Note: Within nine months of the publication of the mention of the grant of the European patent in the European Patent Bulletin, any person may give notice to the European Patent Office of opposition to that patent, in accordance with the Implementing Regulations. Notice of opposition shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

Description**FIELD OF THE INVENTION**

[0001] The present invention relates to isocyanate-based prepolymers and uses thereof.

BACKGROUND TO THE INVENTION

[0002] Prepolymers bearing isocyanate groups are commonly used in industry to make a wide variety of polyurethane products. These prepolymers are usually prepared by mixing a polyol with an excess of a monomeric polyisocyanate, for example, a diisocyanate such as methylene diphenyl diisocyanate (MDI). Disadvantages associated with the process for forming these prepolymers, involve the unreacted monomers.

[0003] In the art, several methods exist to reduce free monomer content in prepolymers. Monomers can be stripped by distillation, more in particular for higher vapor pressure diisocyanate based prepolymers. Methylene diphenyl diisocyanates, on the other hand, have very low vapor pressures. Furthermore, vapor pressure is proportional to concentration. This combination makes it extremely difficult to remove methylene diphenyl diisocyanate monomers from prepolymers down to extremely low levels. In addition, the temperature during distillation is preferably not raised above 220°C, since MDI may start to form carbodiimides and CO₂. This process is expensive, requires high cost equipment, and a high investment for low vacuum pumps.

[0004] Alternatively, free monomer content can be reduced by asymmetric prepolymerization. However, as a result, the reactivity and curing behavior with water can be extremely low due to the full 2,4-isomer content. The mechanical properties for such prepolymers are less desirable as well. Additionally, raw material availability and price may be an issue.

[0005] Therefore, there remains a need for prepolymers and processes to prepare said prepolymers that overcome one or more of the aforementioned issues. It is an object of the present invention to overcome one or more of the aforementioned issues. More in particular, it is an object of the present invention to reduce free monomer content in prepolymers. More in particular, it is an object of the present invention to reduce free monomer content in prepolymers, while keeping good processability thanks to low viscosity. More in particular, it is an object of the present invention to reduce free monomer content in prepolymers, while keeping good mechanical properties. More in particular, it is an object of the present invention to reduce free monomer content in prepolymers, while keeping good processability thanks to low viscosity and good mechanical properties.

SUMMARY OF THE INVENTION

[0006] The present inventors have now surprisingly found that one or more of these objects can be obtained by reacting at least one isocyanate with at least two compounds each different and independently selected from the group comprising monohydric alcohol, thiol and secondary amine.

[0007] According to a first aspect of the present invention, an isocyanate-containing prepolymer is provided, said prepolymer being obtainable by reacting at least one isocyanate with at least one first compound and with at least one second compound different from said at least one first compound, both compounds being each independently selected from the group comprising monohydric alcohols, thiols and secondary amines; and wherein the at least one isocyanate comprises polymeric methylene diphenyl diisocyanate.

[0008] According to a second aspect, the present invention also encompasses a process for preparing an isocyanate-containing prepolymer according to the first aspect, comprising the steps of:

(a) reacting at least one isocyanate with at least one first compound selected from the group comprising monohydric alcohols, thiols and secondary amines; and

(b) reacting the at least one isocyanate and/or the product of step (a) with at least one second compound selected from the group comprising monohydric alcohols, thiols and secondary amines, wherein said second compound is different from said first compound; thereby preparing an isocyanate-containing prepolymer.

[0009] According to a third aspect, the invention encompasses a polyisocyanate composition comprising the isocyanate-containing prepolymer according to the first aspect of the invention.

[0010] According to a fourth aspect, the present invention also encompasses the use of the prepolymer according to the first aspect of the invention, or the use of the polyisocyanate composition according to the third aspect of the invention, as a one component adhesive or as a component in a two component adhesive, preferably wherein the adhesive is a hot melt adhesive or a laminating adhesive.

[0011] According to a fifth aspect, the invention encompasses an adhesive comprising the prepolymer according to

the first aspect of the invention, or the polyisocyanate composition according to the third aspect of the invention.

[0012] According to a sixth aspect, the invention encompasses a one component self leveling liquid membrane prepared from a prepolymer according to the first aspect of the invention, or from a polyisocyanate composition according to the third aspect of the invention.

[0013] The independent and dependent claims set out particular and preferred features of the invention. Features from the dependent claims may be combined with features of the independent or other dependent claims as appropriate.

[0014] The above and other characteristics, features and advantages of the present invention will become apparent from the following detailed description, which illustrates, by way of example, the principles of the invention.

DETAILED DESCRIPTION OF THE INVENTION

[0015] Before the present formulations of the invention are described, it is to be understood that this invention is not limited to particular formulations described, since such formulations may, of course, vary. It is also to be understood that the terminology used herein is not intended to be limiting, since the scope of the present invention will be limited only by the appended claims.

[0016] As used herein, the singular forms "a", "an", and "the" include both singular and plural referents unless the context clearly dictates otherwise. By way of example, "an isocyanate group" means one isocyanate group or more than one isocyanate groups.

[0017] The terms "comprising", "comprises" and "comprised of" as used herein are synonymous with "including", "includes" or "containing", "contains", and are inclusive or open-ended and do not exclude additional, non-recited members, elements or method steps. It will be appreciated that the terms "comprising", "comprises" and "comprised of" as used herein comprise the terms "consisting of", "consists" and "consists of".

[0018] Throughout this application, the term "about" is used to indicate that a value includes the standard deviation of error for the device or method being employed to determine the value.

[0019] As used herein, the terms "% by weight", "wt%", "weight percentage", or "percentage by weight" are used interchangeably.

[0020] The recitation of numerical ranges by endpoints includes all integer numbers and, where appropriate, fractions subsumed within that range (e.g. 1 to 5 can include 1, 2, 3, 4 when referring to, for example, a number of elements, and can also include 1.5, 2, 2.75 and 3.80, when referring to, for example, measurements). The recitation of end points also includes the end point values themselves (e.g. from 1.0 to 5.0 includes both 1.0 and 5.0). Any numerical range recited herein is intended to include all sub-ranges subsumed therein.

[0021] All references cited in the present specification are hereby incorporated by reference in their entirety. In particular, the teachings of all references herein specifically referred to are incorporated by reference.

[0022] Unless otherwise defined, all terms used in disclosing the invention, including technical and scientific terms, have the meaning as commonly understood by one of ordinary skill in the art to which this invention belongs. By means of further guidance, term definitions are included to better appreciate the teaching of the present invention.

[0023] In the following passages, different aspects of the invention are defined in more detail. Each aspect so defined may be combined with any other aspect or aspects unless clearly indicated to the contrary. In particular, any feature indicated as being preferred or advantageous may be combined with any other feature or features indicated as being preferred or advantageous.

[0024] Reference throughout this specification to "one embodiment" or "an embodiment" means that a particular feature, structure or characteristic described in connection with the embodiment is included in at least one embodiment of the present invention. Thus, appearances of the phrases "in one embodiment" or "in an embodiment" in various places throughout this specification are not necessarily all referring to the same embodiment, but may. Furthermore, the particular features, structures or characteristics may be combined in any suitable manner, as would be apparent to a person skilled in the art from this disclosure, in one or more embodiments. Furthermore, while some embodiments described herein include some but not other features included in other embodiments, combinations of features of different embodiments are meant to be within the scope of the invention, and form different embodiments, as would be understood by those in the art. For example, in the appended claims, any of the claimed embodiments can be used in any combination.

[0025] According to a first aspect of the present invention, an isocyanate-containing prepolymer is provided, said prepolymer being obtainable by reacting at least one isocyanate with at least one first compound selected from the group comprising monohydric alcohols, thiols and secondary amines; and with at least one second compound selected from the group comprising monohydric alcohols, thiols and secondary amines; wherein said first and second compounds are different; and wherein the at least one isocyanate comprises polymeric methylene diphenyl diisocyanate. Said prepolymer can also be obtainable by mixing at least one isocyanate with at least one first compound selected from the group comprising monohydric alcohols, thiols and secondary amines; and with at least one second compound selected from the group comprising monohydric alcohols, thiols and secondary amines; wherein said first and second compounds are different; and wherein the at least one isocyanate comprises a methylene diphenyl diisocyanate.

[0026] Preferably, the prepolymer is obtainable from a stepwise mixing and/or reacting with a first compound and a second compound. In a preferred embodiment, said prepolymer is obtainable by mixing and/or reacting at least one isocyanate with at least one first compound selected from the group comprising monohydric alcohols, thiols and secondary amines; and subsequently with at least one second compound selected from the group comprising monohydric alcohols, thiols and secondary amines; wherein said first and second compounds are different; and wherein the at least one isocyanate comprises polymeric methylene diphenyl diisocyanate.

