formulation will depend on several factors, including the condition to be treated, the physicochemical characteristics of the inventive compound and other excipients present, their stability in the formulation, available manufacturing equipment, and costs constraints. As
used herein the term "penetration enhancing agent" means an agent capable of transporting a pharmacologically active compound through the stratum corneum and into the epidermis or dermis, preferably, with little or no systemic absorption. A wide variety of compounds have been evaluated as to their effectiveness in enhancing the rate of penetration of drugs through the skin. See, for example, Percutaneous Penetration Enhancers, Maibach H. I. and Smith H. E. (eds.), CRC Press, Inc., Boca Raton, Fla. (1995), which surveys the use and testing of various skin penetration enhancers, and Buyuktimkin et al., Chemical Means of Transdermal Drug Permeation Enhancement in Transdermal and Topical Drug Delivery Systems, Gosh T. K., Pfister W. R., Yum S. I. (Eds.), Interpharm Press Inc., Buffalo Grove, Ill. (1997). In certain exemplary embodiments, penetration agents for use with the invention include, but are not limited to, triglycerides (e.g., soybean oil), aloe compositions (e.g., aloe-vera gel), ethyl alcohol, isopropyl alcohol, octylphenolpolyethylene glycol, oleic acid, polyethylene glycol 400, propylene glycol, N-decylmethylsulfoxide, fatty acid esters (e.g., isopropyl myristate, methyl laurate, glycerol monooleate, and propylene glycol monooleate) and N-methyl pyrrolidone.

[0258] In certain embodiments, the compositions may be in the form of ointments, pastes, creams, lotions, gels, powders, solutions, sprays, inhalants or patches. In certain exemplary embodiments, formulations of the compositions according to the invention are creams, which may further contain saturated or unsaturated fatty acids such as stearic acid, palmitic acid, oleic acid, palmito-oleic acid, cetyl or oleyl alcohols, stearic acid being particularly preferred. Creams of the invention may also contain a non-ionic surfactant, for example, polyoxy-40-stearate. In certain embodiments, the active component is admixed under sterile conditions with a pharmaceutically acceptable carrier, adjuvant or vehicle and any needed preservatives or buffers as may be required. Ophthalmic formulation, ear drops, and eye drops are also contemplated as being within the scope of this invention. Additionally, the present invention contemplates the use of transdermal patches, which have the added advantage of providing controlled delivery of a compound to the body. Such dosage forms are made by dissolving or dispensing the compound in
the proper medium. As discussed above, penetration enhancing agents can also be used to increase the flux of the compound across the skin. The rate can be controlled by either providing a rate controlling membrane or by dispersing the compound in a polymer matrix or gel.

[0259] It will also be appreciated that the compounds and pharmaceutical compositions of the present invention can be formulated and employed in combination therapies, that is, the compounds and pharmaceutical compositions can be formulated with or administered concurrently with, prior to, or subsequent to, one or more other desired therapeutics or medical procedures. The particular combination of therapies (therapeutics or procedures) to employ in a combination regimen will take into account compatibility of the desired therapeutics and/or procedures and the desired therapeutic effect to be achieved. It will also be appreciated that the therapies employed may achieve a desired effect for the same disorder (for example, an inventive compound may be administered concurrently with another anticancer agent), or they may achieve different effects (e.g., control of any adverse effects).

[0260] For example, other therapies or therapeutic agents that may be used in combination with the inventive compounds of the present invention include surgery, radiotherapy (in but a few examples, γ-radiation, neutron beam radiotherapy, electron beam radiotherapy, proton therapy, brachytherapy, and systemic radioactive isotopes, to name a few), endocrine therapy, biologic response modifiers (interferons, interleukins, and tumor necrosis factor (TNF) to name a few), hyperthermia and cryotherapy, agents to attenuate any adverse effects (e.g., antiemetics), and other approved chemotherapeutic drugs, including, but not limited to, alkylating drugs (mechlorethamine, chlorambucil, Cyclophosphamide, Melphalan, Ifosfamide), antimetabolites (Methotrexate), purine antagonists and pyrimidine antagonists (6-Mercaptopurine, 5-Fluorouracil, Cytarabine, Gemcitabine), spindle poisons (Vinblastine, Vincristine, Vinorelbine, Paclitaxel), podophyllotoxins (Etoposide, Irinotecan, Topotecan), antibiotics (Doxorubicin, Bleomycin, Mitomycin), nitrosoureas (Carmustine, Lomustine), inorganic ions (Cisplatin, Carboplatin), enzymes (Asparaginase), and hormones (Tamoxifen,
Leuprolide, Flutamide, and Megestrol), to name a few. For a more comprehensive discussion of updated cancer therapies see, The Merck Manual, Seventeenth Ed. 1999, the entire contents of which are hereby incorporated by reference. See also the National Cancer Institute (CNI) website (www.nci.nih.gov) and the Food and Drug Administration (FDA) website for a list of the FDA approved oncology drugs (www.fda.gov/der/cancer/druglistframe – See Appendix A).

[0261] In certain embodiments, the pharmaceutical compositions of the present invention further comprise one or more additional therapeutically active ingredients (e.g., chemotherapeutic and/or palliative). For purposes of the invention, the term “Palliative” refers to treatment that is focused on the relief of symptoms of a disease and/or side effects of a therapeutic regimen, but is not curative. For example, palliative treatment encompasses painkillers, antinausea medications and anti-sickness drugs. In addition, chemotherapy, radiotherapy and surgery can all be used palliatively (that is, to reduce symptoms without going for cure; e.g., for shrinking tumors and reducing pressure, bleeding, pain and other symptoms of cancer).

[0262] 4) Research Uses, Pharmaceutical Uses and Methods of Treatment
[0263] Research Uses
[0264] According to the present invention, the inventive compounds may be assayed in any of the available assays known in the art for identifying compounds having antiangiogenic activity and/or antiproliferative activity. For example, the assay may be cellular or non-cellular, in vivo or in vitro, high- or low-throughput format, etc.

[0265] Thus, in one aspect, compounds of this invention which are of particular interest include those which:

- exhibit activity as inhibitors of cell migration;
- exhibit an antiproliferative and/or an antiangiogenic effect on solid tumors; and/or
- exhibit a favorable therapeutic profile (e.g., safety, efficacy, and stability).
As discussed above, certain of the compounds as described herein exhibit activity generally as inhibitors of cell migration and/or angiogenesis. More specifically, compounds of the invention act as inhibitors of tumor growth and angiogenesis.

As detailed in the exemplification herein, in assays to determine the ability of compounds to inhibit tumor cell migration (e.g., chamber cell migration assay), certain inventive compounds exhibited IC₅₀ values ≤ 50 μM. In certain other embodiments, inventive compounds exhibit IC₅₀ values ≤ 40 μM. In certain other embodiments, inventive compounds exhibited IC₅₀ values ≤ 30 μM. In certain other embodiments, inventive compounds exhibited IC₅₀ values ≤ 20 μM. In certain other embodiments, inventive compounds exhibited IC₅₀ values ≤ 10 μM. In certain other embodiments, inventive compounds exhibited IC₅₀ values ≤ 7.5 μM. In certain other embodiments, inventive compounds exhibited IC₅₀ values ≤ 5 μM. In certain other embodiments, inventive compounds exhibit IC₅₀ values ≤ 2.5 μM. In certain other embodiments, inventive compounds exhibited IC₅₀ values ≤ 1 μM. In certain other embodiments, inventive compounds exhibited IC₅₀ values ≤ 750 nM. In certain other embodiments, inventive compounds exhibited IC₅₀ values ≤ 500 nM. In certain other embodiments, inventive compounds exhibited IC₅₀ values ≤ 250 nM. In certain other embodiments, inventive compounds exhibited IC₅₀ values ≤ 100 nM. In other embodiments, exemplary compounds exhibited IC₅₀ values ≤ 75 nM. In other embodiments, exemplary compounds exhibited IC₅₀ values ≤ 50 nM. In other embodiments, exemplary compounds exhibit IC₅₀ values ≤ 40 nM. In other embodiments, exemplary compounds exhibited IC₅₀ values ≤ 30 nM. In other embodiments, exemplary compounds exhibited IC₅₀ values ≤ 25 nM.

As detailed in the exemplification herein, in assays to determine the ability of compounds to inhibit tumor cell proliferation, certain inventive compounds exhibit IC₅₀ values ≤ 200 μM. In certain other embodiments, inventive compounds exhibit IC₅₀ values ≤ 150 μM. In certain other embodiments, inventive compounds exhibit IC₅₀ values ≤ 100 μM. In certain other embodiments, inventive compounds exhibit IC₅₀ values ≤ 50 μM. In certain other embodiments, inventive compounds exhibit IC₅₀ values ≤ 10 μM. In certain other embodiments, inventive
compounds exhibit IC<sub>50</sub> values ≤ 7.5 μM. In certain embodiments, inventive compounds exhibit IC<sub>50</sub> values ≤ 5 μM. In certain other embodiments, inventive compounds exhibit IC<sub>50</sub> values ≤ 2.5 μM. In certain embodiments, inventive compounds exhibit IC<sub>50</sub> values ≤ 1 μM. In certain other embodiments, inventive compounds exhibit IC<sub>50</sub> values ≤ 750 nM. In certain other embodiments, inventive compounds exhibit IC<sub>50</sub> values ≤ 500 nM. In certain other embodiments, inventive compounds exhibit IC<sub>50</sub> values ≤ 250 nM. In certain other embodiments, inventive compounds exhibit IC<sub>50</sub> values ≤ 100 nM. In other embodiments, exemplary compounds exhibit IC<sub>50</sub> values ≤ 75 nM. In other embodiments, exemplary compounds exhibit IC<sub>50</sub> values ≤ 50 nM.

[0269] In certain embodiments, the present invention provides methods for identifying Migrastatin analogs useful in the preparation of pharmaceutical compositions for the treatment of various disorders including cancer, metastasis and disorders involving increased angiogenesis.

[0270] In certain exemplary embodiments, there is provided a method for identifying Migrastatin analogs having anti-angiogenic activity, the method comprising steps of:

a. contacting a compound with a plurality of cells, whereby the compound has the structure:

(I)

or pharmaceutically acceptable derivative thereof;

wherein R<sub>1</sub> and R<sub>2</sub> are each independently hydrogen, halogen, -CN, -S(O)<sub>1</sub>-, -R<sup>1A</sup>, -NO<sub>2</sub>, -COR<sup>1A</sup>, -CO<sub>2</sub>R<sup>1A</sup>, -NR<sup>1A</sup>C(=O)R<sup>1B</sup>, -NR<sup>1A</sup>C(=O)OR<sup>1B</sup>, -CONR<sup>1A</sup>R<sup>1B</sup>, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR<sup>1A</sup>; wherein W is independently -O-, -S- or -NR<sup>1C</sup>-; wherein each occurrence of
R^{1A}, R^{1B} and R^{1C} is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or R_{1} and R_{2}, taken together with the carbon atoms to which they are attached, form an alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

R_{3} is hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or a prodrug moiety or an oxygen protecting group;

R_{4} is halogen, -OR^{4A}, -OC(=O)R^{4A} or -NR^{4A}R^{4B}; wherein R^{4A} and R^{4B} are independently hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; a prodrug moiety, a nitrogen protecting group or an oxygen protecting group; or R^{4A} and R^{4B}, taken together with the nitrogen atom to which they are attached, form a heterocyclic or heteroaryl moiety;

R_{5} is hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

R_{6} is hydrogen, halogen, -CN, -S(O)_{1-2}R^{6A}, -NO_{2}, -COR^{6A}, -CO_{2}R^{6A}, -NR^{6A}C(=O)R^{6B}, -NR^{6A}C(=O)OR^{6B}, -CONR^{6A}R^{6B}, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR^{6A}; wherein W is independently -O-, -S- or -NR^{6C}-, wherein each occurrence of R^{6A}, R^{6B} and R^{6C} is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or R_{6} and R_{6}, taken together with the carbon atoms to which they are attached, form an alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

R_{b} and each occurrence of R_{b} are independently hydrogen, halogen, -CN, -S(O)_{1-2}R^{al}, -NO_{2}, -COR^{al}, -CO_{2}R^{al}, -NR^{al}C(=O)R^{a2}, -NR^{al}C(=O)OR^{a2}, -CONR^{al}R^{a2}, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR^{al}; wherein W is independently -O-, -S- or -NR^{al}-, wherein each occurrence of R^{al}, R^{a2} and R^{a3} is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or R_{a} and the adjacent occurrence of R_{b}, taken together with the carbon atoms to which they are attached, form an alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

R_{e} is hydrogen, halogen, -CN, -S(O)_{1-2}R^{el}, -NO_{2}, -COR^{el}, -CO_{2}R^{el}, -NR^{el}C(=O)R^{e2}, -NR^{el}C(=O)OR^{e2}, -CONR^{el}R^{e2}; an aliphatic, heteroaliphatic,
alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or –WR\(^{y1}\); wherein W is independently -O-, -S- or -NR\(^{y3}\); wherein each occurrence of R\(^{x1}\), R\(^{x2}\) and R\(^{x3}\) is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or R\(_x\) and R\(_z\), taken together with the carbon atoms to which they are attached, form an alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

\(n\) is an integer from 1 to 5;

X\(_1\) is O, S, NR\(^{x1}\) or CR\(^{x1}\)R\(^{x2}\); wherein R\(^{x1}\) and R\(^{x2}\) are independently hydrogen, halogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or a nitrogen protecting group;

Q is hydrogen, halogen, -CN, -S(O)\(_2\)R\(^{o1}\), -NO\(_2\), -COR\(^{o1}\), -CO\(_2\)R\(^{o1}\), -NR\(^{o1}\)C(=O)R\(^{o2}\), -NR\(^{o1}\)C(=O)OR\(^{o2}\), -CONR\(^{o1}\)R\(^{o2}\), an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or –WR\(^{o1}\); wherein W is independently -O-, -S- or -NR\(^{o3}\); wherein each occurrence of R\(^{o1}\), R\(^{o2}\) and R\(^{o3}\) is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

Y\(_1\) and Y\(_2\) are independently hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or –WR\(^{y1}\); wherein W is independently -O-, -S- or -NR\(^{y2}\); wherein each occurrence of R\(^{y1}\) and R\(^{y2}\) is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or Y\(_1\) and Y\(_2\) together with the carbon atom to which they are attached form a moiety having the structure:

\[
\begin{align*}

\text{or } & \\
\end{align*}
\]

b. evaluating the effect of the compound on the complexity of the tube network among the cells.

[0241] In certain embodiments, the compound being contacted with the plurality of cells is at a concentration ≤ 200μM. In certain exemplary embodiments, the compound has the following stereochemistry:
[0242] In certain embodiments, in the method described directly above, the step of evaluating comprises comparing the disturbance of the complexity of the tube network with that observed for cells exposed to a reference Migrastatin concentration. In certain exemplary embodiments, the reference Migrastatin concentration is about 100μM. In certain exemplary embodiments, the reference Migrastatin concentration is about 75μM. In certain exemplary embodiments, the reference Migrastatin concentration is about 50μM. In certain exemplary embodiments, the reference Migrastatin concentration is about 30μM.

[0271] In certain embodiments, the method is for identifying Migrastatin analogs useful in the preparation of pharmaceutical compositions for the treatment of angiogenesis-related disorders.

[0272] In certain other embodiments, the invention provides a high-throughput method for identifying Migrastatin analogs having anti-angiogenic activity, the method comprising steps of:

a. introducing in each of a plurality of reaction vessels:
   a plurality of cells; and
   one or more test compounds with having the structure (I) as defined generally above and in classes and subclasses herein; or pharmaceutically acceptable derivative thereof; and

b. evaluating in each reaction vessel the effect of the test compound on the complexity of the tube network in the cells.

[0243] In certain embodiments, the test compound being contacted with the plurality of cells is at a concentration ≤ 200μM. In certain exemplary embodiments, the test compound has the following stereochemistry:
[0244] In certain embodiments, in the method described directly above, the step of evaluating comprises comparing the disturbance of the complexity of the tube network in each reaction vessel with that observed for cells exposed to a reference Migrastatin concentration. In certain exemplary embodiments, the reference Migrastatin concentration is about 100μM. In certain exemplary embodiments, the reference Migrastatin concentration is about 75μM. In certain exemplary embodiments, the reference Migrastatin concentration is about 50μM. In certain exemplary embodiments, the reference Migrastatin concentration is about 30μM.

[0273] In certain embodiments, the method is for identifying Migrastatin analogs useful in the preparation of pharmaceutical compositions for the treatment of angiogenesis-related disorders.

[0274] In certain exemplary embodiments, there is provided a method for identifying Migrastatin analogs having cell migration inhibitory activity, the method comprising steps of:

a. providing a plurality of cells;
b. applying a scratch to the cell layer surface;
c. contacting the cells with a compound having the structure (I) as defined generally above and in classes and subclasses herein; or pharmaceutically acceptable derivative thereof; and

b. evaluating the wound healing effect of the compound on the cells.

[0245] In certain embodiments, the compound being contacted with the plurality of cells is at a concentration \( \leq 200\mu M \). In certain exemplary embodiments, the compound has the following stereochemistry:
In certain embodiments, in the method described directly above, the step of evaluating comprises comparing the compound wound healing effect with that observed for cells exposed to a reference Migrastatin concentration. In certain exemplary embodiments, the reference Migrastatin concentration is about 100\mu M. In certain exemplary embodiments, the reference Migrastatin concentration is about 75\mu M. In certain exemplary embodiments, the reference Migrastatin concentration is about 50\mu M. In certain exemplary embodiments, the reference Migrastatin concentration is about 30\mu M.

In certain embodiments, the method is for identifying Migrastatin analogs useful in the preparation of pharmaceutical compositions for the treatment of metastasis-related disorders.

In certain embodiments, the method may be adapted to high-throughput format wherein the cells and test compounds are introduced and assayed in each of a plurality of reaction vessels. For example, in certain embodiments, there is provided a high-throughput method for identifying Migrastatin analogs having cell migration inhibitory activity, the method comprising steps of:

a. introducing a plurality of cells in each of a plurality of reaction vessels;
b. in each reaction vessel, applying a scratch to the cell layer surface;
c. contacting the cells, in each reaction vessel, with one or more test compounds having the structure (I) as defined generally above and in classes and subclasses herein; or pharmaceutically acceptable derivative thereof; and
d. evaluating the wound healing effect of the test compound on the cells in each reaction vessel.
[0249] In certain embodiments, the test compound being contacted with the plurality of cells is at a concentration ≤ 200µM. In certain exemplary embodiments, the test compound has the following stereochemistry:

\[ \text{Chemical Structure} \]

[0250] In certain embodiments, in the method described directly above, the step of evaluating comprises comparing the compound wound healing effect in each reaction vessel with that observed for cells exposed to a reference Migrastatin concentration. In certain exemplary embodiments, the reference Migrastatin concentration is about 100µM. In certain exemplary embodiments, the reference Migrastatin concentration is about 75µM. In certain exemplary embodiments, the reference Migrastatin concentration is about 50µM. In certain exemplary embodiments, the reference Migrastatin concentration is about 30µM.

[0275] In certain embodiments, the method is for identifying Migrastatin analogs useful in the preparation of pharmaceutical compositions for the treatment of angiogenesis-related disorders.

[0251] In certain other exemplary embodiments, there is provided a method for identifying Migrastatin analogs having cell migration inhibitory activity, comprising steps of:

a. introducing a plurality of cells into an upper compartment;

b. introducing a test compound having the structure (I) as defined generally above and in classes and subclasses herein; or pharmaceutically acceptable derivative thereof; into the upper compartment and a lower compartment, whereby the lower compartment is separated from the upper compartment by a cell-permeable membrane; and

c. assessing cell migration from the upper to the lower compartment after a given period of time.
[0252] In certain embodiments, the compound being contacted with the plurality of cells is at a concentration $\leq 200\mu M$. In certain exemplary embodiments, the compound has the following stereochemistry:

![Chemical Structure]

[0253] In certain embodiments, in the method described directly above, the step of evaluating comprises comparing cell migration from the upper to the lower compartment with that observed for cells exposed to a reference Migrastatin concentration after about the same period of time. In certain exemplary embodiments, the reference Migrastatin concentration is about $100\mu M$. In certain exemplary embodiments, the reference Migrastatin concentration is about $75\mu M$. In certain exemplary embodiments, the reference Migrastatin concentration is about $50\mu M$. In certain exemplary embodiments, the reference Migrastatin concentration is about $30\mu M$.

[0254] In certain embodiments, the method is for identifying Migrastatin analogs useful in the preparation of pharmaceutical compositions for the treatment of metastasis-related disorders.

[0255] In certain embodiments, the method may be adapted to high-throughput format wherein the cells and test compounds are introduced and assayed in each of a plurality of reaction vessels. For example, in certain embodiments, there is provided a high-throughput method for identifying Migrastatin analogs having cell migration inhibitory activity, the method comprising steps of:

a. providing a plurality of reaction vessels, each comprising an upper and lower compartment separated by a cell-permeable membrane;

b. introducing a plurality of cells into the upper compartment of each of the plurality of reaction vessels;
c. introducing a test compound having the structure (I) as defined generally above and in classes and subclasses herein; or pharmaceutically acceptable derivative thereof; into the upper and lower compartment of each of the plurality of reaction vessels; and

d. in each reaction vessel, assessing cell migration from the upper to the lower compartment after a given period of time.

[0256] In certain embodiments of each of the high-throughput methods described above, a different concentration of the same test compound is introduced in each reaction vessel. In certain other embodiments, a different test compound is introduced in each reaction vessel. In certain embodiments, a different concentration of the same test compound is introduced in a subset of the reaction vessels; and a different test compound is introduced in another subset of the reaction vessels.

[0257] In certain embodiments, a high-throughput method according to the present invention is practiced with dense arrays of reaction vessels. Preferably, the center-to-center distance between reaction vessels is less than about 8.5 mm. More preferably, the distance is less than 4.5 mm. Even more preferably the distance is less than approximately 2.25 mm. Most preferably, the distance is less than approximately 1 mm. In certain embodiments, the method is performed with a 48-well culture dish.

[0258] Conventional high throughput screens are often performed in commercially available 48- or 96-well plates (see, for example, Rice et al. Anal. Biochem. 241:254-259. 1996). Such plates may be utilized according to the present invention. However, denser arrays are generally preferred, though it is appreciated that such arrays may desirably have the same external dimensions of a standard 48- or 96-well plate in order to facilitate automation using available equipment. Plates containing 384 (Nalge Nunc International, Naperville, IL; Greiner America, Lake Mary, FL; Corning Costar, Corning, NY) or 1536 (Greiner America, Lake Mary, FL) wells have recently become commercially available and may be used in the
practice of the present invention. In certain embodiments, a high throughput method according to the present invention is compatible with any or all of these array formats.

[0259] Pharmaceutical Uses and Methods of Treatment

[0260] In yet another aspect, the present invention provides methods of treatment of various disorders, including those associated with metastasis and/or increased angiogenic activity. In certain embodiments, according to the methods of treatment of the present invention, metastasis and/or the growth of tumor cells is inhibited by contacting said tumor cells with an inventive compound or composition, as described herein.

[0261] Accordingly, in another aspect of the invention, methods for the treatment of cancer are provided comprising administering a therapeutically effective amount of a compound of formula (I), as described herein, to a subject in need thereof. In certain embodiments, a method for the treatment of cancer is provided comprising administering a therapeutically effective amount of an inventive compound, or a pharmaceutical composition comprising an inventive compound to a subject in need thereof, in such amounts and for such time as is necessary to achieve the desired result.

[0262] In certain embodiments, the method involves the administration of a therapeutically effective amount of the compound or a pharmaceutically acceptable derivative thereof to a subject (including, but not limited to a human or animal) in need of it. In certain embodiments, the inventive compounds as useful for the treatment of cancer (including, but not limited to, glioblastoma, retinoblastoma, breast cancer, cervical cancer, colon and rectal cancer, leukemia, lymphoma, lung cancer (including, but not limited to small cell lung cancer), melanoma and/or skin cancer, multiple myeloma, non-Hodgkin's lymphoma, ovarian cancer, pancreatic cancer, prostate cancer and gastric cancer, bladder cancer, uterine cancer, kidney cancer, testicular cancer, stomach cancer, brain cancer, liver cancer, or esophageal cancer).
[0263] As discussed above, the compounds of the present invention are inhibit metastasis of tumor cells and/or inhibiting the growth of tumor cells. In general, the inventive anticancer agents are useful in the treatment of cancers and other proliferative disorders, including, but not limited to breast cancer, cervical cancer, colon and rectal cancer, leukemia, lung cancer, melanoma, multiple myeloma, non-Hodgkin's lymphoma, ovarian cancer, pancreatic cancer, prostate cancer, and gastric cancer, to name a few. In certain embodiments, the inventive anticancer agents are active against leukemia cells and melanoma cells, and thus are useful for the treatment of leukemias (e.g., myeloid, lymphocytic, myelocytic and lymphoblastic leukemias) and malignant melanomas. In still other embodiments, the inventive anticancer agents are active against solid tumors.

[0264] In certain embodiments, the present invention provides a method for preventing metastasis of tumor cells in a subject comprising administering to a subject (including, but not limited to, a human or animal) in need thereof a therapeutically effective amount of a compound of the invention and a pharmaceutically acceptable carrier, adjuvant or vehicle. In certain exemplary embodiments, the method is used to prevent metastasis of prostate, breast, colon, bladder, cervical, skin, testicular, kidney, ovarian, stomach, brain, liver, pancreatic or esophageal cancer or lymphoma, leukemia, or multiple myeloma, to name a few.

[0265] In another aspect, the present invention provides methods for decreasing migration of tumor cells. In a further aspect, the present invention provides methods for decreasing anchorage-independent growth of tumor cells. In yet a further aspect, the present invention provides methods for inhibiting angiogenesis.

[0266] In yet another aspect, the present invention provides methods for preventing unwanted angiogenesis in a subject (including, but not limited to, a human or animal).

[0267] As used herein, the term "angiogenesis" means the generation of new blood vessels into a tissue or organ. Under normal physiological conditions, humans or animals only undergo angiogenesis in very specific restricted situations. For example, angiogenesis is normally observed in wound healing, fetal and embryonal development and formation of the corpus luteum, endometrium and placenta. The
control of angiogenesis is a highly regulated system of angiogenic stimulators and inhibitors. The control of angiogenesis has been found to be altered in certain disease states and, in many cases, the pathological damage associated with the disease is related to the uncontrolled angiogenesis.

[0263] Both controlled and uncontrolled angiogenesis are thought to proceed in a similar manner. Endothelial cells and pericytes, surrounded by a basement membrane, form capillary blood vessels. Angiogenesis begins with the erosion of the basement membrane by enzymes released by endothelial cells and leukocytes. The endothelial cells, which line the lumen of blood vessels, then protrude through the basement membrane. Angiogenic stimulants induce the endothelial cells to migrate through the eroded basement membrane. The migrating cells form a "sprout" off the parent blood vessel, where the endothelial cells undergo mitosis and proliferate. The endothelial sprouts merge with each other to form capillary loops, creating the new blood vessel. In the disease state, prevention of angiogenesis could avert the damage caused by the invasion of the new microvascular system.

[0269] Persistent, unregulated angiogenesis occurs in a multiplicity of disease states, tumor metastasis and abnormal growth by endothelial cells and supports the pathological damage seen in these conditions. The diverse pathological states created due to unregulated angiogenesis have been grouped together as angiogenic dependent or angiogenic associated diseases. Therapies directed at control of the angiogenic processes could lead to the abrogation or mitigation of these diseases.

[0270] One example of a disease involving an angiogenic process is ocular neovascular disease. This disease is characterized by invasion of new blood vessels into the structures of the eye such as the retina or cornea. It is the most common cause of blindness and is involved in approximately twenty eye diseases. In age-related macular degeneration, the associated visual problems are caused by an ingrowth of chorioidal capillaries through defects in Bruch's membrane with proliferation of fibrovascular tissue beneath the retinal pigment epithelium. Angiogenic damage is also associated with diabetic retinopathy, retinopathy of prematurity, corneal graft rejection, neovascular glaucoma and retrolental fibroplasia. Other diseases associated with corneal neovascularization include, but
are not limited to, epidemic keratoconjunctivitis, Vitamin A deficiency, contact lens overwear, atopic keratitis, superior limbic keratitis, pterygium keratitis sicca, sjogrens, acne rosacea, phlyctenurosis, syphilis, Mycobacteria infections, lipid degeneration, chemical burns, bacterial ulcers, fungal ulcers, Herpes simplex infections, Herpes zoster infections, protozoan infections, Kaposi's sarcoma, Mooren's ulcer, Terrien's marginal degeneration, marginal keratolysis, rheumatoid arthritis, systemic lupus, polyarteritis, trauma, Wegener's sarcoidosis, scleritis, Stevens-Johnson disease, pemphigoid, radial keratotomy, and corneal graph rejection.

[0271] Diseases associated with retinal/choroidal neovascularization include, but are not limited to, diabetic retinopathy, macular degeneration, sickle cell anemia, sarcoid, syphilis, pseudoxanthoma elasticum, Paget's disease, vein occlusion, artery occlusion, carotid obstructive disease; chronic uveitis/vitritis, mycobacterial infections, Lyme's disease, systemic lupus erythematosis, retinopathy of prematurity, Eales' disease, Behcet's disease, infections causing a retinitis or choroiditis, presumed ocular histoplasmosis, Best's disease, myopia, optic pits, Stargardt's disease, pars planitis, chronic retinal detachment, hyperviscosity syndromes, toxoplasmosis, trauma and post-laser complications. Other diseases include, but are not limited to, diseases associated with rubeosis (neovascularization of the angle) and diseases caused by the abnormal proliferation of fibrovascular or fibrous tissue including all forms of proliferative vitreoretinopathy.

[0272] Another disease in which angiogenesis is believed to be involved is rheumatoid arthritis. The blood vessels in the synovial lining of the joints undergo angiogenesis. In addition to forming new vascular networks, the endothelial cells release factors and reactive oxygen species that lead to pannus growth and cartilage destruction. The factors involved in angiogenesis may actively contribute to, and help maintain, the chronically inflamed state of rheumatoid arthritis.

[0273] Factors associated with angiogenesis may also have a role in osteoarthritis. The activation of the chondrocytes by angiogenic-related factors contributes to the destruction of the joint. At a later stage, the angiogenic factors would promote new bone formation. Therapeutic intervention that prevents the bone
destruction could halt the progress of the disease and provide relief for persons suffering with arthritis.

[0274] Chronic inflammation may also involve pathological angiogenesis. Such disease states as ulcerative colitis and Crohn's disease show histological changes with the ingrowth of new blood vessels into the inflamed tissues. Bartonellosis, a bacterial infection found in South America, can result in a chronic stage that is characterized by proliferation of vascular endothelial cells. Another pathological role associated with angiogenesis is found in atherosclerosis. The plaques formed within the lumen of blood vessels have been shown to have angiogenic stimulatory activity.

[0275] One of the most frequent angiogenic diseases of childhood is the hemangioma. In most cases, the tumors are benign and regress without intervention. In more severe cases, the tumors progress to large cavernous and infiltrative forms and create clinical complications. Systemic forms of hemangiomas, the hemangiomatoses, have a high mortality rate. Therapy-resistant hemangiomas exist that cannot be treated with therapeutics currently in use.

[0276] Angiogenesis is also responsible for damage found in hereditary diseases such as Osler-Weber-Rendu disease, or hereditary hemorrhagic telangiectasia. This is an inherited disease characterized by multiple small angiomas, tumors of blood or lymph vessels. The angiomas are found in the skin and mucous membranes, often accompanied by epistaxis (nosebleeds) or gastrointestinal bleeding and sometimes with pulmonary or hepatic arteriovenous fistula.

