POLYMERIC DRUG CONJUGATES WITH TETHER GROUPS FOR CONTROLLED DRUG DELIVERY

BACKGROUND OF THE INVENTION

[0002] Drug delivery of some small molecule therapeutic agents has been problematic due to their poor pharmacological profiles. These therapeutic agents often have low aqueous solubility, their bioactive forms exist in equilibrium with an inactive form, or high systemic concentrations of the agents lead to toxic side-effects. Some approaches to circumvent the problem of their delivery have been to conjugate the agent directly to a water-soluble polymer such as hydroxypropyl methacrylate (HPMA), polyethylene glycol, and poly-L-glutamic acid. In some cases, such conjugates have been successful in solubilizing or stabilizing the bioactive form of the therapeutic agent, or achieving a sustained release formulation which circumvents complications associated with high systemic concentrations of the agent.

[0003] Another approach to the drug delivery problem has been to form host/guest inclusion complexes between the therapeutic agent and cyclodextrins or derivatives thereof. Cyclodextrins (α, β, γ) and their oxidized forms have unique physico-chemical properties such as good water solubility, low toxicity and low immune response. To date, most of the drug delivery studies with cyclodextrins have focused on their ability to form supra-molecular complexes, wherein cyclodextrins form host/guest inclusion complexes with therapeutic molecules and thus alter the physical, chemical, and/or biological properties of these guest molecules.

SUMMARY OF THE INVENTION

[0005] The present invention relates to novel compositions of polymer conjugates, defined as polymeric materials covalently coupled to therapeutic agents as carriers for therapeutics delivery. In one aspect, the present invention provides water-soluble, biocompatible polymer conjugates comprising a water-soluble, biocompatible polymer covalently attached to therapeutic agents through attachments that are cleaved under biological conditions to release the therapeutic agent.

[0006] One aspect of the invention relates to a polymer conjugate, comprising a therapeutic agent covalently attached to a polymer through a tether, wherein the tether comprises a self-cyclizing moiety. In some embodiments, the tether further comprises a selectivity-determining moiety. In certain embodiments, the tether comprises a self-cyclizing moiety. In certain embodiments, the tether further comprises a selectivity-determining moiety, e.g., covalently attached to the self-cyclizing moiety, such as in series.

[0008] In certain embodiments as disclosed herein, the selectivity-determining moiety is bonded to the self-cyclizing moiety between the self-cyclizing moiety and the polymer. In certain embodiments as disclosed herein, the selectivity-determining moiety promotes selectivity in the cleavage of the bond between the selectivity-determining moiety and the self-cyclizing moiety, e.g., under acidic conditions or under basic conditions. In certain embodiments as disclosed herein, the bond between the selectivity-determining moiety and the self-cyclizing moiety is selected from amide, carbamate, carbonate, ester, thioester, urea, and disulfide bonds.

[0009] In certain embodiments as disclosed herein, the self-cyclizing moiety is selected such that upon cleavage of the bond between the selectivity-determining moiety and the self-cyclizing moiety, cyclization of the self-cyclizing moiety occurs, thereby releasing the therapeutic agent.

[0010] In certain embodiments as disclosed herein, cyclization of the self-cyclizing moiety forms a five- or six-membered ring. In certain embodiments as disclosed herein, the five- or six-membered ring is a heterocycle that comprises at least one heteroatom selected from nitrogen, oxygen, and sulfur. In certain embodiments as disclosed herein, the heterocycle is an imidazolidinone.

[0011] In certain embodiments as disclosed herein, the selectivity-determining moiety promotes enzymatic cleavage (i.e., by cathepsin or cathepsin B) of the bond between the selectivity-determining moiety and the self-cyclizing moiety. In certain embodiments as disclosed herein, the selectivity-determining moiety comprises a peptide (e.g., a dipeptide, tripeptide or tetrapeptide). In certain embodiments as disclosed herein, the peptide comprises a sequence selected from GFYA, GFILG, GFA, GLA, AVA, GVA, GLA, GV1, GV2, GFV, AVF, KF, and FK.

[0012] In certain embodiments as disclosed herein, the selectivity-determining moiety comprises an aminokylcarbonyloxyalkyloxyalkyl moiety. In certain embodiments as disclosed herein, the selectivity-determining moiety comprises cis-aconityl.

[0013] In certain embodiments as disclosed herein, the self-cyclizing moiety has a structure

\[ \text{[0014]} \]

wherein

- [0015] U is selected from NR1 and S;
- [0016] X is selected from O, NR2, and S;
- [0017] V is selected from O, S, and NR4;
- [0018] R2 and R4 are independently selected from hydrogen, alkyl, and alkoxy; or R2 and R4 together with the carbon atoms to which they are attached form a ring; and
- [0019] R1, R4, and R5 are independently selected from hydrogen and alkyl.
In certain embodiments as disclosed herein, U is NR and/or V is NR₄, and R and R₄ are independently selected from methyl, ethyl, propyl, and isopropyl. In certain embodiments as disclosed herein, both R¹ and R⁴ are methyl. In certain embodiments as disclosed herein, both R² and R³ are hydrogen. In certain embodiments as disclosed herein, R² and R³ together are —(CH₂)ₙ— wherein n is 3 or 4.

In certain embodiments as disclosed herein, the self-cyclizing moiety is selected from vino ma.

In certain embodiments as disclosed herein accord ing to Formula B, J comprises an aryl ring, such as a benzo ring. In certain such embodiments as disclosed herein, W and S are in a 1,2-relationship on the aryl ring. In certain embodiments as disclosed herein, the aryl ring is optionally substituted with alkyl, alkenyl, alk oxy, aralkyl, aryloxy, halogen, —CN, azido, —NR'R'', —COOR'', —C(O)—NR'R'', —C(O)—R'', —NR—C(O)—R', —NR—SO₂R', —SR', —S(O)R', —SO₂R', —SO₂NR'R'', —(C(R')₃)n—OR', —(C(R')₃)n—NR'R'', and —(C(R')₃)n—SO₂R'; wherein R' is, independently for each occurrence, H or lower alkyl; and n is, independently for each occurrence, an integer from 0 to 2.

In certain embodiments as disclosed herein accord ing to Formula A or B, J, independently and for each occurrence, is polyethylene glycol, polyethylene, polyester, alkenyl, or alkyl.

In certain embodiments as disclosed herein accord ing to Formula A or B, J, independently and for each occurrence, represents a hydrocarbonyl group comprising one or more methylene groups, wherein one or more methylene groups is optionally replaced by a group Y (provided that none of the Y groups are adjacent to each other), wherein each Y, independently for each occurrence, is selected from, substituted or unsubstituted aryl, heteroaryl, cycloalkyl, heterocycloalkyl, or —O—C(==X) (wherein X is NR₃, O or S), —OC(O)—, —C(==O)—, —NR, CO—, —C(O)NR₃—, —S(O)— (wherein n is 1, 2), —OC(O)—NR₃—, —NR₃—C(O)—NR₃—, —NR₃—C(NR₃)—, and —B(OR₃)—; and R₃, independently for each occurrence, represents H or a lower alkyl.

In certain embodiments as disclosed herein accord ing to Formula A or B, J, independently and for each occurrence, is substituted or unsubstituted lower alkylene (e.g., unsubstituted ethylene).

In certain embodiments as disclosed herein accord ing to Formula A, the selectivity-determining moiety is

[Diagram A]

wherein

S a sulfur atom that is part of a disulfide bond;
J is optionally substituted hydrocarbonyl; and
Q is O or NR₁³, wherein R₁³ is hydrogen or alkyl.

In certain embodiments as disclosed herein, the selectivity-determining moiety is represented by Formula B:

[Diagram B]

wherein

W is selected from NR₁⁴, S, and O;
J, independently and for each occurrence, is hydrocarbonyl or polyethylene glycol;
S is sulfur;
Q is O or NR₁³, wherein R₁³ is hydrogen or alkyl; and
R₁⁴ is selected from hydrogen and alkyl.

In certain embodiments as disclosed herein accord ing to Formula B, the selectivity-determining moiety is selected from

[Diagram C]

wherein

U is bonded to the self-cyclizing moiety.

In certain embodiments as disclosed herein, the selectivity-determining moiety is represented by Formula A:

(A)

In certain embodiments as disclosed herein, the self-cyclizing moiety is selected from

[Diagram D]
[0042] wherein Ar is a substituted or unsubstituted benzo ring;
[0043] J is optionally substituted hydrocarbyl (e.g., as defined anywhere above); and
[0044] Q is O or NR$_{13}^{\text{3}}$, wherein R$_{13}^{\text{3}}$ is hydrogen or alkyl.
[0045] In certain embodiments as disclosed herein Ar is unsubstituted. In certain embodiments as disclosed herein, Ar is a 1,2-benzo ring. In certain such embodiments, the selectivity determining moiety is

![Chemical Structure](image)

[0046] In certain embodiments as disclosed herein, the polymer comprises a plurality of cyclic moieties selected from cyclodextrins, crown ethers, cyclic oligopeptides, cryptands or cryptates, calixarenes, cavatins, or any combination thereof.

[0047] In certain embodiments, the polymer conjugate has a structure of Formula I:

![Chemical Structure](image)

\[ P \]

[0048] wherein P is a monomer moiety;
[0049] A, independently for each occurrence, is a selectivity-determining moiety or a direct bond;
[0050] B, independently for each occurrence, is a self-cyclizing moiety;
[0051] L$_1$, L$_2$, L$_3$ and L$_4$, independently for each occurrence, are a linker group;
[0052] D and D’ are independently a therapeutic agent or prodrug thereof;
[0053] T and T’ are independently a targeting ligand or precursor thereof;
[0054] y and y’ are independently an integer from 1 to 10;
[0055] x, x’, z, and z’ are independently an integer from 0 to 10; and
[0056] h is an integer from 2 to 30,000 (for example, from 2, 3, 4, 5, or 8 to about 25, 50, 100, 500, 1,000, 5,000, 10,000, 15,000, 20,000, or 25,000; or, for example, from 2, 3, or 4 to 5 or 10); wherein at least one occurrence of either x or x’ is an integer greater than 0.

[0057] In certain embodiments, A is a selectivity-determining moiety.

[0058] In certain embodiments, L$_1$, L$_2$, L$_3$ and L$_4$ are independently selected from an alkyl chain, a polyethylene glycol (PEG) chain, polylysine anhydride, poly-L-glutamic acid, poly(ethyleneimine), an oligosaccharide, and an amino acid chain.

[0059] In certain embodiments, any of L$_1$, L$_2$, L$_3$ and L$_4$ are independently an alkyl chain wherein one or more methylene groups is optionally replaced by a group Y (provided that none of the Y groups are adjacent to each other), wherein each Y, independently for each occurrence, is selected from aryl, heteroaryl, carbocyclic, heterocyclic, or —O—, C(=X) (wherein X is NR$_{13}^{\text{3}}$, O or S), —OC(O)—, —C(=O)O—, —NR$_{13}^{\text{3}}$—, —NR$_{13}^{\text{3}}$CO—, —CO(NR$_{13}^{\text{3}}$)NR$_{13}^{\text{3}}$—, —S(O)$_{13}^{\text{3}}$— (wherein n is 0, 1, or 2), —OC(O)—NR$_{13}^{\text{3}}$—C(O)—NR$_{13}^{\text{3}}$—C(NR$_{13}^{\text{3}}$)NR$_{13}^{\text{3}}$—, and —B(OR$_{13}^{\text{3}}$)$_{13}^{\text{3}}$—; and R$_{13}^{\text{3}}$, independently for each occurrence, is H or lower alkyl.

[0060] In certain embodiments, A is selected such that the selectivity-determining moiety promotes selectivity in the cleavage of the bond between the selectivity-determining moiety and the self-cyclizing moiety.

[0061] In certain embodiments, B is capable of self-cyclizing to release the therapeutic agent once the bond between A and B has been cleaved.

[0062] In one aspect, the invention provides for a compound represented by Formula C:

![Chemical Structure](image)

\[ (\text{CD})_{\text{n}} \]

[0063] wherein
[0064] P represents a polymer chain;
[0065] CD represents a cyclic moiety;
[0066] L$_1$, L$_2$ and L$_3$, independently for each occurrence, may be absent or represent a linker group,
provided that a plurality of occurrences of L2 represent linkers that are cleavable under biological conditions;  

[0067] D, independently for each occurrence, is selected from etoposide, tubulysin, epothilone, or an analog or derivative thereof;  

[0068] T, independently for each occurrence, represents a targeting ligand or precursor thereof;  

[0069] a, m and v, independently for each occurrence, represent integers in the range of 1 to 10;  

[0070] n and w, independently for each occurrence, represent an integer in the range of 0 to about 30,000; and  

[0071] b represents an integer in the range of 1 to about 30,000; and  

[0072] either P comprises cyclodextrin moieties in the polymer chain or n is at least 1.  

[0073] In certain embodiments, the compound is represented by Formula C':

\[
\begin{align*}
\text{CD} & \quad \text{L}_4 \quad \text{D}_g \quad \text{T}_y \\
\text{L}_s & \quad \text{L}_2 \quad \text{L}_6 \quad \text{L}_m
\end{align*}
\]

[0074] wherein  

[0075] CD represents a cyclodextrin moiety, or derivative thereof;  

[0076] L4, L2, L6, and Lm, independently for each occurrence, may be absent or represent a linker group;  

[0077] D and D', independently for each occurrence, is selected from etoposide, tubulysin, epothilone, or an analog or derivative thereof;  

[0078] T and T', independently for each occurrence, represents the same or different targeting ligand or precursor thereof;  

[0079] f and y, independently for each occurrence, represent an integer in the range of 1 and 10;  

[0080] g and z, independently for each occurrence, represent an integer in the range of 0 and 10; and  

[0081] h is an integer from 2 to 30,000 (for example, from 2, 3, 4, 5, or 8 to about 25, 50, 100, 500, 1,000, 5,000, 10,000, 15,000, 20,000, or 25,000; or, for example, from 2, 3, or 4 to 5 or 10).