[0027] In some embodiments, the at least one isocyanate is mixed and/or reacted with two or more compounds selected from the group comprising monohydric alcohols, thiols and secondary amines.

[0028] As used herein, the term "isocyanate-containing prepolymer" refers to a prepolymer comprising at least one isocyanate -N=C=O group, whereby the isocyanate group may be a terminating group. Preferably, the isocyanate group is a terminating group.

[0029] The prepolymer according to the first aspect of the invention is prepared from at least one isocyanate, wherein the at least one isocyanate comprises a methylene diphenyl diisocyanate.

[0030] The at least one isocyanate comprises polymeric methylene diphenyl diisocyanate. This can be any mixture of pure MDI (2,4'-, 2,2'- and 4,4'-methylene diphenyl diisocyanate) and higher homologues of formula (I):

wherein n is an integer which can be from 1 to 10, preferably from 1 to 5.

[0031] In an embodiment, the at least one isocyanate is present in an amount of at least 15 % by weight, preferably at least 20% by weight, preferably at least 25% by weight, preferably at least 30% by weight based on the total weight of the prepolymer.

[0032] The at least one isocyanate may also comprise another polyisocyanate. Preferably this polyisocyanate comprises a high functionality polyisocyanate, with a functionality of at least 2.8, preferably at least 2.9, preferably at least 3.0. Non-limiting examples of polyisocyanates which may be used in the prepolymer of the present invention include aliphatic isocyanates such as hexamethylene diisocyanate; m- and p-phenylene diisocyanate, tolylene-2,4- and tolylene-2,6-diisocyanate (also known as toluene diisocyanate, and referred to as TDI, such as 2,4-TDI and 2,6-TDI) in any suitable isomer mixture, chlorophenylene-2,4-diisocyanate, naphthylene-1,5-diisocyanate, diphenylene-4,4'-diisocyanate, 4,4'-diisocyanate-3,3'-dimethyl-diphenyl, 3-methyl-diphenylmethane-4,4'-diisocyanate and diphenyl ether diisocyanate; and cycloaliphatic diisocyanates such as cyclohexane-2,4- and -2,3-diisocyanate, 1-methylcyclohexyl-2,4- and -2,6-diisocyanate and mixtures thereof and bis-(isocyanatocyclohexyl)methane (e.g. 4,4'-diisocyanatodicyclohexylmethane (H12MDI)), triisocyanates such as 2,4,6-triisocyanatotoluene and 2,4,4-triisocyanatodiphenylether, isophorone diisocyanate (IPDI), butylene diisocyanate, trimethylhexamethylene diisocyanate, isocyanatomethyl-1,8-octane diisocyanate, tetramethylxylene diisocyanate (TMXDI), 1,4-cyclohexanediisocyanate (CDI), and tolidine diisocyanate (TODI).

[0033] According to the first aspect of the present invention, the isocyanate-containing prepolymer is obtainable by reacting the at least one isocyanate with at least one first compound and a second compound different from said first compound, each of said first and second compound being independently selected from the group comprising monohydric alcohols, thiols and secondary amines.

[0034] Preferably, the first compound is a monohydric alcohol. Preferably, the second compound is a monohydric alcohol different from said first compound. Preferably, the first compound and the second compound are two monohydric alcohols.

[0035] As used herein, the terms "monohydric alcohol", "mono-alcohol", "mono-ol", or "monol" are synonymous and used interchangeably and refer to an alcohol containing one and only one (1) free hydroxyl (-OH) group.

[0036] Non-limiting examples of suitable monohydric alcohols comprise C₁₋₂₀ linear, branched or cyclic hydroxyalkyl containing only one free OH group (also referred as monohydric C₁₋₂₀ hydroxyalkyl); polyesters containing only one free OH group (monohydric polyester), heterocyclol containing only one free OH group (monohydric heterocyclol); oxygen containing heterocyclol containing only one free OH group, and blends thereof. For example, said monohydric alcohol can be a C₁₋₂₀ monohydric hydroxyalkyl, a C₂₋₁₈ monohydric hydroxyalkyl, C₃₋₁₈ monohydric hydroxyalkyl, a C₄₋₁₈ monohydric hydroxyalkyl, a C₅₋₁₈ monohydric hydroxyalkyl, a C₆₋₁₈ monohydric hydroxyalkyl, or a C₆₋₁₈ monohydric hydroxyalkyl. Suitable polyesters comprise compounds containing at least one ester group and bearing at least one pendant alkyl or alkenyl group of at least four carbon atoms, said alkyl or said alkenyl group being substituted with only one free hydroxyl group. Examples of suitable monohydric oxygen containing heterocyclol are cyclic trimethylolpropane formal and trimethylolpropane oxetane.

[0037] In some embodiments, the first compound is a monohydric alcohol selected from the group comprising monohydric polyesters, monohydric C₁₋₂₀ hydroxyalkyl, and monohydric heterocyclol. In some embodiments, the first com-

pound can be a polyester containing only one free OH group, preferably a polyester polyol containing only one free OH group.

[0038] In some embodiments, the second compound is a monohydric alcohol selected from the group comprising: monohydric C₁₋₂₀ hydroxyalkyl, monohydric polyesters, and monohydric heterocyclyls. Preferably, the second compound is a C₁₀₋₂₀ hydroxyalkyl or blends thereof.

[0039] In some embodiments, the first compound can be a monohydric polyester; and the second compound can be selected from monohydric C₄₋₂₀ hydroxyalkyl or blends thereof, or monohydric heterocyclyls. Preferably, the first compound can be a monohydric polyester; and the second compound can be selected from monohydric C₄₋₂₀ hydroxyalkyl or blends thereof.

[0040] In some embodiment, the first compound can be a monohydric polyester and the second compound can be a blend of C₁₂₋₁₃ primary alcohols.

[0041] The term "alkyl" as a group or part of a group as used herein refers to branched or straight (linear) or cyclic hydrocarbon with no site of unsaturation, preferably having at least 4 carbon atoms in the chain. When a subscript is used herein following a carbon atom, the subscript refers to the number of carbon atoms that the named group may contain. Thus, for example, C₁₋₂₀ alkyl means an alkyl of 1 to 20 carbon atoms.

[0042] The term "hydroxyalkyl" and "monohydric hydroxyalkyl" as used herein refers to an alkyl group, as defined above, being substituted with one hydroxyl (-OH) substituent.

[0043] The term "alkenyl" as a group or part of a group as used herein refers to a branched or straight or cyclic hydrocarbon with at least one site (usually 1 to 3, preferably 1) of unsaturation, namely a carbon-carbon, sp² double bond, preferably having at least 4 carbon atoms in the chain. The double bond may be in the cis or trans configuration.

[0044] In some embodiments, the first compound is a monohydric alcohol having a weight average molecular weight ranging from 32 to 20 000 Da. Preferably, the first compound is a monohydric alcohol having a weight average molecular weight ranging from 100 to 15 000 Da, for example from 500 to 10 000 Da, preferably from 800 to 10 000 Da.

[0045] In some embodiments, the second compound is a monohydric alcohol having a weight average molecular weight ranging from 32 to 20 000 Da. Preferably, the second compound is a monohydric alcohol having a weight average molecular weight ranging from 50 to 15 000 Da, preferably from 100 to 10 000 Da.

[0046] In some embodiments, the two or more compounds are monohydric alcohols having a weight average molecular weight ranging from 32 to 20 000 Da. Preferably, the two or more compounds are monohydric alcohols wherein a first monohydric alcohol has a weight average molecular weight ranging from 100 to 15 000 Da, preferably from 800 to 10 000 Da and a second monohydric alcohol has a weight average molecular weight ranging from 50 to 15 000 Da, preferably ranging from 100 to 10 000 Da, more preferably ranging from 100 to 800 Da, more preferably ranging from 100 to 500 Da, yet more preferably ranging from 100 to 300 Da.

[0047] In an embodiment, the prepolymer is prepared by first reacting at least one isocyanate with at least one first monohydric alcohol having a weight average molecular weight ranging from 800 to 10 000 Da, and subsequently adding to the reaction mixture at least one second monohydric alcohol having a lower weight average molecular weight than said first monohydric alcohol. In a preferred embodiment, the prepolymer is prepared by first reacting at least one isocyanate with at least one first monohydric alcohol having a weight average molecular weight ranging from 800 to 10 000 Da, and subsequently adding to the reaction mixture at least one second monohydric alcohol having a weight average molecular weight ranging from 100 to 800 Da. Preferably, the first monohydric alcohol is a monohydric polyester; and the second monohydric alcohol is selected from monohydric C₄₋₂₀ hydroxyalkyl or blends thereof, or monohydric heterocyclyls.