[0277] Angiogenesis is prominent in solid tumor formation and metastasis. Angiogenic factors have been found associated with several solid tumors such as rhabdomyosarcomas, retinoblastoma, Ewing sarcoma, neuroblastoma, and osteosarcoma. A tumor cannot expand without a blood supply to provide nutrients and remove cellular wastes. Tumors in which angiogenesis is important include solid tumors, and benign tumors such as acoustic neuroma, neurofibroma, trachoma and pyogenic granulomas. Prevention of angiogenesis could halt the growth of these tumors and the resultant damage to the animal due to the presence of the tumor.
It should be noted that angiogenesis has been associated with blood-borne tumors such as leukemias, any of various acute or chronic neoplastic diseases of the bone marrow in which unrestrained proliferation of white blood cells occurs, usually accompanied by anemia, impaired blood clotting, and enlargement of the lymph nodes, liver, and spleen. It is believed that angiogenesis plays a role in the abnormalities in the bone marrow that give rise to leukemia-like tumors.

Angiogenesis is important in two stages of tumor metastasis. The first stage where angiogenesis stimulation is important is in the vascularization of the tumor which allows tumor cells to enter the blood stream and to circulate throughout the body. After the tumor cells have left the primary site, and have settled into the secondary, metastasis site, angiogenesis must occur before the new tumor can grow and expand. Therefore, prevention of angiogenesis could lead to the prevention of metastasis of tumors and possibly contain the neoplastic growth at the primary site.

Knowledge of the role of angiogenesis in the maintenance and metastasis of tumors has led to a prognostic indicator for breast cancer. The amount of neovascularization found in the primary tumor was determined by counting the microvessel density in the area of the most intense neovascularization in invasive breast carcinoma. A high level of microvessel density was found to correlate with tumor recurrence. Control of angiogenesis by therapeutic means could possibly lead to cessation of the recurrence of the tumors.

Angiogenesis is also involved in normal physiological processes such as reproduction and wound healing. Angiogenesis is an important step in ovulation and also in implantation of the blastula after fertilization. Prevention of angiogenesis could be used to induce amenorrhea, to block ovulation or to prevent implantation by the blastula.

In wound healing, excessive repair or fibroplasia can be a detrimental side effect of surgical procedures and may be caused or exacerbated by angiogenesis. Adhesions are a frequent complication of surgery and lead to problems such as small bowel obstruction.
Accordingly, in one aspect, the present invention provides method to inhibit unwanted angiogenesis in a subject (including, but not limited to, a human or animal).

In another aspect, the present invention provides a method for the treatment for diseases mediated by angiogenesis.

In another aspect, the present invention provides a method for the treatment for macular degeneration.

In another aspect, the present invention provides a method for the treatment for all forms of proliferative vitreoretinopathy including those forms not associated with diabetes.

In another aspect, the present invention provides a method for the treatment for solid tumors.

In another aspect, the present invention provides a method for the treatment of blood-borne tumors, such as leukemia.

In another aspect, the present invention provides a method for the treatment of hemangioma.

In another aspect, the present invention provides a method for the treatment of retrolental fibroplasia.

In another aspect, the present invention provides a method for the treatment of psoriasis.

In another aspect, the present invention provides a method for the treatment of Kaposi's sarcoma.

In another aspect, the present invention provides a method for the treatment of Crohn's disease.

In another aspect, the present invention provides a method for the treatment of diabetic retinopathy.

Thus, in certain embodiments, the invention provides a method for preventing unwanted angiogenesis in a subject (including, but not limited to, a human or animal) comprising administering to a subject in need thereof a therapeutically effective amount of the compound of the invention in an amount effective to inhibit angiogenesis.
[0296] In certain other embodiments, the invention provides a method for treating an angiogenesis-dependent disease in a subject (including, but not limited to, a human or animal) comprising administering to a subject in need thereof a therapeutically effective amount of the compound of the invention in an amount effective to inhibit angiogenesis.

[0297] Diseases associated with corneal neovascularization that can be treated according to the present invention include but are not limited to, diabetic retinopathy, retinopathy of prematurity, corneal graft rejection, neovascular glaucoma and retrolental fibroplasia, epidemic keratoconjunctivitis, Vitamin A deficiency, contact lens overwear, atopic keratitis, superior limbic keratitis, pterygium keratitis sicca, sjogrens, acne rosacea, phylectenulosis, syphilis, Mycobacteria infections, lipid degeneration, chemical burns, bacterial ulcers, fungal ulcers, Herpes simplex infections, Herpes zoster infections, protozoan infections, Kaposi's sarcoma, Mooren's ulcer, Terrien's marginal degeneration, mariginal keratolysis, trauma, rheumatoid arthritis, systemic lupus, polyarteritis, Wegener's sarcoidosis, scleritis, Stevens-Johnson disease, pemphigoid, radial keratotomy, and corneal graph rejection.

[0298] Diseases associated with retinal/choroidal neovascularization that can be treated according to the present invention include, but are not limited to, diabetic retinopathy, macular degeneration, sickle cell anemia, sarcoid, syphilis, pseudoxanthoma elasticum, Paget's disease, vein occlusion, artery occlusion, carotid obstructive disease, chronic uveitis/vitritis, mycobacterial infections, Lyme's disease, systemic lupus erythematosus, retinopathy of prematurity, Eales' disease, Behcet's disease, infections causing a retinitis or choroiditis, presumed ocular histoplasmosis, Best's disease, myopia, optic pits, Stargardt's disease, pars planitis, chronic retinal detachment, hyperviscosity syndromes, toxoplasmosis, trauma and post-laser complications. Other diseases include, but are not limited to, diseases associated with rubeosis (neovasculariation of the angle) and diseases caused by the abnormal proliferation of fibrovascular or fibrous tissue including all forms of proliferative vitreoretinopathy, whether or not associated with diabetes.
Diseases associated with chronic inflammation can be treated by the compositions and methods of the present invention. Diseases with symptoms of chronic inflammation include inflammatory bowel diseases such as Crohn's disease and ulcerative colitis, psoriasis, sarcoidosis and rheumatoid arthritis. Angiogenesis is a key element that these chronic inflammatory diseases have in common. The chronic inflammation depends on continuous formation of capillary sprouts to maintain an influx of inflammatory cells. The influx and presence of the inflammatory cells produce granulomas and thus, maintains the chronic inflammatory state. Inhibition of angiogenesis by the compositions and methods of the present invention would prevent the formation of the granulomas and alleviate the disease.

The compositions and methods of the present invention can be used to treat patients with inflammatory bowel diseases such as Crohn's disease and ulcerative colitis. Both Crohn's disease and ulcerative colitis are characterized by chronic inflammation and angiogenesis at various sites in the gastrointestinal tract. Crohn's disease is characterized by chronic granulomatous inflammation throughout the gastrointestinal tract consisting of new capillary sprouts surrounded by a cylinder of inflammatory cells. Prevention of angiogenesis by the compositions and methods of the present invention inhibits the formation of the sprouts and prevents the formation of granulomas.

Crohn's disease occurs as a chronic transmural inflammatory disease that most commonly affects the distal ileum and colon but may also occur in any part of the gastrointestinal tract from the mouth to the anus and perianal area. Patients with Crohn's disease generally have chronic diarrhea associated with abdominal pain, fever, anorexia, weight loss and abdominal swelling. Ulcerative colitis is also a chronic, nonspecific, inflammatory and ulcerative disease arising in the colonic mucosa and is characterized by the presence of bloody diarrhea.

The inflammatory bowel diseases also show extraintestinal manifestations such as skin lesions. Such lesions are characterized by inflammation and angiogenesis and can occur at many sites other than the gastrointestinal tract. The compositions and methods of the present invention are also capable of treating
these lesions by preventing the angiogenesis, thus reducing the influx of inflammatory cells and the lesion formation.

[0303] Sarcoidosis is another chronic inflammatory disease that is characterized as a multisystem granulomatous disorder. The granulomas of this disease may form anywhere in the body and thus the symptoms depend on the site of the granulomas and whether the disease active. The granulomas are created by the angiogenic capillary sprouts providing a constant supply of inflammatory cells.

[0304] The compositions and methods of the present invention can also treat the chronic inflammatory conditions associated with psoriasis. Psoriasis, a skin disease, is another chronic and recurrent disease that is characterized by papules and plaques of various sizes. Prevention of the formation of the new blood vessels necessary to maintain the characteristic lesions leads to relief from the symptoms.

[0305] Another disease which can be treated according to the present invention is rheumatoid arthritis. Rheumatoid arthritis is a chronic inflammatory disease characterized by nonspecific inflammation of the peripheral joints. It is believed that the blood vessels in the synovial lining of the joints undergo angiogenesis. In addition to forming new vascular networks, the endothelial cells release factors and reactive oxygen species that lead to pannus growth and cartilage destruction. The factors involved in angiogenesis may actively contribute to, and help maintain, the chronically inflamed state of rheumatoid arthritis. Another disease that can be treated according to the present invention are hemangiomomas, Osler-Weber-Rendu disease, or hereditary hemorrhagic telangiectasia, solid or blood borne tumors and acquired immune deficiency syndrome.

[0306] It will be appreciated that the compounds and compositions, according to the method of the present invention, may be administered using any amount and any route of administration effective for the treatment of cancer and/or disorders associated with metastasis and/or angiogenesis. Thus, the expression “effective amount” as used herein, refers to a sufficient amount of agent to inhibit the growth of tumor cells, or refers to a sufficient amount to reduce the effects of cancer. The exact amount required will vary from subject to subject, depending on the species,
age, and general condition of the subject, the severity of the diseases, the particular anticancer agent, its mode of administration, and the like.

[0307] The compounds of the invention are preferably formulated in dosage unit form for ease of administration and uniformity of dosage. The expression "dosage unit form" as used herein refers to a physically discrete unit of therapeutic agent appropriate for the patient to be treated. It will be understood, however, that the total daily usage of the compounds and compositions of the present invention will be decided by the attending physician within the scope of sound medical judgment. The specific therapeutically effective dose level for any particular patient or organism will depend upon a variety of factors including the disorder being treated and the severity of the disorder; the activity of the specific compound employed; the specific composition employed; the age, body weight, general health, sex and diet of the patient; the time of administration, route of administration, and rate of excretion of the specific compound employed; the duration of the treatment; drugs used in combination or coincidental with the specific compound employed; and like factors well known in the medical arts (see, for example, Goodman and Gilman's, "The Pharmacological Basis of Therapeutics", Tenth Edition, A. Gilman, J. Hardman and L. Limbird, eds., McGraw-Hill Press, 155-173, 2001, which is incorporated herein by reference in its entirety).

[0308] Furthermore, after formulation with an appropriate pharmaceutically acceptable carrier, adjuvant or vehicle in a desired dosage, the pharmaceutical compositions of this invention can be administered to humans and other animals orally, rectally, parenterally, intracisternally, intravaginally, intraperitoneally, topically (as by powders, ointments, creams or drops), buccally, as an oral or nasal spray, or the like, depending on the severity of the infection being treated. In certain embodiments, compounds of the invention may be administered at dosage levels of about 0.001 mg/kg to about 50 mg/kg, from about 0.01 mg/kg to about 50 mg/kg, from about 0.1 mg/kg to about 50 mg/kg, from about 1 mg/kg to about 50 mg/kg, from about 0.1 mg/kg to about 40 mg/kg, from about 1 mg/kg to about 40 mg/kg, from about 0.1 mg/kg to about 30 mg/kg, from about 1 mg/kg to about 30 mg/kg, from about 5 mg/kg to about 30 mg/kg, from about 0.1 mg/kg to about 20 mg/kg,
from about 1 mg/kg to about 20 mg/kg, of subject body weight per day, one or more times a day, to obtain the desired therapeutic effect. It will also be appreciated that dosages smaller than 0.001 mg/kg or greater than 50 mg/kg (for example 50-100 mg/kg) can be administered to a subject. In certain embodiments, compounds are administered orally or parenterally.

**TREATMENT KIT**

[0309] In other embodiments, the present invention relates to a kit for conveniently and effectively carrying out the methods in accordance with the present invention. In general, the pharmaceutical pack or kit comprises one or more containers filled with one or more of the ingredients of the pharmaceutical compositions of the invention. Such kits are especially suited for the delivery of solid oral forms such as tablets or capsules. Such a kit preferably includes a number of unit dosages, and may also include a card having the dosages oriented in the order of their intended use. If desired, a memory aid can be provided, for example in the form of numbers, letters, or other markings or with a calendar insert, designating the days in the treatment schedule in which the dosages can be administered. Alternatively, placebo dosages, or calcium dietary supplements, either in a form similar to or distinct from the dosages of the pharmaceutical compositions, can be included to provide a kit in which a dosage is taken every day. Optionally associated with such container(s) can be a notice in the form prescribed by a governmental agency regulating the manufacture, use or sale of pharmaceutical products, which notice reflects approval by the agency of manufacture, use or sale for human administration.

**EQUIVALENTS**

[0310] The representative examples that follow are intended to help illustrate the invention, and are not intended to, nor should they be construed to, limit the scope of the invention. Indeed, various modifications of the invention and many further embodiments thereof, in addition to those shown and described herein, will become apparent to those skilled in the art from the full contents of this document, including
the examples which follow and the references to the scientific and patent literature cited herein. It should further be appreciated that the contents of those cited references are incorporated herein by reference to help illustrate the state of the art. Throughout this document, various publications are referred to, each of which is hereby incorporated by reference in its entirety in an effort to more fully describe the state of the art to which the invention pertains.

[0311] The following examples contain important additional information, exemplification and guidance that can be adapted to the practice of this invention in its various embodiments and the equivalents thereof.

**Exemplification**

[0312] The compounds of this invention and their preparation can be understood further by the examples that illustrate some of the processes by which these compounds are prepared or used. It will be appreciated, however, that these examples do not limit the invention. Variations of the invention, now known or further developed, are considered to fall within the scope of the present invention as described herein and as hereinafter claimed.

[0313] *1) General Description of Synthetic Methods:*

[0314] The practitioner has a well-established literature of macrolide chemistry to draw upon, in combination with the information contained herein, for guidance on synthetic strategies, protecting groups, and other materials and methods useful for the synthesis of the compounds of this invention.

[0315] The various references cited herein provide helpful background information on preparing compounds similar to the inventive compounds described herein or relevant intermediates, as well as information on formulation, uses, and administration of such compounds which may be of interest.

[0316] Moreover, the practitioner is directed to the specific guidance and examples provided in this document relating to various exemplary compounds and intermediates thereof.
[0317] The compounds of this invention and their preparation can be understood further by the examples that illustrate some of the processes by which these compounds are prepared or used. It will be appreciated, however, that these examples do not limit the invention. Variations of the invention, now known or further developed, are considered to fall within the scope of the present invention as described herein and as hereinafter claimed.

[0318] According to the present invention, any available techniques can be used to make or prepare the inventive compounds or compositions including them. For example, a variety of solution phase synthetic methods such as those discussed in detail below may be used. Alternatively or additionally, the inventive compounds may be prepared using any of a variety combinatorial techniques, parallel synthesis and/or solid phase synthetic methods known in the art.

[0319] It will be appreciated as described below, that a variety of inventive compounds can be synthesized according to the methods described herein. The starting materials and reagents used in preparing these compounds are either available from commercial suppliers such as Aldrich Chemical Company (Milwaukee, WI), Bachem (Torrance, CA), Sigma (St. Louis, MO), or are prepared by methods well known to a person of ordinary skill in the art following procedures described in such references as Fieser and Fieser 1991, “Reagents for Organic Synthesis”, vols 1-17, John Wiley and Sons, New York, NY, 1991; Rodd 1989 “Chemistry of Carbon Compounds”, vols. 1-5 and supps, Elsevier Science Publishers, 1989; “Organic Reactions”, vols 1-40, John Wiley and Sons, New York, NY, 1991; March 2001, “Advanced Organic Chemistry”, 5th ed. John Wiley and Sons, New York, NY; and Larock 1990, “Comprehensive Organic Transformations: A Guide to Functional Group Preparations”, 2nd ed. VCH Publishers. These schemes are merely illustrative of some methods by which the compounds of this invention can be synthesized, and various modifications to these schemes can be made and will be suggested to a person of ordinary skill in the art having regard to this disclosure.

[0320] The starting materials, intermediates, and compounds of this invention may be isolated and purified using conventional techniques, including filtration,
distillation, crystallization, chromatography, and the like. They may be characterized using conventional methods, including physical constants and spectral data.

[0321] Certain exemplary compounds of the invention are listed below:

[0322] As discussed herein, cancer chemotherapy traditionally relies on therapeutic agents with cytotoxic properties that inhibit tumor cell proliferation and cause cell death. Recently, the idea of targeting cell migration as an alternative strategy for the development of anti-cancer therapies has generated considerable interest.\(^1\) Intense research efforts are currently directed to the exploration of cell shape change and movement and their underlying mechanisms.\(^2\) Cell migration is involved in a number of physiological processes, including ovulation, embryonic development, tissue regeneration (wound healing), and inflammation. On the other hand, cell migration is also observed in pathological conditions such as tumor
angiogenesis, cancer cell invasion, and metastasis.\textsuperscript{3} It is believed that primary solid
tumors depend on angiogenesis (formation of new blood vessels) to obtain the
necessary oxygen and nutrient supplies for growth beyond a certain size (ca. 1-2
mm). The transition from a pre-angiogenic condition to tumor angiogenesis,\textsuperscript{4} often
referred to as the angiogenic switch, is followed by tumor growth, cancer cell
invasion, and metastasis.\textsuperscript{5} In principle, it could be possible to halt (or retard) this
processation at different stages with the help of cell migration inhibitors. Since cell
migration under ordinary physiological conditions in adults is rather infrequent, its
repression might be accompanied by manageable toxicity.

[0323] A significant part of our general research program focuses on the
development of novel, natural product-inspired anti-cancer agents. These efforts
have led to the total chemical synthesis of a number of prominent anti-tumor natural
products, such as the epothilones,\textsuperscript{6} taxol\textsuperscript{7}, and most recently, radicicol\textsuperscript{8} and TMC-95A/B.\textsuperscript{9} The recent entry of 12,13-desoxyepothilone B (dEpoB), first prepared by
total chemical synthesis, into phase II clinical trials,\textsuperscript{10} has been followed by the
discovery of a new generation of highly potent epothilone analogs.\textsuperscript{11} For the most
part, our endeavors have converged on cytotoxic agents. The possibility of
exploiting natural products as leads for the development of anti-angiogenic and anti-
metastatic agents was prompted by the recent isolation and synthesis of compounds
such as epoxyquinol A and B,\textsuperscript{12} trachyspic acid,\textsuperscript{13} azaspirene,\textsuperscript{14} evodiamine,\textsuperscript{15}
motuporamines,\textsuperscript{16} borrelidin,\textsuperscript{17} and terpestacin.\textsuperscript{18}

[0324] In particular, a series of independent reports by Imoto\textsuperscript{19} and Kosan
Bioscience researchers\textsuperscript{20} on the discovery of the natural product migrastatin (I)
enhanced our interest in this area (Scheme 16). It was reported that I, isolated from
a cultured broth of Streptomyces, has the potential of metastasis suppression through
its ability to inhibit tumor cell migration. Although the reported activity of
migrastatin in a wound healing assay was rather modest (IC\textsubscript{50} value of 29 \textmu M), we
considered it as an attractive lead compound in the search for other, more potent
agents. The structure of migrastatin (I), determined by X-ray crystal structure
analysis, features a 14-membered macrolactone with a characteristic glutarimide-
containing side chain. Embedded in the macrocycle are a trisubstituted (Z)-alkene
and two disubstituted (E)-alkenes, as well as three contiguous stereocenters. The side chain projecting from the cyclic core is associated with stereogenic centers at C13 and C14.

[0325] Upon reviewing the literature in search of glutarimide-containing natural products, prominent examples such as cycloheximide (CH1),21 streptimidone,22 and thalidomide (which has resurfaced recently as an anti-angiogenic agent despite its controversial history23) can be identified. Moreover, a number of structural homologs of migrastatin, namely lactimidomycin,24 dorrigocin A and B,20,25 isomigrastatin,20 and NK30424A/B,26 have been discovered (Scheme 16). In 1992, lactimidomycin was isolated from Streptomyces amphibiosporus and characterized by researchers at Bristol-Myers Squibb. This unique triene-containing 12-membered macrolactone antibiotic is highly cytotoxic in vitro against a number of tumor cell lines and displays in vivo anti-tumor activity in mice. In addition, lactimidomycin exhibits potent anti-fungal properties and acts as an inhibitor of DNA and protein synthesis. Two years later, the isolation of dorrigocin A and its allylic isomer dorrigocin B from Streptomyces platensis was described by researchers at Abbott Laboratories. The dorrigocins are linear polyketide carboxylic acids with a functional group arrangement closely related to migrastatin and isomigrastatin (see below), respectively. They were found to reverse the morphology of ras-transformed NIH/3T3 cells from a transformed phenotype to a normal one. Dorrigocin A was also reported to be the first natural product inhibitor of the carboxyl methyltransferase involved in Ras processing. In 2002, the dorrigocins were again isolated from Streptomyces platensis by researchers at Kosan Biosciences along with migrastatin and a new member of the family, isomigrastatin. Structurally, isomigrastatin can be described as being derived from migrastatin via an allylic transposition (C13 → C11) and a concomitant double bond isomerization. Thus, isomigrastatin is a 12-membered macrolactone with an exocyclic trisubstituted (E)-alkene. The Kosan researchers have shown that the hydrolysis of isomigrastatin leads to dorrigocin B, whereas the hydrolysis of migrastatin produces a geometric isomer of dorrigocin A. The biological profile of isomigrastatin has not been reported to date. The latest members of the glutarimide-containing macrolide family
are the natural products NK30424A and its stereoisomer NK30424B, isolated from _Streptomyces_ sp. NA30424 by researchers at Nippon Kayaku. Furthermore, four related compounds, derived from oxidation of the thioether to the sulfoxide, were detected as minor constituents in the cultured broth and were titled as NK30424AS1-2 and NK30424BS1-2. The NK compounds are formally derived from isomigrastatin by conjugate addition of cysteine to the C2-C3 double bond and hydroxylation at C17. Interestingly, these NK congeners are reported to be very potent inhibitors of lipopolysaccharide-induced tumor necrosis factor-α (TNF-α) promoter activity. To date, migrastatin is the only member of the natural product family described above in which the relative and absolute configurations have been determined. Possibly, total chemical synthesis might aid in deciphering the stereochemistry of other members of this series.

[0326] **Scheme 16. Structure of Migrastatin and Related Natural Products**

[0327] In one aspect, the present invention provides synthetic methods for preparing migrastatin and analogs thereof. The first asymmetric total synthesis of naturally occurring (+)-migrastatin (1) is described herein. Exemplary syntheses of Migrastatin analogs are also described herein. The total synthesis of 1 provides researchers (including Applicant) access to material for an independent evaluation of the biology of the natural product and with opportunities via standard medicinal
chemistry for gaining access to a broad range of structural analogs. Moreover, the present invention provides synthetic methods allowing access to a variety of Migrastatin analogs and the exploration of structural types that could not, plausibly, be accessible by chemical modification of migrastatin itself. From a practical standpoint, in vitro screening of migrastatin derivatives (e.g., in cell migration assays) may well lead to informative structure-activity relationship (SAR) profiles, conceivably assisting in the emergence of compounds with improved biological profiles for progression to in vivo models. Preliminary SAR trends are provided herein. In addition, efforts directed at target identification are expected to yield some insight into the biological mode of action of migrastatin and its congeners and analogs.

As discussed above, in one aspect, the present invention provides methods for the preparation of Migrastatin and analogs thereof. Detailed below is a synthetic approach, which resulted in an efficient and flexible total synthesis of 1. Additional guidance may be found, for example, in Gaul, C. et al.; *J. Am. Chem. Soc.* 2003, 125, 6042; Gaul, C. et al.; *J. Am. Chem. Soc.* 2004, 126(4), 1038-1040; and Gaul, C. et al.; *J. Am. Chem. Soc.* 2004, ___, __; each of which is hereby incorporated by reference in its entirety. Migrastatin having known biological activity, it was expected that its analogs would exhibit similar activity. As discussed above, however, the present invention provides the ability to synthesize various migrastatin analogs with a variety of structural features; thereby allowing one to probe and evaluate Structure-Activity Relationships trends within this class of macrocyclic compounds. Preliminary SAR studies have been reported. For example, guidance may be found in U.S. Provisional Application Nos.: 60/458,827 filed March 28, 2003 and 60/496,165 filed August 19, 2003; each of which are incorporated herein by reference. In a preliminary study, a few migrastatin analogs which were evaluated in both tube formation and wound healing assay (See Example 52 and Tables 1 and 2). In addition to two analogs closely structurally related to migrastatin (i.e., N-Methyl-migrastatin and 2,3-Dihydromigrastatin (41)), the question of how the migrastatin C-13 side chain might impact activity was investigated (cf. Migrastatin-Core (45)). One advantage of this type of compounds lies in the
simplicity of their structure; They are therefore easier to synthesize, less costly and more amenable to large scale preparation. Compound 45, along with the other two migrastatin analogs were thus subjected to the aforementioned assays. A chamber cell migration assay was also proposed that could be used to screen and identify migrastatin analogs exhibiting cell migration inhibitory activity (See Example 52 and Table 3). Preliminary results are summarized in Tables 1-3 below.

**Based on the aforementioned preliminary biological data, and without wishing to be bound to any particular theory, we proposed that “truncated” migrastatin analogs (i.e., analogs lacking the side chain at C-13, or having a significantly shorter side chain at C-13) may exhibit improved therapeutic activity. For example, compounds such as those having the general structures depicted below were expected to show good activity as cell migration inhibitors and/or angiogenesis inhibitors:**
wherein \( n \) and \( R_3-R_6 \) are as defined in classes and subclasses herein; and \( Y_1 \) and \( Y_2 \) are independently hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or \(-WR^{Y_1}\); wherein \( W \) is independently \(-O-, -S-\) or \(-NR^{Y_2}-\), wherein each occurrence of \( R^{Y_1} \) and \( R^{Y_2} \) is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or \( Y_1 \) and \( Y_2 \) together with the carbon atom to which they are attached form a moiety having the structure:

\[
\begin{align*}
\text{OR}_1 & \quad \text{NR}_2 \\
\text{OR}_2 & \quad \text{NR}_3 \\
\text{OR}_3 & \quad \text{NR}_4 \\
\text{OR}_4 & \quad \text{NR}_5 \\
\text{OR}_5 & \quad \text{NR}_6
\end{align*}
\]

[0333] In order to evaluate this hypothesis further, additional analogs were synthesized and tested. Compounds were tested in chamber cell migration, cell proliferation and wound healing assays (see Examples 53, 55 and 56, respectively), results of which confirmed our initial hypothesis. Cell migration inhibitory activity of compounds of the invention was evaluated with 4T1 mouse breast tumor cells in chamber cell migration and wound healing assays. The highly aggressive and invasive 4T1 cells are routinely used as model for evaluating test compounds for the treatment of human breast cancer, because the progressive spread of 4T1 cells to lymph nodes, lungs and other organs can be seen to mimic metastasis of human mammary cancer.
In the wound healing assay, standard scratches (i.e., wounds) were made through a confluent 4T1 cell layer. In the absence of serum, cells would not migrate across the empty space created by application of the scratch. Upon addition of serum containing migration-enabling factors, migration of 4T1 cells across the scratch was induced. Exposure to these cells to inventive compounds allowed the evaluation of the cell migration inhibitory activity of these compounds. For example, as seen in Figure 6C, 2,3-dihydro migrastatin (48) almost completely inhibited cell migration across the scratch, while the effect of migrastatin (1) at the same concentration (200μM) was not as great (See, Figure 6D).

Compounds were also subjected to mouse stability studies. As expected, macro lactone-type compounds showed lesser stability in mouse plasma than their macro lactam or macro ketone counterparts (See, for example, stability data obtained for macro lactone compounds 45 and 48, versus that obtained for macro lactam 55 and macro ketone 60 (i.e., the lactone functionality is more vulnerable to esterase hydrolysis).

Finally, compounds showing very good in vitro activity (e.g., chamber 4T1 and HUVEC cell migration assay) were tested in vivo in a mouse breast cancer model (See Example 57 and Figure 4). Macro ketone 60 administered at 10 mg/kg exhibited ~94% inhibition of lung metastasis. Administration of 20 mg/kg of macro ketone 60 resulted in ~99% inhibition of lung metastasis. Similarly, Administration of 10 mg/kg and 20 mg/kg of macro lactam 55 resulted in ~91% inhibition of lung metastasis. The in vivo data confirmed the in vitro findings, thereby validating the in vitro assays described herein as good predictors of therapeutic activity in vivo.

The present invention also provides a preparation and biological evaluation of an extended, diverse set of migrastatin analogs which led to the discovery of highly potent cell migration inhibitors.

Exemplary Synthetic Approach. It was particularly desirable to devise a concise, flexible, and readily scaleable synthesis, since it would remain for synthesis to fuel an aggressive SAR elucidation program and to provide significant quantities of materials for in vivo studies. This is in keeping with the notion that
total synthesis was viewed as a first milestone of the project, rather than as an end-
point. In doing so, several structural features were considered and evaluated. For
example, the (E)-configuration of the C2-C3 and C6-C7 double bonds, and the (Z)-
configuration of the C11-C12 double bond of the trienic lactone are important
features of the migrostatin core. Moreover, maintaining tight stereocontrol over the
dispositions of the stereogenic centers at C8, C9, C10, and C13 was significant. In
addition, the introduction of the side-chain projecting from C13 and the inclusion of
the stereocenter at C14, which is not part of the ring structure, were equally
important aspects of a successful synthesis of the migrostatin target, as were the
incorporation of the C15 keto group as well as the 8-substituted glutarimide at C18.

[0339] In one embodiment, a synthetic approach that embraces these structural
issues is presented in Scheme 17. As depicted in Scheme 17, a retrosynthetic
analysis is based on components 2, 3, 4, 5, and 6. The (E)-geometric character of
the C2-C3 double bond could be secured via reliance to the known compound 6.
An important feature of this synthesis would be the use of aldehyde 2, bearing the
methoxy-substituted stereogenic center, ultimately to be ensconced at C8. Another
important building block would be diene 3. This type of synergistically activated,
dibranched, bisoxygcnated butadiene was part of our all-carbon Diels-Alder research
in the mid 1970's.29 Indeed, in the 1980's this type of diene was used in the context
of our LACDAC chemistry to create dihydropyrans.30 The aldehyde in this case
would be the previously discussed 2. Appropriate disconnection of the pyran would
expose the four carbon segment comprising C10 through C13. The two methyl-
branching elements of 3 would appear at C10 and C12 in migrostatin following
appropriate manipulations. At the outset, the precise nature of the R function in keto
building block 4 awaited specification. A decisive criterion for various candidate
structures that might be contemplated would be their amenability to linkage to the
emerging C13 in the context of macrolactone formation, while enabling smooth
incorporation of the 8-branched glutarimide. We note that the sum of fragments 2
and 6 contains two carbons in excess of those required for formation of the 14-
membered macrolactone. Such a disconnection invited the prospect of establishing
this lactone through a ring-closing metathesis (RCM) reaction with extrusion of the
two seemingly extraneous carbon centers. A more detailed analysis of synthetic issues appears in the context of the next section, in which we describe the implementation of the broad plan.

[0340] Scheme 17. Exemplary Strategy for the Assembly of Miglystatin

[0341] Model Study. It seemed prudent to assess, in the context of a model study, the feasibility of RCM to construct the 14-membered ring of miglystatin (Scheme 18). In this connection, we would also address the stereoselectivity (geometry of the C6-C7 double bond) and chemoselectivity (undesired RCM-participation of the C2-C3 and C11-C12 double bonds) of the ring-closing reaction. Such questions were to be first posed in a study directed to the synthesis of the miglystatin core structure lacking the glutarimide-containing side chain. Since we were concerned about the stability, stereochemical integrity, and potential volatility of the previously unknown α-methoxy-α-vinyl aldehyde 2 (Scheme 17) contemplated for the LACDAC reaction, we began, in this testing phase, with the structurally less challenging heterodienophilic siloxy-aldehyde 8 (Scheme 18). This compound was prepared from commercially available (S)-3-benzyloxy-1,2-propanediol 7 in four securely precedented steps. The sterically demanding TBDPS protecting group was deliberately chosen with a view toward suppressing a possible β-chelation pathway relative to the desired α-chelation mode in the LACDAC sequence. Earlier research from Reetz provided a suggestion that oxygen chelation effects in the control of diastereofacial reactions are suppressed in bulky silyl ether settings.