[0082] In certain embodiments, the compound is represented by Formula D:

\[
\begin{align*}
\text{CD} & \quad \text{L}_4 \quad \text{D}_g \quad \text{T}_y \\
\text{L}_s & \quad \text{L}_2 \quad \text{L}_6 \quad \text{L}_m
\end{align*}
\]

[0083] wherein  

[0084] γ represents a monomer unit of a polymer that comprises cyclodextrin moieties;  

[0085] T, independently for each occurrence, represents a targeting ligand or precursor thereof;  

[0086] L6, L7, L8, L9, and L10, independently for each occurrence, may be absent or represent a linker group;  

[0087] CD, independently for each occurrence, represents a cyclodextrin moiety or a derivative thereof;  

[0088] D, independently for each occurrence, is selected from etoposide, tubulysin, epothilone, or an analog or derivative thereof;  

[0089] m, independently for each occurrence, represents an integer in the range of 1 to 10;  

[0090] α is an integer from 2 to 30,000 (for example, from 2, 3, 4, 5, or 8 to about 25, 50, 100, 500, 1,000, 5,000, 10,000, 15,000, 20,000, or 25,000; or, for example, from 2, 3, or 4 to 5 or 10); and  

[0091] p, n, and q, independently for each occurrence, represent an integer in the range of 0 to 10.  

[0092] wherein CD and D are each present at least once in the compound.

[0093] One aspect of the invention relates to a polymer covalently coupled to a therapeutic agent through a linker, wherein the linker comprises a phosphate group.  

[0094] One aspect of the invention relates to a polymer, such as any polymer as described above, covalently coupled to a therapeutic agent through a linker, wherein the therapeutic agent is selected from etoposide, tubulysin, epothilone, or an analog or derivative thereof.  

[0095] In certain embodiments as described above, the polymers employed may be biocompatible polymers.  

[0096] In certain embodiments as described above, the polymer comprises a plurality of cyclic moieties selected from cyclodextrins, crown ethers, cyclic oligopeptides, cryptands or cryptates, calixarenes, cavitates, and any combination thereof.  

[0097] In certain embodiments as described above, the therapeutic agent is a small molecule. In certain embodiments, the therapeutic agent contains an amino, hydroxyl, or thiol group. In certain embodiments, the therapeutic agent is attached to the self-cyclizing group through the amino, hydroxyl, or thiol group, preferably a hydroxyl group.
In one aspect, the invention provides for a method for delivering a therapeutic agent comprising administering to a patient in need thereof a therapeutically effective amount of one or more of the compounds of the invention. In certain such embodiments, the method is a method for treating cancer.

In one aspect, the invention relates to a compound represented by Formula C:

\[
\begin{align*}
&\text{CD,} \\
&\text{L}, \\
&\text{D}_{m}, \\
&\text{N}_{n}, \\
&\text{P} \text{ represents a polymer chain;} \\

\end{align*}
\]

In certain embodiments, for a plurality of occurrences, \text{L}_2 is a linker group comprising a phosphate group.

In certain embodiments, the compound is represented by Formula C'.
In certain embodiments, at least one linker that connects the therapeutic agent or prodrug thereof to the polymer comprises a group represented by the formula:

![Chemical Structure]

wherein

- **P** is phosphorus;
- **O** is oxygen;
- **E** represents oxygen or **NR**;
- **K** represents hydrocarbyl;
- **X** is selected from **OR**, **NHR**, **NR**, **R**, **R**, and **R** independently represent hydrogen or optionally substituted alkyl.

In certain embodiments, **E** is **NR** and **R** is hydrogen.

In certain embodiments, **K** is lower alkylene (e.g., ethylene).

In certain embodiments, at least one linker comprises a group selected from

![Chemical Structures]

wherein

- **CD** represents a cyclodextrin moiety, or derivatize thereof;
- **L** and **L** independently for each occurrence, may be absent or represent a linker group, wherein for one or more occurrences, **L** or **L** is a linker group that comprises a phosphate group;
- **L** and **L**, independently for each occurrence, may be absent or represent a linker group;
- **D** and **D** independently for each occurrence, represent the same or different therapeutic agent or prodrugs thereof;
- **T** and **T**, independently for each occurrence, represents the same or different targeting ligand or precursor thereof;
- **f** and **y**, independently for each occurrence, represent an integer in the range of 1 and 10;
- **g** and **z**, independently for each occurrence, represent an integer in the range of 0 and 10; and
- **h** is an integer from 2 to 30,000 (for example, from 2, 3, 4, 5, or 8 to about 25, 50, 100, 500, 1,000, 5,000, 10,000, 15,000, 20,000, or 25,000; or, for example, from 2, 3, or 4 to 5 or 10).

In certain embodiments, the compound represented by Formula D:

![Chemical Structure](D)

wherein

- **γ** represents a monomer unit of a polymer;
- **T**, independently for each occurrence, represents a targeting ligand or a precursor thereof;
- **L**, **L**, and **L** independently for each occurrence, may be absent or represent a linker group;
- **L**, independently for each occurrence, may be absent or represents a linker group, wherein for one or more occurrences, **L** is a linker group that comprises a phosphate group;
- **CD**, independently for each occurrence, represents a cyclodextrin moiety or a derivative thereof;
- **D**, independently for each occurrence, represents a therapeutic agent or a prodrug form thereof;
- **m**, independently for each occurrence, represents an integer in the range of 1 to 10;
- **o** is an integer from 2 to 30,000 (for example, from 2, 3, 4, 5, or 8 to about 25, 50, 100, 500, 1,000, 5,000, 10,000, 15,000, 20,000, or 25,000; or, for example, from 2, 3, or 4 to 5 or 10); and
- **p**, **n**, and **q**, independently for each occurrence, represent an integer in the range of 0 to 10.

wherein **CD** and **D** are each present at least once in the compound.
In certain embodiments as disclosed herein, the compound is biodegradable or bioerodible.

In certain embodiments as disclosed herein, the compound has a number average (M_n) molecular weight between 1,000 to 500,000 amu, or between 5,000 to 200,000 amu, or between 10,000 to 100,000 amu.

In one aspect as disclosed herein, the invention provides for a pharmaceutical preparation comprising a pharmaceutical excipient and a compound of the invention, or a pharmaceutically acceptable ester, salt, or hydrate thereof.

In certain embodiments as disclosed herein, the therapeutic agent is selected from anorexics, antiarthritics, antiasthmatic agents, antiinflammatory agents, anticoagulants, antidepressants; antihistamines, anti-inflammatory agents, antianxiety agents, antineoplastics, antipsychotics, antipsychotics, antiepileptics, antihypertensives, diuretics, vasodilators, central nervous system stimulants, cough and cold preparations, decongestants, diagnostics, hormones, bone growth stimulants and bone resorption inhibitors, immunosuppressives, muscle relaxants, psychoanalysants, sedatives, tranquillizers, anti-inflammatory agents, anti-epileptics, anesthetics, hypnotics, sedatives, neuroleptic agents, antidepressants, anxiolytics, anticonvulsant agents, neuron blocking agents, anticholinergic and cholinomimetic agents, antimycotic and mucocutaneous agents, antiadrenergics, antiarrhythmics, and antihypertensive agents.

In certain embodiments as disclosed herein, the therapeutic agent or prodrg thereof makes up at least 5% by weight of the compound. In certain embodiments, the therapeutic agent or prodrg thereof makes up at least 20% by weight of the compound.

In certain embodiments as disclosed herein, the compound is water soluble.

In certain embodiments, a plurality of the linker moieties are attached to therapeutic agents or prodrugs thereof and are cleaved under biological conditions.

In one aspect, the invention provides for a method for delivering a therapeutic agent comprising administering to a patient in need thereof a therapeutically effective amount of one or more of the compounds of the invention. In certain such embodiments, the method is a method for treating cancer.

**DETAILED DESCRIPTION OF THE INVENTION**

1. Compounds

The present invention provides water-soluble, biocompatible polymer conjugates comprising a water-soluble, biocompatible polymer covalently attached to therapeutic agents through attachments that are cleaved under biological conditions to release the therapeutic agent. In certain embodiments, a polymer conjugate comprises a therapeutic agent covalently attached to a polymer, preferably a biocompatible polymer, through a tether, e.g., a linker, wherein the tether comprises a selectivity-determining moiety and a self-cyclizing moiety which are covalently attached to one another in the tether, e.g., between the polymer and the therapeutic agent.

Polymeric conjugates of the present invention may be useful to improve solubility and/or stability of a therapeutic agent, reduce drug-drug interactions, reduce interactions with blood elements including plasma proteins, reduce or eliminate immunogenicity, protect the agent from metabolism, modulate drug-release kinetics, improve circulation time, improve drug half-life (e.g., in the serum, or in selected tissues, such as tumors), attenuate toxicity, improve efficacy, normalize drug metabolism across subjects of different species, ethnicities, and/or sexes, and/or provide for targeted delivery into specific cells or tissues. Poorly soluble and/or toxic compounds may benefit particularly from incorporation into polymeric compounds of the invention. In certain embodiments, the therapeutic agent is a small molecule, a macromolecule, an antibody, a peptide, a protein, an enzyme, a nucleic acid, or a polymer that has therapeutic function.

The polymer may be a polycation, polyanion, or non-ionic polymer. A polycationic or polyanionic polymer has at least one site that bears a positive or negative charge, respectively. In certain such embodiments, at least one of the linker moiety and the cyclic moiety comprises such a charged site, so that every occurrence of that moiety includes a charged site.

In certain embodiments, the polymer may be selected from polysaccharides, and other non-protein biocompatible polymers, and combinations thereof, that contain at least one terminal hydroxyl group, such as polyvinylpyrrolidone, poly(ethylene glycol) (PEG), poly(ethylene glycol) anhydride, poly(ethylene glycol) phosphate, polyglyutamate, polyethyleneimine, maleic anhydride divinyl ether (DIVMA), cellulose, pullulans, inulin, polyvinyl alcohol (PVA), N-(2-hydroxypropyl)methacrylamide (HPMA), dextran and hydroxyethyl starch (HES), and have optional pendant groups for grafting therapeutic agents, targeting ligands, and/or cyclodextrin moieties. In certain embodiments, the polymer may be biodegradable such as polylactic acid, polyglycolic acid, poly(lactic 2-cyanoacrylates), polyanhydrides, and polylactic esters, or bioerodible such as polyacrylate-glycolic acid copolymers, and derivatives thereof, non-peptide polyamino acids, polyvinylamines, poly alpha-amino acids, polyalkyl-cyano-acrylate, polyphosphazenes or acryloxyethyl-poly aspartate and polyglutamate copolymers and mixtures thereof.

In certain such embodiments, the polymer comprises cyclic moieties alternating with linker moieties that connect the cyclic structures, e.g., into linear or branched polymers, preferably linear polymers. The cyclic moieties may be any suitable cyclic structures, such as cyclodextrins, crown ethers (e.g., 18-crown-6, 15-crown-5, 12-crown-4,
cyclic oligopeptides (e.g., comprising from 5 to 10 amino acid residues), cryptands or cryptates (e.g., cryptand [2.2.2], cryptand-2.1.1, and complexes thereof), calixarenes, or cavitands, or any combination thereof. Preferably, the cyclic structure is (or is modified to be) water-soluble. In certain embodiments, e.g., for the preparation of a linear polymer, the cyclic structure is selected such that under polymerization conditions, exactly two moieties of each cyclic structure are reactive with the linker moieties, such that the resulting polymer comprises (or consists essentially of) an alternating series of cyclic moieties and linker moieties, such as at least four of each type of moiety. Suitable difunctionalized cyclic moieties include many that are commercially available and/or amenable to preparation using published protocols. In certain embodiments, conjugates are soluble in water to a concentration of at least 0.1 g/mL, preferably at least 0.25 g/mL.

Thus, in certain embodiments, the invention relates to novel compositions of therapeutic cycloexodextrin-containing polymeric compounds designed for drug delivery of therapeutic agents. In certain embodiments, these cycloexodextrin-containing polymers improve drug stability and/or solubility, and/or reduce toxicity, and/or improve efficacy of the small molecule therapeutic when used in vivo. Furthermore, by selecting from a variety of linker groups, and/or targeting ligands, the rate of drug release from the polymers can be attenuated for controlled delivery.

The present invention includes polymer conjugates, such as cycloexodextrin-containing polymer conjugates, wherein one or more therapeutic agents are covalently attached. The polymers include linear or branched cycloexodextrin-containing polymers and polymers grafted with cycloexodextrin. Exemplary cycloexodextrin-containing polymers that may be modified as described herein are taught in U.S. Pat. Nos. 6,509,323 and 6,884,789, and U.S. Published Patent Application Nos. 2004-0109888, and 2004-0087024, which are incorporated herein in their entirety. These polymers are useful as carriers for small molecule therapeutic delivery, and may improve drug stability and solubility when used in vivo.