[0048] In an embodiment, the first compound is a thiol. In an embodiment, the second compound is a thiol. In an embodiment, the first and second compounds are thiols. As used herein, the term "thiol" refers to compounds comprising at least one free sulfhydryl (-SH) group, preferably one sulfhydryl group. Suitable thiol can be selected from C₁₋₁₅ linear or branched thioalkyl, preferably C₂₋₅ linear or branched thioalkyl, or polyesters substituted with one or more thiol groups. Suitable polyesters comprise compounds containing at least one ester group and bearing at least one pendant alkyl or alkenyl group of at least four carbon atoms, said alkyl or said alkenyl group being substituted with at least one thiol group. Suitable thiols can be selected from the group comprising ethanethiol (e-mercaptan), butanethiol (n-butyl mercaptan), tert-butyl mercaptan, and pentanethiols (pentyl mercaptan), such as 1-pentanethiol.

[0049] In an embodiment, the first compound is a secondary amine. In an embodiment, the second compound is a secondary amine. In an embodiment, the first and second compounds are a secondary amine. As used herein, the term "secondary amine" refers to a compound comprising at least one secondary amine group, preferably comprising one and only one (1) secondary amine group. A non-limiting example of a suitable amine is N,N,N',N'-tetramethyldipropylenetriamine (also known as Jeffcat Z-130, commercially available from Huntsman).

[0050] In some embodiments, said at least one first compound and said at least one second compound are present in a total amount of at least 40% by weight based on the total weight of the isocyanate-containing prepolymer.

[0051] Said first compound and said second compound can be present in a total amount of at least 40% by weight based on the total weight of the prepolymer; preferably in an amount of at least 45% by weight, preferably in an amount

of at least 50% by weight, preferably in an amount of at least 55% by weight, preferably in an amount of at least 60% by weight, preferably in an amount of at least 65% by weight, preferably in an amount of at least 70% by weight, preferably in an amount of at least 75% by weight, preferably in an amount of at least 80% by weight. In some embodiments, said first compound and said second compound can be present in a total amount of at least 40% to at most 90% by weight based on the total weight of the prepolymer, preferably in an amount of at least 50% to at most 90%, preferably in an amount of at least 60% to at most 90%, preferably in an amount of at least 70% to at most 90%, preferably in an amount of at least 80% to at most 87%.

[0052] In an embodiment, said first compound and said second compound are monohydric alcohols, and are present in a total amount of at least 40% by weight based on the total weight of the prepolymer; preferably in an amount of at least 45% by weight, preferably in an amount of at least 50% by weight, preferably in an amount of at least 55% by weight, preferably in an amount of at least 60% by weight, preferably in an amount of at least 65% by weight, preferably in an amount of at least 70% by weight, preferably in an amount of at least 75% by weight. In some embodiments, said monohydric alcohols can be present in a total amount of at least 40% to at most 90% by weight based on the total weight of the prepolymer, preferably in an amount of at least 50% to at most 90%.

[0053] In a preferred embodiment, the at least one first compound is present in a total amount of at least 40% by weight based on the total weight of the isocyanate-containing prepolymer; preferably in an amount of at least 45% by weight, preferably in an amount of at least 50% by weight, preferably in an amount of at least 55% by weight, preferably in an amount of at least 60% by weight. In some embodiments, said first compound can be present in a total amount of at least 40% to at most 90% by weight based on the total weight of the prepolymer, preferably in an amount of at least 50% to at most 80%, preferably in an amount of at least 60% to at most 70%.

[0054] In an embodiment, said first compound is a monohydric alcohol, and is present in a total amount of at least 40% by weight based on the total weight of the prepolymer; preferably in an amount of at least 45% by weight, preferably in an amount of at least 50% by weight, preferably in an amount of at least 55% by weight, preferably in an amount of at least 60% by weight. In some embodiments, said monohydric alcohol can be present in a total amount of at least 40% to at most 90% by weight based on the total weight of the prepolymer, preferably in an amount of at least 50% to at most 80%.

[0055] In a preferred embodiment, said second compound is present in an amount of at least 0.001% by weight based on the total weight of the prepolymer; preferably in an amount of at least 0.010% by weight; for example in an amount of at least 0.100% by weight, for example at least 1.0% by weight, for example 5.0% by weight based on the total weight of the prepolymer. In some embodiments, said second compound is present in at most 50.0% by weight, preferably in at most 30.0% by weight, preferably in at most 20.0% by weight, based on the total weight of the prepolymer. In a preferred embodiment, said second compound is a monohydric alcohol, and is present in an amount of at least 0.001% by weight, for example in an amount of at least 0.010% by weight, for example in an amount of at least 0.100% by weight based on the total weight of the prepolymer.

[0056] In some embodiments, said second compound is a monohydric alcohol comprising at least one tertiary amine group, and is present in an amount of at least 0.001% by weight based on the total weight of the prepolymer. In an embodiment, said second compound comprises at least one tertiary amine group and is present in a total amount of at least 0.001% and at most 20.0% by weight based on the total weight of the prepolymer. In an embodiment, said second compound is a monohydric alcohol comprising at least one tertiary amine group and is present in a total amount of at least 0.001% and at most 20.0% by weight based on the total weight of the prepolymer.

[0057] In some embodiments, said at least one first compound is present in an amount of at least 40% by weight based on the total weight of the prepolymer, preferably at least 50 % by weight, and said second compound is present in an amount of at least 0.001% by weight based on the total weight of the prepolymer.

[0058] In some embodiments, said first and second compounds are monohydric alcohols, and said at least one first monohydric alcohol is present in an amount of at least 40% by weight based on the total weight of the prepolymer, preferably at least 50 % by weight, and said second monohydric alcohol is present in an amount of at least 0.1% by weight based on the total weight of the prepolymer.

[0059] In some embodiments, said first and second compounds are monohydric alcohols, and can be present in a total amount of at least 40.1 % by weight based on the total weight of the prepolymer; preferably at least 50.1% by weight, preferably at least 60.1 % by weight, and said second monohydric alcohol has a lower weight average molecular weight than said at least one first monohydric alcohol.

[0060] In some embodiments, said first and second compounds are monohydric alcohols, said first compound is present in an amount of at least 40% by weight based on the total weight of the prepolymer, said second compound is present in an amount of at least 0.1% by weight based on the total weight of the prepolymer and has a lower weight average molecular weight than said first compound.

[0061] In some embodiments, the first compound is a polyester containing only one free OH group, preferably a polyester polyol containing only one free OH group, preferably in an amount of at least 40% by weight based on the total weight of the prepolymer. In some embodiments, the compound can be a monohydric polyester; and the second

compound is a monohydric alcohol selected from monohydric C₁₋₂₀ hydroxyalkyl or blends thereof, and monohydric heterocyclyls. For example, the first compound can be a monohydric polyester, and can be present in an amount of at least 40% by weight based on the total weight of the prepolymer; and the second compound can be selected from monohydric C₁₋₂₀ hydroxyalkyl or blends thereof, and monohydric heterocyclyls, and can be present in an amount of at least 0.1 % by weight based on the total weight of the prepolymer.

[0062] In some embodiments, said second compound has a different weight average molecular weight than said at least one first compound. In a preferred embodiment, said second compound has a lower weight average molecular weight than said at least one first compound. In a preferred embodiment, said second compound has a different steric hindrance than said at least one first compound. This can be obtained for example by using different branching structures for the first and second compound.

[0063] Preferably, the first compound is a monohydric alcohol, and the second compound is a second monohydric alcohol different from the first one. Said first and second monohydric alcohols can have different weight average molecular weight M_w and/or different OH value. In an embodiment, said second monohydric alcohol has a different weight average molecular weight than said at least one first monohydric alcohol. In a preferred embodiment, said second monohydric alcohol has a lower weight average molecular weight than said at least one first monohydric alcohol. In a preferred embodiment, the first and second monohydric alcohols have a different steric hindrance.

[0064] In some embodiments said first compound comprises at least one tertiary amine group. In some embodiment, said second compound comprises at least one tertiary amine group. For example, said first compound can be a monohydric alcohol which comprises at least one tertiary amine group, a monohydric C₁₋₂₀ hydroxyalkyl substituted with at least one tertiary amine group, or a monohydric heterocyclyl substituted with at least one tertiary amine group. Such tertiary amino groups can be used to increase the blowing and gelling catalytic activity. Preferred compounds comprising a tertiary amine group may be selected from the group comprising: N,N,N'-trimethyl-N'-hydroxyethyl-bisaminoethylether (also known as Jeffcat ZF-10, commercially available from Huntsman), 2-(2-dimethylaminoethoxy)ethanol (also known as DMEE or Jeffcat ZR-70, commercially available from Huntsman), N,N,N'-trimethylaminoethyl-ethanolamine (also known as Jeffcat Z-110, commercially available from Huntsman), N,N-bis(3-dimethylaminopropyl)-N-isopropanolamine (also known as Jeffcat ZR-50, commercially available from Huntsman), and N,N-dimethylethanolamine (also known as DMEA, commercially available from Huntsman).