[0342] Indeed, as intended, reaction of aldehyde 8 and diene 3 under the influence of TiCl₄ yielded the α-chelation controlled product 9 (Scheme 18). Treatment of dihydroxyprone 9 with NaBH₄ and CeCl₃·7H₂O (Luche reduction) led to the corresponding 1,2-reduced compound, which underwent a Ferrier
rearrangement\textsuperscript{37} in aqueous acidic THF to produce lactol 10, with the desired (Z)-olefin now in place. Reductive opening of lactol 10 with LiBH\textsubscript{4} afforded diol 11 in 55% overall yield from dihydropyrone 9. The primary hydroxyl group of 11 was selectively acylated with 2,6-heptadienoyl chloride 12\textsuperscript{38} and, thereafter, the secondary hydroxyl group in the acylation product was protected as its MOM ether.

\textbf{Scheme 18. A Model Study: Synthesis of the Migrastatin Core 15\textsuperscript{2}}

\[ \text{Reagents and conditions: (a) (i) TBDPSCI, imidazole, DMF, rt, (ii) MeI, NaH, THF, rt, (iii) H\textsubscript{2}, Pd(OH)\textsubscript{2} \cdot H\textsubscript{2}O, EtOAc, rt, (iv) (COCl)\textsubscript{2}, Et\textsubscript{3}N, DMSO, CH\textsubscript{2}Cl\textsubscript{2}, −78 °C to rt, 66%; (b) (i) TiCl\textsubscript{4}, CH\textsubscript{2}Cl\textsubscript{2}, −78 °C, (ii) TFA, CH\textsubscript{2}Cl\textsubscript{2}, rt, 79%; (c) (i) NaBH\textsubscript{4}, CeCl\textsubscript{3} \cdot 7H\textsubscript{2}O, EtOH, 0 °C, (ii) CSA, H\textsubscript{2}O, THF, reflux; (d) LiBH\textsubscript{4}, H\textsubscript{2}O, THF, rt, 55% from 9; (e) (i) DMAP, CH\textsubscript{2}Cl\textsubscript{2}, rt, (ii) MOMCl, Bu\textsubscript{3}NI, 1-Pr\textsubscript{2}NEt, CH\textsubscript{2}Cl\textsubscript{2}, rt, 57%; (f) (i) HF-pyridine, THF, rt, (ii) Dess-Martin periodinane, CH\textsubscript{2}Cl\textsubscript{2}, rt, (iii) Tebbe reagent, pyridine, THF, −78 °C to −10 °C, 54%; (g) Grubbs-II catalyst 16 (20 mol%), toluene (0.5 mM), reflux, 50%).}

The RCM precursor 14 was reached from 13 through a three step sequence, consisting of deprotection, oxidation, and Tebbe olefination.\textsuperscript{39} When tetraene 14 was subjected to the action of Grubbs catalyst 16\textsuperscript{40} (see structures below) in refluxing toluene,\textsuperscript{41} the 14-membered macrolactone 15 was generated as the desired (E)-congener in 50% yield. Competitive participation of the electron-poor C2-C3 double bond and the sterically hindered C11-C12 double bond in the metathesis step could not be detected. Interestingly, treatment of 14 with Grubbs-I catalyst 17 in refluxing CH\textsubscript{2}Cl\textsubscript{2} led exclusively to the dimeric product derived from cross metathesis of the terminal double bond of the acyl moiety.
[0346] **Synthesis of Intermediate 26.** The model study demonstrated the efficacy of the LACDAC sequence to construct the three stereocenters C8-C10 and the power of RCM to establish the macrocyclic system. Encouraged by these early results, we embarked on the total synthesis of migrastatin itself. Prior to facing the unresolved issues of building up the remaining stereocenters at C13 and C14 in the context of emplacement of the glutarimide moiety, we addressed an issue of process, asking the question whether α-methoxy-α-vinyl aldehyde 2 might indeed serve as a suitable heterodienophile in the reaction with diene 3 after all. Utilization of aldehyde 2 in the LACDAC reaction would allow us to streamline the synthesis in a most useful way by avoiding the chemistry needed to incorporate the C6-C7 double bond required for RCM.

[0347] Happily, we could gain an excellent entry into this type of aldehyde, starting from commercially available dimethyl 2,3-O-isopropyldiene-L-tartrate 18 (Scheme 19). Toward this end, tartrate 18 was reduced by DIBALH to the corresponding dialdehyde, which was then reacted in situ with divinylzinc to afford carbinol 19 in a highly stereoselective fashion. Dimethylation and cleavage of the acetonide protecting group with aqueous acid furnished 1,2-diol 20 in excellent yield. The desired α-methoxy-α-vinyl aldehyde 2 emerged following cleavage of the glycol linkage of 20. Importantly, no attempts were undertaken to isolate 2 in neat form. Instead, a stock solution of the aldehyde as obtained from the glycol cleavage was directly used for the LACDAC sequence. We were rather encouraged to find that the α-chelation-controlled cyclocondensation of 2 with butadiene 3 occurred in very good yield, producing dihydropyrone 21 as the only detected diastereomer. Compound 21 not only possesses the three contiguous stereocenter of the macrolide, but it also serves as a template for the construction of the trisubstituted C11-C12 (Z)-alkene (Scheme 20). From a process standpoint, it is
noteworthy that only two chromatographic purifications were needed to obtain pure 21, rendering the sequence amenable to scale-up.

\]

\[a\] Reagents and conditions: (a) DIBALH, then ZnCl\(_2\), H\(_2\)C=CHMgBr, toluene, \(-78\) °C to rt, 75% (ds > 90%); (b) (i) MeI, NaH, DMF, rt, (ii) 2M HCl, MeOH, reflux, 80%; (c) Pb(OAc)\(_4\), Na\(_2\)CO\(_3\), CH\(_2\)Cl\(_2\), 0 °C to rt; (d) (i) TiCl\(_4\), CH\(_2\)Cl\(_2\), \(-78\) °C, (ii) TFA, CH\(_2\)Cl\(_2\), rt, 87% from 20.

[0350] Transformation of dihydropyrones 21 into open-chain diol 25 was accomplished as described for our model study (Scheme 18) using a reduction-Ferrier rearrangement-reductive ring-opening protocol (Scheme 20). Initially, we followed the Luche procedure for the reduction of enones to effect the conversion of 21 to 22. Subsequently, we found that the addition of cerium salts was not needed in our case. In fact, all the reductants screened led exclusively to 1,2-reduction. In the end, LiBH\(_4\) turned out to be the reducing agent of choice based on its associated ease of handling and workup. When alcohol 22 was subjected to catalytic amounts of camphorsulfonic acid (CSA) in refluxing aqueous THF, the desired Ferrier-rearranged product 23 was obtained, together with small amounts of dimeric acetal 24. It is appropriate to note that there are few examples of aqueous Ferrier rearrangements reported in the literature,\(^4\) whereas variants using alcohol-based nucleophiles are widely encountered. Reductive opening of lactol 23 with LiBH\(_4\) afforded diol 25 in 53% overall yield (from dihydropyrone 21). In investigating the preparative aspects of the sequence 21 \(\rightarrow\) 25, we realized that larger amounts of 24 (ca. 15%) were isolated when the Ferrier rearrangement was conducted at higher concentrations (0.3M instead of 0.1M). Happily, we were able to obtain single crystals of dimer 24. X-Ray analysis led to a decisive structural verification,\(^4\) revealing the relative configuration of the three contiguous stereocenters and the
geometry of the double bond to be as predicted on the basis of our precedents. By extension, this X-ray analysis also confirms the structure of diol 25.

A next step in this synthesis of migrastatin involved differentiation of the two hydroxyl groups of 25. Previously, we had accomplished this sub-goal via a three step sequence, namely acetylation of the primary hydroxyl group, silylation of the secondary hydroxyl group, and subsequent removal of the acetate protecting group. However, during scale-up efforts, we observed the formation of considerable amounts of diacetylated product. This obstacle complicated purification procedures and lowered the overall yield of the sequence. Fortunately, the problem could easily be solved by initial disilylation, followed by a mild and selective deprotection, producing allylic alcohol 26 in 80% yield (Scheme 20).

Scheme 20. Synthesis of Intermediate 26.a

Reagents and conditions: (a) LiBH₄, MeOH, THF, −10 °C; (b) CSA, H₂O, THF, reflux; (c) LiBH₄, H₂O, THF, rt, 53% from 21; (d) (i) TBSOTf, 2,6-lutidine, CH₂Cl₂, rt, (ii) HOAc, H₂O, THF (3:1:1), rt, 80%.

Incorporation of the Glutarimide-Containing Side Chain. A straightforward way to construct the two remaining stereocenters at C13 and C14 could, in principle, be accomplished by an anti-selective aldol reaction between an aldehyde derived from 26 and an appropriate propionyl fragment. Indeed, Dess-Martin oxidation of 26 generated angelic-type aldehyde 27 (Scheme 21). Fortunately, 27 proved to be notably resistant to (Z) → (E)-double bond
isomerization or vinylogous epimerization, and, accordingly, could serve as a potential substrate in the projected aldol construction. In our early studies, we explored Masamune's anti-aldol protocol, which utilizes a boron enolate of readily available norephedrine derivatives.\textsuperscript{47} This aldol reaction indeed worked smoothly with aldehyde 27. Nonetheless, we were particularly drawn to a mild MgCl\textsubscript{2}-catalyzed anti-aldol procedure that had recently been disclosed by Evans.\textsuperscript{48} In practice, aldehyde 27 reacted with propionyl oxazolidinone 28 in the presence of MgCl\textsubscript{2}, triethylamine, and TMSCl to afford, after treatment with TFA, the desired aldol adduct 29 in 67% yield as a single diastereomer. Noteworthy, the robust reaction conditions, which tolerate the use of reagent-grade ethyl acetate and high substrate concentrations, are attractive features for scale-up purposes. Since the next step of the projected total synthesis was the protection of the C13 hydroxyl group as a TES ether, we tried to accomplish the anti-aldol joining with TESCl instead of TMSCl. Unfortunately, the reaction was very slow under these conditions, and the yields were far from satisfactory. Hence, we had to protect the secondary hydroxyl group with TESCl in a separate step (29 $\rightarrow$ 30) (Scheme 21).

Having successfully merged three of our five components, we focused now on attaching glutarimide aldehyde 5 to the main fragment. A Horner-Wadsworth-Emmons (HWE) reaction between $\beta$-ketophosphonate 32 and aldehyde 5 appeared to be a plausible, attractive solution to this synthetic problem (Scheme 21). Toward this end, we investigated the direct addition of lithiated dimethyl methylphosphonate to imide 30 to access the desired phosphonate 32 in a single transformation. Unfortunately, this projected (but unprecedented) transformation met with no success, resulting in recovery of starting material.\textsuperscript{49} Accordingly, the chiral auxiliary was removed reductively (30 $\rightarrow$ 31). Progress continued with a simple and reliable three step oxidation-addition-reoxidation protocol, cleanly affording phosphonate 32. Glutarimide aldehyde 5,\textsuperscript{50} the fourth component in our synthetic plan, was then treated with phosphonate 32 using the Masamune-Roush variant of the HWE reaction.\textsuperscript{51} Enone 33 was obtained as a single olefin isomer in excellent yield (Scheme 21). Fortunately, neither this reaction nor any of the subsequent transformations required protection of the glutarimide nitrogen.
Conjugate reduction of enone 33 with the Stryker reagent\textsuperscript{52} and cleavage of the TES protecting group occurred smoothly to give alcohol 34. At this stage, the path was clear for introduction of our last component, 2,6-heptadienoic acid 6.

[0356] **Scheme 21.** Incorporation of the Side Chain by an Anti-Aldol Reaction and a HWE coupling\textsuperscript{a}

\[ \text{Reagents and conditions: (a) Dess-Martin periodinane, CH}_2\text{Cl}_2, \text{rt; (b) (i) MgCl}_2, \text{Et}_3\text{N, TMSCl, EtOAc, rt; (ii) TFA, MeOH, rt, 67\% from 26; (c) TESCl, imidazole, CH}_2\text{Cl}_2, \text{rt; (d) LiBH}_4, \text{MeOH, THF, rt, 83\% from 29; (e) (i) Dess-Martin periodinane, CH}_2\text{Cl}_2, \text{rt, (ii) dimethyl methylphosphonate, BuLi, THF, }-78^\circ\text{C to 0 }^\circ\text{C, (iii) Dess-Martin periodinane, CH}_2\text{Cl}_2, \text{rt; (f) LiCl, DBU, MeCN, rt, 57\% from 31; (g) (i) [(Ph}_3\text{P)}CuH]_n, toluene, rt, (ii) HOAc, H}_2\text{O, THF (3:1:1), rt, 82\%.}

[0358] **Completion of a Total Synthesis of Migrastatin.** In our planning stages, we presumed that acylation of secondary alcohol 34 with acid 6 would be straightforward. Unexpectedly, a number of acylation conditions had to be explored to accomplish the desired transformation effectively. Only after several trial attempts did we find that a modified Yamaguchi acylation protocol\textsuperscript{53} (using pyridine instead of DMAP) provided satisfying yields of acylated product 35 (Scheme 22). Most other standard ester formation protocols (a: acid chloride + DMAP, pyridine, or AgCN, b: acid + EDC or DCC, c: acid + Mukaiyama reagent,\textsuperscript{54} d: Keck coupling\textsuperscript{55}) led to either decomposition of starting material or an inseparable product.
mixture of 35 and β,γ-unsaturated ester 36 (Scheme 22). The latter presumably arose from acylation of 34 with the vinylketene derived from 6 upon activation of the acyl group. Attempts to isomerize the C3-C4 double bond of 36 back into conjugation resulted in loss of the carboxylic acid fragment, apparently through a β-elimination pathway.

[0359] Scheme 22. Acylation of Alcohol 34 by a Modified Yamaguchi Procedure

\[34 \xrightarrow{\text{β,γ-unsaturated ester of 6}} 35\]

\[34 \xrightarrow{\text{other standard coupling conditions}} 35 + 36\]

\[\text{DBU, MeCN} \xrightarrow{\beta\text{-elimination product}} \]

[0360] Reagents and conditions: (a) 2,4,6-trichlorobenzoyl chloride, i-Pr2NEt, pyridine, toluene, rt, 67%.

[0361] With RCM precursor 35 now available, we were positioned to investigate the cyclization reaction (Scheme 23). In the event, the ring-closing metathesis conditions employed in our model system (Scheme 18) also sufficed nicely for the case at hand, delivering macrolactone 37 in a highly (E)-selective fashion in 69% yield. This corresponds to an increase in yield by almost 20% compared to our model studies! Finally, removal of the TBS protecting group by buffered hydrogen fluoride completed the total synthesis of (+)-migrastatin (1), whose physical data (NMR, MS, optical rotation) matched those of migrastatin isolated from natural sources.

[0362] Scheme 23. RCM and Deprotection Leading to (+)-Migrastatin (1)
[0363] Reagents and conditions: (a) Grubbs-II catalyst 16 (20 mol%), toluene (0.5 mM), reflux, 69%; (b) HF-pyridine, THF, rt, 85%.

[0364] Design, Chemical Synthesis, and Evaluation of Migrastatin Analogs. Having achieved our initial objective, a total synthesis of migrastatin, we could take full advantage of our flexible multi-component synthesis for the subsequent preparation of a variety of analogs. As will be evident, our modular approach served as an excellent platform from which to quickly explore the SAR profile of migrastatin and assess the anti-metastatic potential of the migrastatin family.

[0365] In certain embodiments, our approach with respect to searching for, preparing, and evaluating migrastatin derivatives as to improved cell migration inhibition properties, comprised three distinct steps: design, chemical synthesis, and biological evaluation. In certain embodiments, the design of migrastatin analogs was aimed at probing the different regions of migrastatin for their contributions to biological activity. Certain regions of the molecule that we initially considered important and accessible by synthesis are highlighted in gray below. These regions were targeted for derivatization.

[0366] In certain embodiments, the selection was driven by the following considerations: The glutarimide moiety is a characteristic functional feature of migrastatin, and might be indispensable for activity. The C2-C3 conjugated double bond is a potential site for deactivation by 1,4-addition of nucleophiles (e.g. thiols, confer the natural products NK30424A/B in Scheme 16), or on the contrary, could render migrastatin a suicide inhibitor by covalent bond formation with bionucleophiles present in the active site of an enzyme. The lactone functionality
could possibly be a target of hydrolysis in living systems. As such, manipulation of the ester bond might enhance the in vivo stability of the molecule. Furthermore, the C6-C12 portion of migrastatin is highly functionalized, and thus, might have biological relevance. One simple way of exploring this region is through derivatization of the C9 hydroxyl group.

[0367] The chemical synthesis of migrastatin analogs was accomplished in an efficient manner by utilizing the concept of diverted total synthesis (DTS). We put to advantage certain intermediates of the migrastatin synthesis, such as 26 and 34 (Schemes 20 and 21), as branching points to rapidly assemble a chemically diverse set of migrastatin derivatives. In keeping with the unique capabilities of diverted total synthesis, we focused on target structures that would not have been accessible through manipulations of the natural product itself or through biosynthetic pathways.

[0368] The biological evaluation of the compounds (in terms of their ability to inhibit cell migration) was accomplished in a Boyden chamber cell migration assay. In this assay, mouse breast tumor cells (4T1 cells) or endothelial cells (HUVECs) are seeded on the upper chamber of a transwell insert. Growth factor-containing serum is added to the lower chamber. After incubation for 6-8 hours in the presence of different concentrations of our analogs, cells that migrated from the upper chamber through the membrane to the lower compartment are counted. Additionally, some of the more potent compounds were tested for their effect on cell proliferation and metabolic stability in mouse plasma. The study helped provide a broad SAR picture with respect to migrastatin analogs.

[0369] In certain embodiments, synthetic studies towards the preparation of chemically diversified migrastatin analogs commenced with the synthesis of 2,3-dihydromigrastatin 41 and N-methylated 2,3-dihydromigrastatin 42. Secondary alcohol 34 (Scheme 21), an advanced intermediate involved in the exemplary migrastatin synthesis described herein, was acylated with 6-heptenoyl chloride 38 to deliver RCM precursor 39 (Scheme 24). As expected, acylation proceeded smoothly, without the use of the reaction conditions utilized for the acylation of 34 with 2,6-heptadienoic acid 6 (Scheme 22). Compound 39 was cyclized to
macrolactone 40 by a very efficient (E)-selective RCM. Cleavage of the TBS ether with HF•pyridine yielded our first analog, 2,3-dihydromigrastatin 41. Alternatively, compound 41 was prepared directly from migrastatin by regioselective reduction using the Stryker reagent (Scheme 24). The yield of the direct transformation, however, was compromised by the formation of a side product that arose from an intramolecular aldol addition of the transient copper enolate to the C15 ketone. Methylation of the glutarimide nitrogen was accomplished by treatment of 41 with MeI and Cs₂CO₃ in acetone, delivering methylated 2,3-dihydromigrastatin 42 in excellent yield.

[0370] The first set of compounds - migrastatin, together with its analogs 41 and 42 - was then evaluated in the chamber cell migration assay. The IC₅₀ value for fully synthetic migrastatin with 4T1 tumor cells was 29 µM (Table 4); this result was in excellent agreement with that reported by Imoto for migrastatin obtained from natural sources. Interestingly, reduction of the C2-C3 double bond and methylation of the glutarimide nitrogen were well tolerated with respect to maintenance of activity. Analogs 41 and 42 are actually slightly more potent than migrastatin itself, with IC₅₀ values of 10 µM and 7 µM, respectively (Table 4).

[0371] Scheme 24. Preparation of Migrastatin Analogs 41 and 42

[0372] a Reagents and conditions: (a) 6-heptenoyl chloride 38, DMAP, CH₂Cl₂, rt, 69%; (b) Grubbs-II catalyst 16 (20 mol%), toluene (0.5 mM), reflux, 79%; (c) HF•pyridine, THF, rt, 81%; (d) MeI, Cs₂CO₃, acetone, 85%.

[0373] The small change in inhibitory activity upon alkylation of the glutarimide moiety encouraged us to undertake a more drastic structural modification of the
migrastatin skeleton. Toward this end, analogs were synthesized lacking the entire glutarimide-containing side chain, namely migrastatin core 45 and the corresponding reduced version 48 (Scheme 25). Starting from advanced intermediate 26 (Scheme 20), derivatives 45 and 48 were quickly assembled via the already established acylation-RCM-deprotection sequence. While the reaction of 26 with 2,6-heptadienoic acid 6 produced acylated product 43 in only moderate (48%) yield, the acylation steps in the ‘dihydro series’ occurred smoothly, affording 46 in 82% yield. The same trend was observed for the subsequent transformation, in which the ring closure was achieved in excellent (76%) yield for the saturated case (46 → 47). By contrast, the unsaturated core was delivered in lower (55%) yield (43 → 44). Finally, protecting group removal delivered macrolactones 45 and 48 without complications.

Scheme 25. Synthesis of Migrastatin Core 45 and Macrolactone 48

Reagents and conditions: (a) 2,6-heptadienoic acid 6, 2,4,6-trichlorobenzoyl chloride, i-Pr2NEt, pyridine, toluene, rt, 48%; (b) Grubbs-II catalyst 16 (20 mol%), toluene (0.5 mM), reflux, 55% (44), 76% (47); (c) HF-pyridine, THF, rt, 66% (45), 94% (48); (d) 6-heptenoyl chloride 38, DMAP, CH₂Cl₂, rt, 82%.

In other embodiments, scale-up studies were carried out to establish the applicability of the exemplary synthesis described herein to the preparation of migrastatin and analogs thereof in sufficient quantities for biological evaluation in animal models. For example, variation of the RCM parameters for a potential large scale preparation of the macrocycles were evaluated. The original reaction conditions called for 20 mol% catalyst at 0.5 mM concentration, but as illustrated for the cyclization of 46 to 47 (Scheme 26), the RCM product could be obtained in just
slightly reduced yield by conducting the reaction with 10 mol% catalyst at 5 mM concentration.

[0378] Upon examination of compounds 45 and 48 in the cell migration assay, we achieved, to our great surprise, a major breakthrough in potency (Table 4). The IC_{50} values for migrastatin core 45 and macrolactone 48 were found to be 22 nM and 24 nM, respectively. This translates into an increase in activity by three orders of magnitude compared to migrastatin! This appears to lead to the conclusion that the migrastatin side chain may not be required for in vitro inhibition of tumor cell migration. However, it remains to be determined if migrastatin and core analogs 45 and 48 are indeed directed at the same cellular targets.

[0379] Another potential interesting site of derivatization of the migrastatin structure is the C6-C12 region with its two double bonds, three stereocenters, and two heteroatoms. An easy way of derivatizing this portion of the molecule was found to be the acylation or oxidation of the C9 hydroxyl group, producing macrolactones 49 and 50, respectively (Scheme 27). As shown in Table 4, the inhibitory activity of analogs 49 and 50 was reduced by roughly an order of magnitude, compared to macrolactone 48, indicating that the C9 position is sensitive toward modification.

[0380] Scheme 27. Modification of Macrolactone 48 at the C9 position and Hydrolysis of 48^a

---

^a Additional information or footnote related to the modification or hydrolysis process.
[0381] *Reagents and conditions: (a) AcCl, DMAP, CH₂Cl₂, rt, 76%; (b) Dess-Martin periodinane, CH₂Cl₂, rt, 72%; (c) 0.5M NaOH, MeOH, rt, 77%.

[0382] Starting from our lead compound migrastatin, we were able to reach simplified congeners/analogs with drastically improved inhibitory activities, in particular macrolactones 45 and 48. In anticipation of subsequent in vivo evaluation of these compounds and others, preliminary metabolic stability studies were carried out. Without wishing to be bound to any particular theory, based on our experiences from the epothilone program,⁵⁶ we propose that the ester bond of the macrolactones may be susceptible to ring opening by esterases in mouse (or human) plasma. Such hydrolysis would presumably lead to a loss in compound activity. Accordingly, mouse blood plasma stability of migrastatin and novel analogs 41, 42, 45, and 48 was evaluated. As summarized in Table 5, migrastatin and side chain-containing derivatives 41 and 42 were completely inert toward lactone opening over the full test period (one hour). However, the most active compounds, macrolactones 45 and 48, were hydrolyzed rapidly (Table 5). These findings are not entirely surprising, considering that the ester bonds in 45 and 48 are sterically less congested relative to those in the other analogs. As a test of the ‘deactivation hypothesis’, the hydrolysis product of macrolactone 48 was prepared (Scheme 27) and tested for its activity against tumor cell migration. Surprisingly, compound 51 was not completely inactive in the chamber assay, but retained a good part of its activity (IC₅₀ value of 378 nM). Therefore, compound 48 might be effective in the projected in vivo models despite its sensitivity toward hydrolysis. Nevertheless, the data on the unsatisfactory metabolic stability of 45 and 48 influenced us, when we entered the second phase of our analog program. The aspiration of reaching migrastatin congeners and/or analogs with enhanced plasma stability and retained or improved activity (compared to 45 or 48) led to the diverted total synthesis of macrolactam 55, macroketone 60 (Scheme 28), and the sterically hindered macrolactones 65 and 68 (Scheme 29).

[0383] The synthesis of analogs 55, 60, 65, and 68 diverged from the original route to migrastatin at the stage of the advanced intermediate 26. For the preparation of lactam 55, alcohol 26 was subjected to Mitsunobu conditions with
DPPA affording allylic azide 52 in 87% yield (Scheme 28). To avoid double bond isomerization of the (Z)-allylic system, azide 52 was immediately reduced following the Staudinger protocol and subsequently joined with 6-heptenoic acid under standard peptide coupling conditions. The resulting product, amide 53, was treated with RCM catalyst 16 under our established reaction conditions, delivering lactam 54 in 60% yield. The latter was then deprotected with HF-pyridine to afford lactam 55.

The preparation of ketone 60 required the conversion of alcohol 26 into allylic bromide 56, which was displaced by β-ketosulfone 57 (Scheme 28). Subsequent reductive removal of the sulfone group yielded RCM precursor 58. The ring closure of 58 to the carbocycle was accomplished, again, very efficiently and selectively by RCM. The desired macroketoone 60 was obtained following deprotection of 59.

Scheme 28. Synthesis of Macrolactam 55 and Macroketone 60°

Reagents and conditions: (a) DPPA (diphenylphosphoryl azide), DBU, toluene, rt, 87%; (b) (i) PPh₃, H₂O, THF, 70 °C, (ii) 6-heptenoic acid, EDC, i-Pr₂NEt, CH₂Cl₂, rt, 92%; (c) Grubbs-II catalyst 16 (20 mol%), toluene (0.5 mM), reflux, 60% (54), 81% (59); (d) HF-pyridine, THF, rt, 81% (58), 90% (60); (e) CBr₄, solid supported PPh₃, CH₂Cl₂, rt; (f) (i) β-ketosulfone 57, DBU, toluene, rt, (ii) Na/Hg, Na₂HPO₄, MeOH, rt, 61% from 26.

The synthesis of isopropyl macrolactones 65 and 68 also commenced from alcohol 26 (Scheme 29). Oxidation of 26 generated the corresponding (Z)-enal which was then treated with i-PrMgCl. When the nucleophilic addition was carried out in THF, an equimolar mixture of the desired addition products 61/62 (3:2 ratio) and the reduced product 26 was obtained. It is well documented in the literature that
addition of isopropyl-Grignard reagents to hindered substrates competes with reduction through hydride delivery from the nucleophile.\textsuperscript{58} Fortunately, the product ratio could be improved by changing the solvent from THF to Et\textsubscript{2}O. The reduction pathway was almost completely suppressed by slow addition of \textit{i}-Pr\textit{MgCl} to a solution of the aldehyde in Et\textsubscript{2}O, while carefully maintaining the reaction temperature at −78 °C for several hours. Diastereomers 61 and 62 were derivatized as their (S)-MPA and (R)-MPA esters (MPA = α-methoxyphenylacetic acid) and analyzed by NMR, leading to the assignment of the newly created stereocenter.\textsuperscript{59} Major isomer 61 has the ‘unnatural’ (S)-configuration and minor isomer 62 has the ‘natural’ (R)-configuration. In addition, the results of the NMR experiment were probed by a degradation study. We were able to transform compound 31 (Scheme 21), a synthetic intermediate of the total synthesis of migrastatin, into minor isomer 62, thereby delivering convincing proof for the correctness of the configurational assignment. The transformation was accomplished by converting alcohol 31 into its tosylate, reducing the tosylate with LiAlH\textsubscript{4},\textsuperscript{60} and removing the TES protecting group. For the preparation of lactones 65 and 68, the addition products 61 and 62 were separated and independently acylated (Scheme 29). Intermediates 63 and 66 were then subjected to our RCM conditions, furnishing the macrocycles 64 and 67 in very good yield. Deprotection occurred smoothly and provided the diastereomeric isopropyl lactones 65 and 68.

[0388] Scheme 29. Synthesis of the Diastereomeric Isopropyl Macrolactones 65 and 68\textsuperscript{a}
Reagents and conditions: (a) (i) Dess-Martin periodinane, CH₂Cl₂, rt, (ii) i-PrMgCl, Et₂O, −78 °C, 86% (3:2-mixture of 61 and 62); (b) (i) TsCl, pyridine, THF, rt, (ii) LiAlH₄, Et₂O, rt, (iii) HOAc, H₂O, THF (3:1:1), rt, yield not determined; (c) 6-heptenoic acid, 2,4,6-trichlorobenzoyl chloride, i-PrN₃, pyridine, toluene, rt, 75% (63), 70% (66); (d) Grubbs-II catalyst 16 (20 mol%), toluene (0.5 mM), reflux; (e) HF-pyridine, THF, rt, 65% (65 from 63), 66% (68 from 66).

Indeed, lateral modification of the vulnerable ester bond of macrolactones 45 and 48 for more robust entities led to the desired effect of enhanced metabolic stability in all four cases: Macrolactam 55, macroketone 60, and isopropyl macrolactones 65 and 68 display no sign of degradation in our assay (Table 5). When tested for their ability to inhibit 4T1 cell migration, compounds 55 and 60 were found to be considerably more active than the natural product migrastatin (255 nM and 100 nM, respectively, Table 4), although some loss of potency relative to lactones 45 and 48 was recorded. Surprisingly, incorporation of an isopropyl group at C13 proved to be deleterious for biological function. Isopropyl macrolides 65 and 68 exhibited only very weak effects on tumor cell migration (Table 4).

As depicted in Scheme 30, our SAR studies were further diverted on the basis of macroketone 60. The ketone functionality proved to be an attractive handle for additional derivatization. We started our explorations by adding various nucleophiles to the carbonyl functionality accessing analogs 69-71. Simple NaBH₄ reduction of 60 afforded secondary alcohol 69 as a mixture of diastereomers, while
addition of MeMgBr gave the corresponding tertiary carbinol mixture 70. Following a procedure by Olah,\textsuperscript{61} nucleophilic addition of a trifluoromethyl group to 60 was accomplished using (trifluoromethyl)trimethylsilane (TMSCF\textsubscript{3}) and catalytic amounts of Bu\textsubscript{4}NF (TBAF). This treatment produced the TMS-protected alcohol intermediate which was transformed into 71 upon prolonged exposure to TBAF (compound 71 was isolated as a single diastereomer after chromatography). Traditional functionalities, such as in oxime 72, could also be easily incorporated starting from macroketone 60. As a part of our long term goal of elucidating the cellular target of migrastatin and our new migrastatin scaffolds, we condensed commercially available Biotin-dPEG\textsubscript{4}TM-hydrazide with ketone 60 furnishing the biotin-labeled acyl-hydrazone 73.