In certain embodiments, the underlying polymers are linear cycloexodextrin-containing polymers, e.g., the polymer backbone includes cycloexodextrin moieties. For example, the polymer may be a water-soluble, linear cycloexodextrin polymer produced by providing at least one cycloexodextrin derivative modified to bear one reactive site at each of exactly two positions, and reacting the cycloexodextrin derivative with a linker having exactly two reactive moieties capable of forming a covalent bond with the reactive sites under polymerization conditions that promote reaction of the reactive sites with the reactive moieties to form covalent bonds between the linker and the cycloexodextrin derivative, whereby a linear polymer comprising alternating units of cycloexodextrin derivatives and linkers is produced. Alternatively, the polymer may be a water-soluble, linear cycloexodextrin polymer having a linear polymer backbone, which polymer comprises a plurality of substituted or unsubstituted cycloexodextrin moieties and linker moieties in the linear polymer backbone, wherein each of the cycloexodextrin moieties, other than a cycloexodextrin moiety at the terminus of a polymer chain, is attached to two of said linker moieties, each linker moiety covalently linking two cycloexodextrin moieties. In yet another embodiment, the polymer is a water-soluble, linear cycloexodextrin polymer comprising a plurality of cycloexodextrin moieties covalently linked together by a plurality of linker moieties, wherein each cycloexodextrin moiety, other than a cycloexodextrin moiety at the terminus of a polymer chain, is attached to two linker moieties to form a linear cycloexodextrin polymer.

Cycloexodextrins are cyclic polysaccharides containing naturally occurring D-(+)-glucopyranose units in an α-(1,4) linkage. The most common cycloexodextrins are alpha (α)-cycloexodextrins, beta (β)-cycloexodextrins and gamma (γ)-cycloexodextrins which contain six, seven, or eight glucopyranose units, respectively. Structurally, the cyclic nature of a cycloexodextrin forms a torus or donut-like shape having an inner apolar or hydrophobic cavity, the secondary hydroxyl groups situated on one side of the cycloexodextrin torus and the primary hydroxyl groups situated on the other. Thus, using (β)-cycloexodextrin as an example, a cycloexodextrin is often represented schematically as follows.
In certain embodiments where the selectivity-determining moiety is selected such that the bond is cleaved enzymatically, it may be selected such that a particular enzyme or class of enzymes cleaves the bond. In certain preferred such embodiments, the selectivity-determining moiety may be selected such that the bond is cleaved by a cathepsin, preferably cathepsin B.

In certain embodiments the selectivity-determining moiety comprises a peptide, preferably a dipeptide, tripeptide, or tetrapeptide. In certain such embodiments, the peptide is a dipeptide is selected from KF and FK. In certain embodiments, the peptide is a tripeptide is selected from GFA, GLA, AVA, GVA, GLA, GVL, GVE, and AVF. In certain embodiments, the peptide is a tetrapeptide selected from GFIYA and GFLG, preferably GFLG.

In certain such embodiments, a peptide, such as GFLG, is selected such that the bond between the selectivity-determining moiety and the self-cyclizing moiety is cleaved by a cathepsin, preferably cathepsin B.

In certain embodiments, the selectivity-determining moiety is represented by Formula A:

\[
\text{Formula A:} \quad \begin{array}{c}
\text{S} \\
\text{J} \\
\text{Q}
\end{array}
\]

wherein

- S is a sulfur atom that is part of a disulfide bond;
- J is optionally substituted hydroxyl; and
- Q is O or NR^3, wherein R^3 is hydrogen or alkyl.

In certain embodiments, J may be polyethylene glycol, polyethylene, polyester, alkene, or alkyl. In certain embodiments, J may represent a hydroxyethylene group comprising one or more methylene groups, wherein one or more methylene groups is optionally replaced by a group Y (provided that none of the Y groups are adjacent to each other), wherein each Y, independently for each occurrence, is selected from, substituted or unsubstituted aryl, heteroaryl, cycloalkyl, heterocycloalkyl, or \(-O--\), \(-C(=X)\) (wherein X is NR^{30}, O or S), \(-\text{OC(O)}--\), \(-\text{C(=O)}O--\), \(-\text{NR}^{30}--\), \(-\text{NR}_{n}\text{CO}--\), \(-\text{C(O)NR}^{30}--\), \(-\text{SR}^{30}--\) (wherein n is 0, 1, or 2), \(-\text{OC(O)NR}^{30}--\), \(-\text{NR}^{30}--\text{C(O)}--\), \(-\text{NR}^{30}--\text{C}--\text{NR}^{30}--\), and \(-\text{B(OR}^{30})--\); and R^{30}, independently for each occurrence, represents H or a lower alkyl. In certain embodiments, J may be substituted or unsubstituted lower alkylene, such as ethylene. For example, the selectivity-determining moiety may be...
In certain embodiments, the selectivity-determining moiety is represented by Formula B:

\[
\begin{align*}
\text{O} & \quad \text{S} \\
\text{W} & \quad \text{J} \\
\text{R}^1 & \quad \text{R}^2
\end{align*}
\]

wherein

- W is either a direct bond or selected from lower alkyl, NR\(^1\), S, O;
- J is independently and for each occurrence, is hydrocarbyl or polyethylene glycol;
- Q is O or NR\(^{13}\), wherein R\(^{13}\) is hydrogen or alkyl; and
- R\(^{14}\) is selected from hydrogen and alkyl.

In certain such embodiments, J may be substituted or unsubstituted lower alkyl, such as methylene. In certain such embodiments, J may be an aryl ring. In certain embodiments, the aryl ring is a benzo ring. In certain embodiments W and S are in a 1,2-relationship on the aryl ring. In certain embodiments, the aryl ring may be optionally substituted with alkyl, alkenyl, alloxy, aralkyl, aryl, heteroaroyl, halogen, CN, azido, NR\(^{14}\), CO\(_2\)R\(^{15}\), C(O)NR\(^{15}\), CR\(^{15}\), NR\(^{15}\)SO\(_2\)R\(^{15}\), -SO\(_2\)R\(^{15}\), S(O)R\(^{15}\), SO\(_2\)R\(^{15}\), SO\(_3\)R\(^{15}\), OR\(^{15}\), CR\(^{15}\)NR\(^{15}\), -NR\(^{15}\), and -(C(O)R\(^{15}\))\(_n\)SO\(_2\)R\(^{15}\), wherein R\(^{15}\) is, independently for each occurrence, H or lower alkyl; and n is, independently for each occurrence, an integer from 0 to 2.

In certain embodiments, the aryl ring is optionally substituted with alkyl, alkenyl, alloxy, aralkyl, aryl, heteroaroyl, halogen, CN, azido, NR\(^{14}\), CO\(_2\)R\(^{15}\), C(O)NR\(^{15}\), CR\(^{15}\), NR\(^{15}\)SO\(_2\)R\(^{15}\), -SO\(_2\)R\(^{15}\), S(O)R\(^{15}\), SO\(_2\)R\(^{15}\), SO\(_3\)R\(^{15}\), OR\(^{15}\), CR\(^{15}\)NR\(^{15}\), -NR\(^{15}\), and -(C(O)R\(^{15}\))\(_n\)SO\(_2\)R\(^{15}\), wherein R\(^{15}\) is, independently for each occurrence, H or lower alkyl; and n is, independently for each occurrence, an integer from 0 to 2.

In certain embodiments, J, independently and for each occurrence, is polyethylene glycol, polyethylene, polyester, alkenyl, or alkyl.

In certain embodiments, independently and for each occurrence, represents a hydrocarbyl group comprising one or more methylene groups, wherein one or more methylene groups is optionally replaced by a group Y (provided that none of the Y groups are adjacent to each other), wherein each Y, independently for each occurrence, is selected from, substituted or unsubstituted aryl, heteroaroyl, cycloalkyl, heterocycloalkyl, or -O-, C(=X) (wherein X is NR\(^{30}\), O or S), -OC(O)-, -C(=O)O, -NR\(^{30}\), -NR\(^{30}\)CO-, -C(O)NR\(^{30}\), S(O)\(^n\) (wherein n is 0, 1, or 2), -OC(O)NR\(^{30}\), -NR\(^{30}\)-C(O)-NR\(^{30}\), -NR\(^{30}\)-C(=O)NR\(^{30}\), -NR\(^{30}\)-C(NR\(^{30}\))-NR\(^{30}\), and -B(O)-; and R\(^{30}\), independently for each occurrence, represents H or a lower alkyl.

In certain embodiments, J, independently and for each occurrence, is substituted or unsubstituted lower alkylene.

In certain embodiments, J, independently and for each occurrence, is substituted or unsubstituted ethylene.

The selectivity-determining moiety may include groups with bonds that are cleavable under certain conditions, such as disulfide groups. In certain embodiments, the selectivity-determining moiety comprises a disulfide-containing moiety, for example, comprising aryl and/or alkyl group(s) bonded to a disulfide group. In certain embodiments, the selectivity-determining moiety has a structure

\[
\text{O} \quad \text{R}^{20} \quad \text{Ar} \quad \text{S} \quad \text{I} \quad \text{S}
\]

wherein

- Ar is a substituted or unsubstituted benzo ring;
- J is optionally substituted hydrocarbyl; and
- Q is O or NR\(^{13}\), wherein R\(^{13}\) is hydrogen or alkyl.

In certain embodiments, Ar is unsubstituted. In certain embodiments, Ar is a 1,2-benzo ring. For example, suitable moieties within Formula B include

\[
\text{O} \quad \text{R}^{20} \quad \text{Ar} \quad \text{S} \quad \text{I} \quad \text{S}
\]

wherein

- Ar is a substituted or unsubstituted benzo ring;
- J is optionally substituted hydrocarbyl; and
- Q is O or NR\(^{13}\), wherein R\(^{13}\) is hydrogen or alkyl.

In certain embodiments, the self-cyclizing moiety is selected such that upon cleavage of the bond between the selectivity-determining moiety and the self-cyclizing moiety, cyclization occurs thereby releasing the therapeutic agent. Such a cleavage-cyclization-release cascade may occur sequentially in discrete steps or substantially simultaneously. Thus, in certain embodiments, there may be a temporal and/or spatial difference between the cleavage and the self-cyclization. The rate of the self-cyclization cascade may depend on pH, e.g., a basic pH may increase the rate of self-cyclization after cleavage. Self-cyclization may have a half-life after introduction in vivo of 24 hours, 18 hours, 14 hours, 10 hours, 6 hours, 3 hours, 2 hours, 1 hour, 30 minutes, 10 minutes, 5 minutes, or 1 minute.

In certain such embodiments, the self-cyclizing moiety may be selected such that, upon cyclization, a five-
or six-membered ring is formed, preferably a five-membered ring. In certain such embodiments, the five- or six-membered ring comprises at least one heteroatom selected from oxygen, nitrogen, or sulfur, preferably at least two, wherein the heteroatoms may be the same or different. In certain such embodiments, the heterocyclic ring contains at least one nitrogen, preferably two. In certain such embodiments, the self-cyclizing moiety cyclizes to form an imidazolidone.

In certain embodiments, the self-cyclizing moiety has a structure

![Structure](image)

wherein

- $U$ is selected from NR$_1$ and S;
- $X$ is selected from O, NR$_2$, and S, preferably 0 or S;
- $V$ is selected from O, S and NR$_4$, preferably 0 or NR$_4$;
- $R^2$ and $R^3$ are independently selected from hydrogen, alkyl, and alkoxy; or $R^2$ and $R^3$ together with the carbon atoms to which they are attached form a ring; and
- $R^1$, $R^4$, and $R^5$ are independently selected from hydrogen and alkyl.

In certain embodiments, $U$ is NR$_1$ and/or $V$ is NR$_4$, and $R^1$ and $R^4$ are independently selected from methyl, ethyl, propyl, and isopropyl. In certain embodiments, both $R^1$ and $R^2$ are methyl. On certain embodiments, both $R^2$ and $R^3$ are hydrogen. In certain embodiments $R^2$ and $R^3$ are independently alkyl, preferably lower alkyl. In certain embodiments, $R^2$ and $R^3$ together are $-(CH_2)_n-$ wherein $n$ is 3 or 4, thereby forming a cyclopentyl or cyclohexyl ring. In certain embodiments, the nature of $R^2$ and $R^3$ may affect the rate of cyclization of the self-cyclizing moiety. In certain such embodiments, it would be expected that the rate of cyclization would be greater when $R^2$ and $R^3$ together with the carbon atoms to which they are attached form a ring than the rate when $R^2$ and $R^3$ are independently selected from hydrogen, alkyl, and alkoxy. In certain embodiments, $U$ is bonded to the self-cyclizing moiety.

In certain embodiments, the self-cyclizing moiety is selected from

![Structures](image)

In certain embodiments, the selectivity-determining moiety may connect to the self-cyclizing moiety through carbonyl-heteroatom bonds, e.g., amide, carbamate, carbonate, ester, thioester, and urea bonds.

In certain embodiments, a therapeutic agent is covalently attached to a polymer through a tether, wherein the tether comprises a selectivity-determining moiety and a self-cyclizing moiety which are covalently attached to one another. In certain embodiments, the self-cyclizing moiety is selected such that after cleavage of the bond between the selectivity-determining moiety and the self-cyclizing moiety, cyclization of the self-cyclizing moiety occurs, thereby releasing the therapeutic agent. As an illustration, ABC may be a selectivity-determining moiety, and DEF and GH may be a self-cyclizing moiety, and ABC may be selected such that enzyme Y cleaves between C and D. Once cleavage of the bond between ABC and GH progresses to a certain point, D will cyclize onto H, thereby releasing therapeutic agent X, or a prodrug thereof.