[0065] In a preferred embodiment, the invention provides the isocyanate-containing prepolymer according to the first aspect of the invention, wherein the ratio of the NCO value of the isocyanate-containing prepolymer, to the weighted average of the OH, SH or NH value, of said first and second monohydric alcohol, thiol or secondary amine respectively ranges from 0.0005 to 1.0000, preferably from 0.0005 to 0.7500, preferably from 0.0010 to 0.600. The NCO value (also referred to as percent NCO or NCO content) of the isocyanate-containing prepolymer is preferably measured by titration with dibutylamine according to the DIN 53185 standard. The NCO value is expressed in weight %.

[0066] The OH value (also referred to as OH number or OH content) is preferably measured according to the ASTM D 1957 standard. The OH value is expressed in mg KOH/g. The SH value (also referred to as mercapto value) can be measured by titration with KOH. In brief, SH groups are acetylated with acetic anhydride in the presence of a suitable Lewis base. The excess acetic anhydride is hydrolyzed with water and the resulting acetic acid is titrated with a potassium hydroxide solution. The SH value can then be calculated using the following equation: $SH\text{ value (mg KOH/g)} = 14.025 \times (B - A) \times N / S$ wherein S represents a sample weight (g); A represents the amount (mL) of the solution of potassium hydroxide required for titrating the sample; B represents the amount (mL) of the solution of potassium hydroxide required for a blank test; and N represents the normality of the potassium hydroxide solution.

[0067] The NH value can be determined by titration of the sample in ethanol solution with standardized 0.1 N HCl by using bromoresol green solution as an indicator.

[0068] The weighted average can be calculated as follows. If for example there are 4 parts of a first monol to 3 parts of a second monol, then the weighted average of the OH value is $(4 \times OH\text{ value of monol 1} + 3 \times OH\text{ value of monol 2}) / (4 + 3)$. In those embodiments where the at least one isocyanate is reacted with two or more compounds selected from the group comprising monohydric alcohols, thiols and secondary amines, the weighted average of the OH value can be calculated from the OH values and the relative concentrations of said two or more compounds.

[0069] When the ratio of the NCO value of the isocyanate-containing prepolymer to the weighted average of the OH, SH or NH value of said first and second monohydric alcohol, thiol or secondary amine respectively ranges from 0.0005 to 1.0000, preferably from 0.0005 to 0.7500, it ranges preferably from 0.0010 to 0.6000, preferably from 0.0010 to 0.2000, preferably from 0.0010 to 0.1000, preferably from 0.0010 to 0.0500, preferably from 0.0010 to 0.0200, preferably from 0.0020 to 0.0200, for example from 0.0050 to 0.0200, preferably from 0.0050 to 0.0150.

[0070] Preferably the NCO value of the prepolymer is at most 15.0%, preferably at most 10.0%, preferably at most 5.0%, preferably at most 2.0%.

[0071] The present inventors have found that the prepolymer according to the first aspect of the invention can have

an improved processability, due to low viscosity. This effect was even observed without the need of a plasticizer.

[0072] Preferably, the viscosity is measured before addition of a plasticizer or a viscosity reducer, herein referred to as a "non-plasticized prepolymer". In a preferred embodiment, the viscosity of the (non-plasticized) prepolymer ranges from 1000 to 200 000 mPa.s, for example from 1500 to 150 000 mPa.s, for example from 2000 to 100 000 mPa.s, for example from 2500 to 50 000 mPa.s, for example from 5000 to 20 000 mPa.s, for example from 5000 to 18 000 mPa.s, for example from 5000 to 15 000 mPa.s, wherein the viscosity is measured at 25°C using Brookfield Viscometer (model DV-II, spindle 21, rpm according 30 - 80% of full scale) according to the ASTM D 4889 standard without any plasticizer added to the prepolymer.

[0073] The present inventors have also found that the prepolymer can have a reduced content in free isocyanate monomers, such as methylene diphenyl diisocyanate monomers in the form of 2,4', 2,2' and 4,4' isomers and mixtures thereof.

[0074] In some embodiments, the prepolymer according to the first aspect of the invention comprises at most 10.0 % by weight of free isocyanate monomers, preferably at most 5.0% by weight of free monomers, preferably at most 3.0% by weight of free monomers, preferably at most 2.0% by weight of free monomers, preferably at most 1.0% by weight of free monomers, preferably at most 0.5% by weight of free monomers, most preferably at most 0.1% by weight of free monomers, with % by weight based on 100% of the total weight of the prepolymer. Preferably, the free isocyanate monomer content is measured before addition of a plasticizer or a viscosity reducer. Preferably, the free isocyanate monomer content is measured by quantitative HPLC GC analysis.

[0075] The prepolymer may comprise one or more additives. In some embodiments, the additive is present in an amount of at least 0.01% by weight, for example at least 0.03% by weight, for example at least 0.1% by weight, preferably at least 0.3% by weight, for example at least 0.5%, for example at least 1.0% by weight, based on the total weight of the prepolymer.

[0076] The additive may be a plasticizer. Preferably, the amount of plasticizer in the prepolymer is limited. In a preferred embodiment, the prepolymer comprises from 0.0% to at most 50.0 % by weight of plasticizer, preferably from 0.0% to at most 15.0 % by weight of plasticizer, preferably from 0.0% to at most 10.0 % by weight of plasticizer, preferably from 0.0% to at most 5.0 % by weight of plasticizer, preferably from 0.0% to at most 1.0% by weight of plasticizer, preferably from 0.00% to at most 0.01% by weight of plasticizer, preferably from 0.000% to at most 0.001% by weight of plasticizer, based on the total weight of the prepolymer.

[0077] Suitable plasticizers, for purposes of the present invention, comprise conventional plasticizers known in the art, such as esters of dibasic or polybasic carboxylic acids with monohydric alcohols. Non-limiting examples of such polycarboxylic acids may be selected from the group comprising succinic acid, isophthalic acid, trimellitic acid, phthalic acid anhydride, tetrahydrophthalic acid anhydride, hexahydrophthalic acid anhydride, endomethylene-tetrahydrophthalic acid anhydride, glutaric acid anhydride, maleic acid anhydride, fumaric acid and dimeric and trimeric fatty acids (such as oleic acid), and combinations thereof, which may be mixed with monomeric fatty acids. Suitable monohydric alcohols are as described and exemplified above.

[0078] Other examples of suitable plasticizers may be selected from the group comprising phthalates, such as dioctyl phthalate, diisooctyl phthalate, diisononyl phthalate, dimethyl phthalate, dibutyl phthalate; phosphates, such as tributyl phosphate, triethyl phosphate (TEP), triphenyl phosphate and cresyl diphenyl phosphate; chlorinated biphenyls; aromatic oils; adipates, such as diisononyl adipate and di-(2-ethylhexyl) adipate; and combinations thereof. Specific examples of suitable plasticizers are commercially available from the BASF Corporation under the trademark of PALATINOL®, such as PALATINOL® 711P, and under the trademark of PLASTOMOLL®, such as PLASTOMOLL® DNA and PLASTOMOLL® DOA.

[0079] Other examples of suitable plasticizers, comprise phosphoric acid esters of the above-mentioned branched and unbranched aliphatic, cycloaliphatic and aromatic alcohols. If appropriate, phosphates of halogenated alcohols, for example, trichloroethyl phosphate, can also be employed. It is to be appreciated that mixed esters of the aforementioned alcohols and carboxylic acids can also be employed. So called polymeric plasticizers can also be employed, for purposes of the present invention. Examples of such plasticizers may be selected from the group comprising polyesters of adipic acid, sebacic acid or phthalic acid. Phenol alkylsulfonates, e.g. phenyl paraffinsulfonates, can also be employed. It is to be appreciated that the prepolymer may comprise any combination of two or more of the aforementioned plasticizers. Alternatively, such plasticizers may also be selected from alkylene carbonates, such as propylene carbonate and ethylene carbonate. These are commercially available from Huntsman under the Jeffsol® trademark.

[0080] The additive may be an amine. In a preferred embodiment the prepolymer comprises at least one amine. Preferably, the amine is a secondary amine, for example dibutylamine.