\textbf{Scheme 30. Derivatization of Macroketone 60\textsuperscript{a}}

\begin{center}
\includegraphics[width=0.5\textwidth]{scheme_30.png}
\end{center}

\textsuperscript{a} Reagents and conditions: (a) NaBH\textsubscript{4}, MeOH, rt, 95%; (b) MeMgBr, THF, 0 °C to rt, 95%; (c) TMSCF\textsubscript{3}, TBAF, THF, 0 °C to rt, 80%; (d) NH\textsubscript{2}OH-HCl, pyridine, 45 °C, 70%; (e) Biotin-dPEG4-hydrazide, EtOH, 55 °C, 75%.

\textbf{0394} Derivatives 69-73 were evaluated for their ability to inhibit tumor cell migration in the chamber assay. Interestingly, substitution of the ketone functionality for a more polar group, such as an alcohol or oxime function, seems to be detrimental to compound activity. Secondary alcohol 69, tertiary alcohol 70, and oxime 72 are rather weak migration inhibitors, with IC\textsubscript{50} values of 8.9 μM, 3.1 μM, and 2.3 μM, respectively (Table 4). It appears that incorporation of a trifluoromethyl group can compensate for the loss of activity caused by the hydroxyl
group: Macro cyclic CF$_3$-alcohol 71 displays the same activity profile as macro ketone 60. Gratifyingly, inhibitory potency is largely retained in biotinylated hydrazone 73. Therefore, system 73, although a mixture of geometric isomers, could qualify as a probe to assist in the target identification process.

[0395] As discussed above, there are other recently discovered natural products that are reported to be strong cell migration inhibitors. In particular, two compounds, epoxyquinol A, a pentaketide dimer with anti-angiogenic activity, and evodiamine, a potent anti-metastatic and anti-invasive alkaloid, attracted great interest and are currently under serious investigation by several research groups.

[0396] These natural products were tested side by side with the inventive miglstatin analogs for the purpose of validating and calibrating our assay. As shown in Table 4, the inventive macrolactones outperform evodiamine and are comparable to epoxyquinol A in the chamber assay.

[0401] Due to the significance of endothelial cell migration in the angiogenesis process, the chamber cell migration assay described above was also conducted with HUVECs (human umbilical vein endothelial cells) and used for the evaluation of our most potent analogs, macrolactones 45 and 48, macrolactam 55, and macak etone 60, together with migrastatin as a reference. The IC₅₀ values obtained from this study are listed in Table 6. The general trend in activity, with the simplified analogs 45, 48, 55, and 60 being significantly more active against tumor cell migration than the parent natural product, was also observed for endothelial cells. However, some erosion of potency in the HUVEC determination compared to the 4T1 cell determination was observed for all compounds tested.

1 Average of three experiments. Each experiment consists of nine data points (nine different concentrations).

In order to complete the in vitro assay data set for the inventive analogs, the effect of migrastatin and cell migration inhibitors 48, 55, and 60 on 4T1 cell proliferation was examined. Macrolactone 48, macrolactam 55, and macroketone 60 did not have any cytotoxic or anti-proliferative effects up to 20 μM, whereas migrastatin turned out to be a weak proliferation inhibitor (IC_{50} value of 42 μM). Without wishing to be bound to any particular theory, this outcome appears to lead to the conclusion that cell proliferation inhibition is not a contributor to the effects observed in the chamber assays, and that the migrastatin analogs of the invention may be specific for cell migration inhibition.

Without wishing to be bound to any particular theory, the following preliminary structure-activity relationship (SAR) trends appear to emerge: reduction of the 2,3-double bond of migrastatin results in no significant loss of activity. Similarly, alkylation of the glutarimide nitrogen does not appear to negatively impact activity. Complete removal of the C-13 side-chain (e.g., compounds 45, 48, 49, 50, 55, 60 and 71), thereby producing simple macrolactones, dramatically increases activity. This region appears to be relatively sensitive, as indicated by the following observations: replacing the sidechain with a small (isopropyl) mimic results in almost complete loss of activity. When the oxygen of the macrolactone is replaced with either a nitrogen or a carbon atom, the effect is much more subtle (activity decreases by about one order of magnitude). When the conjugated 2,3-olefin is reduced, activity does not appear to be negatively impacted. For
compounds of formula (I) where \( X_1 \) is \( \text{CH}_2 \) and \( Y_1, Y_2 \) taken to gether with the carbon atom to which they are attached is \( \text{C}(=\text{O}) \) (i.e., macroketone), oxime formation, reduction or addition of small nucleophiles to the ketone moiety appears to be detrimental to activity while the addition of larger nucleophiles (\( \text{CF}_3 \)) is tolerated. The activity of compounds of formula (I) where \( R_4 \) is \( \text{C}=\text{O} \) or \( \text{O}\text{Ac} \) (e.g., compounds 49 and 50) is minimally affected (about one order of magnitude) as compared to the corresponding compounds where \( R_4 \) is \( \text{OH} \) (e.g., compounds 45 and 46).

**General Reaction Procedures:**

Unless mentioned specifically, reaction mixtures were stirred using a magnetically driven stirrer bar. Reactions involving air or moisture-sensitive reagents or intermediates were performed under argon or nitrogen atmosphere in glassware which had been heat gun or flame-dried under high vacuum. An inert atmosphere refers to either dry argon or dry nitrogen. Reactions were monitored either by thin layer chromatography, by proton nuclear magnetic resonance (NMR) or by high-pressure liquid chromatography (HPLC), of a suitably worked up sample of the reaction mixture.

Indicated reaction temperatures refer to those of the reaction bath, while room temperature (rt) is noted as 22 °C. Preparative reactions were stirred magnetically. Tetrahydrofuran (THF), diethyl ether (\( \text{Et}_2\text{O} \)), methylene chloride (\( \text{CH}_2\text{Cl}_2 \)), and toluene were obtained from a dry solvent system (activated alumina columns, positive pressure of argon). All other solvents were used as received in Sure/Seal bottles (Aldrich). Triethylamine (\( \text{Et}_3\text{N} \)), diisopropylethylamine (\( \text{i-Pr}_2\text{NEt} \)), pyridine, 2,6-lutidine, and chlorotrimethylsilane (TMSCl) were distilled from CaH\(_2\) immediately prior to use. All other reagents were purchased from Aldrich at the highest commercial quality and used without further purification, with the exception of the Stryker reagent which was purchased from Fluka, the RCM catalysts 16 and 17 which were purchased from Strem, and biotin-dPEG\(_4\)-hydrazide which was purchased from Quanta Bodesign.

Listed below are abbreviations used for some common organic reagents referred to herein:
[0410] CSA: Camphorsulphonic acid
[0411] DBU: 1,8-Diazabicyclo[5.4.0]undec-7-ene
[0412] Dess-Martin: Dess-Martin periodinane
[0413] DIBAL-H: Diisobutyl aluminium hydride
[0414] DMAP: \(N,N\)-Dimethylaminopyridine
[0415] DMF: \(N,N\)-Dimethylformamide
[0416] TBSOTf: \textit{Tert} -butyl- dimethylsilyl triflate
[0417] TESCl: Triethylsilyl chloride
[0418] TFA: Trifluoroacetic acid
[0419] TMSCl: Trimethylsilyl chloride
[0420] THF: Tetrahydrofuran

[0421] **General Work Up Procedures:**
[0422] Unless mentioned specifically, reaction mixtures were cooled to room temperature or below then quenched, when necessary, with either water or a saturated aqueous solution of ammonium chloride. Desired products were extracted by partitioning between water and a suitable water-immiscible solvent (e.g. ethyl acetate, dichloromethane, diethyl ether). The desired product containing extracts were washed appropriately with water followed by a saturated solution of brine. On occasions where the product containing extract was deemed to contain residual oxidants, the extract was washed with a 10% solution of sodium sulphite in saturated aqueous sodium bicarbonate solution, prior to the aforementioned washing procedure. On occasions where the product containing extract was deemed to contain residual acids, the extract was washed with saturated aqueous sodium bicarbonate solution, prior to the aforementioned washing procedure (except in those cases where the desired product itself had acidic character). On occasions where the product containing extract was deemed to contain residual bases, the extract was washed with 10% aqueous citric acid solution, prior to the aforementioned washing procedure (except in those cases where the desired product itself had basic character). Post washing, the desired product containing extracts were dried over anhydrous magnesium sulphate, and then filtered. The crude products were then
isolated by removal of solvent(s) by rotary evaporation under reduced pressure, at an appropriate temperature (generally less than 45°C).

**General Purification Procedures:**

Unless mentioned specifically, chromatographic purification refers to flash column chromatography on silica, using a single solvent or mixed solvent as eluent. Suitably purified desired product containing elutes were combined and concentrated under reduced pressure at an appropriate temperature (generally less than 45°C) to constant mass. Final compounds were dissolved in 50% aqueous acetonitrile, filtered and transferred to vials, then freeze-dried under high vacuum before submission for biological testing.

**Analytical Equipment:**

Optical rotations were measured on a JASCO DIP-370 digital polarimeter at rt. Concentration (c) in g/100 ml and solvent are given in parentheses. Infrared spectra were obtained on a Perkin-Elmer 1600 FT-IR spectrophotometer neat or as a film in CHCl₃ (NaCl plates). Absorption bands are noted in cm⁻¹. ¹H- and ¹³C-NMR spectra were recorded on a Bruker AMX-400 or a Bruker DRX-500 spectrometer in CDCl₃. Chemical shifts (δ-values) are reported in ppm with residual undeuterated CHCl₃ as the internal standard (referenced to 7.26 ppm for ¹H-NMR and 77.0 ppm for ¹³C-NMR). Coupling constants (J) (H,H) are given in Hz, spectral splitting patterns are designated as singulet (s), doublet (d), triplet (t), quadruplet (q), multiplet or more overlapping signals (m), apparent (app), broad signal (br). Low resolution mass spectra (ionspray, a variation of electrospray) were acquired on a Perkin-Elmer Sciex API 100 spectrometer. Samples were introduced by direct infusion. High resolution mass spectra (fast atom bombardment, FAB) were acquired on a Micromass 70-SE-4F spectrometer. Flash chromatography (FC) was performed with E. Merck silica gel (60, particle size 0.040-0.063 mm). Preparative thin layer chromatography (TLC) was performed with Whatman Partisil Plates (10x10 cm, 60 Å, 200 μm).

**Example 1**

Preparation of the divinylzinc reagent: To vinylmagnesium bromide (294 mL, 294 mmol, 1.0 M in THF) was added slowly a solution of anhydrous ZnCl₂ (20.0 g, 147 mmol, beads) in THF (100 mL) to yield a dark brown solution of divinylzinc in THF (with some precipitate).

Preparation of vinyl carbinol 19: To a solution of dimethyl 2,3-O-isopropylidene-L-tartrate 18 (8.58 g, 39.3 mmol) in toluene (100 mL) at -78 °C was added slowly DIBALH (90 mL, 90.0 mmol, 1.0 M in toluene). The reaction mixture turned into a white slurry during the course of the addition. After stirring for 3 h (the reaction temperature has to be kept at -78 °C to prevent overreduction), the divinylzinc solution as prepared above was added to the reaction mixture via cannula over 45 min. After stirring for another 30 min, the reaction mixture was warmed to rt and stirred for 4 h. The reaction mixture was then carefully (!) treated with saturated aqueous NH₄Cl solution and 20% aqueous Na/K-tartrate solution. The organic layer was separated and the aqueous layer was extracted with Et₂O (3x). The combined organic layers were dried (MgSO₄) and concentrated under reduced pressure. Purification of the crude product by FC (hexane/EtOAc 4:1) afforded vinyl carbinol 19 (6.28 g, 75%, diastereoselectivity > 90%) as a colorless oil. ¹H-NMR (400 MHz, CDCl₃) δ 6.04-5.94 (m, 2H), 5.40 (d, J = 17.3, 2H), 5.30 (d, J = 10.5, 2H), 4.19-4.16 (m, 2H), 3.89-3.87 (m, 2H), 2.91 (br s, 2H), 1.42 (s, 6H).

Example 2
[0432] 1,2-Diol 20: The preparation of compound 20 has been reported before by Chang, (See, Lee, W. W.; Chang, S. *Tetrahedron: Asymmetry* 1999, 10, 4473) but experimental details have not been provided.

[0433] To a solution of vinyl carbinol 19 (6.28 g, 29.2 mmol) in DMF (100 mL) at 0 °C was added NaH (2.58 g, 64.5 mmol, 60% dispersion in mineral oil) and, 5 min later, MeI (4.38 mL, 70.3 mmol). The reaction mixture was warmed to rt, stirred for 45 min, and then treated with 2M NH₄OH. The organic layer was separated and the aqueous layer was extracted with Et₂O (3x). The combined organic layers were dried (MgSO₄) and concentrated under reduced pressure. The crude product was dissolved in MeOH (150 mL) and 2M HCl (50 mL) and heated to reflux for 2 h. The reaction mixture was cooled to rt, treated with saturated aqueous Na₂CO₃ solution and diluted with Et₂O. The organic layer was separated and the aqueous layer was extracted with Et₂O (3x). The combined organic layers were dried (MgSO₄) and concentrated under reduced pressure. Purification of the crude product by FC (hexane/EtOAc 2:1) afforded 1,2-diol 20 (4.72 g, 80%) as a colorless oil. [α]₀ +31.0° (c 1.77, CHCl₃); IR (neat) 3454, 3078, 2982, 2936, 2824, 1643, 1420, 1192, 1102, 992; ¹H-NMR (500 MHz, CDCl₃) δ 5.77-5.71 (m, 2H), 5.36-5.32 (m, 4H), 3.81 (app t, J = 6.3, 2H), 3.76 (d, J = 5.5, 2H), 3.32 (s, 6H), 2.96 (br s, 2H); ¹³C-NMR (125 MHz, CDCl₃) δ 135.08, 119.27, 86.65, 71.23, 57.15; MS (ESI) 225 [M+Na⁺]; HRMS (FAB) calcd. for C₁₀H₁₄O₄Na [M+Na⁺] 225.1103, found 225.1079.

[0434] Example 3

[Diagram]
Butadiene 3: Compound 3 was prepared using modified literature

To a suspension of NaH (4.40 g, 110 mmol, 60% dispersion in mineral
oil) in toluene (90 mL) and MeOH (0.1 mL) at 0 °C was added a mixture of 3-
pentanone (10.6 mL, 105 mmol) and methyl formate (8.00 mL, 130 mmol) over 1
hr. The reaction mixture was warmed to rt, stirred for another 3 h, and then diluted
with Et₂O. The suspension was filtered and the precipitate was washed with Et₂O.
The resulting crude sodium salt of 1-hydroxy-2-methyl-1-penten-3-one was
dissolved in DMSO (100 mL) and Me₂SO₄ (9.16 mL, 97.0 mmol) was added at rt.
After stirring for 30 min, the reaction mixture was treated with 2M NH₄OH and
diluted with Et₂O. The organic layer was separated, washed with H₂O and saturated
aqueous NaCl solution, dried (MgSO₄), and concentrated under reduced pressure to
afford 1-methoxy-2-methyl-1-penten-3-one (8.27 g, 74%). To a solution of 1-
methoxy-2-methyl-1-penten-3-one (2.60 g, 20.3 mmol) in Et₂O (12.0 mL) was
added Et₃N (7.08 mL, 50.8 mmol) and TMSOTf (3.68 mL, 20.3 mL) at 0 °C. The
reaction mixture was warmed to rt, stirred for another 3 h, and then poured onto a
saturated aqueous NaHCO₃ solution. The organic layer was separated, washed with
saturated aqueous NaCl solution, dried (MgSO₄), and concentrated under reduced
pressure to afford butadiene 3 (3.66 g, 90%). ¹H-NMR (400 MHz, CDCl₃) δ 6.35 (s,
1H), 4.75 (q, J = 6.9, 1H), 3.63 (s, 3H), 1.66 (s, 3H), 1.62 (d, J = 6.9, 3H), 0.22 (s,
9H).

Example 4
[0432] Dihydropyrrone 21: To a solution of diol 20 (2.55 g, 12.6 mmol) in CH₂Cl₂ (130 mL) at 0 °C was added Na₂CO₃ (1.40 g, 13.2 mmol) and Pb(OAc)₄ (5.87 g, 13.2 mmol). The reaction mixture was warmed to rt, stirred for 25 min, and then treated with ethylene glycol (300 μL). After stirring for another 5 min, the reaction mixture was filtered through a Celite pad. The filtrate was washed with saturated aqueous NaHCO₃ solution and saturated aqueous NaCl solution and dried (MgSO₄). The obtained solution of α-methoxy-α-vinyl aldehyde 2 in CH₂Cl₂ was cooled to −78 °C, and then TiCl₄ (2.77 mL, 25.2 mmol) and butadiene 3 (6.06 g, 30.3 mmol) were added. After stirring for 20 min, the reaction mixture was treated with MeOH (5 min), followed by the addition of saturated aqueous NaHCO₃ solution and 20% aqueous Na/K-tartrate solution. The organic layer was separated and the aqueous layer was extracted with CH₂Cl₂ (3x). The combined organic layers were dried (MgSO₄) and concentrated under reduced pressure. The crude product was dissolved in CH₂Cl₂ (130 mL) and TFA (13 mL) and stirred for 1 hr. Toluene (50 mL) was added and the reaction mixture was concentrated under reduced pressure. Purification of the crude product by FC (hexane/EtOAc 20:1 → 10:1 → 7:1) afforded dihydropyrrone 21 (4.31 g, 87%) as a colorless oil. [α]D +77.1° (c 2.00, CHCl₃); IR (neat) 2980, 2938, 2883, 2827, 1785, 1671, 1622, 1602, 1460, 1387, 1305, 1214, 1176, 1085, 1010; ¹H-NMR (500 MHz, CDCl₃) δ 7.36 (s, 1H), 6.53-5.54 (m, 1H), 5.48-5.43 (m, 2H), 4.25 (dd, J = 8.6, 2.9, 1H), 3.88 (app t, J = 8.5, 1H), 3.37 (s, 3H), 2.44 (dq, J = 7.2, 2.9, 1H), 1.68 (s, 3H), 1.07 (d, J = 7.2, 3H); ¹³C-NMR (125 MHz, CDCl₃) δ 198.99, 160.75, 131.79, 122.06, 112.51, 82.69,
81.99, 56.37, 40.62, 10.42, 9.96; MS (ESI) 219 \([M+Na^+]\); HRMS (FAB) calcd. for C\(_{11}\)H\(_{16}\)O\(_3\)Na \([M+Na^+]\) 219.0997, found 219.0991.

**Example 5**

\[
\begin{align*}
2i & \xrightarrow{\text{LiBH}_4} \text{O} & \xrightarrow{\text{CSA}} \text{OH} \\
\text{OH} & \xrightarrow{\text{LiBH}_4} \text{OMe} \\
\text{OMe} & \xrightarrow{\text{LiBH}_4} \text{OH}
\end{align*}
\]

**Diol 25:** To a solution of dihydropyrone 21 (4.30 g, 21.9 mmol) in THF (50 mL) at \(-10\) °C was added MeOH (977 µL, 24.1 mmol) and LiBH\(_4\) (12.1 mL, 24.1 mmol, 2M in THF). After stirring for 10 min, the reaction mixture was carefully treated with 0.2M HCl (25 mL) and stirring was continued for another 20 min. Then the organic layer was separated and the aqueous layer was extracted with EtOAc (4x). The combined organic layers were dried (MgSO\(_4\)) and concentrated under reduced pressure. The crude alcohol 22 was dissolved in THF (280 mL) and H\(_2\)O (28 mL), and champhorsulfonic acid (1.02 g, 4.38 mmol) was added. After refluxing for 2 h, the reaction mixture was treated with saturated aqueous NaHCO\(_3\) solution. The organic layer was separated and the aqueous layer was extracted with EtOAc (3x). The combined organic layers were dried (MgSO\(_4\)) and concentrated under reduced pressure. The crude lactol 23 was dissolved in THF (60 mL) and H\(_2\)O (15 mL), and LiBH\(_4\) (12.1 mL, 24.1 mmol, 2M in THF) was added at rt. After stirring for 15 min, the reaction mixture was treated with 0.2M HCl (35 mL) and stirring was continued for another 20 min. Then the organic layer was separated and the aqueous layer was extracted with EtOAc (3x). The combined organic layers were dried (MgSO\(_4\)) and concentrated under reduced pressure. Purification of the crude product by FC (hexane/EtOAc 4:1 → 2:1 → 1:1) afforded diol 25 (2.34 g, 53%) as a colorless oil. \([\alpha]_D^{20} +40.0^\circ\) (c 1.00, CHCl\(_3\)); IR (CHCl\(_3\)) 3621, 3565, 3444,
3012, 2934, 2868, 1449, 1393, 1238, 1083; \(^1\)H-NMR (500 MHz, CDCl\(_3\)) \(\delta\) 5.74-5.67 (m, 1H), 5.33-5.25 (m, 2H), 5.16 (d, \(J = 10.2\), 1H); 4.12 (d, \(J = 11.9\), 1H), 3.95 (d, \(J = 11.9\), 1H); 3.48 (dd, \(J = 8.1\), 5.4, 1H); 3.26 (app t, \(J = 5.5\), 1H); 3.23 (s, 3H); 2.74-2.68 (m, 1H); 2.57 (br s, 2H); 1.79 (d, \(J = 1.4\), 3H); 0.98 (d, \(J = 6.9\), 3H); \(^13\)C-NMR (125 MHz, CDCl\(_3\)) \(\delta\) 135.32, 135.20, 130.41, 119.51, 83.42, 77.44, 61.51, 55.93, 34.80, 21.89, 16.85; MS (ESI) 223 [M+Na\(^+\)]; HRMS (FAB) calcd. for C\(_{11}\)H\(_{20}\)O\(_3\)Na [M+Na\(^+\)] 223.1310, found 223.1301.

Example 6

Dimeric Acetal 24: The Ferrier rearrangement described above was carried out at a concentration of 0.07M. When the Ferrier rearrangement was conducted at a concentration of 0.30M, the formation of a side product, which corresponds to dimeric acetal 24, was observed. Compound 24 was isolated after FC (hexane/EtOAc 20:1 → 10:1) in 15-20% yield as a white crystalline solid. M.p. 83-95 °C; [\(\alpha\)_D] = -161.3° (c 1.00, CHCl\(_3\)); IR (CHCl\(_3\)) 3003, 2910, 2816, 1446, 1382, 1317, 1211, 1088, 965; \(^1\)H-NMR (500 MHz, CDCl\(_3\)) \(\delta\) 5.67-5.59 (m, 4H), 5.39-5.28 (m, 6H), 3.93 (dd, \(J = 8.4\), 2.9, 2H); 3.57 (app t, \(J = 8.2\), 2H); 3.32 (s, 6H); 1.94-1.91 (m, 2H); 1.74 (s, 6H); 0.91 (d, \(J = 6.8\), 6H); \(^13\)C-NMR (125 MHz, CDCl\(_3\)) \(\delta\) 134.66, 132.01, 129.40, 119.11, 93.37, 83.15, 72.19, 56.79, 30.44, 18.81, 12.78; MS (ESI) 401 [M+Na\(^+\)]; HRMS (FAB) calcd. for C\(_{22}\)H\(_{35}\)O\(_5\) [M+H\(^+\)] 379.2485, found 379.2486.

Example 7
Monoprotected Diol 26: To a solution of diol 25 (364 mg, 1.82 mmol) in CH$_2$Cl$_2$ (3 mL) at rt was added 2,6-lutidine (530 µL, 4.55 mmol) and TBSOTf (961 µL, 4.19 mmol). After stirring for 20 min, the reaction mixture was treated with saturated aqueous NaHCO$_3$ solution. The organic layer was separated and the aqueous layer was extracted with CH$_2$Cl$_2$ (3x). The combined organic layers were dried (MgSO$_4$) and concentrated under reduced pressure. Purification of the crude product by FC (hexane/EtOAc 30:1) afforded the corresponding diprotected diol (731 mg, 94%) as a colorless oil. $[\alpha]_D$ +0.1$^\circ$ (c 1.00, CHCl$_3$); IR (CHCl$_3$) 2929, 2856, 1472, 1253, 1076; $^1$H-NMR (500 MHz, CDCl$_3$) $\delta$ 5.67-5.60 (m, 1H), 5.29-5.21 (m, 3H), 4.14 (d, $J = 11.8$, 1H), 4.04 (d, $J = 11.8$, 1H), 3.43 (dd, $J = 7.2$, 2.9, 1H), 3.37 (app t, $J = 7.5$, 1H), 3.21 (s, 3H), 2.60-2.56 (m, 1H), 1.72 (d, $J = 0.9$, 3H), 0.91-0.89 (m, 21H), 0.05-0.04 (m, 12H); $^{13}$C-NMR (125 MHz, CDCl$_3$) $\delta$ 135.44, 133.27, 131.41, 118.43, 86.20, 78.68, 61.91, 56.17, 33.85, 26.17, 25.93, 20.99, 18.56, 18.36, 14.13, -3.82, -4.80, -5.29; MS (ESI) 451 [M+Na$^+$]; HRMS (FAB) calcd. for C$_{23}$H$_{48}$O$_7$Si$_2$Na [M+Na$^+$] 451.3054, found 451.3054.

A solution of the diprotected diol (731 mg, 1.71 mmol) in HOAc (9 mL), THF (3 mL), and H$_2$O (3 mL) was stirred at rt for 8 h. The reaction mixture was neutralized with solid Na$_2$CO$_3$ and diluted with H$_2$O and Et$_2$O. The organic layer was separated and the aqueous layer was extracted with Et$_2$O (3x). The combined organic layers were dried (MgSO$_4$) and concentrated under reduced pressure. Purification of the crude product by FC (hexane/EtOAc 10:1 $\rightarrow$ 5:1) afforded monoprotected diol 26 (456 mg, 85%) as a colorless oil. $[\alpha]_D$ +3.8$^\circ$ (c 1.85, CHCl$_3$); IR (neat) 3352, 2957, 2930, 2857, 1472, 1462, 1250, 1127, 1081, 1028; $^1$H-NMR (500 MHz, CDCl$_3$) $\delta$ 5.73-5.66 (m, 1H), 5.30-5.24 (m, 3H), 4.12 (dd, $J = 11.8$, 4.9, 1H), 4.00 (dd, $J = 11.8$, 6.5, 1H), 3.48-3.43 (m, 2H), 3.22 (s, 3H), 2.69-2.61 (m, 1H), 1.78 (d, $J = 1.1$, 3H), 1.68 (br t, 1H), 0.90-0.89 (m, 12H), 0.06 (s, 3H), 0.04 (s,
3H); $^{13}$C-NMR (125 MHz, CDCl$_3$) $\delta$ 135.15, 133.05, 118.54, 85.89, 78.28, 61.76, 56.12, 34.23, 26.11, 25.64, 21.53, 18.49, 15.32, $-$3.88, $-$4.70; MS (ESI) 337 [M+Na$^+$]; HRMS (FAB) calcd. for C$_{17}$H$_{34}$O$_3$SiNa [M+Na$^+$] 337.2175, found 337.2162.

[0446] Example 8

[0447] Propionyl Oxazolidinone 28: Compound 28 was prepared by reaction of (R)-(+)-4-benzyl-2-oxazolidinone with BuLi and propionyl chloride in THF according to standard literature procedures (See, Evans, D. A. Aldrichimica Acta 1982, 15, 23).

[0448] Example 9

[0449] Aldol Product 29: To a solution of alcohol 26 (189 mg, 0.601 mmol) in CH$_2$Cl$_2$ (4 mL) at rt was added Dess-Martin periodinane (280 mg, 0.661 mmol). After stirring for 50 min, the reaction mixture was treated with saturated aqueous Na$_2$S$_2$O$_3$ solution and saturated aqueous NaHCO$_3$ solution. The organic layer was separated and the aqueous layer was extracted with CH$_2$Cl$_2$ (3x). The combined organic layers were dried (MgSO$_4$) and concentrated under reduced pressure to yield crude aldehyde 27. IR (neat) 2958, 2936, 2891, 2858, 1674, 1467, 1378, 1249, 1126, 1093, 1031; $^1$H-NMR (500 MHz, CDCl$_3$) $\delta$ 10.06 (s, 1H), 6.51 (dd, $J$ = 10.7, 1.5, 1H), 5.63 (ddd, $J$ = 17.4, 10.5, 7.9, 1H), 5.32-5.25 (m, 2H), 3.56 (dd, $J$ = 6.6, 3.8, 1H), 3.45 (app t, $J$ = 7.3, 1H), 3.42-3.35 (m, 1H), 3.20 (s, 3H), 1.75 (s, 3H), 1.03
(d, $J = 6.6$, 3H), 0.91 (s, 9H), 0.07 (s, 3H), 0.02 (s, 3H); $^{13}$C-NMR (125 MHz, CDCl$_3$) $\delta$ 191.36, 153.37, 134.76, 133.96, 119.12, 85.73, 78.03, 56.21, 33.15, 26.05, 18.44, 16.37, 14.73, −3.84, −4.85.

[0450] The crude aldehyde 27 was dissolved in EtOAc (2 mL) and added to neat propionyl oxazolidinone 28 (210 mg, 0.902 mmol). The reaction mixture was then treated at rt with anhydrous MgCl$_2$ (57 mg, 0.601 mmol), Et$_3$N (210 $\mu$L, 1.50 mmol), and TMSCl (153 $\mu$L, 1.20 mmol). After stirring for 36 h, the reaction mixture was filtered through a silica plug (Et$_2$O) and the filtrate was concentrated under reduced pressure. The residual oil was dissolved in MeOH (3 mL), treated with TFA (1 drop) and stirred for 10 min. Toluene (3 mL) was added and the reaction mixture was concentrated under reduced pressure. Purification of the crude product by FC (hexane/CH$_2$Cl$_2$ 1:1 $\rightarrow$ CH$_2$Cl$_2$) afforded aldol product 29 (219 mg, 67%) as a colorless oil. [α]$_D$ $-16.1^\circ$ (c 1.77, CHCl$_3$); IR (neat) 3505, 2920, 2856, 1782, 1699, 1453, 1384, 1258, 1208, 1125, 1079, 1020; $^1$H-NMR (500 MHz, CDCl$_3$) $\delta$ 7.35-7.26 (m, 5H), 5.64 (ddd, $J = 17.6$, 10.3, 7.6, 1H), 5.56 (d, $J = 10.2$, 1H), 5.37 (dd, $J = 10.4$, 1.8, 1H), 5.30 (dd, $J = 17.4$, 1.8, 1H), 4.73-4.69 (m, 2H), 4.22-4.16 (m, 2H), 4.14-4.08 (m, 1H), 3.46 (dd, $J = 8.0$, 1.8, 1H), 3.39 (app t, $J = 8.0$, 1H), 3.36 (dd, $J = 14.1$, 3.8, 1H), 3.21 (s, 3H), 2.81 (dd, $J = 13.6$, 9.6, 1H), 2.75-2.68 (m, 1H), 2.39 (br s, 1H), 1.75 (s, 3H), 1.02 (d, $J = 7.0$, 3H), 0.92 (s, 9H), 0.91 (d, $J = 6.0$, 3H), 0.07 (s, 3H), 0.04 (s, 3H); $^{13}$C-NMR (125 MHz, CDCl$_3$) $\delta$ 176.48, 153.94, 135.68, 135.35, 134.76, 131.41, 129.52, 128.94, 127.29, 119.26, 86.43, 78.16, 72.78, 66.06, 56.01, 55.76, 41.09, 37.74, 33.44, 26.16, 18.60, 17.16, 14.48, 13.60, −3.74, −4.86; MS (ESI) 546 [M+H$^+$]; HRMS (FAB) calcd. for C$_{30}$H$_{46}$NO$_6$Si [M+H$^+$] 546.3251, found 546.3251.