In certain embodiments therapeutic agent X may further comprise additional intervening components, including, but not limited to another self-cyclizing moiety or a leaving group linker, such as CO$_2$ or methoxymethyl, that spontaneously dissociates from the remainder of the molecule after cleavage occurs.

In certain embodiments, the invention provides a polymer conjugate, comprising a therapeutic agent covalently attached to a polymer (such as any of the polymers discussed above) through a linker, wherein the therapeutic agent is selected from etoposide, tubulysin, epothilone, or an analog or derivative thereof. The linkers may be cleavable under biological conditions. In some embodiments, a polymer may also comprise a targeting ligand, and/or one or more cyclodextrin moieties pendant on the polymer. Thus one aspect of the invention relates to a polymer conjugate comprising a therapeutic agent covalently attached to a polymer through a tether, wherein the tether is cleavable under biological conditions.
One aspect of the invention relates to a compound, in some instances a polymeric compound, having a structure of Formula C:

\[ \text{Formula C} \]

\[ \text{wherein} \]
\[ P \text{ represents a polymer chain;} \]
\[ \text{CD represents a cyclic moiety;} \]
\[ \text{L}_1, \text{L}_2 \text{ and } \text{L}_3 \text{ independently for each occurrence, may be absent or represent a linker group, provided that a plurality of occurrences of } \text{L}_2 \text{ represent linkers that are cleavable under biological conditions;} \]
\[ D, \text{ independently for each occurrence, represents a therapeutic agent or a prodrug thereof;} \]
\[ T, \text{ independently for each occurrence, represents a targeting ligand or precursor thereof;} \]
\[ a, m \text{ and } v \text{ independently for each occurrence, represent integers in the range of 1 to 10;} \]
\[ n \text{ and } w \text{, independently for each occurrence, represent an integer in the range of 0 to about 30,000; and} \]
\[ b \text{ represents an integer in the range of 1 to about 30,000;} \]
\[ \text{wherein either } P \text{ comprises a plurality of cyclic moieties in the polymer chain or } n \text{ is at least 1.} \]

In some embodiments, the cyclic moieties are independently selected from cyclodextrins, crown ethers, cyclic oligopeptides, cryptands or cryptates, calixarenes, cavitands, and any combination thereof. In certain embodiments, either P comprises cyclodextrin moieties in the polymer chain or n is at least 1.

In one aspect, Formula C may be represented by Formula C':

\[ \text{Formula C'} \]

\[ \text{wherein} \]
\[ \text{CD represents a cyclodextrin moiety, or derivative thereof;} \]
\[ \text{L}_4, \text{L}_5, \text{L}_6 \text{ and } \text{L}_7 \text{ independently for each occurrence, may be absent or represent a linker group;} \]

\[ D \text{ and } D', \text{ independently for each occurrence, represents a therapeutic agent or a prodrug thereof;} \]
\[ T \text{ and } T', \text{ independently for each occurrence, represents the same or different targeting ligand or precursor thereof;} \]
\[ f \text{ and } y \text{, independently for each occurrence, represent an integer in the range of 1 and 10;} \]
\[ g \text{ and } z \text{, independently for each occurrence, represent an integer in the range of 0 and 10;} \]
\[ h \text{ is an integer from 2 to 30,000 (for example, from 2, 3, 4, 5, or 8 to about 25, 50, 100, 500, 1,000, 5,000, 10,000, 15,000, 20,000, or 25,000; or, for example, from 2, 3, or 4 to 5 or 10).} \]

In one aspect, Formula C may be represented by Formula D:

\[ \text{Formula D} \]

\[ \text{wherein} \]
\[ \gamma \text{ represents a monomer unit of a polymer;} \]
\[ T, \text{ independently for each occurrence, represents a targeting ligand or a precursor thereof;} \]
\[ L_9, L_7, L_8, L_9, \text{ and } L_{10}, \text{ independently for each occurrence, may be absent or represent a linker group;} \]
\[ CD, \text{ independently for each occurrence, represents a cyclodextrin moiety or a derivative thereof;} \]
\[ D, \text{ independently for each occurrence, represents a therapeutic agent or a prodrug thereof;} \]
\[ m, \text{ independently for each occurrence, represents an integer in the range of 1 to 10;} \]
\[ o \text{ is an integer from 2 to 30,000 (for example, from 2, 3, 4, 5, or 8 to about 25, 50, 100, 500, 1,000, 5,000, 10,000, 15,000, 20,000, or 25,000; or, for example, from 2, 3, or 4 to 5 or 10); and} \]
\[ p, n \text{, and } q, \text{ independently for each occurrence, represent an integer in the range of 0 to 10, wherein } CD \text{ and } D \text{ are present at least once in the compound.} \]

In certain embodiments, the compound has a number average (\(M_n\)) molecular weight between 1,000 to 500,000 amu, between 5,000 to 200,000 amu, or between 10,000 to 100,000 amu.

In one aspect, the compounds of the invention, or a pharmaceutically acceptable ester, salt, or hydrate thereof, may be included in a pharmaceutical preparation that further comprises a pharmaceutical excipient.

In certain embodiments, B is a self-cyclizing moiety which is capable of self-cyclizing to release the therapeutic agent or prodrug thereof once the bond between the selectivity-determining moiety (A) and the self-cyclizing moiety has been cleaved. In certain such embodiments, the self-cyclizing moiety is capable of cyclizing to form an imidazolidinone.
In some embodiments, the therapeutic agent is a small molecule, for example, a hormone (e.g., luteinizing hormone-releasing hormone (LHRH)), etoposide, tubulysin, epothilone, or an analog or derivative thereof. In certain embodiments, therapeutic agent contains an amino, hydroxyl, or thiol group. In certain embodiments, the therapeutic agent is attached to the self-cyclizing group through the amino, hydroxyl, or thiol group. In certain embodiments, the therapeutic agent is attached to the self-cyclizing group through a hydroxyl group. In certain embodiments, the hormone facilitates endocytosis.

In certain embodiments, the therapeutic agent is a small molecule, a peptide, a protein, a nucleotide, a polynucleotide, or a polymer that has therapeutic function. In certain embodiments, the agent is an anti-cancer, anti-fungal, anti-bacterial, anti-mycotic, or anti-viral therapeutic. In certain embodiments, the agent is a receptor agonist. In certain embodiments, the agent is a receptor antagonist. Furthermore, a polymer of the present invention may contain one kind of therapeutic agent, or may contain more than one kind of therapeutic agent. For instance, two or more different cancer drugs, or a cancer drug and an immunosuppressant, or an antibiotic and an anti-inflammatory agent may be grafted on the polymer. By selecting different selectivity determining moieties for different drugs, the release of each drug may be attenuated to achieve maximal dosage and efficacy.

In certain embodiments, the therapeutic agent may contain an amino, hydroxyl, or thiol group. In certain embodiments, the therapeutic agent may be attached to the self-cyclizing group through the amino, hydroxyl, or thiol group. In certain embodiments, the therapeutic agent is a hydroxyl-containing agent, including, but not limited to, salicylic acid, acetaminophen, morphine, etoposide, a tubulysin (preferably tubulysin A, tubulysin B, or tubulysin C), an epothilone, camptothecin, geldanamycin, rapamycin, or vancomycin, or an analog or derivative thereof.

In some embodiments, such therapeutic agents are covalently attached to subject polymers through functional groups comprising one or more heterocarbons, for example, hydroxy, thiol, carboxy, amino, and amide groups. Such groups may be covalently attached to the subject polymers through linker groups as described herein, for example, bio- or chemically cleavable linker groups, and/or through linkers, such as a tether comprising a selectivity-determining moiety and a self-cyclizing moiety which are covalently attached to one another.

In certain embodiments, the therapeutic agent is selected from anorexics, antiarthritics, antiasthmatic agents, anticonvulsants, antidepressants; antihistamines, anti-inflammatory agents, antineoplastic agents, antipruritics, antipsychotics, antipyretics, antisapstomods, cardiovascular preparations, antihypertensive, diuretics, vasodilators, central nervous system stimulants, cough and cold preparations, decongestants, diagnostics, hormones, bone growth stimulants and bone resorption inhibitors, immunosuppressives, muscle relaxants, psychostimulants, sedatives, tranquilizers, anti-inflammatory agents, anti-epileptics, anesthetics, hypnotics, sedatives, neuroleptic agents, antidepressants, anxiolytics, anticonvulsant agents, neuron blocking agents, anticholinergic and cholinomimetic agents, antimuscarnic and muscarinic agents, antihyperglycemics, antiarrhythmics, and antihypertensive agents.

In certain embodiments, the therapeutic agent is hydrophobic and has a log P of 0.4. In certain embodiments, the therapeutic agent has low aqueous solubility. In certain embodiments, the therapeutic agent or targeting ligand is covalently bonded to the linker group via a biodegradable bond (e.g., an ester, amide, carbonate, or a carbamate).

In certain embodiments, the therapeutic agent or produrg thereof makes up at least 5%, 10%, 15%, or at least 20% by weight of the compound.

In certain embodiments, the compounds comprise cyclohexenio moieties wherein at least one or a plurality of the cyclohexenio moieties of P is oxidized. In certain embodiments, the cyclohexenio moieties of P alternate with linker moieties in the polymer chain.

In certain embodiments, the compounds of the invention may be water soluble.

In certain embodiments, the linker group that connects to the therapeutic agent may comprise a self-cyclizing moiety, or a selectivity-determining moiety, or both. In certain embodiments, the selectivity-determining moiety is a moiety that promotes selectivity in the cleavage of the bond between the selectivity-determining moiety and the self-cyclizing moiety. Such a moiety may, for example, promote enzymatic cleavage between the selectivity-determining moiety and the self-cyclizing moiety. Alternatively, such a moiety may promote cleavage between the selectivity-determining moiety and the self-cyclizing moiety under acidic conditions or basic conditions.

In certain embodiments where the selectivity-determining moiety is selected such that the bond is cleaved enzymatically, it may be selected such that a particular enzyme or class of enzymes cleaves the bond. In certain preferred such embodiments, the selectivity-determining moiety may be selected such that the bond is cleaved by a cathepsin, preferably cathepsin B.

In certain embodiments the selectivity-determining moiety comprises a peptide, preferably a dipeptide, tripeptide, or tetrapeptide. In certain such embodiments, the peptide is a dipeptide is selected from FA and F. In certain embodiments, the peptide is a tripeptide is selected from GFA, GLA, AVA, GVA, GLA, GV1, GFV, and AVF. In certain embodiments, the peptide is a tetrapeptide selected from GFAA and GFGL, preferably GFGL.

In certain such embodiments, a peptide, such as GFGL, is selected such that the bond between the selectivity-determining moiety and the self-cyclizing moiety is cleaved by a cathepsin, preferably cathepsin B.

In certain embodiments, the linker group that connects to the therapeutic agent may comprise a phosphate group, such as a phosphoramidite group. In certain embodiments, the linker group comprising a phosphate group is represented by the formula

![Chemical Structure](attachment:chemical_structure.png)

wherein

P is phosphorus;
O is oxygen;
E represents oxygen or NR40;
K represents hydrocarbyl;
X is selected from OR\(^2\) or NR\(^{45}\)R\(^{46}\); and

R\(^{40}\), R\(^{41}\), R\(^{42}\), R\(^{43}\), and R\(^{44}\) independently represent hydrogen or optionally substituted alkyl, including lower alkyl (e.g., methyl, ethyl).

In certain embodiments, E is NR\(^{40}\) and R\(^{40}\) is hydrogen. In certain embodiments, K is lower alkylene, such as, for example, ethylene. In certain embodiments, X is OR\(^2\).

In certain embodiments, the linker group is selected from

![Chemical Structure](image)

In certain embodiments, the linker group is connected to the therapeutic agent through a hydroxyl group (e.g., a phenolic hydroxyl group) on the therapeutic agent.

In certain embodiments, the linker group comprises an amino acid or peptide, or derivative thereof.

In certain embodiments, any of the linker groups represents a hydro(ar)ylene group wherein one or more methylene groups is optionally replaced by a group Y (provided that none of the Y groups are adjacent to each other), wherein each Y, independently for each occurrence, is selected from, substituted or unsubstituted aryl, heteroaryl, cycloalkyl, heterocycloalkyl, or \(\text{O}, \text{C}(=\text{X})\) (wherein X is NR\(^{40}\), O or S), \(-\text{OC}(\text{O})\), \(-\text{C}(=\text{O})\text{O}\), \(-\text{NR}^{41}\), \(-\text{NR}^{42}\), \(-\text{NR}^{43}\), \(-\text{C}(=\text{O})\text{NR}^{41}\), \(-\text{O}(\text{C})\), \(-\text{S}(\text{O})\text{n} \ (\text{wherein n is } 0, 1, \text{or } 2), \ -\text{OC}(\text{O})\text{NR}^{41}, \ -\text{NR}^{41}\text{C}(=\text{O})\text{NR}^{41}, \ -\text{NR}^{41}\text{C}(=\text{O})\text{NR}^{41}, \ -\text{NR}^{41}\text{C}(=\text{O})\text{NR}^{41}, \ -\text{NR}^{41}\text{C}(=\text{O})\text{NR}^{41}, \ -\text{H}(\text{OR}^{41}); and R\(^{41}\), independently for each occurrence, represents H or lower alkyl.

In certain embodiments, any of the linker groups may comprise a self-cyclizing moiety or a self-cyclizing moiety, or both. In certain embodiments, the selectivity-determining moiety may be bonded to the self-cyclizing moiety between the self-cyclizing moiety and the polymer.