[0081] According to a second aspect, the present invention also encompasses a process for preparing an isocyanate-containing prepolymer comprising the steps of:

- (a) reacting at least one isocyanate with at least one first compound selected from the group comprising monohydric alcohols, thiols and secondary amines; and

(b) reacting the at least one isocyanate and/or the product of step (a) with at least one second compound selected from the group comprising monohydric alcohols, thiols and secondary amines, wherein said second compound is different from said first compound;

thereby preparing an isocyanate-containing prepolymer.

[0082] Said process can also comprise the steps of:

(a) mixing at least one isocyanate with at least one first compound selected from the group comprising monohydric alcohols, thiols and secondary amines; and

(b) mixing the at least one isocyanate and/or the product of step (a) with at least one second compound selected from the group comprising monohydric alcohols, thiols and secondary amines, wherein said second compound is different from said first compound;

thereby preparing an isocyanate-containing prepolymer.

[0083] Preferably, the addition of the first and second compounds is a stepwise process. In an embodiment, said process comprises the steps of:

(a) mixing and/or reacting at least one isocyanate with at least one first compound selected from the group comprising monohydric alcohols, thiols and secondary amines; and

(b) subsequently, mixing and/or reacting the product of step (a) with at least one second compound selected from the group comprising monohydric alcohols, thiols and secondary amines, wherein said second compound is different from said first compound;

thereby preparing an isocyanate-containing prepolymer.

[0084] In a preferred embodiment, at least one mixing or reacting step is performed at a temperature of at least 60°C, preferably at least 65°C, preferably at least 70°C, preferably at least 75°C, preferably at least 80°C. Preferably, all mixing and reacting steps are performed at said temperature.

[0085] The compounds, such as the monohydric alcohols, may be gradually added to the at least one isocyanate, for example step wise, or they may be continuously added, for example drop by drop. Preferably, the compounds are added continuously drop by drop. Preferably, the monohydric alcohols are continuously added drop by drop.

[0086] In some embodiments, at least one mixing or reacting step can be performed in the presence of a catalyst. All mixing and reacting steps can also be performed in the presence of a catalyst.

[0087] Non-limiting examples of suitable catalysts include non grafted catalysts, such as 2,2'-dimorpholinodiethylether (DMDEE, available commercially from Huntsman), and grafted catalysts, such as dimethylethanolamine (DMEA) and 2(2-dimethylaminoethoxy)ethanol (DMEE). Preferably, the catalyst is 2,2'-dimorpholinodiethylether (DMDEE) or 2(2-dimethylaminoethoxy)ethanol (DMEE). Preferably, the catalyst is a grafted catalyst.

[0088] In some embodiments, the catalyst is an organometallic catalyst. In these embodiments, the catalyst comprises an element selected from the group comprising tin, iron, lead, bismuth, mercury, titanium, hafnium, zirconium, and combinations thereof. In certain embodiments, the catalyst comprises a tin catalyst. Suitable tin catalysts, for purposes of the present invention, may be selected from tin(II) salts of organic carboxylic acids, e.g. tin(II) acetate, tin(II) octoate, tin(II) ethylhexanoate and tin(II) laurate. In an embodiment, the organometallic catalyst comprises dibutyltin dilaurate, which is a dialkyltin(IV) salt of an organic carboxylic acid. Specific examples of suitable organometallic catalyst, e.g. dibutyltin dilaurates, for purposes of the present invention, are commercially available from Air Products and Chemicals, Inc. under the trademark of DABCO®. The organometallic catalyst can also comprise other dialkyltin(IV) salts of organic carboxylic acids, such as dibutyltin diacetate, dibutyltin maleate and dioctyltin diacetate.

[0089] Non-limiting examples of other suitable catalysts, may be selected from the group comprising iron(II) chloride; zinc chloride; lead octoate; tris(dialkylaminoalkyl)-s-hexahydrotriazines including tris(N,N-dimethylaminopropyl)-s-hexahydrotriazine; tetraalkylammonium hydroxides including tetramethylammonium hydroxide; alkali metal hydroxides including sodium hydroxide and potassium hydroxide; alkali metal alkoxides including sodium methoxide and potassium isopropoxide; and alkali metal salts of long-chain fatty acids having from 10 to 20 carbon atoms and/or lateral OH groups; triethylamine, N,N,N',N'-tetramethylethylenediamine, N,N-dimethylaminopropylamine, N,N,N',N',N"-pentamethyldipropylenetriamine, tris(dimethylaminopropyl)amine, N,N-dimethylpiperazine, tetramethylimino-bis(propylamine), dimethylbenzylamine, trimethyl amine, triethanolamine, N,N-diethyl ethanolamine, N-methylpyrrolidone, N-methylmorpholine, N-ethylmorpholine, bis(2-dimethylamino-ethyl)ether, N,N-dimethylcyclohexylamine (DMCHA), N,N,N',N',N"-pentamethyldiethylenetriamine, 1,2-dimethylimidazole, 3-(dimethylamino) propylimidazole; N,N,N-dimethylaminopropylhexahydrotriazine, potassium acetate, N,N,N-trimethyl isopropyl amine formate, and combinations thereof. It is to be appreciated that the catalyst component may include any combination of two or more of the aforementioned catalysts.

[0090] Preferably, the catalyst can be present in an amount of at least 10 ppm, for example at least 0.01% by weight, for example at least 0.20% by weight, with % by weight being based on the total weight of the prepolymer.

[0091] According to a third aspect, the invention encompasses a polyisocyanate composition comprising the isocyanate-containing prepolymer according to the first aspect of the invention.

[0092] The present invention encompasses the use of the prepolymer according to the first aspect of the invention or the polyisocyanate composition according to the third aspect of the invention for the preparation of an adhesive, a coating, an elastomer, a foam, or a polyurethane. The invention also encompasses said prepared adhesive, coating, elastomer, foam or polyurethane.

[0093] The present invention also encompasses the use of the prepolymer according to the first aspect of the invention or the use of the polyisocyanate composition according to the third aspect of the invention for the preparation of a polyurethane. The invention also encompasses said polyurethane.

[0094] The invention encompasses the use of the prepolymer in a one-component system, which can be cured by moisture. The invention also encompasses said one-component system. The invention also encompasses the use of the prepolymer in a two-component system, preferably in a two-component polyurethane or a two-component heat curable polyisocyanurate system. The invention also encompasses said two-component system.

[0095] According to a fourth aspect, the present invention also encompasses the use of the prepolymer according to the first aspect of the invention, or the use of the polyisocyanate composition according to the third aspect of the invention, as a one component adhesive or as a component in a two component adhesive, preferably wherein the adhesive is a hot melt adhesive or a laminating adhesive. The invention also encompasses said one component adhesive or said two component adhesive. Preferably these adhesives are used for laminating an object.

[0096] According to a fifth aspect, the invention encompasses an adhesive comprising the prepolymer according to the first aspect of the invention, or the polyisocyanate composition according to the third aspect of the invention.

[0097] The prepolymers according to the invention or the polyisocyanates obtained therewith are particularly useful as raw material for formulating a one-component (1C), for example moisture curing, adhesive, with free monomer content of at most 1.0 weight%, preferably at most 0.5 weight%, preferably at most 0.2 weight%, most preferably at most 0.1 weight%. The prepolymers according to the invention or the polyisocyanates obtained therewith are also particularly useful for formulating a two-component (2C) adhesive, with free monomer content of at most 1.0 weight%, preferably at most 0.5 weight%, preferably at most 0.2 weight%, most preferably at most 0.1 weight%.

[0098] A one-component adhesive may comprise DIY (do-it-yourself) adhesives, which react with moisture in the air. A two-component system may react with a polyol. Preferably, the adhesive is a D4 adhesive. As used herein, the term D4 adhesive refers to adhesives corresponding to the EN 204 specifications for the D4 class. In some embodiments of the invention, the prepolymer fulfills the D4 (EN 204) specifications for DIY wood adhesives, while showing a free monomer content of at most 1.0 weight%, preferably at most 0.5 weight%, preferably at most 0.2 weight%, most preferably at most 0.1 weight%.

[0099] Preferably, the adhesive is a hot melt adhesive. The invention also encompasses said hot melt adhesive. The prepolymers according to the invention or the polyisocyanates obtained therewith are particularly useful for formulating a reactive hot melt (RHM) adhesive, with free monomer content of at most 1.0 weight%, preferably at most 0.5 weight%, preferably at most 0.2 weight%, most preferably at most 0.1 weight%.

[0100] Preferably, the adhesive is a laminating adhesive. The invention also encompasses said laminating adhesive. The prepolymers according to the invention or the polyisocyanates obtained therewith are particularly useful for formulating a laminating adhesive, with free monomer content of at most 1.0 weight%, preferably at most 0.5 weight%, preferably at most 0.2 weight%, most preferably at most 0.1 weight%.