[0451] Example 10
[0452] **Primary Alcohol 31:** To a solution of aldol product 29 (215 mg, 0.394) in CH₂Cl₂ (5 mL) at rt was added imidazole (107 mg, 1.58 mmol) and TESCl (198 µL, 1.18 mmol). After stirring for 12 h, the reaction mixture was treated with H₂O and diluted with CH₂Cl₂. The organic layer was separated and the aqueous layer was extracted with CH₂Cl₂ (3x). The combined organic layers were dried (MgSO₄) and concentrated under reduced pressure to afford the TES-protected aldol product 30. The crude product 30 was dissolved in THF (5 mL), and MeOH (64 µL, 0.394 mmol) and LiBH₄ (35 mg, 1.58 mmol) were added at rt. After stirring for 1 h, the reaction mixture was treated with 0.5M NaOH. The organic layer was separated and the aqueous layer was extracted with Et₂O (3x). The combined organic layers were dried (MgSO₄) and concentrated under reduced pressure. Purification of the crude product by FC (hexane/EtOAc 10:1) afforded primary alcohol 31 (159 mg, 83%) as a colorless oil. [α]_D +10.9° (c 2.38, CHCl₃); IR ( neat) 3460, 2970, 2930, 2880, 1460, 1380, 1250, 1130, 1060, 1020; ¹H-NMR (500 MHz, CDCl₃) δ 5.60-5.53 (m, 1H), 5.35-5.26 (m, 3H), 4.31 (d, J = 9.1, 1H), 3.68-3.58 (m, 2H), 3.42-3.34 (m, 2H), 3.20 (s, 3H), 3.13 (app d, J = 7.0, 1H), 2.65-2.59 (m, 1H), 1.94-1.88 (m, 1H), 1.67 (d, J = 1.2, 3H), 0.94 (t, J = 8.0, 9H), 0.93-0.91 (m, 12H), 0.70 (d, J = 7.1, 3H), 0.58 (q, J = 8.0, 6H), 0.04 (s, 3H), 0.00 (s, 3H); ¹³C-NMR (125 MHz, CDCl₃) δ 135.10, 133.66, 133.46, 118.84, 86.46, 78.30, 76.58, 68.33, 56.08, 38.87, 33.24, 26.13,
18.58, 17.70, 14.25, 12.64, 6.75, 4.74, -3.85, -4.89; MS (ESI) 509 [M+Na\(^\text{+}\)]; HRMS (FAB) calcd. for C\(_{26}\)H\(_{34}\)O\(_4\)Si\(_2\)Na [M+Na\(^\text{+}\)] 509.3458, found 509.3468.

**Example 11**

Glutarimide Aldehyde 5: Compound 5 was synthesized according to a literature procedure (See, Egawa, Y. et al.; Chem. Pharm. Bull. 1963, 11, 589).

**Example 12**

Enone 33: To a solution of primary alcohol 31 (142 mg, 0.292 mmol) in CH\(_2\)Cl\(_2\) (5 mL) at rt was added Dess-Martin periodinane (136 mg, 0.321 mmol). After stirring for 45 min, the reaction mixture was treated with saturated aqueous Na\(_2\)S\(_2\)O\(_3\) solution and saturated aqueous NaHCO\(_3\) solution. The organic layer was separated and the aqueous layer was extracted with CH\(_2\)Cl\(_2\) (3x). The combined organic layers were dried (MgSO\(_4\)) and concentrated under reduced pressure. In a separate flask, dimethyl methylphosphonate (316 \(\mu\)L, 2.92 mmol) in THF (2 mL) at
−78 °C was treated with BuLi (1.64 mL, 2.62 mmol, 1.6M in hexane). After stirring for 20 min, the crude aldehyde obtained from the Dess-Martin oxidation was dissolved in THF (1mL) and added to the reaction mixture. The reaction mixture was warmed to 0 °C, stirred for 15 min, and then treated with saturated aqueous NH₄Cl solution. The organic layer was separated and the aqueous layer was extracted with EtOAc (4x). The combined organic layers were dried (MgSO₄) and concentrated under reduced pressure. The crude product was dissolved in CH₂Cl₂ (5 mL), and Dess-Martin periodinane (136 mg, 0.321 mmol) was added at rt. After stirring for 20 min, the reaction mixture was treated with saturated aqueous Na₂S₂O₅ solution and saturated aqueous NaHCO₃ solution. The organic layer was separated and the aqueous layer was extracted with CH₂Cl₂ (1x) and EtOAc (3x). The combined organic layers were dried (MgSO₄) and concentrated under reduced pressure. The crude phosphonate 32 was put under high vacuum for 1 hr. To a solution of the crude product 32 in MeCN (5 mL) at rt was added anhydrous LiCl (25 mg, 0.583 mmol) and DBU (87 µL, 0.583 mmol). After stirring for 10 min, a solution of glutarimide aldehyde 5 (136 mg, 0.875 mmol) in MeCN (1 mL) was added. After stirring for 1 h, the reaction mixture was treated with saturated aqueous NH₄Cl solution and diluted with EtOAc. The organic layer was separated and the aqueous layer was extracted with EtOAc (3x). The combined organic layers were dried (MgSO₄) and concentrated under reduced pressure. Purification of the crude product by FC (hexane/EtOAc 4:1 → 2:1) afforded enone 33 (105 mg, 57%) as a colorless oil. [α]D +4.4° (c 1.69, CHCl₃); IR (neat) 2955, 2931, 2877, 2855, 1722, 1698, 1628, 1461, 1377, 1288, 1254, 1128, 1066, 1035; ¹H-NMR (500 MHz, CDCl₃) δ 7.91 (br s, 1H), 6.71-6.67 (m, 1H), 6.26 (d, J = 15.9, 1H), 5.65 (ddd, J = 17.4, 10.4, 8.4, 1H), 5.41-5.36 (m, 2H), 5.29 (dd, J = 17.4, 1.6, 1H), 4.62 (d, J = 9.3, 1H), 3.43 (app d, J = 7.2, 1H), 3.38-3.33 (m, 1H), 3.21 (s, 3H), 3.09-2.99 (m, 1H), 2.75-2.66 (m, 3H), 2.36-2.28 (m, 5H), 1.66 (s, 3H), 0.91 (s, 9H), 0.87-0.82 (m, 15H), 0.46 (q, J = 7.9, 6H), 0.05 (s, 3H), −0.01 (s, 3H); ¹³C-NMR (125 MHz, CDCl₃) δ 202.98, 171.17, 140.21, 134.99, 134.43, 134.09, 132.47, 119.18, 86.57, 78.53, 72.86, 55.97, 47.67, 37.47, 37.43, 37.27, 33.22, 29.82, 29.69, 26.13, 18.59,
14.18, 12.53, 6.76, 4.71, −3.83, −4.91; MS (ESI) 636 [M+H⁺]; HRMS (FAB) calcd. for C₃₄H₆₂NO₆Si₂ [M+H⁺] 636.4116, found 636.4116.

[0457] **Example 15**

[0458] **Secondary Alcohol 34:** To a solution of enone 33 (101 mg, 0.159 mmol) in toluene (4.5 mL) at rt was added the Stryker reagent (156 mg, 0.079 mmol, dark red solid if quality is good). After stirring for 3.5 h, hexane (3 mL) was added, and the reaction mixture was exposed to air, stirred for 20 min, and concentrated under reduced pressure. Purification of the crude product by FC (hexane/EtOAc 6:1 → 2:1) afforded the corresponding saturated ketone as a colorless oil. [α]D +7.7° (c 3.00, CHCl₃); IR (neat) 3217, 2954, 2932, 2877, 1713, 1459, 1377, 1253, 1126, 1061, 1035, 1006; ¹H-NMR (500 MHz, CDCl₃) δ 8.05 (br s, 1H), 5.63 (ddd, J = 17.0, 10.0, 8.2, 1H), 5.40-5.36 (m, 2H), 5.28 (dd, J = 17.0, 1.8, 1H), 4.55 (d, J = 9.4, 1H), 3.41 (dd, J = 8.2, 1.2, 1H), 3.35 (app t, J = 8.2, 1H), 3.19 (s, 3H), 2.82-2.64 (m, 4H), 2.60-2.41 (m, 2H), 2.29-2.23 (m, 2H), 2.18-2.10 (m, 1H), 1.62 (d, J = 1.2, 3H), 1.61-1.53 (m, 2H), 1.43-1.34 (m, 2H), 0.92-0.90 (m, 12H), 0.86 (t, J = 7.8, 9H), 0.77 (d, J = 7.0, 3H), 0.46 (q, J = 7.8, 6H), 0.03 (s, 3H), −0.02 (s, 3H); ¹³C-NMR (125 MHz, CDCl₃) δ 213.45, 172.06, 134.91, 134.57, 132.25, 119.24, 86.58, 78.52, 72.90, 55.94, 49.29, 44.53, 37.75, 34.32, 33.18, 30.44, 26.11, 19.97, 18.57, 17.16, 13.90, 12.46, 6.75, 4.71, −3.85, −4.93; MS (ESI) 638 [M+H⁺]; HRMS (FAB) calcd. for C₃₄H₆₄NO₆Si₂ [M+H⁺] 638.4272, found 638.4273.

[0459] A solution of the saturated ketone in HOAc (3 mL), THF (1 mL), and H₂O (1 mL) was stirred at rt for 2 h. The reaction mixture was neutralized with solid Na₂CO₃ and diluted with H₂O and EtOAc. The organic layer was separated and the aqueous layer was extracted with EtOAc (3x). The combined organic layers were dried (MgSO₄) and concentrated under reduced pressure. Purification of the crude product by FC (hexane/EtOAc 4:1 → 1:1) afforded secondary alcohol 34 (68 mg, 82%) as a white foam. [α]D +1.0° (c 1.00, CHCl₃); IR (CHCl₃) 3601, 3366, 3035, 2931, 2861, 1708, 1455, 1378, 1249, 1120, 1026; ¹H-NMR (500 MHz, CDCl₃) δ 8.22 (br s, 1H), 5.63-5.56 (m, 1H), 5.48 (d, J = 9.3, 1H), 5.33 (dd, J =
10.3, 1.5, 1H), 5.27 (dd, J = 17.2, 1.5, 1H), 4.60 (d, J = 9.8, 1H), 3.42-3.35 (m, 2H), 3.18 (s, 3H), 2.79-2.63 (m, 4H), 2.58-2.54 (m, 2H), 2.29-2.23 (m, 2H), 2.18-2.10 (m, 1H), 1.95 (br s, 1H), 1.67 (d, J = 1.0, 3H), 1.66-1.59 (m, 2H), 1.42-1.37 (m, 2H), 0.91 (s, 9H), 0.89 (d, J = 6.6, 3H), 0.87 (d, J = 7.1, 3H), 0.05 (s, 3H), 0.01 (s, 3H); $^{13}$C-NMR (125 MHz, CDCl$_3$) δ 214.01, 172.21, 135.51, 134.72, 131.56, 119.19, 36.30, 78.26, 71.69, 55.98, 48.87, 42.70, 37.73, 37.70, 34.08, 33.26, 30.32, 26.11, 20.07, 18.55, 17.35, 13.87, 13.63, -3.79, -4.90; MS (ESI) 546 [M+Na$^+$]; HRMS (FAB) calcd. for C$_{25}$H$_{49}$NO$_6$SiNa [M+Na$^+$] 546.3227, found 546.3227.

[0460] Example 14

[0461] 2,6-Heptadienoic Acid 6: Compound 6 can be prepared by $\gamma$-alkylation of crotonic acid with allyl bromide (See, Katzenellenbogen, J. A. et al.; J. Chem. Soc., Perkin Trans. 1 1998, 2721). However, it was found that the procedure described below is more convenient for larger scale preparations of 2,6-heptadienoic acid 6.

[0462] To a solution of oxalyl chloride (3.36 mL, 39.2 mmol) in CH$_2$Cl$_2$ (100 mL) at -78 °C was added DMSO (5.56 mL, 78.3 mmol). After stirring for 5 min, 4-penten-1-ol (2.00 mL, 19.6 mmol) was added, and after another 15 min Et$_3$N (13.6 mL, 97.9 mmol) was added. The reaction mixture was warmed to rt and then treated with 0.1M HCl. The organic layer was separated, washed with saturated aqueous NaCl solution, dried (MgSO$_4$), and treated with Ph$_3$PCHCO$_2$-Bu (7.38 g, 19.6 mmol) at rt. The reaction mixture was stirred for 5 h and then treated with saturated aqueous NH$_4$Cl solution and diluted with CH$_2$Cl$_2$. The organic layer was separated and the aqueous layer was extracted with CH$_2$Cl$_2$ (3x). The combined organic layers were dried (MgSO$_4$) and concentrated under reduced pressure. The crude product was filtered through a silica plug (CH$_2$Cl$_2$/pentane 1:1) to give $\tau$-butyl (E)-2,6-heptadienoate. To a solution of this ester in CH$_2$Cl$_2$ (40 mL) was added TFA (5 mL) at rt. After stirring for 12 h, the reaction mixture was concentrated under reduced pressure. Purification of the crude product by FC (hexane/EtOAc 15:1 → 5:1) afforded 2,6-heptadienoic acid 6 (1.67 g, 68%) as a colorless oil. $^1$H-NMR (400
MHz, CDCl₃) δ 7.12–7.05 (m, 1H), 5.88–5.76 (m, 2H), 5.08–5.02 (m, 2H), 2.37–2.32 (m, 2H), 2.26–2.21 (m, 2H).

**Example 15**

**Formation of the mixed anhydride:** To a solution of 2,6-heptadienoic acid 6 (66 mg, 0.535 mmol) in toluene (1 mL) at rt was added 2,4,6-trichlorobenzoyl chloride (84 μL, 0.535 mmol) and i-Pr₂NEt (89 μL, 0.508 mmol). The reaction mixture was stirred for 3 h and then used as it is as a stock solution (0.54 M) for the subsequent acylation reactions.

**Example 16**

**Unsaturated Ester 35:** To a solution of alcohol 34 (41 mg, 0.078 mmol) in toluene (0.1 mL) at rt was added pyridine (25 μL, 0.313 mmol) and the mixed anhydride (See above for the preparation of a stock solution of the mixed anhydride in toluene) (460 μL, 0.235 mmol, 0.54 M in toluene). After stirring for 24 h, the reaction mixture was directly loaded onto a silica column and purified by FC (hexane/EtOAc 10:1 → 4:1 → 2:1) to afford unsaturated ester 35 (33 mg, 67%) as a colorless oil. [α]D₂⁰ = -29.0° (c 1.00, CHCl₃); IR (neat) 3214, 3081, 2930, 2856, 1722, 1452, 1377, 1256, 1126, 1028; ^1^H-NMR (500 MHz, CDCl₃) δ 7.87 (br s, 1H), 6.89 (app dt, J = 15.5, 6.8, 1H), 5.81–5.62 (m, 4H), 5.61 (dd, J = 10.3, 1.2, 1H), 5.38 (dd, J = 10.3, 1.8, 1H), 5.32 (dd, J = 17.3, 1.4, 1H), 5.03–4.98 (m, 2H), 3.43–3.39 (m, 2H), 3.21 (s, 3H), 3.00–2.85 (m, 2H), 2.72–2.68 (m, 2H), 2.56–2.44 (m, 2H), 2.30–2.24 (m, 4H), 2.23–2.08 (m, 3H), 1.62 (s, 3H), 1.61–1.58 (m, 2H), 1.36–1.32 (m, 2H), 0.94 (app t, J = 7.2, 6H), 0.90 (s, 9H), 0.06 (s, 3H), 0.00 (s, 3H); ^1^C-NMR (125 MHz, CDCl₃) δ 211.20, 171.83, 164.68, 148.92, 137.72, 136.96, 134.57, 127.00, 121.15, 119.23, 115.60, 86.28, 78.39, 73.79, 56.03, 47.39, 41.45, 37.72, 34.16, 33.84, 31.97, 31.46, 30.40, 26.21, 26.13, 20.10, 18.59, 17.70, 13.72, 12.66, -3.76, -4.94; MS (ESI) 654 [M+Na⁺]; HRMS (FAB) calcd. for C₃₅H₇₇NO₇SiNa [M+Na⁺] 654.3826, found 654.3835.
[0467] Example 17

[0468] TBS-Migrastatin 37: To a solution of an unsaturated ester 35 (29 mg, 0.046 mmol) in refluxing toluene (100 mL) was added Grubbs-II catalyst 16 (8 mg, 0.0092 mmol). After stirring for 15 min, the reaction mixture was cooled to rt and filtered through a silica plug (hexane/EtOAc 1:3). Purification of the crude product by FC (hexane/EtOAc 5:1 → 2:1 → 1:1) afforded TBS-migrastatin 37 (19 mg, 69%) as a white solid. [α]D +13.7° (c 0.50, CHCl3); 1H-NMR (500 MHz, CDCl3) δ 7.77 (br s, 1H), 6.54-6.48 (m, 1H), 5.59 (d, J = 15.7, 1H), 5.56 (d, J = 10.7, 1H), 5.51-5.45 (m, 1H), 5.22 (dd, J = 15.4, 4.6, 1H), 5.08 (d, J = 9.5, 1H), 3.39 (dd, J = 8.1, 4.6, 1H), 3.19 (s, 3H), 3.03 (app d, J = 7.8, 1H), 2.98-2.92 (m, 1H), 2.91-2.85 (m, 1H), 2.73-2.68 (m, 2H), 2.50 (app t, J = 6.9, 2H), 2.44-2.40 (m, 2H), 2.29-2.09 (m, 5H), 1.81 (d, J = 1.1, 3H), 1.64-1.57 (m, 2H), 1.37-1.31 (m, 2H), 1.11 (d, J = 7.2, 3H), 0.92-0.90 (m, 12H), 0.04 (s, 3H), −0.01 (s, 3H); 13C-NMR (125 MHz, CDCl3) δ 210.81, 171.82, 163.80, 150.36, 133.94, 130.17, 129.49, 128.78, 121.88, 83.37, 79.25, 76.82, 56.68, 51.15, 40.24, 37.70, 37.68, 34.17, 33.47, 31.15, 30.36, 30.27, 26.29, 20.12, 18.63, 13.61, 13.30, −3.61, −4.95; MS (ESI) 626 [M+Na]+; HRMS (FAB) calcd. for C33H52NO7SiNa [M+Na]+ 626.3489, found 626.3489.

[0469] Example 18

[0470] Migrastatin 1: To a solution of TBS-migrastatin 37 (19 mg, 0.032 mmol) in THF (1.5 mL) at rt was added HF·pyridine (0.25 mL). After stirring for 15 h, the reaction mixture was carefully treated with MeOTMS (3 mL) and concentrated under reduced pressure. Purification of the crude product by FC (hexane/EtOAc 2:1 → 1:1 → 1:2) afforded migrastatin 1 (13 mg, 85%) as a white solid. [α]D +12.6° (c 0.50, MeOH); 1H-NMR (500 MHz, CDCl3) δ 7.82 (br s, 1H), 6.49 (ddd, J = 15.7, 10.5, 3.7, 1H), 5.64 (dd, J = 10.7, 1.2, 1H), 5.58 (dd, J = 15.7, 1.2, 1H), 5.54-5.48 (m, 1H), 5.24 (dd, J = 15.5, 4.7, 1H), 5.08 (d, J = 10.0, 1H), 3.47 (dd, J = 8.7, 4.7, 1H), 3.30 (s, 3H), 3.03 (dd, J = 8.7, 1.7, 1H), 2.99-2.87 (m, 2H), 2.80 (br s, 1H), 2.73-2.68 (m, 2H), 2.50 (app t, J = 6.9, 2H), 2.44-2.39 (m, 2H), 2.28-2.17 (m, 4H), 2.16-2.08 (m, 1H), 1.86 (d, J = 1.2, 3H), 1.69-1.55 (m, 2H), 1.41-1.30 (m, 2H), 1.12 (d, J = 7.2, 3H), 0.96 (d, J = 6.9, 3H); 13C-NMR (125 MHz, 1H-NMR (500 MHz, CDCl3) δ 7.82 (br s, 1H), 6.49 (ddd, J = 15.7, 10.5, 3.7, 1H), 5.64 (dd, J = 10.7, 1.2, 1H), 5.58 (dd, J = 15.7, 1.2, 1H), 5.54-5.48 (m, 1H), 5.24 (dd, J = 15.5, 4.7, 1H), 5.08 (d, J = 10.0, 1H), 3.47 (dd, J = 8.7, 4.7, 1H), 3.30 (s, 3H), 3.03 (dd, J = 8.7, 1.7, 1H), 2.99-2.87 (m, 2H), 2.80 (br s, 1H), 2.73-2.68 (m, 2H), 2.50 (app t, J = 6.9, 2H), 2.44-2.39 (m, 2H), 2.28-2.17 (m, 4H), 2.16-2.08 (m, 1H), 1.86 (d, J = 1.2, 3H), 1.69-1.55 (m, 2H), 1.41-1.30 (m, 2H), 1.12 (d, J = 7.2, 3H), 0.96 (d, J = 6.9, 3H); 13C-NMR (125 MHz, δ 7.82 (br s, 1H), 6.49 (ddd, J = 15.7, 10.5, 3.7, 1H), 5.64 (dd, J = 10.7, 1.2, 1H), 5.58 (dd, J = 15.7, 1.2, 1H), 5.54-5.48 (m, 1H), 5.24 (dd, J = 15.5, 4.7, 1H), 5.08 (d, J = 10.0, 1H), 3.47 (dd, J = 8.7, 4.7, 1H), 3.30 (s, 3H), 3.03 (dd, J = 8.7, 1.7, 1H), 2.99-2.87 (m, 2H), 2.80 (br s, 1H), 2.73-2.68 (m, 2H), 2.50 (app t, J = 6.9, 2H), 2.44-2.39 (m, 2H), 2.28-2.17 (m, 4H), 2.16-2.08 (m, 1H), 1.86 (d, J = 1.2, 3H), 1.69-1.55 (m, 2H), 1.41-1.30 (m, 2H), 1.12 (d, J = 7.2, 3H), 0.96 (d, J = 6.9, 3H); 13C-NMR (125 MHz,

Example 19
6-Heptenoyl Chloride 38: To a solution of 6-heptenoic acid (251 μL, 1.85 mmol) in CH₂Cl₂ (5 mL) at rt was added oxalyl chloride (476 μL, 5.55 mmol) and DMF (1 drop). After stirring for 1 hr, the reaction mixture was concentrated under reduced pressure and put under high vacuum for 15 min. The residual yellow oil was dissolved in CH₂Cl₂ (3 mL) and used as a stock solution (0.62 M) for the subsequent acylation reactions.

Example 20
Ester 39: To a solution of alcohol 34 (37 mg, 0.070 mmol) in CH₂Cl₂ (2 mL) at rt was added DMAP (17 mg, 0.139 mmol) and 6-heptenoyl chloride (See above for the preparation of a stock solution of 6-heptenoyl chloride 38 in CH₂Cl₂) 38 (202 μL, 0.125 mmol, 0.62 M in CH₂Cl₂). After stirring for 2 h, the reaction mixture was treated with 0.1 M HCl and diluted with CH₂Cl₂. The organic layer was separated and the aqueous layer was extracted with CH₂Cl₂ (3x). The combined organic layers were dried (MgSO₄) and concentrated under reduced pressure. Purification of the crude product by FC (hexane/EtOAc 10:1 → 4:1 → 2:1) afforded ester 39 (31 mg, 69%) as a colorless oil. ¹H-NMR (500 MHz, CDCl₃) δ 8.22 (br s, 1H), 5.79-5.72 (m, 1H), 5.67-5.61 (m, 2H), 5.55 (d, J = 10.3, 1H), 5.36 (dd, J = 10.3, 1.3, 1H), 5.30 (d, J = 17.1, 1H), 5.00-4.92 (m, 2H), 3.40-3.37 (m, 2H), 3.20 (s, 3H), 2.93-2.85 (m, 2H), 2.71 (dd, J = 17.0, 4.0, 2H), 2.55-2.42 (m, 2H), 2.29-2.21 (m, 2H), 2.19-2.11 (m, 3H), 2.09-2.00 (m, 2H), 1.60 (s, 3H), 1.59-1.51 (m, 5H), 1.47-1.42 (m, 1H), 1.38-1.32 (m, 2H), 0.92-0.90 (m, 15H), 0.05 (s, 3H), -0.01 (s, 3H); ¹³C-NMR (125 MHz, CDCl₃) δ 211.06, 172.07, 171.68, 138.28, 137.75, 134.48, 126.86, 119.24, 114.73, 86.25, 78.39, 73.62, 56.01, 47.13, 41.67, 37.70,
34.18, 34.08, 33.78, 33.28, 30.41, 28.21, 28.18, 26.11, 24.38, 20.12, 18.56, 17.61, 13.73, 12.64, –3.78, –4.97; MS (ESI) 656 [M+Na⁺]; HRMS (FAB) calcd. for C₃₅H₅₉NO₇SiNa [M+Na⁺] 656.3959, found 656.3956.

**Example 21**

**[0475]**

**[0476]** TEG-2,3-Dihydromigrastatin 40: To a solution of ester 39 (31 mg, 0.048 mmol) in refluxing toluene (100 mL) was added Grubbs-II catalyst 16 (8 mg, 0.0094 mmol). After stirring for 15 min, the reaction mixture was cooled to rt and filtered through a silica plug (hexane/EtOAc 1:3). Purification of the crude product by FC (hexane/EtOAc 5:1 → 2:1 → 1:1) afforded TBS-2,3-dihydromigrastatin 40 (23 mg, 79%) as a colorless oil. ¹H-NMR (500 MHz, CDCl₃) δ 7.90 (br s, 1H), 5.65-5.57 (m, 2H), 5.35 (dd, J = 15.7, 5.1, 1H), 5.20 (d, J = 9.2, 1H), 3.43-3.40 (m, 1H), 3.23-3.20 (m, 1H), 3.21 (s, 3H), 3.03-2.98 (m, 1H), 2.95-2.91 (m, 1H), 2.73-2.69 (m, 2H), 2.59-2.43 (m, 2H), 2.33-2.22 (m, 4H), 2.17-2.07 (m, 3H), 1.75 (d, J = 0.9, 3H), 1.61-1.55 (m, 5H), 1.40-1.35 (m, 3H), 1.07 (d, J = 7.2, 3H), 0.94 (d, J = 6.8, 3H), 0.91 (s, 9H), 0.07 (s, 3H), 0.03 (s, 3H); ¹³C-NMR (125 MHz, CDCl₃) δ 210.63, 171.84, 171.80, 134.70, 131.22, 129.51, 128.39, 82.98, 79.10, 76.46, 56.49, 51.24, 40.62, 37.74, 37.69, 34.18, 33.35, 33.18, 31.11, 30.37, 26.29, 25.76, 25.16, 22.80, 20.18, 18.71, 13.66, 13.12, –3.56, –4.97; MS (ESI) 628 [M+Na⁺]; HRMS (FAB) calcd. for C₃₃H₅₅NO₇SiNa [M+Na⁺] 628.3646, found 628.3644.

**Example 28**

TBS-Macro lactone 47: To a solution of ester 46 (95 mg, 0.224 mmol) in refluxing toluene (450 mL) was added Grubbs-II catalyst 16 (38 mg, 0.045 mmol). After stirring for 15 min, the reaction mixture was cooled to rt and filtered through a silica plug (hexane/EtOAc 5:1). Purification of the crude product by FC (hexane/EtOAc 30:1) afforded TBS-macro lactone 47 (67 mg, 76%) as a colorless oil. $^1$H-NMR (500 MHz, CDCl$_3$) δ 5.71-5.65 (m, 1H), 5.56 (d, J = 10.0, 1H), 5.28 (dd, J = 15.7, 8.0, 1H), 4.52 (d, J = 13.9, 1H), 4.35 (d, J = 13.9, 1H), 3.46 (dd, J = 7.7, 2.6, 1H), 3.39 (app t, J = 7.8, 1H), 3.20 (s, 3H), 2.85-2.82 (m, 1H), 2.42-2.36 (m, 1H), 2.26-2.20 (m, 1H), 2.18-2.14 (m, 1H), 2.11-2.06 (m, 1H), 1.77-1.72 (m, 1H), 1.71 (d, J = 1.1, 3H), 1.62-1.50 (m, 2H), 1.46-1.40 (m, 1H), 0.91 (s, 9H), 0.88 (d, J = 6.8, 3H), 0.07 (s, 3H), 0.05 (s, 3H); $^{13}$C-NMR (125 MHz, CDCl$_3$) δ 173.74, 134.81, 133.62, 128.75, 126.14, 85.42, 77.78, 65.01, 55.97, 34.31, 34.01, 29.37, 27.34, 26.16, 23.36, 23.09, 18.58, 13.86, -3.78, -4.96; MS (ESI) 419 [M+Na$^+$]; HRMS (FAB) calcd. for C$_{22}$H$_{40}$O$_4$SiNa [M+Na$^+$] 419.2594, found 419.2601.

**Example 29**

Macrolactone 48: To a solution of TBS-macro lactone 47 (179 mg, 0.452 mmol) in THF (6 mL) at rt was added HF•pyridine (in the beginning: 0.6 mL, after a total of 15 h: an additional 0.6 mL, after a total of 25 h: an additional 0.3 mL). After stirring for a total of 40 h, the reaction mixture was carefully treated with MeOTMS (12 mL) and concentrated under reduced pressure. Purification of the crude product by FC (hexane/EtOAc 10:1 → 5:1) afforded macrolactone 48 (120 mg, 94%) as a white crystalline solid. [α]$_D$ +115.3° (c 1.00, CHCl$_3$); IR (CHCl$_3$)
3567, 3016, 2933, 2858, 1724, 1450, 1387, 1317, 1258, 1145, 1115, 979; \(^1\)H-NMR (500 MHz, CDCl\(_3\) ) \(\delta\) 5.74-5.67 (m, 2H), 5.23 (dd, \(J = 15.7, 7.7, 1H\)), 4.54 (d, \(J = 13.1, 1H\)), 4.29 (d, \(J = 13.1, 1H\)), 3.46-3.39 (m, 2H), 3.30 (s, 3H), 2.82-2.77 (m, 1H), 2.44-2.39 (m, 1H), 2.26-2.15 (m, 2H), 2.03-1.97 (m, 1H), 1.74 (d, \(J = 0.9, 3H\)), 1.74-1.70 (m, 1H), 1.60-1.52 (m, 2H), 1.36-1.32 (m, 1H), 0.93 (d, \(J = 6.9, 3H\)); \(^{13}\)C-NMR (125 MHz, CDCl\(_3\) ) \(\delta\) 173.69, 135.19, 134.39, 129.02, 127.14, 83.82, 75.91, 64.76, 56.34, 34.23, 32.06, 29.88, 27.20, 23.40, 23.27, 12.81; MS (ESI) 305 [M+Na\(^{+}\)]; HRMS (FAB) calcd. for C\(_{16}\)H\(_{28}\)O\(_4\)Na [M+Na\(^{+}\)] 305.1719, found 305.1729.

[0493]  **Example 30**  

[0494] **Acylated Macrolactone 49:** To a solution of macrolactone 48 (4.5 mg, 0.016 mmol) in CH\(_2\)Cl\(_2\) (0.75 mL) at rt was added DMAP (6 mg, 0.048 mmol) and AcCl (3.5 \(\mu\)L, 0.048 mmol). After stirring for 24 h, the reaction mixture was concentrated under reduced pressure to a volume of ca. 0.2 mL. Purification of the residual solution by preparative TLC (hexane/EtOAc 2:1) afforded the acylated macrolactone 49 (4 mg, 76%) as a colorless oil. \(^1\)H-NMR (500 MHz, CDCl\(_3\) ) \(\delta\) 5.78-5.72 (m, 1H), 5.37 (dd, \(J = 15.7, 8.2, 1H\)), 5.28 (d, \(J = 10.0, 1H\)), 4.89 (dd, \(J = 8.0, 3.6, 1H\)), 4.56 (d, \(J = 13.2, 1H\)), 4.32 (d, \(J = 13.2, 1H\)), 3.57 (app t, \(J = 8.1, 1H\)), 3.23 (s, 3H), 3.02-2.97 (m, 1H), 2.46-2.41 (m, 1H), 2.25-2.19 (m, 2H), 2.11 (s, 3H), 2.10-2.05 (m, 1H), 1.81-1.75 (m, 1H), 1.71 (d, \(J = 0.9, 3H\)), 1.61-1.53 (m, 2H), 1.43-1.39 (m, 1H), 0.95 (d, \(J = 6.9, 3H\)); \(^{13}\)C-NMR (125 MHz, CDCl\(_3\) ) \(\delta\) 173.61, 170.82, 135.23, 132.14, 127.76, 82.63, 76.83, 64.69, 56.46, 34.30, 32.10, 29.58, 27.02, 23.39, 23.04, 21.10, 14.85; MS (ESI) 347 [M+Na\(^{+}\)]; HRMS (FAB) calcd. for C\(_{18}\)H\(_{28}\)O\(_5\)Na [M+Na\(^{+}\)] 347.1834, found 347.1848.