In certain embodiments, any of the linker groups may independently be an alkyl chain, a polyethylene glycol (PEG) chain, poly(aspartic acid), poly-L-glutamic acid, poly(ethyleneimine), an oligosaccharide, an amino acid chain, or any other suitable linkage. In certain embodiments, the linker group itself can be stable under physiological conditions, such as an alkyl chain, or it can be cleavable under physiological conditions, such as by an enzyme (e.g., the linkage contains a peptide sequence that is a substrate for a peptidase), or by hydrolysis (e.g., the linkage contains a hydrolyzable group, such as an ester or thioester). The linker groups can be biologically inactive, such as a PEG, polymeric, or polymeric acid chain, or can be biologically active, such as an oligo- or polypeptide that, when cleaved from the moieties, binds a receptor, deactivates an enzyme, etc. Various oligomeric linker groups that are biologically compatible and/or bioerodible are known in the art, and the selection of the linkage may influence the ultimate properties of the material, such as whether it is durable when implanted, whether it gradually deforms or shrinks after implantation, or whether it gradually degrades and is absorbed by the body. The linker group may be attached to the moieties by any suitable bond or functional group, including carbon-carbon bonds, esters, ethers, amidines, amides, carbamates, carbamates, sulfonamides, etc.

In certain embodiments, any of the linker groups may independently be an alkyl group wherein one or more methylene groups is optionally replaced by a group Y (provided that none of the Y groups are adjacent to each other), wherein each Y, independently for each occurrence, is selected from aryl, heteroaryl, carbocyclic, heterocyclic, or \(-\text{O}, \text{C}(=\text{X})\) (wherein X is NR\(^{40}\), O or S), \(-\text{OC}(\text{O})\), \(-\text{C}(=\text{O})\text{O}\), \(-\text{NR}^{41}\), \(-\text{NR}^{42}\), \(-\text{NR}^{43}\), \(-\text{C}(=\text{O})\text{NR}^{41}\), \(-\text{O}(\text{C})\), \(-\text{S}(\text{O})\text{n} \ (\text{wherein n is } 0, 1, \text{or } 2), \ -\text{OC}(\text{O})\text{NR}^{41}, \ -\text{NR}^{41}\text{C}(=\text{O})\text{NR}^{41}, \ -\text{NR}^{41}\text{C}(=\text{O})\text{NR}^{41}, \ -\text{NR}^{41}\text{C}(=\text{O})\text{NR}^{41}, \ -\text{H}(\text{OR}^{41}); and R\(^{41}\), independently for each occurrence, is H or lower alkyl.

In certain embodiments, any of the linker groups may independently be a derivatized or non-derivatized amino acid. In certain embodiments, linker groups with one or more terminal carboxyl groups may be conjugated, e.g., covalently conjugated, to the polymer. In certain embodiments, one or more of these terminal carboxyl groups may be capped by covalently attaching them to a therapeutic agent, a targeting ligand, or a cycloextrin moiety via an (thio)ester or amide bond. In still other embodiments, linker groups with one or more terminal hydroxyl, thiol, or amino groups may be incorporated into the polymer. In preferred embodiments, one or more of these terminal hydroxyl groups may be capped by covalently attaching them to a therapeutic agent, a targeting ligand, or a cycloextrin moiety via an (thio)ester, amide, carbonate, carbamate, thiocarbamate, or thioicarbonate bond. In certain embodiments, these (thio)ester, amide, (thio)carbonate or (thio)carbamates bonds may be biodegradable, i.e., capable of being hydrolyzed under biological conditions.

In certain embodiments, the polymers as described above have polydispersities less than about 3, or even less than about 2.

The invention further contemplates methods for delivering a therapeutic agent comprising administering to a patient in need thereof a therapeutically effective amount of one or more of the compounds of the invention.

Tubulysins and derivatives and/or analogs thereof may be found, for example, in WO2004/005269, WO2004/005327, WO2004/005326, WO1998/13375, and WO2004/046170 and German Application Serial Nos. DE 100 08 089 8, the contents of which are incorporated herein in their entireties.

For example, tubulysin derivatives and/or analogs may be represented by Formula II:
[0311] wherein

[0312] A is a substituted 5- or 6-membered heteroaryl;

[0313] X is O, S or NR13, or CR14R15;

[0314] X1 is O, S or NR12;

[0315] Y is O, S or NR16, and

[0316] R1, R2, R3, R4, R5, R6, R7, R8, R9, R10, R13, R14, R15, R16, and R6 are independently H, alkyl, alkenyl, alkynyl, heteroaryl, aryl, heteroaryl, cycloalkyl, alkycycloalkyl, heterocycloalkyl, aralkyl, heteroaralkyl, 

-C(=O)-alkyl, -C(=O)-alkenyl, -C(=O)-alkynyl, 
-C(=O)-heteroaryl, -C(=O)-aryls, -C(=O)-heteroaryl, 
-C(=O)-cycloalkyl, -(C-O)-alkycycloalkyl, 
-C(=O)-heterocycloalkyl, -(C-O)-aralkyl, or -C(=O)-heteroaralkyl;

[0317] R12 is H, alkyl, alkenyl, alkynyl, heteroaryl, aryl, heteroaryl, cycloalkyl, alkycycloalkyl, heterocycloalkyl, aralkyl, heteroaralkyl, 

-X1-alkyl, -X1-alkenyl, -X1-alkynyl, 

-X1-heteroaryl, -X1-aryls, -X1-heteroaryl, 

-X1-cycloalkyl, -X1-cycloalkyl, 

-X1-heterocycloalkyl, -X1-aralkyl, or 

-X1-heteroaralkyl;

[0318] or two R's taken together form a cycloalkyl or heterocycloalkyl ring system;

[0319] or a pharmaceutically acceptable salt, a solvate, a hydrate or a pharmaceutically acceptable formulation thereof.

[0320] In some embodiments, tubulysin derivatives of Formula II are covalently attached to subject polymers through an occurrence of a functional group comprising one or more heteroatoms, for example, hydroxy, thiol, carboxy, amino, and amide groups, for example, when such groups occur in R13 or R12.

[0321] In certain embodiments, tubulysin derivatives and/or analogs of Formula II may be represented by Formula III:

[0331] In certain embodiments, R19 represents the following structure:

[0332] wherein

[0333] R21 represents OH, NH2, alkoxy, alkyl amino or dialkyl amino;

[0334] R22 represents halogen, OH, NO2, NH2, alkoxy, alkyl amino or dialkyl amino, and

[0335] p equals 0, 1, 2 or 3.

[0336] In some embodiments, tubulysin derivatives of Formula III are covalently attached to subject polymers through an occurrence of a functional group comprising one or more heteroatoms, for example, hydroxy, thiol, carboxy, amino, and amide groups, such as the hydroxy or amino groups of R21 or R22.

[0337] In certain embodiments, tubulysin derivatives and/or analogs of Formula II may be represented by Formula IV:

[0338] wherein

[0339] m equals 0, 1, 2 or 3;

[0340] R1 represents methyl or ethyl;

[0341] R6 represents isopropyl, isobutyl, ethyl, cyclopropyl, CH2-cyclopropyl, or CH(CH3)CH2CH3;

[0342] R9 represents isopropyl, trifluoromethyl, chloromethyl, isobutyl, ethyl, cyclopropyl, CH2-cyclopropyl, CH(CH3)CH2CH3, cyclopentyl, or cyclohexyl;

[0343] R17 represents methyl, ethyl, propyl, isopropyl, butyl, isobutyl, CH═C(CH3), cyclopropyl, cyclobutyl, or cyclohexyl; and

[0344] R20 represents methyl, ethyl, propyl, isopropyl, or phenyl; and

[0345] R19 represents

[0346] wherein R1 represents C1-C4 alkyl;

[0347] R6 represents C1-C6 alkyl;

[0348] R6 represents C1-C6 alkyl;

[0349] R17 represents C1-C6 alkyl or C1-C6 alkenyl;

[0350] R19 represents aralkyl or heteroaralkyl;

[0351] R20 represents C1-C4 alkyl; and

[0352] m equals 1 or 2.
[0346] In some embodiments, tubulysin derivatives of Formula IV are covalently attached to subject polymers through an occurrence of a functional group comprising one or more heteroatoms, for example, hydroxy, thiol, carboxy, amino, and amide groups, such as the hydroxy or carboxy groups of R*.

[0347] Further tubulysin derivatives and/or analogs may be represented by Formula V:

[0348] wherein

[0349] R represents H, alkyl, aryl, OR, NR, or NH(CHR)2;

[0350] R1 represents H, alkyl or aryl;

[0351] R2 represents H, alkyl or aryl;

[0352] Q represents H, halogen, NO2 or NHR3;

[0353] U represents H, halogen, NO2 or NHR3;

[0354] R3 represents H, HCO or C1=alkyl-CO;

[0355] T represents H, halogen, or OR, for example, T may represent H or OR3;

[0356] R4 represents H, alkyl, aryl, COR, P(O)(OR3)2 or SO3R3;

[0357] R5 represents alkyl, aryl or heteroaryl;

[0358] R6 represents H, alkyl or a metal ion;

[0359] V represents H, OR, halogen, or taken together with W represents —O;

[0360] R7 represents H, alkyl or COR3;

[0361] R8 represents alkyl, alkenyl or aryl;

[0362] W represents H or alkyl, or taken together with V represents —O;

[0363] X represents H, alkyl, alkenyl, CH2NR, or CH2OR, for example, X may represent H, alkyl, alkenyl or CH2OR;

[0364] R9 represents H, alkyl, aryl or COR3;

[0365] R10 represents alkyl (e.g., methyl, ethyl, propyl, butyl (e.g., n-butyl, i-butyl), alkenyl (e.g., vinyl, dimethylvinyl), aryl or heteroaryl);

[0366] Y represents a free electron pair when Z represents CH3 or COR11, or O when Z represents CH3;

[0367] R11 represents alkyl, CF3 or aryl; and

[0368] Z represents CH3 when Y represents O or a free electron pair, or COR11 when Y represents a free electron pair.

[0369] In some embodiments, tubulysin derivatives of Formula V are covalently attached to subject polymers through an occurrence of a functional group comprising one or more heteroatoms, for example, hydroxy, thiol, carboxy, amino, and amide groups, in some instances, through T or R.

[0370] Additional tubulysin derivatives of Formula V may be represented by Formula Va:

[0371] In some embodiments, tubulysin derivatives of Formula V are covalently attached to subject polymers through an occurrence of a functional group comprising one or more heteroatoms, for example, hydroxy, thiol, carboxy, amino, and amide groups, such as the carboxy group of Formula V or R1.
Further tubulysin derivatives and/or analogs may be represented by Formula VI:

![Formula VI](image)

In some embodiments, tubulysin derivatives of Formula VI are covalently attached to subject polymers through an occurrence of a functional group comprising one or more heteroatoms, for example, hydroxy, thiol, carboxy, amino, and amide groups, for example through the phenol group or the carboxy group depicted in Formula VI.

Additionally, epothilones and derivatives and/or analogs thereof may be found, for example, in PCT Publication Nos. WO2005/030767, WO2004/007492, WO2004/007483, and WO2002/32844 and German Application Serial Nos. DE 197 13 970.1, DE 100 51 136.8, DE 101 34 172.5, DE 102 32 094.2, the contents of which are incorporated herein in their entireties.

For example, epothilone derivatives and/or analogs may be represented by Formula VII:

![Formula VII](image)

wherein
- A is a heteroalkyl, heterocycloalkyl, heteroalkycycloalkyl, heteroaryl, heteroalkylnitrogen, or heteroaralkyl group;
- U is hydrogen, halogen, an alkyl, heteroalkyl, heterocycloalkyl, heteroalkycycloalkyl, heteroaryl or heteroaralkyl group;
- G-E is selected from the following groups,

![Groups](image)

or is part of an optionally substituted phenyl ring:

- R₁ is a C₁-C₄-alkyl, a C₂-C₄-alkenyl, a C₂-C₄-alkynyl, or a C₃-C₄-cycloalkyl group;
- V—W is a group of formula CH₂CH or CH═C;
- X is oxygen or a group of the formula NR₂, wherein R₂ is hydrogen, an alkyl, alkenyl, alkylnitrogen, heteroalkyl, aryl, heteroaryl, cycloalkyl, alkylylcycloalkyl, heterocycloalkyl, aralkyl, or heteroaralkyl group; and
- R₃ and R₄ independently from each other represent hydrogen, C₁-C₄-alkyl or together are part of a cycloalkyl group with 3 or 4 ring atoms, or a pharmaceutically acceptable salt, solvate, hydrate or formulation thereof.

Further epothilone derivatives and/or analogs may be represented by Formula X:

![Formula X](image)

wherein
- Q is sulfur, oxygen or NR₂ (especially oxygen or sulfur), wherein R₇ is hydrogen, C₁-C₄ alkyl or C₁-C₄ heteroaryl;
- Z is nitrogen or CH (especially CH); and
- R₈ is OR₆, NH, or C₂-C₄ alkyl, C₂-C₄ alkenyl, C₂-C₄ alkynyl or C₁-C₄ heteroalkyl (especially methyl, CH₂OR₆ or CH₂NH, wherein R₆ is hydrogen, C₁-C₄ alkyl or C₁-C₄ heteroalkyl (especially hydrogen).