[0101] In some embodiments, the prepolymer can be particularly useful for formulating a laminating adhesive, and preferably for flexible packaging adhesive. The prepolymers are particularly useful as raw material for formulating fast curing and low migration 1C and 2C flexible packaging adhesives.

[0102] Preferably, the laminating adhesive is a 2C system. Some adhesives according to embodiments of the present invention provide bonds suitable to be used in flexible packaging for indirect food contact, due to a reduced migration of aromatic amines, i.e. a migration rate below the legally required limit, for example below a content of 2 ppb of polyaromatic amine.

[0103] The prepolymer is particularly useful for flexible packaging where a laminated film or sheet, produced using an adhesive, is used.

[0104] As an applicator of an adhesive according to the present invention there can be mentioned known applicators such as airless spray machine, air spray machine, immersion, roll coater, brush and the like. The conditions used for lamination using an adhesive according to the invention are preferably 20 to 150°C, for example 20 to 100°C, for example 40 to 150°C, particularly preferably 40 to 100°C.

[0105] In producing a laminated film by using the present adhesive, the film used is not critical. As the film, there can be mentioned a film of polyester type such as polyethylene terephthalate or the like; a film of polyolefin type such as polyethylene, polypropylene or the like; a film of polyamide type such as nylon or the like; a metal foil such as aluminum

foil, copper foil or the like; an ethylene-vinyl acetate copolymer or a saponification product thereof; a cellophane; a polyvinyl chloride; a polyvinylidene chloride; a polystyrene; a paper; and so forth. There can also be suitably used stretched products thereof and surface-treated (e.g. corona discharge-treated or surface-coated) products thereof.

[0106] The adhesive of the present invention can be suitably used for lamination not only between two film layers but also between three or more film layers.

[0107] The prepolymers according to the invention or the polyisocyanates obtained therewith are particularly useful as raw material for formulating a one-component moisture curing self leveling liquid membrane for coating applications. The present invention encompasses a one component self leveling liquid membrane prepared from a prepolymer according to the first aspect of the invention, or from a polyisocyanate composition according to the third aspect of the invention.

[0108] In some embodiments, two-components systems based on these prepolymers, can achieve permanent tack properties. Accordingly, the present invention also encompasses pressure sensitive adhesive prepared using the prepolymers according to the invention.

[0109] In some embodiments, the prepolymer can be useful for formulating an adhesive for a material comprising lignocellulose, herein also referred to as a "lignocellulosic material".

[0110] The present invention also encompasses a substrate comprising a prepolymer according to the invention. The present invention also encompasses a lignocellulosic body prepared using the prepolymer according to the invention.

[0111] The invention also encompasses the use of the prepolymer for the preparation of a coating, an elastomer, a one component foam, or a two component foam.

[0112] The invention is illustrated but not limited by the following examples.

EXAMPLES

[0113] The examples described hereunder illustrate the properties of the prepolymers and compositions according to embodiments of the present invention. Unless otherwise indicated, all parts and all percentages in the following examples, as well as throughout the specification, are parts by weight or percentages by weight respectively.

[0114] The following ingredients were used in the preparation of the prepolymers:

Isocyanate 1: polymeric methylene diphenyl isocyanate (pMDI), with an NCO value of 31.0 %, with a functionality of 2.7 (softblock content 0.0 %).

Isocyanate 2: polymeric methylene diphenyl isocyanate (pMDI) of NCO value 30.5 %, with a functionality of 2.85 (softblock content 0.0 %).

Monol 1: polyester monol of M_w 900, and a functionality of 1, based on transesterification and dehydration reaction products of castor oil with glycerol.

Monol 2: blend of C_{12} - C_{13} primary alcohols of M_w 193, and a functionality of 1, CAS n°67762-41-8, available as Neodol 23E from Shell Chemicals.

Monol 3: CTPF (cyclic trimethylol propane formal) also known as 5-ethyl-1,3-dioxane-5-methanol, CAS n°5187-23-5 with M_w 146.

Monol 4: TMPO (trimethylol propane oxetane) also known as 3-ethyl-3-oxetanemethanol, CAS n° 3047-32-3 with M_w 116.

Diol 1: polypropylene glycol of molecular weight 2000 (PPG2000).

Diol 2: polypropylene glycol of functionality 2 and molecular weight of 125.

Secondary amine 1: N,N,N',N'-tetramethyldipropylenetriamine, commercially available from Huntsman as Jeffcat Z-130.

DMDEE: 2,2'-dimorpholinodiethylether.

DMEA: N,N-dimethylethanolamine.

Methods

[0115] The following methods were used in the examples:

The NCO value (or percent NCO), given in weight %, was measured according to the DIN 53185 standard. In brief, isocyanate is reacted with an excess of di-n-butylamine to form ureas. The unreacted amine is then titrated with standard nitric acid to the color change of bromocresol green indicator or to a potentiometric endpoint. The percent NCO or NCO-value is defined as the percent by weight of NCO-groups present in the product.

[0116] The OH value (also referred to as OH number or OH content) was measured according to the ASTM D 1957 standard. In brief, hydroxyl groups are acetylated with acetic anhydride in the presence of pyridine and heat. The excess acetic anhydride is hydrolyzed with water and the resulting acetic acid is titrated with standard potassium hydroxide solution. The OH value is expressed in mg KOH/g sample. The OH value was calculated using the following equation:

$$\text{OH value (mg KOH/g)} = 56.1 \times (B - A) \times N / S$$

wherein S represents a sample weight (g); A represents the amount (mL) of the solution of potassium hydroxide required for titrating the sample; B represents the amount (mL) of the solution of potassium hydroxide required for a blank test; and N represents the normality of the potassium hydroxide solution.

[0117] The concentration in free monomer was measured by quantitative HPLC GC analysis.

[0118] Final lap shear strength in climate condition (after 7 days at 23°C 50% RH), after boiling (a boiling test of 6 hr and after this condition 2 hr cold water) and after water immersion (4 days in water at 20°C +/- 5°C) of prepolymers was determined according to Standard EN 204-205.

Example 1

[0119] The prepolymers 1-4 were prepared by reacting monol 1, having an OH value of 62, with isocyanate 2, and subsequently mixing the product with monol 2, having an OH value of 290. The formulations are listed in Table 1.

[0120] The comparative prepolymers 1-4 were obtained by mixing diol 1 having an OH value of 56, with isocyanate 2, and mixing the product with diol 2, having an OH value of 897. The formulations are listed in Table 1.

[0121] The comparative prepolymers 1'-4' were obtained by mixing monol 1, having an OH value of 62, with isocyanate 2. The formulations are listed in Table 1.

[0122] The NCO value and the free monomer content of the prepolymers (prepo) were measured. The ratio NCO value of the prepolymer to the weighted OH value of the monols or diols (NCO prepo/OH alcohol(s)) was determined. The results are listed in Table 1.

[0123] Figure 1 represents the free monomer content of the prepolymer vis-a-vis the NCO of the prepolymer for the various prepolymers above made either with two diols, two monols or one monol.

[0124] It is clear that by using two monols the free monomer content of the prepolymer is decreased compared to using only one monol or using two diols, especially at low NCO value.

Table 1

	Isocyanate 2	Monol 1	Monol 2	Diol 1	Diol 2	NCO value in prepo	NCO prepo/ OH alcohol(s)	Free isocyanate monomer
	(wt %)	(wt%)	(wt%)	(wt%)	(wt%)	(wt%)		(wt%)

Example 2

[0125] The prepolymers 5 and 6, have the same ingredients as prepolymer 3 of example 1, but were prepared differently. The prepolymer 3 was prepared by adding monol 1 to isocyanate 2, and then subsequently adding monol 2 to the reaction mixture. The prepolymer 5 was prepared by adding monol 2 to isocyanate 2, and subsequently adding monol 1 to the reaction mixture. The prepolymer 6 was prepared by simultaneously mixing all the ingredients together: isocyanate 2, monol 1 and monol 2. The NCO value and the free monomer content of the prepolymers was measured and compared with the free monomer content of prepolymer 3. The formulations and results are listed in Table 2. The ratio of the NCO value of the prepolymer to the weighted OH value of the monols (NCO prepo/OH) was 0.046.