[0495]  **Example 31**  

[0496] **Oxidized Macrolactone 50:** To a solution of macrolactone 48 (7 mg, 0.025 mmol) in CH\(_2\)Cl\(_2\) (1.5 mL) at rt was added Dess-Martin periodinane (12 mg, 0.027 mmol). After stirring for 4 h, the reaction mixture was concentrated under reduced pressure to a volume of ca. 0.2 mL. Purification of the residual solution by
preparative TLC (hexane/EtOAc 1:1) afforded oxidized macrolactone 50 (5 mg, 72%) as a colorless oil. $^1$H-NMR (500 MHz, CDCl$_3$) $\delta$ 5.92-5.86 (m, 1H), 5.73 (d, J = 9.9, 1H), 5.34 (dd, J = 15.5, 8.0, 1H), 4.54 (d, J = 11.6, 1H), 4.37 (d, J = 8.0, 1H), 4.31 (d, J = 11.6, 1H), 3.71-3.65 (m, 1H), 3.32 (s, 3H), 2.41-2.36 (m, 1H), 2.27-2.21 (m, 1H), 2.20-2.16 (m, 1H), 2.06-1.99 (m, 1H), 1.81 (s, 3H), 1.68-1.60 (m, 2H), 1.58-1.51 (m, 1H), 1.41-1.33 (m, 1H), 1.19 (d, J = 7.1, 3H); $^{13}$C-NMR (125 MHz, CDCl$_3$) $\delta$ 207.91, 173.74, 138.30, 130.64, 130.42, 124.64, 86.15, 62.75, 56.65, 41.61, 34.04, 30.35, 26.64, 23.40, 23.18, 18.89; MS (ESI) 303 [M+Na$^+$]; HRMS (FAB) calcd. for C$_{16}$H$_{24}$O$_4$Na [M+Na$^+$] 303.1572, found 303.1588.

Example 32

Hydroyzed Core 51: To a solution of macrolactone 48 (5 mg, 0.018 mmol) in MeOH (1.5 mL) at rt was added 0.5M NaOH (0.3 mL). After stirring for 2 h, the reaction mixture was concentrated under reduced pressure to a volume of ca. 0.5 mL, diluted with CH$_2$Cl$_2$, and acidified with 1M HCl (2 mL). The organic layer was separated, dried (MgSO$_4$), and concentrated under reduced pressure to afford hydroyzed core 51 (4 mg, 77%) as a colorless oil. $^1$H-NMR (500 MHz, CDCl$_3$) $\delta$ 5.75-5.70 (m, 1H), 5.34 (dd, J = 15.5, 8.7, 1H), 5.23 (d, J = 10.1, 1H), 4.15 (d, J = 11.8, 1H), 3.97 (d, J = 11.8, 1H), 3.47-3.44 (m, 1H), 3.29-3.26 (m, 1H), 3.23 (s, 3H), 2.74-2.69 (m, 1H), 2.36 (app t, J = 7.4, 2H), 2.14 (app q, J = 7.1, 2H), 1.82 (d, J = 1.2, 3H), 1.69-1.63 (m, 2H), 1.51-1.45 (m, 2H), 0.99 (d, J = 6.7, 3H); $^{13}$C-NMR (125 MHz, CDCl$_3$) $\delta$ 177.87, 136.20, 134.96, 130.90, 127.34, 83.24, 77.55, 61.56, 55.65, 34.56, 33.59, 31.81, 28.38, 24.13, 22.00, 16.39; MS (ESI) 323 [M+Na$^+$]; HRMS (FAB) calcd. for C$_{16}$H$_{28}$O$_5$Na [M+Na$^+$] 323.1834, found 323.1840.

Example 33

Allylic Azide 52: To a solution of alcohol 26 (300 mg, 0.954 mmol) in toluene (3 mL) at rt was added DBU (214 $\mu$L, 1.43 mmol) and diphenylphosphoryl azide (308 $\mu$L, 1.43 mmol). After stirring for 5 h, the reaction mixture was treated with saturated aqueous NH$_4$Cl solution and diluted with Et$_2$O. The organic layer
was separated and the aqueous layer was extracted with Et₂O (3x). The combined organic layers were dried (MgSO₄) and concentrated under reduced pressure. Purification of the crude product by FC (hexane/EtOAc 30:1) afforded allylic azide 52 (281 mg, 87%) as a colorless oil. Compound 52 should be used immediately for the subsequent steps to avoid double bond isomerization. ¹H-NMR (500 MHz, CDCl₃) δ 5.68-5.60 (m, 1H), 5.52 (d, J = 10.0, 1H), 5.32-5.25 (m, 2H), 3.81 (d, J = 13.0, 1H), 3.66 (d, J = 13.0, 1H), 3.45 (dd, J = 7.1, 3.0, 1H), 3.39 (app t, J = 7.5, 1H), 3.21 (s, 3H), 2.56-2.52 (m, 1H), 1.77 (d, J = 1.2, 3H), 0.93-0.90 (m, 12H), 0.06 (s, 3H), 0.04 (s, 3H); ¹³C-NMR (125 MHz, CDCl₃) δ 135.97, 135.19, 127.27, 118.81, 86.04, 78.39, 56.13, 51.46, 34.40, 26.14, 22.21, 18.53, 14.43, −3.80, −4.77; MS (ESI) 362 [M+Na⁺]; HRMS (FAB) calcld. for C₁₇H₃₃N₃O₂SiNa [M+Na⁺] 362.2240, found 362.2239.

[0501] Example 34

[0502] Amide 53: To a solution of azide 52 (184 mg, 0.542 mmol) in THF (5 mL) at 70 °C was added PPh₃ (249 mg, 0.949 mmol) and H₂O (49 µL, 2.71 mmol). After stirring for 4 h, the reaction mixture was dried (MgSO₄) and concentrated under reduced pressure. The residue was dissolved in CH₂Cl₂ (5 mL) and treated with i-Pr₂NEt (378 µL, 2.17 mmol), 6-heptenoic acid (147 µL, 1.08 mmol), and EDC (207 mg, 1.08 mmol). After stirring for 30 min, the reaction mixture was concentrated under reduced pressure to a volume of ca. 1 mL. Purification of the residual solution by FC (CH₂Cl₂ → CH₂Cl₂/Et₂O 10:1) afforded amide 53 (211 mg, 92%) as a colorless oil. ¹H-NMR (500 MHz, CDCl₃) δ 5.83-5.74 (m, 1H), 5.70-5.64 (m, 1H), 5.41 (br s, 1H), 5.32-5.23 (m, 3H), 5.01-4.93 (m, 2H), 3.86 (dd, J = 14.1, 5.6, 1H), 3.79 (dd, J = 14.1, 5.5, 1H), 3.47-3.37 (m, 2H), 3.21 (s, 3H), 2.61-2.56 (m, 1H), 2.19-2.15 (m, 2H), 2.08-2.04 (m, 2H), 1.68 (d, J = 1.3, 3H), 1.67-1.59 (m, 2H), 1.45-1.38 (m, 2H), 0.91-0.89 (m, 12H), 0.06 (s, 3H), 0.02 (s, 3H); ¹³C-NMR (125 MHz, CDCl₃) δ 172.79, 138.44, 135.10, 133.94, 129.82, 118.66, 114.66, 86.01, 78.22, 56.11, 39.84, 36.65, 34.26, 33.44, 28.52, 26.11, 25.25, 21.93, 18.50, 14.76,
3.83, –4.77; MS (ESI) 446 [M+Na⁺]; HRMS (FAB) calcd. for C₂₄H₄₃NO₅SiNa [M+Na⁺] 446.3066, found 446.3065.

[0503] Example 35

[0504] TBS-Macro lactam 54: To a solution of amide 53 (105 mg, 0.248 mmol) in refluxing toluene (350 mL) was added Grubbs-II catalyst 16 (42 mg, 0.050 mmol). After stirring for 15 min, the reaction mixture was cooled to rt and filtered through a silica plug (hexane/EtOAc 1:2). Purification of the crude product by FC (hexane/EtOAc 2:1) afforded TBS-macro lactam 54 (59 mg, 60%) as a colorless oil. ¹H-NMR (500 MHz, CDCl₃) δ 5.81-5.75 (m, 1H), 5.46 (d, J = 9.9, 1H), 5.36 (dd, J = 15.9, 6.0, 1H), 5.30 (br s, 1H), 3.77 (dd, J = 13.9, 3.5, 1H), 3.66 (dd, J = 13.9, 5.4, 1H), 3.48-3.44 (m, 2H), 3.21 (s, 3H), 2.63-2.58 (m, 1H), 2.21-2.08 (m, 3H), 2.05-1.98 (m, 1H), 1.73 (d, J = 1.1, 3H), 1.65-1.49 (m, 3H), 1.39-1.32 (m, 1H), 0.92-0.90 (m, 12 H), 0.07 (s, 3H), 0.05 (s, 3H); ¹³C-NMR (125 MHz, CDCl₃) δ 173.26, 134.11, 133.90, 129.03, 128.54, 84.80, 77.46, 56.29, 41.41, 36.01, 34.48, 29.59, 27.45, 26.11, 24.68, 24.32, 18.56, 14.77, –3.92, –4.93; MS (ESI) 418 [M+Na⁺⁺]; HRMS (FAB) calcd. for C₂₂H₄₁NO₅SiNa [M+Na⁺⁺] 418.2753, found 418.2752.

[0505] Example 36

[0506] Macro lactam 55: To a solution of TBS-macro lactam 54 (91 mg, 0.230 mmol) in THF (3 mL) at rt was added HF•pyridine (in the beginning: 0.4 mL, after a total of 18 h: an additional 0.15 mL). After stirring for a total of 21 h, the reaction mixture was carefully treated with MeOTMS (5 mL) and concentrated under reduced pressure. Purification of the crude product by FC (hexane/EtOAc 1:1 → 1:2) afforded macro lactam 55 (52 mg, 81%) as a colorless oil. [α]D +101.3° (c 1.00, CHCl₃); IR (CHCl₃) 3566, 3444, 3021, 2936, 2828, 1658, 1504, 1478, 1398, 1229, 1088, 979; ¹H-NMR (500 MHz, CDCl₃) δ 5.79-5.73 (m, 1H), 5.66 (d, J = 10.2, 1H), 5.24 (dd, J = 15.8, 7.5, 1H), 5.12 (br s, 1H), 3.91 (dd, J = 13.7, 4.1, 1H), 3.50-3.46 (m, 2H), 3.34-3.30 (m, 1H), 3.31 (s, 3H), 2.89 (br s, 1H), 2.56-2.52 (m, 1H), 2.32-2.25 (m, 2H), 2.16-2.11 (m, 1H), 1.96-1.89 (m, 1H), 1.77 (d, J = 1.1, 3H), 1.73-1.51
(m, 3H), 1.37-1.32 (m, 1H), 0.94 (d, J = 6.9, 3H); 13C-NMR (125 MHz, CDCl3) δ 173.36, 135.52, 133.77, 129.89, 128.73, 83.21, 76.38, 56.45, 41.40, 35.95, 32.27, 29.86, 27.00, 24.82, 24.42, 13.03; MS (ESI) 304 [M+Na]+; HRMS (FAB) calcd. for C16H27NO3Na [M+Na]+ 304.1889, found 304.1889.

[0507] **Example 37**

[0508] **Allylic Bromide 56:** To a solution of alcohol 26 (325 mg, 1.03 mmol) in CH2Cl2 (10 mL) at rt was added solid supported PPh3 (excess until reaction complete) and CBr4 (478 mg, 1.44 mmol). After stirring for 15 min, the reaction mixture was filtered through a cotton plug and concentrated under reduced pressure to yield the allylic bromide 56. 1H-NMR (500 MHz, CDCl3) δ 5.67 (ddd, J = 17.2, 10.3, 8.3, 1H), 5.41 (dd, J = 10.0, 0.9, 1H), 5.31 (dd, J = 10.3, 2.0, 1H), 5.27 (dt, J = 17.2, 1.0, 1H), 3.94 (s, 2H), 3.55 (dd, J = 7.2, 3.0, 1H), 3.39 (app t, J = 7.4, 1H), 3.21 (s, 3H), 2.63-2.56 (m, 1H), 1.81 (d, J = 0.9, 3H), 0.93 (d, J = 6.4, 3H), 0.91 (s, 9H), 0.06 (s, 3H), 0.03 (s, 3H); 13C-NMR (125 MHz, CDCl3) δ 136.35, 135.20, 129.64, 118.82, 86.09, 77.57, 56.15, 34.68, 32.34, 26.13, 21.91, 18.50, 13.54, -3.83, -4.82.

[0509] **Example 38**

[0510] **β-Ketosulfone 57:** To a solution of methyl phenyl sulfone (1.43 g, 9.14 mmol) in THF (15 mL) at −15 °C was added BuLi (6.28 mL, 10.0 mmol, 1.6M in hexane). After stirring for 30 min, the reaction mixture was cooled to −78 °C and ethyl 6-heptenoate (802 µL, 4.57 mmol) was added. The reaction mixture was warmed to rt and then treated with saturated aqueous NH4Cl solution. The organic layer was separated and the aqueous layer was extracted with EtOAc (3x). The combined organic layers were dried (MgSO4) and concentrated under reduced pressure. Purification of the crude product by FC (hexane/EtOAc 5:1) afforded β-ketosulfone 57 (1.12 g, 92%) as a white solid. 1H-NMR (500 MHz, CDCl3) δ 7.88-7.86 (m, 2H), 7.68-7.65 (m, 1H), 7.58-7.54 (m, 2H), 5.79-5.71 (m, 1H), 5.00-4.92 (m, 2H), 4.14 (s, 2H), 2.70-2.67 (m, 2H), 2.05-2.00 (m, 2H), 1.58-1.52 (m, 2H),
1.38-1.32 (m, 2H); $^{13}$C-NMR (125 MHz, CDCl$_3$) $\delta$ 197.99, 138.14, 134.19, 129.25, 129.06, 128.17, 114.73, 66.70, 44.12, 33.26, 27.85, 22.42; MS (ESI) 289 [M+Na$^+$];
HRMS (FAB) calcd. for C$_{14}$H$_{18}$O$_3$SNa [M+Na$^+$] 289.0874, found 289.0882.

**Example 39**

**Ketone 58:** To a solution of $\beta$-ketosulfone 57 (685 mg, 2.57 mmol) in toluene (5 mL) at rt was added DBU (385 $\mu$L, 2.57 mmol). After stirring for 50 min, a solution of crude allylic bromide 56 in toluene (5 mL) was added and the reaction mixture was stirred for another 45 min. The reaction mixture was concentrated under reduced pressure to a volume of ca. 1 mL and the residual solution was filtered through a silica plug (hexane/EtOAc 7:1). To a solution of crude alkylated sulfone in MeOH (10 mL) at rt was added Na$_2$HPO$_4$ (366 mg, 2.57 mmol) and 10% Na/Hg (474 mg, ca. 2.06 mmol). After stirring for 3 h, the reaction mixture was filtered through a cotton plug and H$_2$O was added to the filtrate. The organic layer was separated and the aqueous layer was extracted with CH$_2$Cl$_2$ (3×). The combined organic layers were dried (MgSO$_4$) and concentrated under reduced pressure. Purification of the crude product by FC (hexane/EtOAc 30:1) afforded ketone 58 (258 mg, 61%) as a colorless oil. $^1$H-NMR (500 MHz, CDCl$_3$) $\delta$ 5.82-5.75 (m, 1H), 5.67-5.60 (m, 1H), 5.29-5.18 (m, 3H), 5.02-4.93 (m, 2H), 3.41 (dd, $J = 7.2$, 2.8, 1H), 3.37 (app t, $J = 7.6$, 1H), 3.20 (s, 3H), 2.52-2.47 (m, 1H), 2.44-2.38 (m, 4H), 2.28-2.18 (m, 2H), 2.06 (app q, $J = 7.1$, 2H), 1.64 (d, $J = 1.2$, 3H), 1.62-1.56 (m, 2H), 1.41-1.35 (m, 2H), 0.90 (s, 9H), 0.87 (d, $J = 6.7$, 3H), 0.05 (s, 3H), 0.01 (s, 3H); $^{13}$C-NMR (125 MHz, CDCl$_3$) $\delta$ 210.57, 138.45, 135.30, 131.81, 131.30, 118.53, 114.64, 86.27, 78.61, 56.10, 42.64, 41.23, 34.05, 33.50, 28.46, 26.16, 26.12, 23.27, 23.11, 18.55, 14.05, -3.79, -4.79; MS (ESI) 445 [M+Na$^+$];
HRMS (FAB) calcd. for C$_{25}$H$_{46}$O$_3$SiNa [M+Na$^+$] 445.3114, found 445.3095.

**Example 40**

**TES-Macroketone 59:** To a solution of ketone 58 (258 mg, 0.610 mmol) in refluxing toluene (1200 mL) was added Grubbs-II catalyst 16 (104 mg,
0.122 mmol). After stirring for 15 min, the reaction mixture was cooled to rt and filtered through a silica plug (hexane/EtOAc 2:1). Purification of the crude product by FC (hexane/EtOAc 20:1) afforded TBS-macroketone 59 (194 mg, 81%) as a colorless oil. \(^1\)H-NMR (500 MHz, CDCl\(_3\)) \(\delta\) 5.67-5.61 (m, 1H), 5.32 (dd, \(J = 15.7, 6.7, 1H\)), 5.26 (dd, \(J = 9.8, 0.9, 1H\)), 3.41-3.36 (m, 2H), 3.21 (s, 3H), 2.55-2.49 (m, 1H), 2.46-2.41 (m, 1H), 2.39-2.33 (m, 1H), 2.32-2.18 (m, 5H), 2.14-2.10 (m, 1H), 1.68-1.63 (m, 1H), 1.67 (d, \(J = 1.3, 3H\)), 1.62-1.53 (m, 2H), 1.51-1.46 (m, 1H), 0.90 (s, 9H), 0.89 (d, \(J = 6.8, 3H\)), 0.05 (s, 3H), 0.00 (s, 3H); \(^{13}\)C-NMR (125 MHz, CDCl\(_3\)) \(\delta\) 211.96, 133.10, 131.91, 131.68, 129.87, 84.77, 79.32, 56.24, 41.44, 40.91, 34.32, 30.25, 28.74, 26.84, 26.15, 23.15, 22.85, 18.60, 12.78, –3.85, –5.03; MS (ESI) 417 [M+Na\(^+\)]; HRMS (FAB) calcd. for C\(_{23}\)H\(_{22}\)O\(_5\)SiNa [M+Na\(^+\)] 417.2801, found 417.2819.

[0515] **Example 41**

**Macroketone 60:** To a solution of TBS-macroketone 59 (194 mg, 0.492 mmol) in THF (15 mL) at rt was added HF•pyridine (3.5 mL). After stirring for 15 h, the reaction mixture was carefully treated with MeOTMS (25 mL) and concentrated under reduced pressure. Purification of the crude product by FC (hexane/EtOAc 10:1 → 4:1) afforded macroketone 60 (124 mg, 90%) as a colorless oil. [\(\alpha\)]\(_D\) +77.6° (c 0.50, CHCl\(_3\)); IR (neat) 3566, 3022, 3015, 2975, 2937, 2879, 1700, 1448, 1384, 1237, 1109, 1085, 979; \(^1\)H-NMR (500 MHz, CDCl\(_3\)) \(\delta\) 5.72 (ddd, \(J = 15.0, 8.5, 6.0, 1H\)), 5.37 (dd, \(J = 10.0, 0.9, 1H\)), 5.31 (dd, \(J = 15.6, 7.8, 1H\)), 3.47 (app t, \(J = 8.5, 1H\)), 3.36 (dd, \(J = 9.2, 1.2, 1H\)), 3.31 (s, 3H), 2.78 (br s, 1H), 2.51-2.45 (m, 2H), 2.37-2.32 (m, 2H), 2.26-2.16 (m, 5H), 1.69 (d, \(J = 1.3, 3H\)), 1.68-1.59 (m, 2H), 1.55-1.50 (m, 2H), 0.95 (d, \(J = 6.8, 3H\)); \(^{13}\)C-NMR (125 MHz, CDCl\(_3\)) \(\delta\) 212.10, 135.23, 132.91, 130.26, 129.22, 83.69, 77.62, 56.45, 42.08, 40.67, 32.57, 30.33, 28.57, 27.01, 23.22, 23.14, 12.61; MS (ESI) 303 [M+Na\(^+\)]; HRMS (FAB) calcd. for C\(_{17}\)H\(_{28}\)O\(_5\)Na [M+Na\(^+\)] 303.1936, found 303.1938.

[0517] **Example 42**
Secondary Alcohols 61 and 62: To a solution of alcohol 26 (360 mg, 1.15 mmol) in CH₂Cl₂ (5 mL) at rt was added Dess-Martin periodinane (970 mg, 2.29 mmol). After stirring for 1 h, the reaction mixture was treated with saturated aqueous Na₂S₂O₃ solution and saturated aqueous NaHCO₃ solution. The organic layer was separated and the aqueous layer was extracted with CH₂Cl₂ (3x). The combined organic layers were dried (Na₂SO₄) and concentrated under reduced pressure to afford the corresponding aldehyde 27. Crude product 27 was dissolved in Et₂O (12 mL) and i-PrMgCl (2.90 mL, 5.80 mmol, 2M in THF) was added at −78 °C. After stirring for 5 h, the reaction mixture was treated with saturated aqueous NH₄Cl solution. The organic layer was separated and the aqueous layer was extracted with EtOAc (3x). The combined organic layers were dried (MgSO₄) and concentrated under reduced pressure. Purification of the crude product by FC (toluene/EtOAc 19:1) afforded (S)-secondary alcohol 61 (186 mg, 50%) and (R)-secondary alcohol 62 (134 mg, 36%) as colorless oils.

(S)-Secondary Alcohol 61: IR (neat) 3476, 2956, 2929, 2884, 2857, 1471, 1462, 1378, 1251, 1127, 1096, 1080, 1032, 1006; ¹H-NMR (500 MHz, CDCl₃) δ 5.78-5.68 (m, 1H), 5.31-5.23 (m, 3H), 3.98 (d, J = 9.8, 1H), 3.51-3.48 (m, 2H), 3.24 (s, 3H), 2.73-2.68 (m, 1H), 1.78-1.69 (m, 1H), 1.66 (s, 3H), 1.60 (br s, 1H), 1.03 (d, J = 6.4, 3H), 0.91 (s, 9H), 0.89 (d, J = 6.0, 3H), 0.73 (d, J = 6.9, 3H), 0.07 (s, 3H), 0.05 (s, 3H); ¹³C-NMR (125 MHz, CDCl₃) δ 135.37, 134.58, 133.16, 118.24, 85.74, 77.85, 75.73, 56.23, 33.64, 30.96, 26.13, 19.51, 18.93, 18.48, 17.56, 15.66, −3.86, −4.57; MS (ESI) 379 [M+Na⁺]; HRMS (FAB) calcd. for C₂₀H₄₀O₅SiNa [M+Na⁺] 379.2644, found 379.2663.

[0531] Example 48

Macro cyclic Tertiary Alcohol 70 (diastereomeric mixture): To a solution of macroketone 60 (5.5 mg, 0.020 mmol) in THF (0.4 mL) at 0 °C was added MeMgBr (66 μL, 0.200 mmol, 3M in Et₂O). After stirring for 5 min, the reaction mixture was treated with saturated aqueous NH₄Cl solution and diluted with EtOAc. The organic layer was separated and the aqueous layer was extracted with EtOAc (4x). The combined organic layers were dried (MgSO₄) and concentrated under reduced pressure to afford a diastereomeric mixture of macrocyclic tertiary alcohol 70 (6.0 mg, 95%) as a colorless oil. IR (neat) 3434, 2933, 2856, 1460, 1448, 1117, 1083; ¹H-NMR (500 MHz, CDCl₃) δ 5.66-5.60 (m, 2H), 5.34-5.31 (m, 2H), 5.24-5.17 (m, 2H), 3.46-3.32 (m, 6H), 3.30 (s, 6H), 2.80-2.70 (m, 2H), 2.61-2.51 (m, 2H), 2.30-2.26 (m, 2H), 2.17 (br s, 1H), 2.14-2.01 (m, 2H), 1.95-1.82 (m, 2H), 1.77-1.60 (m, 2H), 1.70 (s, 6H), 1.58-1.36 (m, 8H), 1.34-1.14 (m, 5H), 1.20 (s, 6H), 1.02 (app t, J = 7.2, 2H), 0.94-0.92 (m, 6H); ¹³C-NMR (125 MHz, CDCl₃) δ 136.55, 136.44, 134.45, 134.35, 129.44, 129.32, 84.34, 84.24, 72.90, 72.80, 56.27, 56.23, 38.71, 38.60, 38.48, 38.43, 32.10, 32.09, 30.92, 30.56, 29.69, 29.32, 29.24, 27.41, 27.37, 26.79, 24.27, 23.34, 23.33, 21.91, 21.14, 12.64, 12.57; MS (ESI) 319 [M+Na⁺]; HRMS (FAB) calcd. for C₁₈H₃₂O₂Na [M+Na⁺] 319.2249, found 319.2264.

[0533] Example 49

Macro cyclic CF₃-Alcohol 71 (major): To a solution of macroketone 60 (10 mg, 0.036 mmol) and TMSCF₃ (27 μL, 0.180 mmol) in THF (0.6 mL) at rt was added a catalytic amount of TBAF. After stirring for 1 h, the reaction mixture was treated with excess TBAF and stirred for another 5 h. The reaction mixture was concentrated under reduced pressure. Purification of the crude product by FC
(hexane/EtOAc 3:1) afforded a diastereomeric mixture of alcohol 71 (10 mg, 80%) as a colorless oil. Further purification by FC (hexane/EtOAc 7:1 → 3:1) provided the major isomer 71 in pure form as a colorless oil. IR (neat) 3409, 2963, 2931, 2922, 1457, 1244, 1150, 1112; $^1$H-NMR (500 MHz, CDCl$_3$) $\delta$ 5.64 (ddd, $J = 17.2$, 9.4, 5.1, 1H), 5.34 (d, $J = 10.7$, 1H), 5.19 (dd, $J = 17.2$, 8.2, 1H), 3.43 (app t, $J = 9.0$, 1H), 3.36 (app d, $J = 9.5$, 1H), 3.30 (s, 3H), 2.87 (br s, 1H), 2.56-2.47 (m, 1H), 2.31-2.26 (m, 1H), 2.11-2.03 (m, 1H), 2.00-1.84 (m, 2H), 1.71-1.68 (m, 2H), 1.69 (s, 3H), 1.69-1.38 (m, 4H), 1.30-1.22 (m, 2H), 0.99 (app t, $J = 7.3$, 1H), 0.93 (d, $J = 7.0$, 3H); $^{13}$C-NMR (125 MHz, CDCl$_3$) $\delta$ 136.38, 133.31, 129.78, 129.45, 83.77, 56.33, 32.00, 31.02, 30.41, 29.72, 26.99, 25.09, 23.93, 23.27, 20.20, 19.63, 12.74; MS (ESI) 373 [M+Na$^+$]; HRMS (FAB) calcd. for C$_{18}$H$_{29}$F$_3$O$_3$Na [M+Na$^+$] 373.1966, found 373.1971.

[0535] Example 50

[0536] Macrootoxine 72 (diastereomeric mixture): A solution of macroketone 60 (5 mg, 0.018 mmol) and NH$_2$OH.HCl (12 mg, 0.178 mmol) in pyridine (0.3 mL) was heated to 45 °C for 3 h. The reaction mixture was concentrated under reduced pressure and the crude product was purified by FC (hexane/EtOAc 1:1) to afford a diastereomeric mixture of macrotoxine 72 (4 mg, 70%) as a colorless oil. IR (neat) 3326, 2930, 1447, 1109, 1086, 981; $^1$H-NMR (500 MHz, CDCl$_3$) $\delta$ 5.72-5.64 (m, 2H), 5.37 (d, $J = 9.1$, 2H), 5.31-5.25 (m, 2H), 3.50-3.45 (m, 2H), 3.38-3.35 (m, 2H), 3.32 (s, 6H), 2.82 (br s, 2H), 2.62-2.57 (m, 2H), 2.43-2.36 (m, 2H), 2.29-2.04 (m, 14H), 1.76 (d, $J = 1.6$, 3H), 1.71 (d, $J = 1.8$, 3H), 1.56-1.48 (m, 6H), 1.27-1.24 (m, 2H), 0.97 (d, $J = 6.8$, 3H), 0.96 (d, $J = 6.8$, 3H); $^{13}$C-NMR (125 MHz, CDCl$_3$) $\delta$ 161.91, 161.66, 135.46, 135.30, 134.03, 133.76, 129.76, 129.64, 129.29, 129.19, 83.93, 83.89, 77.65, 77.48, 56.42, 33.66, 32.57, 32.51, 32.42, 30.62, 30.41, 30.29, 28.22, 27.01, 26.94, 26.70, 26.64, 24.42, 23.51, 23.13, 12.67; MS (ESI) 318 [M+Na$^+$]; HRMS (FAB) calcd. for C$_{17}$H$_{28}$NO$_2$Na [M+Na$^+$] 318.2045, found 318.2049.
[0537] **Example 51**

[0538] Biotinylated Macro hydrazone 73 (diastereomeric mixture): A solution of macro ketone 60 (6 mg, 0.021 mmol) and biotin-dPEG₄-hydrazide (13 mg, 0.026 mmol) in EtOH (0.3 mL) was heated to 55 °C for 1 h. The reaction mixture was concentrated under reduced pressure and the crude product was purified by FC (CH₂Cl₂/MeOH 4:1) to afford a diastereomeric mixture of biotinylated macro hydrazone 73 (12 mg, 75%) as a colorless oil. IR (neat) 3291, 2930, 2872, 1703, 1691, 1680, 1540, 1459, 1261, 1104; H-NMR (500 MHz, CDCl₃) δ 9.56 (s, 0.4H), 9.50 (s, 0.4H), 9.23 (s, 0.6H), 9.10 (s, 0.6H), 6.77-6.73 (m, 2H), 6.58 (s, 0.6H), 6.50 (s, 6H), 6.12 (s, 0.4H), 6.08 (s, 0.4H), 5.70-5.63 (m, 2H), 5.42-5.34 (m, 2H), 5.32-5.25 (m, 2H), 5.18 (s, 0.8H), 5.04 (s, 1.2H), 4.50-4.47 (m, 2H), 4.37-4.32 (m, 2H), 3.83-3.79 (m, 4H), 3.68-3.55 (m, 32H), 3.48-3.41 (m, 6H), 3.39-3.28 (m, 8H), 3.16-3.14 (m, 2H), 2.97-2.89 (m, 5H), 2.82 (s, 0.6H), 2.78 (s, 0.4H), 2.74-2.70 (m, 2H), 2.64-2.56 (m, 4H), 2.30-2.22 (m, 10H), 2.20-2.02 (m, 4H), 2.17 (s, 3H), 1.77 (s, 3H), 1.75-1.64 (m, 12H), 1.25-1.24 (m, 2H), 0.95 (d, J = 7.0, 3.6H), 0.92 (d, J = 6.6, 2.4H); C-NMR (125 MHz, CDCl₃) δ 173.95, 173.74, 173.33, 173.22, 163.73, 163.67, 163.49, 160.94, 160.65, 156.08, 155.65, 135.39, 135.02, 134.78, 133.92, 133.65, 132.80, 132.62, 130.73, 130.61, 129.71, 129.56, 129.39, 128.99, 128.92, 83.99, 83.83, 83.79, 83.70, 77.64, 77.53, 77.46, 77.41, 70.42, 70.38, 70.14, 70.04, 69.92, 61.77, 61.73, 60.08, 56.46, 56.40, 40.61, 40.54, 39.13, 39.10, 36.29, 35.86, 35.77, 33.17, 32.68, 32.44, 30.92, 30.67, 30.46, 30.36, 29.68, 28.07, 27.41, 26.88, 26.81, 26.58, 25.51, 25.45, 24.59, 23.63, 23.49, 23.26, 12.71, 12.66; MS (ESI) 768 [M+H⁺]; HRMS (FAB) calcd. for C₃₈H₆₆N₅O₆S [M+H⁺] 768.4581, found 768.4581.