Further epothilone derivatives and/or analogs may be represented by Formula XI:
R₁ is a C₁₋₅ alkyl, a C₂₋₅ alkenyl or a C₂₋₅ alkynyl radical;

R₂ is a hydrogen atom or a C₁₋₅ alkyl radical;

X—Y is selected from the following groups:

R₃ is a halogen atom or a C₁₋₅ alkyl, a C₂₋₅ alkenyl or a C₁₋₅ heteroalkyl radical;

R₄ is a bicycloaryl radical, a bicycloheteroaryl radical or a group of formula —C(Rₓ)₂—CHRₓ;

R₅ is a hydrogen atom or a methyl group; and

R₆ is an optionally substituted aryl or heteroaryl group;

or a pharmacologically acceptable salt, solvate, hydrate or a pharmacologically acceptable formulation thereof.

In certain embodiments, R₄ represents

In some embodiments, epothilone derivatives of Formula X are covalently attached to subject polymers through an occurrence of a functional group comprising one or more heteroatoms, for example, hydroxy, thiol, carboxy, amino, and amide groups, for example, either of the hydroxy groups depicted in Formula VII.

In certain embodiments, the compound of Formula X can be represented by the following structures:

Further epothilone derivatives and/or analogs may be represented by Formula XI:

wherein

R₁, B₂, B₃ are selected from single bonds; double bonds in the E(trans) form, Z(cis) form or as E/Z mixture; epoxide rings in the E(trans) form, Z(cis) form or E/Z mixture; cyclopropane rings in the E(trans) form, Z(cis) form or E/Z mixture; and/or combinations thereof; and being preferably selected from single and double bonds; and particularly preferably being selected from B₁ as Z double bonds or epoxide and B₂ and B₃ as single bond;

R is selected from H; alkyl; aryl; aralkyl such as —CH₂-aryl, —C₆H₅-aryl and the like; alkenyl, such as vinyl; cycloalkyl, particularly a 3- to 7-membered cycloalkyl; CH₂Fₓₓ with n=0 to 3; oxacycloalkyl, particularly a 3- to 7-membered oxacycloalkyl; and/or combinations thereof; being particularly selected from H, methyl, ethyl, phenyl, benzyl; and being particularly preferred selected from H, methyl, ethyl and combinations thereof;

R' is selected from the same group as R, and is preferably H;

R'' is selected from the same group as R, and is preferably methyl;

Y is selected from S, NH, N-PG, NR and O; being preferably selected from NH, N—PG, NR and O, and being particularly preferably O;
[0412] Y' is selected from H, OH, OR, O—PG, NH₂, NR₂, N(PG)₂, SR and SH; being preferably O—PG and/or OH;

[0413] Nu is selected from R, O—PG, OR, N(PG)₂, NR₂, S-PG, SR, SeR, CN, N₃, aryl and heteroaryl; being preferably selected from R, O—PG, OR, N(PG)₂ and NR₂, and being particularly preferably H;

[0414] Z is selected from —OH, —O—PG, —OR, —O, —N—Nu, —CH-heteroaryl, —CH-aryl and —PR₂, where all previously mentioned double bond groups may be present in the E(trans) form, Z(cis) form or as E/Z mixture; being preferably —CH-heteroaryl; and being particularly preferred selected from —O, (E)-(2-methylthiazol-4-yl)-CH—; (E)-(2-methylthiazol-4-yl)-CH—; R″=H; R″=Me, Y’, Z=O—PG, OR and/or Y=O.

[0415] In certain embodiments, derivatives of epothilone may be represented by Formula XII:

\[
\text{XII} \quad (\text{XII})
\]

[0416] B₃ is selected from single or double bonds in the E(trans) form, Z(cis) form or as E/Z mixture; being preferably selected from single and double bonds with heteroatoms such as O, S and N; and being particularly preferred a single bond to OR and/or OR;

[0417] PG is a protecting group, and is preferably selected from allyl, methyl, t-butyl (preferably with electron withdrawing group), benzyl, silyl, acyl and activated methylene derivatives such as methoxymethyl, alkoxyalkyl or 2-oxacycloalkyl; being preferably—predominantly for alcohol and amine functions—selected from trimethylsilyl, triethylsilyl, dimethyl-tert-butylsilyl, acetyl, propionyl, benzoyl, tert-butryl, as well as protecting groups protecting neighbouring or bivalent groups (PG₂) concomitantly under formation of 5- to 7-membered rings, such as succinyl, phthalal, methylene, ethylene, propylene, 2,2-dimethylprop-1-3-diy, acetonide; and/or combinations of all previously named protecting groups; alkyl is selected from hydrocarbons, also of branched isomers, preferably with C₁₋₂₀, particularly with 1 to 8 carbon atoms; aryl is selected from phenyl, naphthyl, benzyl, and their derivatives, preferably with up to five alkyl, alkoxy and/or halogen substituents, preferably from those with up to three substituents, particularly preferred with up to one substituent; preferably being selected from phenyl and benzyl derivatives; and combinations of these.

[0418] Hetaryl/heteroaryl is selected from five- to six-membered heteroaromatic moieties with one or more O, S and N atoms and their derivatives with up to four alkyl, alkoxy and/or halogen substituents, preferably from those with up to two substituents, particularly preferred with up to one substituent; preferably being selected from oxazole, thiazole and pyrimidine derivatives; and particularly preferred being an alkylthiazole derivative; and combinations thereof, with being particularly preferred Z=O, (E)-(2-methylthiazol-4-yl)-CH—; (E)-(2-methylthiazol-4-yl)-CH—; R″=H; R″=Me, Y’, Z=O—PG, OR and/or Y=O.

[0419] In some embodiments, epothilone derivatives of Formula XI are covalently attached to subject polymers through an occurrence of a functional group comprising one or more heteroatoms, for example, hydroxy, thiol, carboxy, amino, and amide groups, such as that of Y’ or Z’.

[0420] In certain embodiments, derivatives and/or analogs of epothilone may be represented by Formula XII:

\[
\text{XII} \quad (\text{XII})
\]

[0421] wherein R is selected from OR¹, NHR¹, alkyl, alkenyl, alkynyl, and heteroalkyl (e.g., CH₃OR³ or CH₃NR²) and

[0422] R³ is selected from hydrogen, C₁₋₄ alkyl, and C₁₋₄ heteroalkyl, preferably hydrogen.

[0423] In certain embodiments, R is selected from methyl, CH₃OH, and CH₃NH₂.

[0424] In some embodiments, epothilone derivatives of Formula XII are covalently attached to subject polymers through an occurrence of a functional group comprising one or more heteroatoms, for example, hydroxy, thiol, carboxy, amino, and amide groups, for example, the hydroxy group depicted in Formula XII.

[0425] In certain embodiments, the selectivity-determining moiety may be GFLG or KF, the self-cycling moiety may be an imidazolidone-forming moiety, and the therapeutic agent may be a hydroxyl-containing agent, including, but not limited to, etoposide. The cascade to release etoposide for GFLG, for example, may be illustrated as shown below.
A similar cascade is contemplated when KF or FK is used in place of GFLG as the selectivity-determining moiety.

In certain embodiments, the selectivity-determining moiety may be cis-aconityl, the self-cyclizing moiety may be an imidazolidone-forming moiety, and the therapeutic agent may be a hydroxyl-containing agent, including, but not limited to, etoposide. The cascade to release etoposide may be illustrated as shown below, wherein either isoform of cis-aconityl may be used.

In certain embodiments, the selectivity-determining moiety may be cleavable under basic conditions, the self-cyclizing moiety may be an imidazolidone-forming moiety, and the therapeutic agent may be a hydroxyl-containing agent, including, but not limited to, etoposide. The cascade to release etoposide may be illustrated as shown below.

In certain embodiments, the cyclodextrin moieties make up at least about 2%, 5%, or 10% by weight, up to 20%, 30%, 50%, or even 80% of the cyclodextrin-modified polymer by weight. In certain embodiments, the therapeutic agent, including, but not limited to, etoposide. The cascade to release etoposide may be illustrated as shown below.

In certain embodiments, the present invention contemplates a linear, water-soluble, cyclodextrin-containing polymer, wherein a plurality of therapeutic agents are covalently attached to the polymer through attachments that are cleaved under biological conditions to release the therapeutic agents as discussed above, wherein administration of the polymer to a patient results in release of the therapeutic agent over a period of at least 2, 3, 5, 6, 8, 10, 15, 20, 24, 36, 48 or even 72 hours.

One embodiment of the present invention provides an improved delivery of certain hydrophobic small molecule therapeutics by covalently conjugating them to cyclodextrin-containing polymers as discussed above. Such conjugation improves the aqueous solubility and hence the bioavailability of the therapeutic agents. Accordingly, in one embodiment of the invention, the therapeutic agent is a hydrophobic compound with a log P > 0.4, > 0.6, > 0.8, > 1, > 2, > 3, > 4, or even > 5.

The polymer conjugates of the present invention preferably have molecular weights in the range of 10,000 to 500,000, 30,000 to 200,000, or even 70,000 to 150,000 amu.
ments, the polymeric therapeutics of the present invention are compositions for controlled delivery of therapeutic agents. One skilled in the art would also recognize that by labeling the therapeutic agent and/or targeting ligand with radionuclide, or by forming complexes of NMR active nuclei, e.g., technetium, gadolinium, or dysprosium, the polymers of the present invention can achieve a dual diagnostic/therapeutic utility.

In other embodiments, the polymeric compounds stabilize the bioactive form of a therapeutic agent that exists in equilibrium between an active and inactive form. For instance, conjugating the therapeutic agent to the polymers of the present invention may shift the equilibrium between two tautomeric forms of the agent to the bioactive tautomer. In other embodiment, the polymeric compounds may attenuate the equilibrium between lactonic and acid forms of a therapeutic agent.

One method to determine molecular weight is by gel permeation chromatography (“GPC”), e.g., mixed bed columns, CH$_2$Cl$_2$ solvent, light scattering detector, and offline dn/dc. Other methods are known in the art.

In other embodiments, the polymer conjugate of the invention may be a flexible or flowable material. When the polymer used is itself flowable, the polymer composition of the invention, even when viscous, need not include a biocompatible solvent to be flowable, although trace or residual amounts of biocompatible solvents may still be present.

While in certain embodiments the biodegradable polymer or the therapeutic agent may be dissolved in a small quantity of a non-toxic solvent to more efficiently produce an amorphous, monolithic distribution or a fine dispersion of the biologically active agent in the flexible or flowable composition, in certain preferred embodiments, no solvent is required to form a flowable composition. In certain embodiments where a solvent is used to facilitate mixing or to maintain the flowability of the polymer conjugate of the invention, it is preferably non-toxic and otherwise biocompatible, and preferably used in relatively small amounts.

Examples of suitable biocompatible solvents include, but are not limited to, N-methyl-2-pyrrolidone, 2-pyrrrolidone, ethanol, propylene glycol, acetone, methyl acetate, ethyl acetate, methyl ethyl ketone, dimethylformamide, dimethylsulfoxide, tetrahydrofuran, caprolactum, oleic acid, or 1-dodecylazacycloheptanone. Preferred solvents include N-methylpyrrolidone, 2-pyrrrolidone, dimethylsulfoxide, and acetone because of their solvating ability and their biocompatibility.

In certain embodiments, the subject polymer conjugates are soluble in one or more common organic solvents for ease of fabrication and processing. Common organic solvents include, but are not limited to, dichloromethane, dichloroethane, 2-butanol, butyl acetate, ethyl butyrate, acetone, ethyl acetate, dimethylacetamide, N-methylpyrrolidone, dimethylformamide, and dimethylsulfoxide.

II. Targeting Ligand

In certain embodiments, the polymer conjugate comprises a targeting ligand. Thus in certain embodiments, a receptor, cell, and/or tissue-targeting ligand, or a precursor thereof is coupled to a polymer conjugate.

As used herein the term “targeting ligand” refers to any material or substance which may promote targeting of receptors, cells, and/or tissues in vivo or in vitro with the compositions of the present invention. The targeting ligand may be synthetic, semi-synthetic, or naturally-occurring. Materials or substances which may serve as targeting ligands include, but are not limited to, proteins, including antibodies, antibody fragments, hormones, hormone analogues, glycoproteins and lectins, peptides, polypeptides, amino acids, sugars, saccharides, including monosaccharides and polysaccharides, carbohydrates, small molecules, vitamins, steroids, steroid analogs, hormones, cofactors, bioactive agents, and genetic material, including nucleosides, nucleotides, nucleotide acid constructs and polynucleotides.

As indicated above, in certain instances, the targeting ligand may be a hormone, for example a hormone that facilitates endocytosis, such as receptor-mediated endocytosis. Such endocytosis may occur with regard to the present polymer conjugates in various structural forms thereof, such as microspheres, microparticles, and nanoparticles. The endocytosis may facilitate cellular uptake of the present polymer conjugates. In certain embodiments, the targeting ligand may be luteinizing hormone-releasing hormone (LHRH). For example, targeting ligands, such as hormones, such as LHRH, may be used in the subject polymer conjugates in combination with therapeutic agents and analogs or derivatives thereof as described herein, such as epothilones and tubulysins and analogs or derivatives thereof. In some embodiments, use of a hormone, such as LHRH, as a targeting ligand increases the cellular uptake of the present polymer conjugates in cells exhibiting abnormal proliferation, such as in cancer and/or tumor cells. For example, use of a hormone, such as LHRH, as a targeting ligand can be used to increase cellular uptake of the present polymer conjugates in breast, lung, colon, and ovarian cancer cells.