Table 2

NCO value in prepo (wt%) = 5	Isocyanate 2	First monol added	Second monol added	Free isocyanate monomer
	(wt%)	(wt%)	(wt%)	(wt%)
Prepo 3	33.86	52.91 monol 1	13.23 monol 2	1.3
Prepo 5	33.86	13.23 monol 2	52.91 monol 1	1.9
Prepo 6	33.86	52.91 monol 1 and 13.23 monol 2		6.2

[0126] The prepolymers 7 to 9 have the same ingredients but were prepared differently. Prepolymer 7 was prepared by reacting isocyanate 1 with monol 1 in a first step and subsequently adding monol 3 to the reaction mixture in a second step. Prepolymer 8 was prepared by reacting isocyanate 1 with monol 3 in a first step and subsequently adding monol 1 to the reaction mixture in a second step. Prepolymer 9 was prepared by simultaneously reacting isocyanate 1, with monol 1 and monol 3 in one step. The formulations are listed in Table 3. The free monomer content of the prepolymers (prepo) was measured. The results are listed in Table 3. The ratio of the NCO value of the prepolymer to the weighted OH value of the monols (NCO prepo/OH) was 0.039.

Table 3

NCO value in prepo (wt%) = 5	Isocyanate 1	First monol added	Second monol added	Free isocyanate monomer
	(wt%)	(wt%)	(wt%)	(wt%)
Prepo 7	35.89	51.29 monol 1	12.82 monol 3	0.5
Prepo 8	35.89	12.82 monol 3	51.29 monol 1	1.2
Prepo 9	35.89	51.29 monol 1 and 12.89 monol 3		2.3

[0127] The prepolymers 10 to 12 have the same ingredients but were prepared differently. Prepolymer 10 was prepared by reacting isocyanate 2 with monol 1 in a first step and subsequently adding monol 4 to the reaction mixture in a second step. Prepolymer 11 was prepared by reacting isocyanate 2 with monol 4 in a first step and subsequently adding monol 1 to the reaction mixture in a second step. Prepolymer 12 was prepared by simultaneously reacting isocyanate 2, with monol 1 and monol 4 in one step. The formulations are listed in Table 4. The free monomer content of the prepolymers (prepo) was measured. The results are listed in Table 4. The ratio of the NCO value of the prepolymer to the weighted OH value of the monols (NCO prepo/OH) was 0.035.

Table 4

NCO value in prepo (wt%) = 5	Isocyanate 2	First monol added	Second monol added	Free isocyanate monomer
	(wt%)	(wt%)	(wt%)	(wt%)
Prepo 10	38.30	49.36 monol 1	12.34 monol 4	<0.1
Prepo 11	38.30	12.34 monol 4	49.36 monol 1	0.4
Prepo 12	38.30	49.36 monol 1 and 12.34 monol 4		0.8

[0128] Tables 2-4 also show the effect on the free monomer content of the steric hindrance of the monol used. Tables 2-4 also show the effect on the free monomer content of the order in which the monol may be added.

[0129] Tables 2-4 also show the effect of the NCO prepo/OH ratio on the free monomer content of the prepolymer. For example, a small difference in the ratio NCO prepo/OH between prepolymers 3 and 10 (both with an NCO content of 5%), gave a significant difference in free monomer content.

[0130] By accurately selecting the monohydric alcohol, the NCO content may be raised, while keeping the free monomer content low. A higher NCO content of the prepolymer may lead to improved mechanical properties of the cured system.

Example 3

[0131] The durability of prepolymers 2, 3, 7 and 10 was further tested according to EN-204-205.

[0132] After 7 days (final strength) in climate condition (23°C 50% RH) a lap shear strength was measured. After the final strength was reached, a lap shear strength (water test) was measured after 4 days in water (20±5 °C). The final strength also resisted a boiling test of 6 hr and after this condition 2 hr cold water. The lap shear measured after the boiling test is also shown in Table 5.

[0133] The prepolymers 2, 3, 7 and 10 achieved the D4 classification.

Table 5

	Final strength	Boiling Test	Water Test	Free isocyanate monomer
	(MPa)	(MPa)	(MPa)	(wt%)
Prepo 2	12.1	4.8	4.5	6.1
Prepo 3	10.8	4.4	5.1	1.3
Prepo 7	10.1	4.2	4.8	0.5
Prepo 10	11.4	4.3	5.1	<0.1

Example 4

[0134] The prepolymers 13 to 18 were prepared by mixing the ingredients of prepolymer 3 of example 1 with DMDEE, DMEA, or secondary amine 1 as shown in Table 6. The free monomer content and the NCO value of the prepolymers were measured and compared with the free monomer content of prepolymer 3. The formulations and results are listed in Table 6.

Table 6

	Prepo 3	DMDEE	DMEA	Secondary amine 1	Free isocyanate monomer	NCO value in prepo
	(wt%)	(wt%)	(wt%)	(wt%)	(wt%)	(wt%)
Prepo 3	100.0	0.0	0.0	0.0	1.3	5
Prepo 13	99.9	0.1	0.0	0.0	1.1	5
Prepo 14	99.8	0.2	0.0	0.0	0.8	4.9
Prepo 15	99.7	0.5	0.0	0.0	0.5	4.7
Prepo 16	99.0	0.0	0.9	0.0	0.7	4.5
Prepo 17	98.2	0.0	1.8	0.0	0.3	4
Prepo 18	95.0	0.0	0.0	5.0	< 0.1	4.1

[0135] It is to be understood that although preferred embodiments have been discussed for providing embodiments according to the present invention, various modifications or changes may be made without departing from the scope and spirit of this invention.

Claims

1. An isocyanate-containing prepolymer obtainable by reacting at least one isocyanate with at least one first compound and with at least one second compound different from said at least one first compound, both compounds being each independently selected from the group comprising monohydric alcohols, thiols and secondary amines; and wherein the at least one isocyanate comprises polymeric methylene diphenyl diisocyanate.
2. The prepolymer according to claim 1, wherein said at least one second compound has a lower weight average molecular weight than said at least one first compound.
3. The prepolymer according to claim 1 or 2, wherein said first compound is a monohydric alcohol selected from the group comprising monohydric polyesters, monohydric C₁₋₂₀hydroxyalkyl, and monohydric heterocyclyl.
4. The prepolymer according to any of claims 1 to 3, wherein said second compound is a monohydric alcohol selected from the group comprising monohydric polyesters, monohydric C₁₋₂₀hydroxyalkyl, and monohydric heterocyclyl.
5. The prepolymer according to any of claims 1 to 4, wherein said second compound comprises at least one tertiary amine group.
6. The prepolymer according to any of claims 1 to 5, wherein the ratio of the NCO value of the isocyanate-containing prepolymer, to the weighted average of the OH, SH or NH value, of said first and second compounds ranges from 0.0005 to 1.0000.
7. The prepolymer according to any of claims 1 to 6, wherein said first compound is present in a total amount of at least 40.0% by weight based on the total weight of the isocyanate-containing prepolymer.
8. The prepolymer according to any of claims 1 to 7, wherein said second compound is present in a total amount of

at least 0.001% by weight based on the total weight of the isocyanate-containing prepolymer.

9. The prepolymer according to any of claims 1 to 8, wherein the viscosity of the prepolymer ranges from 1000 to 200 000 mPa.s, wherein the viscosity is measured at 25°C using Brookfield Viscometer according to the ASTM D 4889 standard without any plasticizer added to the prepolymer.

10. The prepolymer according to any one of claims 1 to 9, wherein the prepolymer has a free isocyanate monomer content of at most 1.0 wt%, as measured by quantitative HPLC GC analysis.

11. Process for preparing an isocyanate-containing prepolymer as defined in any of claims 1 to 10, comprising the steps of:

(a) reacting at least one isocyanate with at least one first compound selected from the group comprising monohydric alcohols, thiols and secondary amines; and

(b) reacting the at least one isocyanate and/or the product of step (a) with at least one second compound selected from the group comprising monohydric alcohols, thiols and secondary amines, wherein said second compound is different from said first compound;

thereby preparing an isocyanate-containing prepolymer.

12. A polyisocyanate composition comprising the prepolymer as defined in any one of claims 1 to 10.

13. Use of the prepolymer as defined in any one of claims 1 to 10 or a polyisocyanate composition as defined in claim 12, as a one component adhesive or as a component in a two component adhesive, preferably wherein the adhesive is a hot melt adhesive or a laminating adhesive.

14. Adhesive comprising the prepolymer as defined in any of claims 1 to 10 or the polyisocyanate composition as defined in claim 12.

15. One component self leveling liquid membrane prepared from a prepolymer as defined in any one of claims 1 to 10, or from a polyisocyanate composition as defined in claim 12.

Patentansprüche

1. Isocyanat-haltiges Präpolymer, erhältlich durch Umsetzung mindestens eines Isocyanats mit mindestens einer ersten Verbindung und mindestens einer zweiten Verbindung, die sich von der mindestens ersten Verbindung unterscheidet, wobei beide Verbindungen unabhängig voneinander aus der einwertige Alkohole, Thiole und sekundäre Aminen umfassenden Gruppe ausgewählt sind und wobei das mindestens eine Isocyanat polymeres Methylendiisocyanat umfasst.