[0539] **Example 52**

[0540] Preliminary Biological Data

[0541] 1. Tube formation assay (Table 1):

[0542] A protocol was designed based on the instructions from the provider (BD Bioscience, San Jose, CA). Briefly, wells of a 48 well culture dish were covert with 150 µL matrigel and the matrigel was gelatinized for 30 min at 37 °C. A 30-90%
confluent HUVEC (BD Bioscience, San Jose, CA) culture was trypsin treated, the
detached cells were collected by centrifugation and resuspended in EGM-2 media
(BD Bioscience, San Jose, CA). Cell concentration was adjusted to 100,000
cells/mL. 400 μL of the cell suspension were filled in the matrigel coated wells, and
a solution of the inhibitor was added to the intended final concentration. The plates
were incubated at 37 °C with 5 % CO₂ for 16 – 18 h. Media was removed, and the
matrigel surface was washed twice with 500 μL PBS before cells were labeled with
250 μL 8 μM Calcein AM (Pierce, Rockford, IL) in PBS for 30 min at 37 °C. After
two additional washing steps (500 μL PBS) cells were visualized under an inverted
microscope. Fluorescence was excited at 488 nm and recorded at 538 nm. The
minimum effect concentration was defined as the minimal inhibitor concentration
that caused a definite disturbance of the complexity of the formed tube network.

[0543] 2. Wound healing assay (Table 2)

[0544] The wound healing assay was performed based on the method described
by Nakae et al. (Nakae et al., J. Antibiotics (2000), 53, 1130-1136). Briefly,
adherent cells were grown in a suitable media to confluence (e.g. KYSE-520 cells in
RPMI-1640 with 10 % FBS). Cells were starved for 24 h in serum free media. A
scratch (ca. 0.5 mm) was applied and the cell layer was washed twice with PBS after
removal of the media. Fresh, serum free media with the test compound at the desired
concentration was added and the cells were incubated for 28 to 30 h at 37 °C, 5 %
CO₂. The scratch size was compared to that observed for cells exposed to 100μM
Migrastatin. Test compounds associated with a scratch size equal to or larger than
that observed for cells exposed to 100μM Migrastatin were deemed to have cell
migration inhibitory activity at least equal to Migrastatin.

[0545] 3. Chamber cell migration assay (Table 3)

[0546] Cells were grown in an appropriate media to 70 to 80 % confluence and
incubated in serum and growth factor free media for 24 h. Cells were detached by
trypsin treatment, collected by centrifugation and resuspended in serum free media
to a final concentration of 150,000 cells/mL. 400 μL of the cell suspension were
loaded into a fibronectin coated insert for 24 well multidishes. 750 μL fully
supplemented media were applied to the compartment under the insert. To both
chambers the inhibitor was added at the intended concentration and the plates were incubated for 36 h at 37 °C, 5 % CO₂. The media from both chambers was aspirated, the lower section was filled with 300 μL CyQuant assay solution (Molecular Probes, Eugene, OR), and incubated at room temperature for 5 min. The resulting CyQuant assay solution was transferred to the cavities of a 96 well microtiter plate and the fluorescence signal was recorded in an appropriate reader. The CyQuant dye forms a highly fluorescent complex with DNA, thus the fluorescence signal is proportional to the number of cells that migrated through the membrane in the presence of the test compound (N\textsuperscript{inh}). A positive control (i.e., without a test compound in the growth media) was carried out according to the procedure described above, except that no test compound was added. The positive control fluorescent reading correlates with the number of cells that migrate through the membrane in the absence of inhibitor (N\textsuperscript{+}). A negative control (i.e., without a test compound and without attractants (e.g., growth factors, serum) in the growth media) was carried out according to the procedure described above, except that no test compound and attractants were added. The negative control fluorescent reading correlates with the number of cells that migrate through the membrane through non-directed processes (N). The anti-migratory effect of a test compound is determined by the ratio (N\textsuperscript{inh} - N)/ (N\textsuperscript{+} - N).

[0547] Example 53
[0548] Chamber Cell Migration Assay (Tables 4 and 6): Cell migrations were assayed with Boyden chambers [8.0 μm pore size, polyethylene terephthalate membrane, FALCON cell culture insert (Becton-Dickinson)]. 4T1 mouse breast tumor cells or HUVECs were trypsinized and counted. 300 μl of 5-10x 10\textsuperscript{4} cells in serum-free medium was added to the upper chamber and 500 μl of medium with 10% fetal bovine serum (FBS) was added to the lower chamber. The transwells were incubated for 6-8 h at 37 °C with different concentrations of chemical compound in both upper and lower chamber. Cells on the inside of the transwell inserts were removed with a cotton swab, and cells on the underside of the insert
were fixed and stained. Photographs of three random regions were taken and the number of cells was counted to calculate the average number of cells that have transmigrated.

Exemplary effects of migrastatin analogs, macrolactone 4C and migrastatin 1, on 4T1 tumor cell migration are shown in Figure 2.

**Example 54**

**Mouse Plasma Stability Studies (Table 5):** *HPLC conditions:* The sample is injected and separated using an Inertsil ODS3 6u 3x 150 mm column with a mobile phase of MeCN and water (50% for migrastatin) at a flow of 0.4 mL/min, monitored at 220 nm at 0.02 AUFS (the retention time for migrastatin is ca. 4 min, the identity of this peak was confirmed by mass spectral analysis). *Incubation and sample preparation conditions:* A solution (ca. 30 mM) of chemical compound (Table 5) in DMSO is prepared. 2 μL of the solution is added to a mixture containing 200 μL of mouse plasma and 800 μL of PBS. The resulting solution is put into a water bath at 37 °C, and 100 μL of sample is withdrawn at 10, 20, 30, 45, and 60 min. The precipitate is removed by centrifugation and 20 μL of the supernatant is injected onto the HPLC.

**Example 55**

**Cell Proliferation Assay:** 4x 10^4 of 4T1 tumor cells in RPMI-1640 medium containing 10% FBS were seeded into wells of 96-multiwell plates (Becton-Dickinson) in the presence or absence of chemical compounds and then incubated at 37 °C for 48 h. An MTT kit (Cell Proliferation Kit I, Roche) (a colorimetric assay) was used to quantify cell proliferation and viability. The number of living cells, thus the total metabolic activity, directly correlates to the amount of purple formazan crystals formed (monitored by the absorbance).

Exemplary effects of migrastatin 1, and migrastatin analogs, macrolactone 48, macrolactam 55, and macroketone 60 on 4T1 tumor cell proliferation are shown in Figure 3.
Example 56

Inhibition of metastasis of mouse breast tumors by migrastatin analogs in mice. 4T1 mouse breast tumor cell line was isolated from a single spontaneously arising mammary tumor from a BALB/BfC3H mouse (MMTV+). The 4T1 tumor closely mimics human breast cancer in its anatomical site, immunogenecity, growth characteristics, and metastatic properties. From the mammary gland, 4T1 tumor spontaneously metastasizes to a variety of target organs including the lung, bone, brain, and liver through primarily a hematogenous rout.

To assess the efficacy of therapeutic application of migrastatin analogs in the 4T1 murine mammary carcinoma models, we administered migrastatin analogs (macroketone and macrolactam) to BALB/c mice carrying the 4T1 tumors.

Female BALB/c mice (6-8 week old) were purchased from the Jackson Laboratory (Bar Harbor, Maine). All mice were housed at the Weill Medical College of Cornell University Animal Facilities in accordance with the Principles of Animal Care (NIH publication no. 85-23, revised 1985). 4T1 tumor cells (1 x 10⁵) were injected subcutaneously into the abdominal mammary gland area of mice in 0.1 ml of a single-cell suspension in phosphate buffered saline (PBS) on Day 0. The dosage of tumor implantation was empirically determined to give rise to tumor of ~10 mm in diameter in untreated wild type mice in 21-23 days. On Day 7, when the tumors averaged in size ~4-5 mm in diameter, migrastatin analogs or control PBS saline were given every day by intraperitoneal injection at 10 mg/kg or 20 mg/kg per mouse until Day 25. On Day 28, the mice were sacrificed. This regimen of migrastatin analogs was well tolerated with no signs of overt toxicity. Every group included five mice. Primary tumors were measured using electronic calipers on the day when the mice were sacrificed. Tumor size was the square root of the product of two perpendicular diameters. Numbers of metastatic 4T1 cells in lung were determined by the clonogenic assay. In brief, lungs were removed from each mouse on Day 28, finely minced and digested in 5 ml of enzyme cocktail containing 1 X PBS and 1 mg/ml collagenase type IV for 2 hours at 37°C on a platform rocker. After incubation, samples were filtered through 70 uM nylon cell strainers and
washed twice with PBS. Resulting cells were suspended and plated serially diluted in 10 cm tissue culture dishes in medium RPMI1640 containing 60 uM thio guanine for clonogenic growth. 6-Thioguanine-resistant tumor cells formed foci after 14 days, at which time they were fixed with methanol and stained with 0.03% methylene blue for counting.

[0559] Example 57
[0560] Treatment 4T1 tumor lung metastasis in syngeneic mice with migrastatin analogs (See, Figure 4). 4T1 tumor cells (10^5) were injected s.c. in the abdominal mammary gland with 0.1 ml of a single-cell suspension. Macroketone or macrolactam at 10 mg/kg or 20 mg/kg was given i.p. on Day 7 when the tumor size was about 5 mm in diameter, and every day until Day 25. On Day 28, the mice were sacrificed. Each group comprised five mice. Lung metastasis was measured by the 6-thioguanine clonogenic assay. The mean and standard deviation are presented. In the control group (daily PBS injection), there were 61300 ± 18900 colonies. In the group treated with 10 mg/kg of macroketone, there were 3875 ± 2525 colonies (~94% inhibition of lung metastasis). In the group treated with 20 mg/kg of macroketone, there were 650 ± 575 colonies (~99% inhibition of lung metastasis). In the group treated with 10 mg/kg of macrolactam, there were 5333 ± 1778 colonies (~91% inhibition of lung metastasis). In the group treated with 20 mg/kg of macrolactam, there were 5675 ± 6263 colonies (~91% inhibition of lung metastasis).

[0561] Example 58
[0562] Effect of migrastatin analogs on 4T1 tumor cell growth (See, Figure 5). 4T1 tumor cells (10^5) were injected s.c. in the abdominal mammary gland with 0.1 ml of a single-cell suspension. Macroketone or macrolactam at 10 mg/kg or 20 mg/kg was given i.p. on Day 7 when the tumor size was about 5 mm in diameter, and every day until Day 25. On Day 28, primary tumors were measured using electronic calipers. Treatment with the migrastatin analogs did not slow the growth of 4T1 tumors significantly compared to the control PBS saline. We noticed that macroketone at 10 mg/kg had a minor effect on tumor growth in mice since the final
tumor size was a little smaller. We dissolved all compounds in DMSO and then
diluted into PBS. The final concentration of DMSO was 1% in all cases. The
control mice were injected with 1% DMSO in PBS. Each group was comprised of
five mice. The mean and standard deviation are presented.

Example 59

Wound-Healing Assay (See Figure 6). 4T1 mouse breast tumor cells in
RPMI-1640 medium containing 10% fetal bovine serum (FBS) were seeded into
wells of 24-multiwell plates (Becton-Dickinson). After cells grew to confluence,
wounds were made with sterile pipette tips. Cells were washed with Phosphate
Buffered Saline (PBS) and refreshed with growth medium containing different
concentrations of chemical compounds. After overnight incubation at 37°C, cells
were fixed and photographed.

[0525] 21. Cycloheximide (CHE) is a glutarimide antibiotic that inhibits protein synthesis. CHE is widely used for studies of cell death and is commercially available as Ready Made solution by Sigma. For a more recent leading article, see: Mattson, M. P.; Furukawa, K. *Aoptosis* 1997, 2, 257.

[0605] 41. For the first report of these new, optimized RCM conditions, see: Yamamoto, K.; Biswas, K.; Gaul, C.; Danishefsky, S. J. Tetrahedron Lett. 2003, 44, 3297. The same reaction conditions were also applied to the first total synthesis of epothilone 490: Biswas, K.; Lin, H.; Njardarson, J. T.; Chappell, M. D.; Chou, T.

[0609] 45. Crystallographic data (excluding structural data) for compound 24 have been deposited with the Cambridge Crystallographic Data Centre (CCDC) as Deposition No. CCDC 230121.

<tr>
<td>daunorubicin</td>
<td>Wyeth Ayerst</td>
<td>In combination with approved anticancer drugs for induction of remission in adult ALL.</td>
</tr>
<tr>
<td>daunorubicin, daunomycin</td>
<td>Saragen, Inc</td>
<td>Accele. Approx. (clinical benefit not established) treatment of patients with persistent or recurrent cutaneous T-cell lymphoma whose malignant cells express the G55 component of the IL-2 receptor</td>
</tr>
<tr>
<td>daunomycin</td>
<td>Pharmacia &amp; Upjohn Company</td>
<td>Inducing the incidence and severity of cardiomyopathy associated with doxorubicin administration in women with metastatic breast cancer who have received a cumulative doxorubicin dose of 300 mg/m² and who will continue to receive doxorubicin therapy to maintain tumor control. It is not recommended for use with the initiation of doxorubicin therapy.</td>
</tr>
<tr>
<td>dacevatol</td>
<td>Taxotere</td>
<td>Accele. Approx. (clinical benefit subsequently established) Treatment of patients with locally advanced or metastatic breast cancer who have progressed during anthracycline-based therapy or who relapsed during anthracycline-based adjuvant therapy.</td>
</tr>
<tr>
<td>dacevatol</td>
<td>Taxotere</td>
<td>For the treatment of locally advanced or metastatic breast cancer which has progressed during anthracycline-based treatment or relapsed during anthracycline-based adjuvant therapy.</td>
</tr>
<tr>
<td>dacevatol</td>
<td>Taxotere</td>
<td>For locally advanced or metastatic non-small cell lung cancer after failure of prior platinum-based chemotherapy.</td>
</tr>
<tr>
<td>dacevatol</td>
<td>Taxotere</td>
<td>In combination with cisplatin for the treatment of patients with unresectable, locally advanced or metastatic non-small cell lung cancer who have not previously received chemotherapy for this condition.</td>
</tr>
<tr>
<td>doxorubicin</td>
<td>Adriamycin, Rubex</td>
<td>Antibiotic, antitumor agent.</td>
</tr>
<tr>
<td>doxorubicin</td>
<td>Pharmacia &amp; Upjohn Company</td>
<td>Accel. Approx. (clinical benefit not established) Treatment of AIDS-related Kaposis sarcoma in patients with disease that has progressed on prior combination chemotherapy or in patients who are intolerant to such therapy.</td>
</tr>
<tr>
<td>doxorubicin liposomal</td>
<td>Doxil</td>
<td>Accel. Approx. (clinical benefit not established) Treatment of metastatic carcinoma of the ovary in patient with disease that is refractory to both paclitaxel and platinum based regimens</td>
</tr>
<tr>
<td>DROMOSTANOLONE PROPIONATE</td>
<td>Eli Lilly</td>
<td>Sigma selective inhibitor of aromatase.</td>
</tr>
<tr>
<td>DROMOSTANOLONE PROPIONATE</td>
<td>SYNTEx</td>
<td>Sigma selective inhibitor of aromatase.</td>
</tr>
<tr>
<td>Elliott's B Solution</td>
<td>Orphan Medical, Inc</td>
<td>Clidinium for the intrathecal administration of methotrexate sodium and cytarabine for the prevention or treatment of meningeval leukemia or lymphocytic lymphoma.</td>
</tr>
<tr>
<td>epirubicin</td>
<td>Elance</td>
<td>A component of adjuvant therapy in patients with evidence of ankylosing spondylitis.</td>
</tr>
<tr>
<td>Epotin alfa</td>
<td>Amgen, Inc</td>
<td>EPOGENB is indicated for the treatment of anemia related to therapy with zidovudine in HIV-infected patients. EPOGENB is indicated to elevate or maintain the red blood cell level (as manifested by the hematocrit or hemoglobin determinations) and to decrease the need for transfusions in these patients. EPOGENB is not indicated for the treatment of anemia in HIV-infected patients due to other factors such as iron or folate deficiencies, hemolysis or gastrointestinal bleeding, which should be managed appropriately.</td>
</tr>
<tr>
<td>Epotin alfa</td>
<td>Amgen, Inc</td>
<td>EPOGEN is indicated for the treatment of anemic patients (hemoglobin &gt; 10 to &lt; 13 g/dL) scheduled to undergo elective, noncardiac, nonvascular surgery to reduce the need for allogeneic blood transfusions.</td>
</tr>
<tr>
<td>Epotin alfa</td>
<td>Amgen, Inc</td>
<td>EPOGEN is indicated for the treatment of anemia in patients with non-myeloid malignancies where anemia is due to the effect of concomitantly administered chemotherapy. EPOGEN is indicated to decrease the need for transfusions in patients who will be receiving concomitant chemotherapy for a minimum of 2 months. EPOGEN is not indicated for the treatment of anemia in cancer patients due to other factors such as iron or folate deficiencies,</td>
</tr>

<tr>
<td>-------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
<td>-------------------------------------------------------</td>
</tr>
<tr>
<td>Epoetin alfa (Epo)</td>
<td>EPOGEN is indicated for the treatment of anemia associated with CRF, including patients on dialysis (ESRD) and patients not on dialysis.</td>
<td>Amgen, Inc. Jul 20 1999</td>
</tr>
<tr>
<td>Estramustine (Emcyt)</td>
<td>palliation of prostate cancer</td>
<td>Pharmacy &amp; Urology Company Dec 24 1981</td>
</tr>
<tr>
<td>Etoposide, VP-16 (Vepeacid)</td>
<td>Refractory testicular tumors-in combination therapy with other approved chemotherapy agents in patients with refractory testicular tumors who have already received appropriate surgical, chemotherapy and radiation therapy.</td>
<td>Bristol-Myers Squibb Nov 10 1993</td>
</tr>
<tr>
<td>Etoposide, VP-16 (Vepeacid)</td>
<td>In combination with other approved chemotherapy agents as first line treatment in patients with small cell lung cancer.</td>
<td>Bristol-Myers Squibb Dec 30 1983</td>
</tr>
<tr>
<td>Etoposide, VP-16 (Vepeacid)</td>
<td>In combination with other approved chemotherapy agents as first line treatment in patients with small cell lung cancer.</td>
<td>Bristol-Myers Squibb Dec 30 1983</td>
</tr>
<tr>
<td>Exemestane (Aromash)</td>
<td>Treatment of advance breast cancer in postmenopausal women whose disease has progressed following tamoxifen therapy.</td>
<td>Pharmacy &amp; Urology Company Oct 21 1999</td>
</tr>
<tr>
<td>Filgrastim (Neupogen)</td>
<td>NEUPOGEN is indicated to reduce the duration of neutropenia and neutropenia-related clinical sequelae, eg, febrile neutropenia, in patients with nonmyeloid malignancies undergoing myelosuppressive chemotherapy followed by marrow transplantation.</td>
<td>Amgen, Inc. Feb 20 1991</td>
</tr>
<tr>
<td>Filgrastim (Neupogen)</td>
<td>NEUPOGEN is indicated to decrease the incidence of infection, as manifested by febrile neutropenia, in patients with nonmyeloid malignancies receiving myelosuppressive anticancer drugs associated with a significant incidence of severe neutropenia with fever.</td>
<td>Amgen, Inc. Apr 2 1998</td>
</tr>
<tr>
<td>Filgrastim (Neupogen)</td>
<td>NEUPOGEN is indicated for reducing the time to neutrophil recovery and the duration of fever, following induction or consolidation chemotherapy treatment of adults with AML.</td>
<td>Amgen, Inc. Apr 1 1998</td>
</tr>
<tr>
<td>5-Fluorouracil (infusion) (FUDR)</td>
<td>Palliative treatment of patients with B-cell lymphocytic leukemia (CLL) who have not responded or have progressed during treatment with at least one standard alkylating agent containing regimen.</td>
<td>Roche Dec 18 1970</td>
</tr>
<tr>
<td>Fludarabine (Fludara)</td>
<td>Palliative treatment of patients with B-cell lymphocytic leukemia (CLL) who have not responded or have progressed during treatment with at least one standard alkylating agent containing regimen.</td>
<td>Barix Laboratories Inc. Apr 18 1991</td>
</tr>
<tr>
<td>Fluorouracil, 5-FU (Adrucil)</td>
<td>prolong survival in combination with leucovorin.</td>
<td>ICN Puerto Rico Apr 25 1992</td>
</tr>
<tr>
<td>Fulvestrant (Faslodex)</td>
<td>the treatment of hormone receptor-positive metastatic breast cancer in postmenopausal women with disease progression following antiestrogen therapy.</td>
<td>IPR Apr 25 2002</td>
</tr>
<tr>
<td>Gemcitabine (Gemzar)</td>
<td>Treatment of patients with locally advanced (nonresectable stage II or III) or metastatic (stage IV) adenocarcinoma of the pancreas. Indicated for first-line treatment and for patients previously treated with a 5-fluorouracil-containing regimen.</td>
<td>Eli Lilly May 15 1998</td>
</tr>
<tr>
<td>Gemcitabine (Gemzar)</td>
<td>For use in combination with cisplatin for the first-line treatment of patients with inoperable, locally advanced (Stage IIIA or IIIB) or metastatic (Stage IV) non-small cell lung cancer.</td>
<td>Eli Lilly Aug 15 1996</td>
</tr>
<tr>
<td>gemcitabine, nab-paclitaxel (Mylotarg)</td>
<td>Azacil. Approv. (clinical benefit not established). Treatment of CD33 positive acute myeloid leukemia in patients in first relapse who are 60 years of age or older and who are not considered candidates for cytotoxic chemotherapy.</td>
<td>Wyeth Ayerst May 17 2000</td>
</tr>
<tr>
<td>goserelin acetate (Zoladex implant)</td>
<td>Palliative treatment of advanced breast cancer in pre- and perimenopausal women.</td>
<td>Astrazeneca Pharmaceuticals Dec 18 1992</td>
</tr>
<tr>
<td>goserelin acetate (Zoladex)</td>
<td>Palliative treatment of advanced breast cancer in pre- and perimenopausal women.</td>
<td>Astrazeneca Pharmaceuticals Dec 18 1992</td>
</tr>
<tr>
<td>Hydroxyurea (Hydrea)</td>
<td>Refractory testicular tumors-in combination therapy with other approved chemotherapy agents in patients with refractory testicular tumors who have already received appropriate surgical, chemotherapy and radiation therapy.</td>

<td>Decrease need for transfusions in sickle cell anemia</td>
<td>Bristol-Myers Squibb</td>
</tr>
<tr>
<td>Rituximab</td>
<td>Treatment of patients with relapsed or refractory low-grade, follicular, or transformed B-cell non-Hodgkin's lymphoma, including patients with Rituximab refractory follicular non-Hodgkin's lymphoma.</td>
<td>IDEC Pharmaceuticals Corp</td>
</tr>
<tr>
<td>Ibrutinib</td>
<td>For use in combination with other approved antileukemic drugs for the treatment of acute myeloid leukemias (AML) in adults.</td>
<td>Asta Laboratories</td>
</tr>
<tr>
<td>Ibrutinib</td>
<td>In combination with other approved antileukemic drugs for the treatment of acute non-lymphocytic leukemias in adults.</td>
<td>Pharmacia &amp; Upjohn Company</td>
</tr>
<tr>
<td>Ibrutinib</td>
<td>First line chemotherapy of germ cell testicular cancer when used in combination with certain other approved antineoplastic agents.</td>
<td>Bristol-Myers Squibb</td>
</tr>
<tr>
<td>Imatinib mesylate</td>
<td>Accel. Approv. (clinical benefit not established) Initial therapy of chronic myelogenous leukemia</td>
<td>Novartis</td>
</tr>
<tr>
<td>Imatinib mesylate</td>
<td>Accel. Approv. (clinical benefit not established) Metastatic or unresectable malignant gastrointestinal stromal tumors</td>
<td>Novartis</td>
</tr>
<tr>
<td>Imatinib mesylate</td>
<td>Accel. Approv. (clinical benefit not established) Initial treatment of newly diagnosed Ph+ chronic myelogenous leukemia (CML).</td>
<td>Novartis</td>
</tr>
<tr>
<td>Interferon alfa-2a</td>
<td>Interferon alfa-2a, recombinant for injection is indicated as adjuvant to surgical treatment in patients 18 years of age or older with malignant melanoma who are free of disease but at high risk for systemic recurrence within 56 days of surgery.</td>
<td>Schering Corp</td>
</tr>
<tr>
<td>Interferon alfa-2b</td>
<td>Interferon alfa-2b, recombinant for injection is indicated as the initial treatment of clinically aggressive follicular Non-Hodgkin's Lymphoma in conjunction with anthracycline-containing combination chemotherapy in patients 18 years of age or older.</td>
<td>Schering Corp</td>
</tr>
<tr>
<td>Interferon alfa-2b</td>
<td>Interferon alfa-2b, recombinant for injection is indicated for intralexional treatment of selected patients 18 years of age or older with condylomatous acuminate involving external surfaces of the genital and perianal areas.</td>
<td>Schering Corp</td>
</tr>
<tr>
<td>Interferon alfa-2b</td>
<td>Interferon alfa-2b, recombinant for injection is indicated for the treatment of chronic hepatitis C in patients 18 years of age or older with compensated liver disease who have a history of blood or blood-product exposure and/or are HCV antibody positive.</td>
<td>Schering Corp</td>
</tr>
<tr>
<td>Interferon alfa-2b</td>
<td>Interferon alfa-2b, recombinant for injection is indicated for the treatment of chronic hepatitis B in patients 18 years of age or older with compensated liver disease and HBV replication.</td>
<td>Schering Corp</td>
</tr>
<tr>
<td>Interferon alfa-2b</td>
<td>Interferon alfa-2b, recombinant for injection is indicated for the treatment of patients 18 years of age or older with hairy cell leukemia.</td>
<td>Schering Corp</td>
</tr>
<tr>
<td>Interferon alfa-2b</td>
<td>Interferon alfa-2b, recombinant for injection is indicated for the treatment of selected patients 18 years of age or older with AIDS-Related Kaposis's Sarcoma. The likelihood of response to Intertron A Therapy is greater in patients who are without symptoms who have limited lymphadenopathy and who have a relatively intact immune system as estimated by total CD4 count.</td>
<td>Schering Corp</td>
</tr>
<tr>
<td>Interferon alfa-2b</td>
<td>Accel. Approv. (clinical benefit subsequently established) Treatment of patients with metastatic carcinoma of the colon or rectum whose disease has recurred or progressed following 5-FU-based therapy.</td>
<td>Pharmacia &amp; Upjohn Company</td>
</tr>
<tr>
<td>Interferon alfa-2b</td>
<td>Follow up of treatment of metastatic carcinoma of the colon or rectum whose disease has recurred or progressed following 5-FU-based therapy.</td>
<td>Pharmacia &amp; Upjohn Company</td>
</tr>
<tr>
<td>Interferon alfa-2b</td>
<td>For first line treatment n combination with 5-FU/5-FU/sucrivorin of metastatic carcinoma of the colon or rectum.</td>
<td>Pharmacia &amp; Upjohn Company</td>
</tr>
<tr>
<td>Fosfamide</td>
<td>First-line treatment of postmenopausal women with hormone</td>
<td>Novartis</td>
</tr>
<tr>

<tr>
<td>Methoacrylate</td>
<td>Uvadex</td>
<td>For the use of UVAX with the UVADEX photopheresis system in the palliative treatment of the skin manifestations of cutaneous T-cell lymphoma (CTCL) that is unresponsive to other forms of treatment.</td>
</tr>
<tr>
<td>Mitomycin C</td>
<td>Mutamycin</td>
<td></td>
</tr>
<tr>
<td>Mitomycin C</td>
<td>Mitocysine</td>
<td>Therapy of disseminated adenocarcinoma of the stomach or pancreas in proven combinations with other approved chemotherapeutic agents and as palliative treatment when other modalities have failed.</td>
</tr>
<tr>
<td>Mitotane</td>
<td>Lysodren</td>
<td>For use in combination with corticosteroids as initial chemotherapy</td>
</tr>
<tr>
<td>Compound</td>
<td>Sponsor</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>mitoxantrone</td>
<td>Novantrone</td>
<td>For the treatment of patients with pain related to advanced hormone-refractory prostate cancer.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For use with other approved drugs in the initial therapy for acute nonlymphocytic leukemia (ANLL) in adults.</td>
</tr>
<tr>
<td>naproxene</td>
<td>Durabol-60</td>
<td></td>
</tr>
<tr>
<td>norethisterone</td>
<td>Vistarina</td>
<td></td>
</tr>
<tr>
<td>Oprolvetin</td>
<td>Neumega</td>
<td>Neumega is indicated for the prevention of severe thrombocytopenia and the reduction of the need for platelet transfusions following myelo-suppressive chemotherapy in adult patients with nonmyeloid malignancies who are at high risk of severe thrombocytopenia.</td>
</tr>
<tr>
<td>Oprolvetin</td>
<td>Neumega</td>
<td></td>

<tr>
<td>Oprolvetin</td>
<td>Neumega</td>
<td>Oprolvetin is indicated for the prevention of severe thrombocytopenia and the reduction of the need for platelet transfusions following myelo-suppressive chemotherapy in adult patients with nonmyeloid malignancies who are at high risk of severe thrombocytopenia.</td>
</tr>
<tr>
<td>oxaliplatin</td>
<td>Elotatin</td>
<td>Acost. Approx. (clinical benefit not established) in combination with infusional 5-FU/LV, is indicated for the treatment of patients with metastatic carcinoma of the colon or rectum whose disease has recurred or progressed during or within 6 months of completion of first line therapy with the combination of bolus 5-FU/LV and irinotecan.</td>
</tr>
<tr>
<td>paclitaxel</td>
<td>Paxon</td>
<td>Treatment of advanced AIDS-related Kaposi’s sarcoma after failure of first line or subsequent systemic chemotherapy.</td>
</tr>
<tr>
<td>paclitaxel</td>
<td>Taxol</td>
<td>Treatment of patients with metastatic carcinoma of the ovary after failure of first-line or subsequent chemotherapy.</td>
</tr>
<tr>
<td>paclitaxel</td>
<td>Taxol</td>
<td>Treatment of breast cancer after failure of combination chemotherapy for metastatic disease or relapse within 6 months of adjuvant chemotherapy. Prior therapy should have included an anthracycline unless clinically contraindicated.</td>
</tr>
<tr>
<td>paclitaxel</td>
<td>Taxol</td>
<td>New dosing regimen for patients who have failed initial or subsequent chemotherapy for metastatic carcinoma of the ovary</td>
</tr>
<tr>
<td>paclitaxel</td>
<td>Taxol</td>
<td>For first-line therapy for the treatment of advanced carcinoma of the ovary in combination with cisplatin.</td>
</tr>
<tr>
<td>paclitaxel</td>
<td>Taxol</td>
<td>For use in combination with cisplatin, for the first-line treatment of non-small cell lung cancer in patients who are not candidates for potentially curative surgery and/or radiation therapy.</td>
</tr>
<tr>
<td>paclitaxel</td>
<td>Taxol</td>
<td>For the adjuvant treatment of node-positive breast cancer administered sequentially to standard doxorubicin-containing combination therapy.</td>
</tr>
<tr>
<td>paclitaxel</td>
<td>Taxol</td>
<td>First line ovarian cancer with 3 hour infusion.</td>
</tr>
<tr>
<td>pamidronate</td>
<td>Aredia</td>
<td>Treatment of osteolytic bone metastases of breast cancer in conjunction with standard antineoplastic therapy.</td>
</tr>
<tr>
<td>pegademase</td>
<td>Adagen (Pegademase Avonex)</td>
<td>Enzyme replacement therapy for patients with severe combined immunodeficiency due to adenosine deaminase deficiency.</td>
</tr>
<tr>
<td>Pegaspargine</td>
<td>Cynaspar</td>
<td></td>
</tr>
<tr>
<td>Pegfilgrastim</td>
<td>Neulasta</td>
<td>Neulasta is indicated to decrease the incidence of infection, as manifested by febrile neutropenia, in patients with non-myeloid malignancies receiving myelosuppressive anti-cancer drugs associated with a clinically significant incidence of febrile neutropenia.</td>
</tr>
<tr>
<td>pentostatin</td>
<td>Nipent</td>
<td>Single agent treatment for untreated hairy cell leukemia patients with active disease as defined by clinically significant anemia, neutropenia, thrombocytopenia, or disease-related symptoms.</td>
</tr>