As used herein, the term “precursor” to a targeting ligand refers to any material or substance which may be converted to a targeting ligand. Such conversion may involve, for example, anchoring a precursor to a targeting ligand. Exemplary targeting precursor moieties include maleimide groups, disulfide groups, such as ortho-riptyridyl disulfide, vinylsulfone groups, azide groups, and $^{125}$I-iodo acetyl groups. The attachment of the targeting ligand or precursor thereof to the polymer may be accomplished in various ways including, but not limited to, covalent attachment, or formation of host-guest complexes. In certain embodiments, an optional linker group may be present between the targeting ligand or precursor thereof and the polymer, wherein the linker group is attached to the polymer via chelation, covalent attachment or form host guest complexes. For example, the one terminal end of a linker group may be attached to the targeting ligand while the other may be attached to an adamantane group, or other such hydrophobic moiety, which forms a host guest complex with a cyclodextrin moiety. Thus the targeting ligand may be attached to a grafted cyclodextrin moiety, to a cyclodextrin moiety within the polymeric chain, or to the polymeric chain itself. The number of targeting ligands per polymeric chain may vary according to various factors including but not limited to the identity of the therapeutic agent, nature of the disease, type of polymer chain. Structures of possible linker groups are the same as linker groups defined elsewhere in this application.
III. Definitions

[0444] The term “active” as used herein means biologically, therapeutically or pharmacologically active.

[0445] An “adjuvant”, as the term is used herein, is a compound that has little or no therapeutic value on its own, but increases the effectiveness of a therapeutic agent. Exemplary adjuvants include radiosensitizers, transfection-enhancing agents (such as chloroquine and analogs thereof), chemotactic agents and chemotracotants, peptides that modulate cell adhesion and/or cell mobility, cell permeabilizing agents, inhibitors of multidrug resistance and/or efflux pumps, etc.

[0446] The term “agonist”, as used herein, is meant to refer to an agent that mimics or up-regulates (e.g., potentiates or supplements) the bioactivity of a protein of interest, or an agent that facilitates or promotes (e.g., potentiates or supplements) an interaction among polypeptides or between a polypeptide and another molecule (e.g., a steroid, hormone, nucleic acids, small molecules etc.). An agonist can be a wild-type protein or derivative thereof having at least one bioactivity of the wild-type protein. An agonist can also be a small molecule that up-regulates the expression of a gene or which increases at least one bioactivity of a protein.

[0447] “Antagonist” as used herein is meant to refer to an agent that down-regulates (e.g., suppresses or inhibits) the bioactivity of a protein of interest, or the agent that inhibits/ suppresses or reduces (e.g., destabilizes or decreases) interaction among polypeptides or other molecules (e.g., steroids, hormones, nucleic acids, etc.). Antiagonist can also be a compound that down-regulates the expression of a gene of interest or which reduces the amount of the wild-type protein present. An antagonist can also be a protein or small molecule which decreases or inhibits the interaction of a polypeptide of interest with another molecule, e.g., a target peptide or nucleic acid.

[0448] The terms “biocompatible polymer” and “biocompatibility” when used in relation to polymers are art-recognized. For example, biocompatible polymers include polymers that are neither themselves toxic to the host (e.g., an animal or human), nor degrade (if the polymer degrades) at a rate that produces monomeric or oligomeric subunits or other byproducts at toxic concentrations in the host. In certain embodiments of the present invention, biodegradation generally involves degradation of the polymer in an organism, e.g., into its monomeric subunits, which may be known to be effectively non-toxic. Intermediate oligomeric products resulting from such degradation may have different toxicological properties, however, or biodegradation may involve oxidation or other biochemical reactions that generate molecules other than monomeric subunits of the polymer. Consequently, in certain embodiments, biodegradation of the polymer intended for in vivo use, such as implantation or injection into a patient, may be determined after one or more toxicity analyses. It is not necessary that any subject composition have a purity of 100% to be deemed biocompatible. Hence, a subject composition may comprise 99%, 98%, 97%, 96%, 95%, 90% 85%, 80%, 75% or even less of biocompatible polymers, e.g., including polymers and other materials and excipients described herein, and still be biocompatible.

[0449] To determine whether a polymer or other material is biocompatible, it may be necessary to conduct a toxicity analysis. Such assays are well known in the art. One example of such an assay may be performed with live carcinoma cells, such as GT3TKB tumor cells, in the following manner: the sample is degraded in 1 M NaOH at 37° C. until complete degradation is observed. The solution is then neutralized with 1 M HCl. About 200 μL of various concentrations of the degraded sample products are placed in 96-well tissue culture plates and seeded with human gastric carcinoma cells (GT3TKB) at 104/well density. The degraded sample products are incubated with the GT3TKB cells for 48 hours. The results of the assay may be plotted as % relative growth vs. concentration of degraded sample in the tissue-culture well. In addition, polymers and formulations of the present invention may also be evaluated by well-known in vivo tests, such as subcutaneous implantations in rats to confirm that they do not cause significant levels of irritation or inflammation at the subcutaneous implantation sites.

[0450] The term “biodegradable” is art-recognized, and includes polymers, compositions and formulations, such as those described herein, that are intended to degrade during use. Biodegradable polymers typically differ from non-biodegradable polymers in that the former may be degraded during use. In certain embodiments, such use involves in vivo use, such as in vivo therapy, and in other certain embodiments, such use involves in vitro use. In general, degradation attributable to biodegradability involves the degradation of a biodegradable polymer into its component subunits, or digestion, e.g., by a biochemical process, of the polymer into smaller, non-polymeric subunits. In certain embodiments, two different types of biodegradation may generally be identified. For example, one type of biodegradation may involve cleavage of bonds (whether covalent or otherwise) in the polymer backbone. In such biodegradation, monomers and oligomers typically result, and even more typically, such biodegradation occurs by cleavage of a bond connecting one or more of subunits of a polymer. In contrast, another type of biodegradation may involve cleavage of a bond (whether covalent or otherwise) internal to sidechain or that connects a side chain to the polymer backbone. For example, a therapeutic agent or other chemical moiety attached as a side chain to the polymer backbone may be released by biodegradation. In certain embodiments, one or the other or both general types of biodegradation may occur during use of a polymer.

[0451] As used herein, the term “biodegradation” encompasses both general types of biodegradation. The degradation rate of a biodegradable polymer often depends in part on a variety of factors, including the chemical identity of the linkage responsible for any degradation, the molecular weight, crystallinity, biostability, and degree of cross-linking of such polymer, the physical characteristics (e.g., shape and size) of an implant, and the mode and location of administration. For example, the greater the molecular weight, the higher the degree of crystallinity, and/or the greater the biostability, the biodegradation of any biodegradable polymer is usually slower. The term “biodegradable” is intended to cover materials and processes also termed “bioerodable”.

[0452] In certain embodiments wherein the biodegradable polymer also has a therapeutic agent or other material associated with it, the biodegradation rate of such polymer may be characterized by a release rate of such materials. In
such circumstances, the biodegradation rate may depend on not only the chemical identity and physical characteristics of the polymer, but also on the identity of material(s) incorporated therein. Degradation of the subject compositions includes not only the cleavage of intramolecular bonds, e.g., by oxidation and/or hydrolysis, but also the disruption of intermolecular bonds, such as dissociation of host/guest complexes by competitive complex formation with foreign inclusion hosts.

[0453] In certain embodiments, polymeric formulations of the present invention biodegrade within a period that is acceptable in the desired application. In certain embodiments, such as in vivo therapy, such degradation occurs in a period usually less than about five years, one year, six months, three months, one month, fifteen days, five days, three days, or even one day on exposure to a physiological solution with a pH between 6 and 8 having a temperature of between 25 and 37° C. In other embodiments, the polymer degrades in a period of between about one hour and several weeks, depending on the desired application.

[0454] As herein used the term “bioerodible” refers to polymers which deliver sustained effective amounts of therapeutic agent to target tissue over desired extended periods of time. Thus, a polymer according to the invention in the biological environment of host tissue and the like, in one aspect, is subjected to hydrolytic enzymes and oxidative species under, and in proportion to, the host’s inflammatory response. This results in release of the therapeutic agent via the breaking of the covalent linked bonds. Thus, in certain embodiments, the materials of the invention utilize the mammal’s own wound-healing repair process in being degraded thereby, as hereinbefore described.

[0455] The biodegradable polymers polyactic acid, polyglycolic acid, and poly(lactic-glycolic acid copolymer (PLGA), have been investigated extensively for nanoparticle formulation. These polymers are polysters that, upon implantation in the body, undergo simple hydrolysis. The products of such hydrolysis are biologically compatible and metabolizable moieties (e.g., lactic acid and glycolic acid), which are eventually removed from the body by the citric acid cycle. Polymer biodegradation products are formed at a very slow rate, and hence do not affect normal cell function. Several implant studies with these polymers have proven safe in drug delivery applications, used in the form of matrices, microspheres, bone implant materials, surgical sutures, and also in contraceptive applications for long-term effects. These polymers are also used as graft materials for artificial organs, and recently as basement membranes in tissue engineering investigations. Nature Med. 824-826 (1996). Thus, these polymers have been time-tested in various applications and proven safe for human use. Most importantly, these polymers are FDA-approved for human use.

[0456] When polymers are used for delivery of pharmacologically active agents in vivo, it is essential that the polymers themselves be nontoxic and that they degrade into non-toxic degradation products as the polymer is eroded by the body fluids. Many synthetic biodegradable polymers, however, yield oligomers and monomers upon erosion in vivo that adversely interact with the surrounding tissue. D. F. Williams, J. Mater. Sci. 1233 (1982). To minimize the toxicity of the intact polymer carrier and its degradation products, polymers have been designed based on naturally occurring metabolites. Probably the most extensively studied examples of such polymers are the polyesters derived from lactic or glycolic acid and polyamides derived from amino acids.

[0457] A number of bioerodable or biodegradable polymers are known and used for controlled release of pharmaceuticals. Such polymers are described in, for example, U.S. Pat. Nos. 4,291,013, 4,347,234, 4,525,495, 4,570,629, 4,572,832, 4,587,268, 4,638,04, 4,675,381, 4,745,160, and 5,219,980, which are incorporated herein in their entirety.

[0458] A biodegradable polymer (e.g., ester, amide, carbonate, carbamates, or imide) refers to a bond that is cleaved (e.g., an ester is cleaved to form a hydroxyl and a carboxylic acid) under physiological conditions. Physiological conditions include the acidic and basic environments of the digestive tract (e.g., stomach, intestines, etc.), acidic environment of a tumor, enzymatic cleavage, metabolism, and other biological processes, and preferably refer to physiological conditions in a vertebrate, such as a mammal.

[0459] Upon copolymerization of a comonomer precursor with a cyclodextrin monomer precursor, two cyclodextrin monomers may be linked together by joining the primary hydroxyl side of one cyclodextrin monomer with the primary hydroxyl side of another cyclodextrin monomer, or by joining the secondary hydroxyl side of one cyclodextrin monomer with the secondary hydroxyl side of another cyclodextrin monomer, or by joining the primary hydroxyl side of one cyclodextrin monomer with the secondary hydroxyl side of another cyclodextrin monomer. Accordingly, combinations of such linkages may exist in the final copolymer. Both the comonomer A and the comonomer B of the final copolymer may be neutral, cat- lonic (for example quaternary ammonium groups), or anionic (for example sulfate, phosphate, borinate or carboxylate) groups. The charge of comonomer A of the copolymer may be adjusted by adjusting pH conditions. Examples of suitable comonomer A precursors include, but are not limited to succinimide (e.g., dithiobis(succinimidyl propionate) DSP, and disuccinimidyl suberate (DSS)), glutamates, and aspartates).

[0460] The cyclodextrin-containing polymers of the present invention may be linear, branched or grafted. As used herein, the term “linear cyclodextrin-containing polymer” refers to a polymer comprising (α, β, or γ) cyclodextrin molecules, or derivatives thereof which are inserted within a polymer chain. As used herein, the term “grafted cyclodextrin-containing polymer” refers to a polymer comprising (α, β, or γ) cyclodextrin molecules, or derivatives thereof which are pendant off the polymer chain. The term “grafted polymer” as used herein refers to a polymer molecule which has additional moieties attached as pendant groups along a polymer backbone. The term “graft polymerization” denotes a polymerization in which a side chain is grafted onto a polymer chain, which side chain consists of one or several other monomers. The properties of the graft copolymer obtained thus, as for example, solubility, melting point, water absorption, wettability, mechanical properties, adsorption behavior, etc., deviate more or less sharply from those of the initial polymer as a function of the type and amount of the grafted monomers. The term “grafting ratio”, as used herein, means the weight percent of the amount of the monomers grafted based on the weight of the polymer. As used herein, a branched cyclodextrin-containing polymer refers to a polymer backbone with a plurality of branch points, wherein each branch point is a starting point of yet
another strand of the polymer backbone, and each section of polymer backbone may have a plurality of (α, β, or γ) cyclodextrin molecules, or derivatives thereof, inserted into or grafted onto the chain.

[0461] The phrase “controlled release” or “sustained release” refers to the use of systems that allow for the controlled or tunable delivery of one or more of the present compounds or compositions over time. For example, in certain instances, the present compounds or compositions are used in conjunction with a controlled release system that delivers an effective amount (such as an approximately continuous amount, an increasing amount, or a decreasing amount) of the compound(s) over a certain period of time, for example, over a period of at least about 4, 8, 12, 24, 48, or 72 hours, over a period of at least about 1, 2, 3, 4, or 5 days, over a period of at least about 1, 2, or 3 weeks, or over a period of at least about 1, 2, 3, 4, 5, or 6 months. Such controlled release systems may be used in conjunction with medical devices, such as stents and catheters, to provide medical devices which offer controlled release of the present compounds and/or compositions. By way of example, some suitable controlled release systems include hydrogels, polymers, meshes, and others demonstrated in the art.

