JOHN HILTS, OF DETROIT, MICHIGAN.

Letters Patent No. 89,045, dated April 20, 1869.

IMPROVED TABLE-LEAF SUPPORT.

The Schedule referred to in these Letters Patent and making part of the same.

To whom it may concern:

Be it known that I, JOHN HILTS, of Detroit, in the county of Wayne, and State of Michigan, have invented a new and useful Improvement in Table-Leaf Support; and I do declare that the following is a true and accurate description thereof, reference being had to the accompanying drawings, and to the letters of reference marked thereon, and being a part of this specification.

This invention relates to a support for the fly or folding-leaf of tables, and consists of a circular bar, hinged or otherwise, secured to a proper plate or to the under side of the leaf, and passing through a loop secured to the table frame. A latch, hinged upon the said frame, secures into a notch in the circular bar.

A is the leaf hinged to the table B in any ordinary manner.

C is a circular bar, hinged to the plate K, which is properly secured to the under side of the leaf A, and

passing through the loop D secured to the bottom of the table-frame E.

A latch, F, pivoted at I to frame E, clamps the circular bar by fitting into a notch, L, when the bar is extended to support the leaf.

The stop G, which may be pivoted or bolted to the frame E at J, serves to prevent the latch from being thrown too far round when it is desired to release the bar.

What I claim as my invention, and desire to secure by Letters Patent, is—

The circular-bar C, hinged or otherwise secured to the plate K, or to the under side of the leaf of a table, as herein set forth, in combination with the loop D and latch F, substantially in the manner and for the purposes herein set forth and described.