2. Präpolymer nach Anspruch 1, wobei die mindestens eine zweite Verbindung ein niedrigeres gewichtsgemitteltes Molekulargewicht als die mindestens eine erste Verbindung aufweist.

3. Präpolymer nach Anspruch 1 oder 2, wobei die erste Verbindung ein einwertiger Alkohol ist, der aus der einwertige Polyester, einwertiges C₁-C₂₀-Hydroxyalkyl und einwertiges Heterocyclyl umfassenden Gruppe ausgewählt ist.

4. Präpolymer nach irgendeinem der Ansprüche 1 bis 3, wobei die zweite Verbindung ein einwertiger Alkohol ist, der aus der einwertige Polyester, einwertiges C₁-C₂₀-Hydroxyalkyl und einwertiges Heterocyclyl umfassenden Gruppe ausgewählt ist.

5. Präpolymer nach irgendeinem der Ansprüche 1 bis 4, wobei die zweite Verbindung mindestens eine tertiäre Amingruppe umfasst.

6. Präpolymer nach irgendeinem der Ansprüche 1 bis 5, wobei das Verhältnis des NCO-Wertes des Isocyanat-haltigen Präpolymers zu dem gewichtsgemittelten OH-, SH- oder NH-Wert der ersten und zweiten Verbindungen zwischen 0,0005 und 1,0000 liegt.

7. Präpolymer nach irgendeinem der Ansprüche 1 bis 6, wobei die erste Verbindung in einer Gesamtmenge von mindestens 40,0 Gewichts-%, bezogen auf das Gesamtgewicht des Isocyanat-haltigen Präpolymers, vorliegt.
8. Präpolymer nach irgendeinem der Ansprüche 1 bis 7, wobei die zweite Verbindung in einer Gesamtmenge von mindestens 0,001 Gewichts-%, bezogen auf das Gesamtgewicht des Isocyanat-haltigen Präpolymers, vorliegt.
9. Präpolymer nach irgendeinem der Ansprüche 1 bis 8, wobei die Viskosität des Präpolymers zwischen 1000 und 200 000 mPa.s liegt, wobei die Viskosität bei 25°C unter Verwendung eines Brookfield-Viskosimeters gemäß ASTM D 4889-Standard ohne Zugabe jeglichen Weichmachers zu dem Präpolymer gemessen wird.
10. Präpolymer nach irgendeinem der Ansprüche 1 bis 9, wobei das Präpolymer einen Gehalt an freiem Isocyanatmonomer von höchstens 1,0 Gew.-%, gemessen durch quantitative HPLC GC-Analyse, aufweist.
11. Verfahren zur Herstellung eines Isocyanat-haltigen Präpolymers, wie in irgendeinem der Ansprüche 1 bis 10 definiert, umfassend die Schritte:

- (a) Umsetzen mindestens eines Isocyanats mit mindestens einer ersten Verbindung, die aus der aus einwertige Alkohole, Thiole und sekundäre Amine umfassenden Gruppe ausgewählt ist, und
- (b) Umsetzen des mindestens einen Isocyanats und/oder des Produkts von Schritt (a) mit mindestens einer zweiten Verbindung, die aus der einwertige Alkohole, Thiole und sekundäre Amine umfassenden Gruppe ausgewählt ist, wobei sich die zweite Verbindung von der ersten Verbindung unterscheidet,

wodurch ein Isocyanat-haltiges Präpolymer hergestellt wird.

12. Polyisocyanatzusammensetzung, umfassend das Präpolymer, wie in irgendeinem der Ansprüche 1 bis 10 definiert.
13. Verwendung des Präpolymers, wie in irgendeinem der Ansprüche 1 bis 10 definiert, oder einer Polyisocyanatzusammensetzung, wie im Anspruch 12 definiert, als ein Einkomponentenklebstoff oder als Bestandteil in einem Zweikomponentenklebstoff, vorzugsweise wenn der Klebstoff ein Heißschmelzklebstoff oder ein Kaschierklebstoff ist.
14. Klebstoff, umfassend das Präpolymer, wie in irgendeinem der Ansprüche 1 bis 10 definiert, oder die Polyisocyanatzusammensetzung, wie im Anspruch 12 definiert.
15. Selbstnivellierende Einkomponenten-Flüssigmembran, hergestellt mit einem Präpolymer, wie in irgendeinem der Ansprüche 1 bis 10 definiert, oder mit einer Polyisocyanatzusammensetzung, wie im Anspruch 12 definiert.

Revendications

1. Prépolymère à base d'isocyanate pouvant être obtenu en faisant réagir au moins un isocyanate avec au moins un premier composé et avec au moins un second composé différent dudit au moins un premier composé, les deux composés étant choisis chacun indépendamment dans le groupe comprenant des alcools monohydroxyliques, des thiols et des amines secondaires ; et dans lequel ledit au moins un isocyanate comprend le méthylène-diphényldiisocyanate polymère.
2. Prépolymère suivant la revendication 1, dans lequel ledit au moins second composé a une moyenne en poids du poids moléculaire inférieure à celle dudit un premier composé.
3. Prépolymère suivant la revendication 1 ou 2, dans lequel ledit premier composé est un alcool monohydroxylique choisi dans le groupe comprenant des polyesters mono-hydroxyliques, des alcools monohydroxyliques hydroxyalkyliques en C₁ à C₂₀ et des alcools monohydroxyliques hétérocycliques.
4. Prépolymère suivant l'une quelconque des revendications 1 à 3, dans lequel ledit second composé est un alcool monohydroxylique choisi dans le groupe comprenant des polyesters monohydroxyliques, des alcools monohydroxyliques hydroxyalkyliques en C₁ à C₂₀ et des alcools monohydroxyliques hétérocycliques.
5. Prépolymère suivant l'une quelconque des revendications 1 à 4, dans lequel ledit second composé comprend au

moins un groupe amine tertiaire.

6. Prépolymère suivant l'une quelconque des revendications 1 à 5, dans lequel le rapport de l'indice de NCO du prépolymère à base d'isocyanate à la moyenne pondérée de l'indice de OH, SH ou NH, desdits premier et second composés va de 0,0005 à 1,0000.

7. Prépolymère suivant l'une quelconque des revendications 1 à 6, dans lequel ledit premier composé est présent en une quantité totale d'au moins 40,0 % en poids sur la base du poids total du prépolymère à base d'isocyanate.

8. Prépolymère suivant l'une quelconque des revendications 1 à 7, dans lequel ledit second composé est présent en une quantité totale d'au moins 0,001 % en poids sur la base du poids total du prépolymère à base d'isocyanate.

9. Prépolymère suivant l'une quelconque des revendications 1 à 8, la viscosité du prépolymère allant de 1000 à 200 000 mPa.s, la viscosité étant mesurée à 25°C au moyen d'un viscosimètre Brookfield suivant la norme ASTM D 4889 sans aucun plastifiant ajouté au prépolymère.

10. Prépolymère suivant l'une quelconque des revendications 1 à 9, le prépolymère ayant une teneur en monomères isocyanates libres d'au plus 1,0 % en poids, telle que mesurée par analyse par CLHP-CG quantitative.

11. Procédé pour préparer un prépolymère à base d'isocyanate tel que défini dans l'une quelconque des revendications 1 à 10, comprenant les étapes de :

a) réaction d'au moins un isocyanate avec au moins un premier composé choisi dans le groupe comprenant des alcools monohydroxyliques, des thiols et des amines secondaires ; et

b) réaction dudit au moins un isocyanate et/ou du produit de l'étape (a) avec au moins un second composé choisi dans le groupe comprenant des alcools monohydroxyliques, des thiols et des amines secondaires, ledit second composé étant différent dudit premier composé ;

ce qui permet de préparer un prépolymère à base d'isocyanate.

12. Composition de polyisocyanate comprenant le prépolymère tel que défini dans l'une quelconque des revendications 1 à 10.

13. Utilisation du prépolymère tel que défini dans l'une quelconque des revendications 1 à 10 ou d'une composition de polyisocyanate telle que définie dans la revendication 12, comme adhésif à un constituant ou comme constituant dans un adhésif à deux constituants, l'adhésif étant de préférence un adhésif thermofusible ou un adhésif de stratification.

14. Adhésif comprenant le prépolymère tel que défini dans l'une quelconque des revendications 1 à 10 ou la composition de polyisocyanate telle que définie dans la revendication 12.

15. Membrane liquide à auto-nivellement à un constituant préparée à partir d'un prépolymère tel que défini dans l'une quelconque des revendications 1 à 10 ou à partir d'une composition de polyisocyanate telle que définie dans la revendication 12.