CLAIMS

We claim:

1. A pharmaceutical composition comprising:
   a pharmaceutically acceptable carrier, adjuvant or vehicle; and
   a therapeutically effective amount of a compound having the structure:

   ![Chemical Structure](image)

   (I)

   or pharmaceutically acceptable salt thereof;

   wherein \( R_1 \) and \( R_2 \) are each independently hydrogen, halogen, -CN, -S(O)\(_2\),
   -NO\(_2\), -COR\(^{1A}\), -CO\(_2\)R\(^{1A}\), -NR\(^{1A}\)C(=O)R\(^{1B}\), -NR\(^{1A}\)C(=O)OR\(^{1B}\), -CONR\(^{1A}\)R\(^{1B}\),
   an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or
   -WR\(^{1A}\), wherein \( W \) is independently -O-, -S- or -NR\(^{1C}\), wherein each occurrence of
   R\(^{1A}\), R\(^{1B}\) and R\(^{1C}\) is independently hydrogen, or an aliphatic, heteroaliphatic,
   alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or \( R_1 \) and \( R_2 \), taken together
   with the carbon atoms to which they are attached, form an alicyclic, heteroalicyclic,
   aryl or heteroaryl moiety;

   \( R_3 \) is hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or
   heteroaryl moiety; or a prodrug moiety or an oxygen protecting group;

   \( R_4 \) is halogen, -OR\(^{4A}\), -OC(=O)R\(^{4A}\) or -NR\(^{4A}\)R\(^{4B}\), wherein \( R^{4A} \) and \( R^{4B} \) are
   independently hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl
   or heteroaryl moiety; a prodrug moiety, a nitrogen protecting group or an oxygen
   protecting group; or \( R^{4A} \) and \( R^{4B} \), taken together with the nitrogen atom to which
   they are attached, form a heterocyclic or heteroaryl moiety;

   \( R_5 \) is hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or
   heteroaryl moiety;
\( R_6 \) is hydrogen, halogen, -CN, -S(O)\(_{1,2}\)R\(^{6A}\), -NO\(_2\), -COR\(^{6A}\), -CO\(_2\)R\(^{6A}\), -NR\(^{6A}\)C(=O)R\(^{6B}\), -NR\(^{6A}\)C(=O)OR\(^{6B}\), -CONR\(^{6A}\)R\(^{6B}\), an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR\(^{6A}\), wherein W is independently -O-, -S- or -NR\(^{6C}\), wherein each occurrence of R\(^{6A}\), R\(^{6B}\) and R\(^{6C}\) is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or R\(_6\) and R\(_8\), taken together with the carbon atoms to which they are attached, form an alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

R\(_4\) and each occurrence of R\(_b\) are independently hydrogen, halogen, -CN, -S(O)\(_{1,2}\)R\(^{al}\), -NO\(_2\), -COR\(^{al}\), -CO\(_2\)R\(^{al}\), -NR\(^{al}\)C(=O)R\(^{a2}\), -NR\(^{al}\)C(=O)OR\(^{a2}\), -CONR\(^{al}\)R\(^{al}\), an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR\(^{al}\); wherein W is independently -O-, -S- or -NR\(^{al}\), wherein each occurrence of R\(^{al}\), R\(^{a2}\) and R\(^{al}\) is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or R\(_8\) and the adjacent occurrence of R\(_b\), taken together with the carbon atoms to which they are attached, form an alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

R\(_e\) is hydrogen, halogen, -CN, -S(O)\(_{1,2}\)R\(^{el}\), -NO\(_2\), -COR\(^{el}\), -CO\(_2\)R\(^{el}\), -NR\(^{el}\)C(=O)R\(^{e2}\), -NR\(^{el}\)C(=O)OR\(^{e2}\), -CONR\(^{el}\)R\(^{e2}\), an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR\(^{el}\); wherein W is independently -O-, -S- or -NR\(^{el}\), wherein each occurrence of R\(^{el}\), R\(^{e2}\) and R\(^{el}\) is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or R\(_e\) and R\(_6\), taken together with the carbon atoms to which they are attached, form an alicyclic, heteroalicyclic, aryl or heteroaryl moiety;

n is an integer from 1 to 5;

X\(_1\) is O, S, NR\(^{X1}\) or CR\(^{X1}\)R\(^{X2}\), wherein R\(^{X1}\) and R\(^{X2}\) are independently hydrogen, halogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or a nitrogen protecting group;

Q is hydrogen, halogen, -CN, -S(O)\(_{1,2}\)R\(^{Q1}\), -NO\(_2\), -COR\(^{Q1}\), -CO\(_2\)R\(^{Q1}\), -NR\(^{Q1}\)C(=O)R\(^{Q2}\), -NR\(^{Q1}\)C(=O)OR\(^{Q2}\), -CONR\(^{Q1}\)R\(^{Q2}\), an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety, or -WR\(^{Q1}\); wherein W is independently -O-, -S- or -NR\(^{Q1}\), wherein each occurrence of R\(^{Q1}\), R\(^{Q2}\) and R\(^{Q3}\) is
independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; and

\( Y_1 \) and \( Y_2 \) are independently hydrogen, an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or \(-W R^{Y_1}\); wherein \( W \) is independently \(-O-, -S-\) or \(-NR^{Y_2}\), wherein each occurrence of \( R^{Y_1} \) and \( R^{Y_2} \) is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; or \( Y_1 \) and \( Y_2 \) together with the carbon atom to which they are attached form a moiety having the structure:

\[
\begin{align*}
\text{O} & \quad \text{N} \\
\text{N} & \quad \text{O} \\
\text{R}^{Y_1} & \quad \text{R}^{Y_1} \\
\text{R}^{Y_2} & \quad \text{R}^{Y_2}
\end{align*}
\]

whereby the composition is formulated for administration to a subject at a dosage between about 0.1 mg/kg to about 50 mg/kg of body weight.

2. The composition of claim 1, wherein the dosage is between about 1 mg/kg to about 50 mg/kg of body weight.

3. The composition of claim 1, wherein the dosage is between about 0.1 mg/kg to about 40 mg/kg of body weight.

4. The composition of claim 1, wherein the dosage is between about 1 mg/kg to about 40 mg/kg of body weight.

5. The composition of claim 1, wherein the dosage is between about 0.1 mg/kg to about 30 mg/kg of body weight.

6. The composition of claim 1, wherein the dosage is between about 5 mg/kg to about 30 mg/kg of body weight.

7. The composition of claim 1, wherein the dosage is between about 1 mg/kg to about 30 mg/kg of body weight.
8. The composition of claim 1, wherein the dosage is between about 0.1 mg/kg to about 20 mg/kg of body weight.

9. The composition of claim 1, wherein the dosage is between about 1 mg/kg to about 20 mg/kg of body weight.

10. The composition of claim 1, wherein the dosage is 10 mg/kg or greater of body weight.

11. The composition of claim 1, wherein:

   \( \mathbf{R}_1 \) and \( \mathbf{R}_2 \) are each independently hydrogen or substituted or unsubstituted lower alkyl; or \( \mathbf{R}_1 \) and \( \mathbf{R}_2 \), taken together with the carbon atoms to which they are attached, form an epoxide, an aziridine or a substituted or unsubstituted cyclopropyl moiety;

   \( \mathbf{R}_3 \) is hydrogen, or substituted or unsubstituted lower alkyl or aryl; a prodrug moiety or an oxygen protecting group;

   \( \mathbf{R}_4 \) is halogen, \(-\mathbf{O}\mathbf{R}_4^\mathbf{A}, -\mathbf{O}\mathbf{C}(=\mathbf{O})\mathbf{R}_4^\mathbf{A}\) or \(-\mathbf{N}\mathbf{R}_4^\mathbf{A}\mathbf{R}_4^\mathbf{B}\); wherein \( \mathbf{R}_4^\mathbf{A} \) and \( \mathbf{R}_4^\mathbf{B} \) are independently hydrogen, or substituted or unsubstituted lower alkyl; a prodrug moiety, a nitrogen protecting group or an oxygen protecting group; or \( \mathbf{R}_4^\mathbf{A} \) and \( \mathbf{R}_4^\mathbf{B} \), taken together with the nitrogen atom to which they are attached, form a heterocyclic or heteroaryl moiety; or \( \mathbf{R}_4 \), taken together with the carbon atom to which it is attached forms a moiety having the structure:

   \[ \begin{array}{c}
   \text{\textit{R}_5} \\
   \text{\textit{R}_6}
   \end{array} \]

   \( \mathbf{R}_5 \) and \( \mathbf{R}_6 \) are each independently hydrogen or substituted or unsubstituted lower alkyl; or \( \mathbf{R}_5 \) and \( \mathbf{R}_6 \), taken together with the carbon atoms to which they are attached, form an epoxide, an aziridine or a substituted or unsubstituted cyclopropyl moiety;
Rₖ and each occurrence of Rₜ are independently hydrogen, halogen, alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety, or -WR³¹; wherein W is independently -O-, -S- or -NR³³-, wherein each occurrence of R³¹, and R³³ is independently hydrogen, or an alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety; or Rₖ and the adjacent occurrence of Rₜ, taken together, form an epoxide, an aziridine or a substituted or unsubstituted cyclopropyl moiety;

Rₜ is hydrogen, halogen, alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety, or -WRⁱ¹; wherein W is independently -O-, -S- or -NR³³-, wherein each occurrence of Rⁱ¹ and R³³ is independently hydrogen, or an alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety; or Rₜ and R₆, taken together with the carbon atoms to which they are attached, form an epoxide, an aziridine or a substituted or unsubstituted cyclopropyl moiety;

n is an integer from 1 to 5;

X₁ is O, S, NR³¹ or CR³¹R³²; wherein R³¹ and R³² are independently hydrogen, halogen, substituted or unsubstituted alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl, or a nitrogen protecting group;

Q is hydrogen, halogen, -CN, -S(O)₁₂R³¹, -NO₂, -COR³¹, -CO₂R³¹, -NR³¹C(-O)R³², -NR³¹C(=O)OR³², -CONR³¹R³², an aliphatic, heteroaliphatic, alicyclic, heteroaicyclic, aryl or heteroaryl moiety, or -WR³¹; wherein W is independently -O-, -S- or -NR³³-, wherein each occurrence of R³¹, R³² and R³³ is independently hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroaicyclic, aryl or heteroaryl moiety;

Y₁ and Y₂ are independently hydrogen, an alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety; or -WR²¹; wherein W is independently -O-, -S- or -NR²², wherein each occurrence of R²¹ and R²² is independently hydrogen, or an alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety; or Y₁ and Y₂ together with the carbon atom to which they are attached form
a moiety having the structure:

12. The composition of claim 1, wherein R_a, R_b and R_c are each hydrogen, and the compound has one of the following structures:

wherein R_Y^1 is hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety.

13. The composition of claim 1, wherein R_a, R_b and R_c are each hydrogen, Q is a carbonyl-containing moiety and the compound has one of the following structures:
wherein R₁-R₆, Y₂, X₁, and n are as defined in claim 1; W is O or NH; and \( R_{Y1} \) is hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; \( R_7 \) is a substituted or unsubstituted lower alkyl or heteroalkyl moiety; \( R_8 \) is a substituted or unsubstituted alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety; and Alk is a substituted or unsubstituted C₀₋₆ alkylidene or C₀₋₆ alkenylidene chain wherein up to two non-adjacent methylene units are independently optionally replaced by CO, CO₂, COCO, CONR²¹, OCONR²¹, NR²¹NR²², NR²¹NR²¹CO, NR²¹CO, NR²¹CO₂, NR²¹CONR²², SO, SO₂, NR²¹SO₂, SO₂NR²¹, NR²¹SO₂NR²², O, S, or NR²¹; wherein each occurrence of \( R_{Z1} \) and \( R_{Z2} \) is independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl.

14. The composition of claim 1, wherein \( R_a \), \( R_b \) and \( R_c \) are each hydrogen, n is 3 and the compound has one of the following structures:
wherein $R_1$-$R_6$, $Y_2$, $Q$ and $X_1$ are as defined in claim 1; $W$ is O or NH; and $R^{Y_1}$ is hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety.

15. The composition of claim 1, wherein $R_a$, $R_b$ and $R_c$ are each hydrogen, $n$ is 3, $Q$ is a carbonyl-containing moiety, and the compound has one of the following structures:

wherein $R_1$-$R_6$, $X_1$ and $Y_2$ are as defined in claim 1; $W$ is O or NH; $R^{Y_1}$ is hydrogen, or an aliphatic, heteroaliphatic, alicyclic, heteroalicyclic, aryl or heteroaryl moiety; $R_7$ is a substituted or unsubstituted lower alkyl or heteroalkyl moiety; $R_8$ is a substituted or unsubstituted alkyl, heteroalkyl, cycloalkyl,
heterocycloalkyl, aryl or heteroaryl moiety; and Alk is a substituted or unsubstituted C₈-C₆ alkylidene or C₈-C₆ alkenylidene chain wherein up to two non-adjacent methylene units are independently optionally replaced by CO, CO₂, COCO, COH₂, OC₆, NR₆, NR₂₆, NR₆₆, NR₂₆CO, NR₆₆CO, NR₆₆CO₂, NR₂₆CO₂, SO₂, SO₂, NR₆₆SO₂, SO₆NR₆, NR₆₆SO₂NR₂₆, O, S, or NR₆, wherein each occurrence of R₂₆ and R₂₆ is independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl; and R₈ is a substituted or unsubstituted alkyl, heteroalkyl, cycloalkyl, heterocycloalkyl, aryl or heteroaryl moiety.

16. The composition of any one of claims 1 and 11-15, wherein R₁ and R₂ are each hydrogen.

17. The composition of any one of claims 1 and 11-15, wherein R₅ and R₆ are each methyl.

18. The composition of any one of claims 1 and 11-15, wherein R₃ is lower alkyl.

19. The composition of claim 18, wherein R₃ is methyl.

20. The composition of any one of claims 1 and 11-15, wherein R₄ is OH, NH₂ or halogen.

21. The composition of claim 13 or 15, wherein R₇ is lower alkyl.

22. The composition of claim 21, wherein R₇ is methyl.

23. The composition of any one of claims 1, 11-12 and 14, wherein Q has the structure:
wherein $R_7$ is a substituted or unsubstituted, linear or branched, cyclic or acyclic lower alkyl moiety; $R_8$ is a substituted or unsubstituted carbocyclic, heterocyclic, aryl or heteroaryl moiety; and $X$, $Y$ and $Z$ are independently a bond, -O-, -S-, -C(=O)-, -NR$^{Z1}$, -CHOR$^{Z1}$, -CHNR$^{Z1}$R$^{Z2}$, C=S, C=N(R$^{Y1}$) or -CH(Hal); or a substituted or unsubstituted C$_{0-6}$alkylidene or C$_{0-6}$alkenylidene chain wherein up to two non-adjacent methylene units are independently optionally replaced by CO, CO$_2$, COCO, CONR$^{Z1}$, OCONR$^{Z1}$, NR$^{Z1}$NR$^{Z2}$, NR$^{Z1}$NR$^{Z2}$CO, NR$^{Z1}$CO, NR$^{Z1}$CO$_2$, NR$^{Z1}$CONR$^{Z2}$, SO, SO$_2$, NR$^{Z1}$SO$_2$, SO$_2$NR$^{Z1}$, NR$^{Z1}$SO$_2$NR$^{Z2}$, O, S, or NR$^{Z1}$, wherein Hal is a halogen selected from F, Cl, Br and I; and each occurrence of R$^{Z1}$ and R$^{Z2}$ is independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl; or R$^{Z1}$ and R$^{Z2}$, taken together with the nitrogen atom to which they are attached, for a heterocyclic or heteroaryl moiety; and pharmaceutically acceptable derivatives thereof.

24. The composition of claim 23, wherein Q has the structure:

wherein $R_7$ is a substituted or unsubstituted, linear or branched, cyclic or acyclic lower alkyl moiety; $R_8$ is a substituted or unsubstituted carbocyclic, heterocyclic, aryl or heteroaryl moiety; and $R^Y$ is hydrogen, halogen, -OR$^{Y1}$ or -NR$^{Y1}$NR$^{Y2}$; wherein $R^{Y1}$ and $R^{Y2}$ are independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl, or $R^{Y1}$ and $R^{Y2}$, taken together with the nitrogen atom to which they are attached, for a heterocyclic or heteroaryl moiety.

25. The composition of any one of claims 13, 15, 23 and 24, wherein $R_8$ is one of:
wherein p is an integer from 0 to 5; q is 1 or 2, r is an integer from 1 to 6; each occurrence of \( R^{8A} \) is independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl, -(alkyl)aryl or -(alkyl)heteroaryl, -OR\(^{8C}\), -SR\(^{8C}\), -N(R\(^{R^{8C}}\))\(_2\), -SO\(_2\)N(R\(^{8C}\))\(_2\), -(C=O)N(R\(^{8C}\))\(_2\), halogen, -CN, -NO\(_2\), -(C=O)OR\(^{8C}\), -N(R\(^{8C}\))(C=O)R\(^{8D}\), wherein each occurrence of R\(^{8C}\) and R\(^{8D}\) is independently hydrogen, lower alkyl, lower heteroalkyl, aryl, heteroaryl, -(alkyl)aryl or -(alkyl)heteroaryl; and each occurrence of R\(^{8B}\) is independently hydrogen or lower alkyl.

26. The composition of claim 25, wherein R\(_8\) has the structure:

\[
\begin{align*}
\text{O} & \quad \text{N} \\
\text{R}^{8B} & \quad \text{O}
\end{align*}
\]

wherein R\(^{8B}\) is hydrogen or lower alkyl.

27. The composition of claim 1, 11, 12 or 13, wherein n is 3.

28. The composition of claim 12, 13, 14 or 15, wherein Y\(_1\) is OR\(^{Y1}\) and Y\(_2\) is lower alkyl; wherein R\(^{Y1}\) is hydrogen or lower alkyl.
29. The composition of claim 28, wherein $Y_1$ is OH and $Y_2$ is CF$_3$.

30. The composition of claim 11 wherein $R_a$, $R_b$ and $R_c$ are each hydrogen, and the compound has one of the structures:

![Chemical structures]

or pharmaceutically acceptable derivative thereof;

wherein $R_3$-$R_6$, $n$ and $Q$ are as defined in claim 1; and $Y_2$ and $R^{Y_1}$ are independently hydrogen or lower alkyl.

31. The composition of claim 1 wherein the compound has the structure:
or pharmaceutically acceptable derivative thereof;

wherein R₃-R₅ and Q are as defined in claim 11; and Y₂ and R⁻¹ are independently hydrogen or lower alkyl.

32. The composition of claim 11 wherein the compound has the structure:
or pharmaceutically acceptable derivative thereof;

wherein R₁-R₆ and n are as defined in claim 11; Y₂ and R_Y¹ are independently hydrogen or lower alkyl; R₇ is a substituted or unsubstituted, linear or branched, cyclic or acyclic lower alkyl moiety; R₈ is hydrogen or lower alkyl; and X, Y and Z are independently a bond, -O-, -S-, -C(=O)-, -NR¹⁻, -CHOR²⁻, -CHNR²⁻R₃⁻, C=S, C=N(R_Y¹) or -CH(Hal); or a substituted or unsubstituted C₀-alkylidene or C₀-alkenylidene chain wherein up to two non-adjacent methylene units are independently optionally replaced by CO, CO₂, COCONR²⁻, OCONR¹⁻, NR¹⁻NR²⁻, NR¹⁻NRCO, NR¹⁻CO₂, NR¹⁻CONR²⁻, SO₂, SO₂R¹⁻, SR¹⁻SO₂, SR¹⁻SO₂R²⁻, O, S, or NR¹⁻; wherein Hal is a halogen selected from F, Cl, Br and I; and each occurrence of R_Z¹ and R_Z² is independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl; or R_Z¹ and R_Z², taken together with the nitrogen atom to which they are attached, for a heterocyclic or heteroaryl moiety.
33. The composition of claim 11 wherein the compound has the structure:

or pharmaceutically acceptable derivative thereof;

wherein R₃-R₆ are as defined in claim 11; Y₂ and R⁺¹ are independently hydrogen or lower alkyl; R₇ is a substituted or unsubstituted, linear or branched, cyclic or acyclic lower alkyl moiety; R⁺¹ is hydrogen or lower alkyl; and X, Y and Z
are independently a bond, -O-, -S-, -C(=O)-, -NR\textsuperscript{Z1}, -CH\textsubscript{2}OR\textsuperscript{Z1}, -CH\textsubscript{2}NR\textsuperscript{Z1}R\textsuperscript{Z2}, C=S, C=N(R\textsuperscript{Y1}) or -CH(Hal); or a substituted or unsubstituted C\textsubscript{0}-alkylidene or C\textsubscript{0}-
alkenylidene chain wherein up to two non-adjacent methylene units are
independently optionally replaced by CO, CO\textsubscript{2}, COCO, CONR\textsuperscript{Z1}, OCONR\textsuperscript{Z1},
NR\textsuperscript{Z1}NR\textsuperscript{Z2}, NR\textsuperscript{Z1}NR\textsuperscript{Z2}CO, NR\textsuperscript{Z1}CO, NR\textsuperscript{Z1}CO\textsubscript{2}, NR\textsuperscript{Z1}CONR\textsuperscript{Z2}, SO, SO\textsubscript{2}, NR\textsuperscript{Z1}SO\textsubscript{2},
SO\textsubscript{2}NR\textsuperscript{Z1}, NR\textsuperscript{Z1}SO\textsubscript{2}NR\textsuperscript{Z2}, O, S, or NR\textsuperscript{Z1}; wherein Hal is a halogen selected from F,
Cl, Br and I; and each occurrence of R\textsuperscript{Z1} and R\textsuperscript{Z2} is independently hydrogen, alkyl,
heteroalkyl, aryl, heteroaryl or acyl; or R\textsuperscript{Z1} and R\textsuperscript{Z2}, taken together with the nitrogen
atom to which they are attached, for a heterocyclic or heteroaryl moiety.

34. The composition of claim 32 or 33, wherein -X-Y-Z together represents the
moiety -CH\textsubscript{2}Y-CH\textsubscript{2}-; wherein Y is -CH\textsubscript{2}OR\textsuperscript{Y1}, -CH\textsubscript{2}NR\textsuperscript{Y1}R\textsuperscript{Y2}, C=O, C=S, C=N(R\textsuperscript{Y1})
or -CH(Hal); wherein Hal is a halogen selected from F, Cl, Br and I; and R\textsuperscript{Y1} and
R\textsuperscript{Y2} are independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl, or R\textsuperscript{Y1}
and R\textsuperscript{Y2}, taken together with the nitrogen atom to which they are attached, for a
heterocyclic or heteroaryl moiety.

35. The composition of claim 11 wherein the compound has the structure:
wherein R3-R6 and n are as defined in claim 11; Y2 and RY1 are independently hydrogen or lower alkyl; R7 is a substituted or unsubstituted, linear or branched, cyclic or acyclic lower alkyl moiety; R8B is hydrogen or lower alkyl; and Y is –CHORY1, –CHNRY1RY2, C=O, C=S, C=N(RY1) or –CH(Hal); wherein Hal is a halogen selected from F, Cl, Br and I; and RY1 and RY2 are independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl, or RY1 and RY2, taken together with the nitrogen atom to which they are attached, for a heterocyclic or heteroaryl moiety.

36. The composition of claim 11 wherein the compound has the structure:
wherein R_{3}-R_{6} are as defined in claim 11; Y_{2} and R^{Y_{1}} are independently hydrogen or lower alkyl; R_{7} is a substituted or unsubstituted, linear or branched, cyclic or acyclic lower alkyl moiety; R^{BB} is hydrogen or lower alkyl; and Y is \(-\text{CHOR}^{Y_{1}}, \text{-CHNR}^{Y_{1}}R^{Y_{2}}, \text{C}=\text{O}, \text{C}=\text{S}, \text{C}=\text{N}(\text{R}^{Y_{1}})\) or \(-\text{CH(Hal)}\); wherein Hal is a halogen selected from F, Cl, Br and I; and R^{Y_{1}} and R^{Y_{2}} are independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl, or R^{Y_{1}} and R^{Y_{2}}, taken together with the nitrogen atom to which they are attached, for a heterocyclic or heteroaryl moiety.

37. The composition of claim 11 wherein the compound has the structure:
wherein n, R₃ and R₄ are as defined in claim 11; Y₂ and R¹¹ are independently hydrogen or lower alkyl; R⁸⁻ is hydrogen or lower alkyl; and R¹ is hydrogen, halogen, −OR¹¹ or −NR¹¹,NR¹¹; wherein R¹¹ and R¹² are independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl, or R¹¹ and R¹², taken together with the nitrogen atom to which they are attached, for a heterocyclic or heteroaryl moiety.

38. The composition of claim 11 wherein the compound has the structure:
wherein R₃ and R₄ are as defined in claim 11; Y₂ and R⁰₁ are independently hydrogen or lower alkyl; R⁰² is hydrogen or lower alkyl; and R⁵ is hydrogen, halogen, -OR⁰₁ or -NR⁰₁NR⁰₂; wherein R⁰₁ and R⁰₂ are independently hydrogen, alkyl, heteroalkyl, aryl, heteroaryl or acyl, or R⁰₁ and R⁰₂, taken together with the nitrogen atom to which they are attached, for a heterocyclic or heteroaryl moiety.
39. The composition of claim 11 wherein the compound has the structure:

\[ \text{Structure Diagram} \]

wherein $R_3$-$R_5$ and $n$ are as defined in claim 11; $Y_2$ and $R^{Y_1}$ are independently hydrogen or lower alkyl; $R_7$ is a substituted or unsubstituted, linear or branched, cyclic or acyclic lower alkyl moiety; and $R^{BB}$ is hydrogen or lower alkyl.

40. The composition of claim 11 wherein the compound has the structure:
wherein $R_3$-$R_6$ are as defined in claim 11; $Y_2$ and $R_{Y1}$ are independently hydrogen or lower alkyl; $R_7$ is a substituted or unsubstituted, linear or branched, cyclic or acyclic lower alkyl moiety; and $R^{8b}$ is hydrogen or lower alkyl.

41. The composition of claim 11 wherein the compound has the following structure:
or a pharmaceutically acceptable salt thereof;

wherein \( X_1 \) is \( \text{CH}_2, \text{NH} \) or \( \text{O}; \)

\( Y_1 \) and \( Y_2 \) are independently \( \text{OH}, \text{C}(R^{Y_1})_3 \) or \( Y_1 \) and \( Y_2 \) taken
together with the carbon atom to which they are attached are \( -\text{C}=\text{O} \), wherein \( R^{Y_1} \) is halo;

\( R_6 \) is \( \text{H} \) or lower alkyl;

\( R_5 \) is \( \text{H} \) or lower alkyl;

\( R_4 \) is \( \text{OH} \); and

\( R_3 \) is alkyl.

42. The composition of claim 41 wherein the compound has one of the following structures:
43. The composition of claim 1, wherein the compound is present in an amount effective to inhibit metastasis of tumor cells.

44. The composition of claim 1, wherein the compound is present in an amount effective to inhibit angiogenesis.

45. The composition of claim 1, further comprising a cytotoxic agent.

46. The composition of claim 45, wherein the cytotoxic agent is an anticancer agent.

47. The composition of claim 1, further comprising a palliative agent.

48. A method for treating breast tumor metastasis in a subject comprising:
administering to a subject in need thereof a therapeutically effective amount of the composition of claim 1.

49. The method of claim 48, wherein the dosage is between about 1 mg/kg to about 50 mg/kg of body weight.

50. The method of claim 48, wherein the dosage is between about 0.1 mg/kg to about 40 mg/kg of body weight.

51. The method of claim 48, wherein the dosage is between about 1 mg/kg to about 40 mg/kg of body weight.

52. The method of claim 48, wherein the dosage is between about 0.1 mg/kg to about 30 mg/kg of body weight.

53. The method of claim 48, wherein the dosage is between about 1 mg/kg to about 30 mg/kg of body weight.
54. The method of claim 48, wherein the dosage is between about 5 mg/kg to about 30 mg/kg of body weight.

55. The method of claim 48, wherein the dosage is between about 0.1 mg/kg to about 20 mg/kg of body weight.

56. The method of claim 48, wherein the dosage is between about 1 mg/kg to about 20 mg/kg of body weight.

57. The method of claim 48, wherein the dosage is 10 mg/kg or greater of body weight.

58. The method of claim 48 wherein in the composition, the compound has one of the following structures:

59. The method of claim 58, wherein the composition is administered at a dosage between about 10 mg/kg to about 20 mg/kg of body weight.

60. The method of claim 48, further comprising administering a cytotoxic agent.

61. The method of claim 60, wherein the cytotoxic agent is an anticancer agent.

62. The method of claim 48, further comprising administering a palliative agent.

INTERNATIONAL SEARCH REPORT

International Application No

A. CLASSIFICATION OF SUBJECT MATTER

IPC 7 C07D225/02 C07D313/00 C07D405/06 C07D495/04 A61K31/365
A61K31/435 A61P35/00 C07C13/02

//C07D495/04,333:00,235.00)

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 7 C07D A61K C07C

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal, WPI Data, CHEM ABS Data

### Box II Observations where certain claims were found unsearchable (Continuation of Item 2 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. □ Claims Nos.:  
   because they relate to subject matter not required to be searched by this Authority, namely:

2. □ Claims Nos.:  
   because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
   see FURTHER INFORMATION sheet PCT/ISA/210

3. □ Claims Nos.:  
   because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

### Box III Observations where unity of invention is lacking (Continuation of Item 3 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. □ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2. □ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. □ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:

4. □ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

#### Remark on Protest

□ The additional search fees were accompanied by the applicant's protest.

□ No protest accompanied the payment of additional search fees.
Continuation of Box II.2

Claims Nos.: 1-13, 27

Present claims 1-13 relate to an extremely large number of possible compounds, as the term "composition" alone also designates the compound itself.

Support within the meaning of Article 6 PCT and disclosure within the meaning of Article 5 PCT is to be found, however, for only a very small proportion of the compounds claimed. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible.

Furthermore the initial phase of the search revealed a very large number of documents relevant to the issue of novelty. So many documents were retrieved that it is impossible to determine which parts of the claims may be said to define subject-matter for which protection might legitimately be sought (Article 6 PCT).

Also for these reasons, a meaningful search over the whole breadth of the claim is neither possible nor reasonable.

Consequently, the search has been restricted to the compounds according to the structural formulas displayed in claim 14 in which

R1, R2 designate hydrogen
R3, R5 and R6 designate a methyl group

The subsequent claims were considered dependent from claim 14

The applicant's attention is drawn to the fact that claims relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure. If the application proceeds into the regional phase before the EPO, the applicant is reminded that a search may be carried out during examination before the EPO (see EPO Guideline C-VI, 8.5), should the problems which led to the Article 17(2) declaration be overcome.