[0462] The term “cyclodextrin moiety” refers to (α, β, or γ) cyclodextrin molecules or derivatives thereof, which may be in their oxidized or reduced forms. Cyclodextrin moieties may comprise optional linkers. Optional therapeutic agents and/or targeting ligands may be further linked to these moieties via an optional linker. The linkage may be covalent (optionally via biodegradable bonds, e.g., esters, amides, carbamates, and carbonates) or may be a host-guest complex between the cyclodextrin derivative and the therapeutic agent and/or targeting ligand or the optional linkers of each. Cyclodextrin moieties may further include one or more carbohydrate moieties, preferably simple carbohydrate moieties such as galactose, attached to the cyclic core, either directly (i.e., via a carbohydrate linkage) or through a linker group.

[0463] As used herein, the term “EC50” means the concentration of a drug that produces 50% of its maximum response or effect.

[0464] The term “ED50” means the dose of a drug that produces 50% of its maximum response or effect.

[0465] An “effective amount” of a subject compound, with respect to the subject method of treatment, refers to an amount of the therapeutic in a preparation which, when applied as part of a desired dosage regimen provides a benefit according to clinically acceptable standards for the treatment or prophylaxis of a particular disorder.

[0466] As used herein the term “low aqueous solubility” refers to water insoluble compounds having poor solubility in water, that is <5 mg/ml at physiological pH (6.5-7.4). Preferably, their water solubility is <1 mg/ml, more preferably <0.1 mg/ml. It is desirable that the drug is stable in water as a dispersion; otherwise a lyophilized or spray-dried solid form may be desirable.

[0467] A “patient” or “subject” to be treated by the subject method can mean either a human or non-human subject.

[0468] The “polymerizations” of the present invention include radical, anionic, and cationic mechanisms, as well as reactions of bifunctional molecules (analogous to the formation of nylon, e.g., reacting molecules each of which bears two or more different reactive moieties that react with each other (but, preferably, are disfavored from reacting intramolecularly by steric, conformational, or other constraints), or reacting two or more different compounds, each compound bearing two or more reactive moieties that react only with reactive moieties of different compounds (i.e., intermolecularly), as well as metal-catalyzed polymerizations such as olefin metathesis, and other polymerization reactions known to those of skill in the art.

[0469] The terms “prophylactic” and “therapeutic” are art-recognized and includes administration to the host of one or more of the subject compositions. If it is administered prior to clinical manifestation of the unwanted condition (e.g., disease or other unwanted state of the host animal) then the treatment is prophylactic, i.e., it protects the host against developing the unwanted condition, whereas if it is administered after manifestation of the unwanted condition, the treatment is therapeutic, (i.e., it is intended to diminish, ameliorate, or stabilize the existing unwanted condition or side effects thereof).

[0470] The term “preventing” is art-recognized, and when used in relation to a condition, such as a local recurrence (e.g., pain), a disease such as cancer, a syndrome complex such as heart failure or any other medical condition, is well understood in the art, and includes administration of a composition which reduces the frequency of, or delays the onset of, symptoms of a medical condition in a subject relative to a subject which does not receive the composition. Thus, prevention of a condition includes, for example, reducing the number of detectable cancerous growths in a population of patients receiving a prophylactic treatment relative to an untreated control population, and/or delaying the appearance of detectable cancerous growths in a treated population versus an untreated control population, e.g., by a statistically and/or clinically significant amount. Prevention of an infection includes, for example, reducing the number of diagnoses of the infection in a treated population versus an untreated control population, and/or delaying the onset of symptoms of the infection in a treated population versus an untreated control population. Prevention of pain includes, for example, reducing the frequency of, or alternatively delaying, pain sensations experienced by subjects in a treated population versus an untreated control population.

[0471] The term “small molecule” refers to a compound having a molecular weight less than about 2500 amu, preferably less than about 2000 amu, even more preferably less than about 1500 amu, still more preferably less than about 1000 amu, or most preferably less than about 750 amu.

[0472] The term “substituted” refers to moieties having substituents replacing a hydrogen on one or more carbons of the backbone. It will be understood that “substitution” or “substituted with” includes the implicit proviso that such substitution is in accordance with permitted valence of the substituted atom and the substituent, and that the substitution results in a stable compound, e.g., which does not spontaneously undergo transformation such as by rearrangement, cyclization, elimination, etc. As used herein, the term “substituted” is contemplated to include all permissible substituents of organic compounds. In a broad aspect, the permissible substituents include acyclic and cyclic, branched and unbranched, carbocyclic and heterocyclic, aromatic and non-aromatic substituents of organic compounds. The permissible substituents may be one or more and the same or different for appropriate organic compounds. For purposes of this invention, the heteroatoms such as nitrogen may have hydrogen substituents and/or any
permissible substituents of organic compounds described herein which satisfy the valences of the heteroatoms. Substituents may include any substituents described herein, for example, a halogen, a hydroxyl, a carbonyl (such as a carboxyl, an alkoxycarbonyl, a formyl, or an acetyl), a thiocarbonyl (such as a thioester, a thioacetal, or a thioformate), an alkoxyl, a phosphoryl, a phosphate, a phosphonate, a phosphinate, an amino, an amido, an amidine, an imine, a cyano, a nitro, an azido, a sulfonyl, an alkylthio, a sulfate, a sulfonate, a sulfamoyl, a sulfonamido, a sulfonyl, a het-
ercyclicyl, an aralkyl, or an aromatic or heteroaromatic moiety. It will be understood by those skilled in the art that the moieties substituted on the hydrocarbon chain may themselves be substituted, if appropriate. Unless specifically indicated as unsubstituted, all occurrences of moieties bearing one or more C—H bonds may be either unsubstituted or substituted as defined herein. By way of example, a reference to an “alkyl” or “aryl” group will be understood to include unsubstituted or substituted variants thereof.

[0473] As used herein, the terms “therapeutic agent” includes any synthetic or naturally occurring biologically active compound or composition of matter which, when administered to an organism (human or nonhuman animal), induces a desired pharmacologic, immunologic, and/or physiologic effect by local and/or systemic action. The term therefore encompasses those compounds or chemicals traditionally regarded as drugs, vaccines, and biopharmaceuticals including molecules such as proteins, peptides, hormones, nucleic acids, gene constructs and the like. More particularly, the term “therapeutic agent” includes compounds or compositions for use in all of the major therapeutic areas including, but not limited to, adjuvants; anti-infectives such as antibiotics and antiviral agents; analgesics and anesthetic combinations, anorexics, anti-inflammatory agents, anti-epileptics, local and general anesthetics, hypnotics, sedatives, antipsychotic agents, neuroleptic agents, antidepressants, anxiolytics, antagonists, neuron blocking agents, anti-cholinergic and cholinomimetic agents, antimuscarinic and muscarinic agents, antihistaminics, anti-hypertensives, hormones, and nutrients, anti-arthritis, antiasthmatic agents, antiinflammatory agents, anticonvulsants, antihistamines, antinauseants, antineoplastics, antipruritics, antipyretics; antispasmodics, cardiovascular preparations (including calcium channel blockers, beta-blockers, beta-
agonists and antiarrhythmics), anti-hypertensives, diuretics, vasodilators; central nervous system stimulants; cough and cold preparations; decongestants; diuretics; hormones; bone growth stimulants and bone resorption inhibitors; immunosuppressives; muscle relaxants; psychostimulants; sedatives; tranquilizers; proteins, peptides and fragments thereof (whether naturally occurring, chemically synthesized or recombinantly produced); and nucleic acid molecules (polymeric forms of two or more nucleotides, either ribonucleotides (RNA) or deoxyribonucleotides (DNA) including both double- and single-stranded molecules, gene constructs, expression vectors, antisense molecules and the like), small molecules (e.g., doxorubicin) and other biologically active macromolecules such as, for example, proteins and enzymes. The agent may be a biologically active agent used in medical, including veterinary, applications and in agriculture, such as with plants, as well as other areas. The term “therapeutic agent” also includes without limitation, medicaments; vitamins; mineral supplements; substances used for the treatment, prevention, diagnosis, cure or mitigation of disease or illness; or substances which affect the structure or function of the body; or prodrugs, which become biologically active or more active after they have been placed in a predetermined physiological environment.

[0474] A “therapeutically effective amount” of a compound, with respect to a method of treatment, refers to an amount of the compound(s) in a preparation which, when administered as part of a desired dosage regimen (to a mammal, preferably a human) alleviates a symptom, ameliorates a condition, or slows the onset of disease conditions according to clinically acceptable standards for the disorder or condition to be treated or the cosmetic purpose, e.g., at a reasonable benefit/risk ratio applicable to any medical treatment.

[0475] “Physiological conditions” describe the conditions inside an organism, i.e., in vivo. Physiological conditions include the acidic and basic environments of body cavities and organs, enzymatic cleavage, metabolism, and other biological processes, and preferably refer to physiological conditions in a vertebrate, such as a mammal.

[0476] The term “physiological pH,” as used herein, refers to a pH that is about 7.4 at the standard physiological temperature of 37.4°C. The term “non-physiological pH,” as used herein, refers to a pH that is less than or greater than “physiological pH,” preferably between about 4 and 7.3, or greater than 7.5 and less than about 12. The term “neutral pH,” as used herein, refers to a pH of about 7. In preferred embodiments, physiological pH refers to pH 7.4, and non-physiological pH refers to pH between about 6 and 7. The term “acidic pH” refers to a pH that is below pH 7, preferably below about pH 6, or even below about pH 4.

[0477] The term “prodrug” is intended to encompass compounds which, under physiological conditions, are converted into the therapeutically active agents of the present invention. A common method for making a prodrug is to include selected moieties which are hydrolyzed under physiological conditions to reveal the desired molecule. In other embodiments, the prodrug is converted by an enzymatic activity of the host animal.

[0478] As used herein, “proliferating” and “proliferation” refer to cells undergoing mitosis.

[0479] The term “acyl” is art-recognized and refers to a group represented by the general formula hydrocarbylC(0)—, preferably alkylC(0)—.

[0480] The term “acyloxy” is art-recognized and refers to a group represented by the general formula hydrocarbylC(0)O—, preferably alkylC(0)O—.

[0481] The term “alkoxyalkyl” refers to an alkyl group substituted with an alkoxyl group and may be represented by the general formula alkyl-O-alkyl.

[0482] The terms “alkenyl” and “alkyny” refer to unsaturated aliphatic groups analogous in length and possible substitution to the alkyls described below, but that contain at least one double or triple bond respectively.

[0483] The term “alkoxy” refers to an alkyl group having an oxygen attached thereto. Representative alkoxy groups include methoxy, ethoxy, propoxy, tert-butoxy and the like.

[0484] The term “alkyl” refers to saturated aliphatic groups, including straight-chain alkyl groups, branched-chain alkyl groups, cycloalkyl (alicyclic) groups, alkyl-substituted cycloalkyl groups, and cycloalkyl-substituted alkyl groups. In preferred embodiments, a straight chain or branched chain alkyl has 30 or fewer carbon atoms in its
backbone (e.g., C_{1-30} for straight chains, C_{3-30} for branched chains), and more preferably 20 or fewer.

[0485] Moreover, the term “alkyl” as used throughout the specification, examples, and claims is intended to include both unsubstituted and substituted alkyl groups, the latter of which refers to alkyl moieties having substituents replacing a hydrogen on one or more carbons of the hydrocarbon backbone, including haloalkyl groups such as trifluoromethyl and 2,2,2-trifluoroethyl, etc.

[0486] The term “C_{x-y},” when used in conjunction with a chemical moiety, such as, acyl, acyloxy, alkyloxy, alkenyl, alkynyl, or alkaxy, is meant to include groups that contain from x to y carbons in the chain. C_{x-y} indicates a hydrogen where the group is in a terminal position, a bond if internal. A C_{x-y} alkyl group, for example, contains from one to six carbon atoms in the chain.

[0487] The term “alkylamino,” as used herein, refers to an amino group substituted with at least one alkyl group.

[0488] The term “alkylcycloalkyl,” as used herein, refers to groups, which contain cycloalkyl as well as alkyl, alkenyl or alkynyl groups according to the above definition, e.g., alkylcycloalkyl, alkenylcycloalkyl, and alkynylcycloalkyl groups, etc. Preferentially a alkylcycloalkyl group is composed of a cycloalkyl group, comprising one or more rings, comprising three to ten, preferably three, four, five, six or seven carbon-atoms and one or two alkyl, alkenyl, or alkynyl groups with one to two to six carbon atoms.

[0489] The term “alkylthio,” as used herein, refers to a thiol group substituted with an alkyl group and may be represented by the general formula alkyl-S—.

[0490] The term “amide” or “amido,” as used herein, refers to a group

![amide group](image)

wherein R^8 and R^{10} each independently represent a hydrogen or hydrocarbyl group, or R^8 and R^{15} taken together with the N atom to which they are attached complete a heterocycle having from 4 to 8 atoms in the ring structure.

[0491] The terms “amine” and “aminoo” are art-recognized and refer to both unsubstituted and substituted amines and salts thereof, e.g., a moiety that can be represented by

![amine group](image)

wherein R^9, R^{10}, and R^{15} each independently represent a hydrogen or a hydrocarbyl group, or R^9 and R^{15} taken together with the N atom to which they are attached complete a heterocycle having from 4 to 8 atoms in the ring structure.

[0492] The term “aminocycloalkyl,” as used herein, refers to an alkyl group substituted with an amino group.

[0493] The term “amidene” denotes the group —C(NH)—NHR wherein R is H or alkyl or aralkyl. A preferred amidine is the group —C(NH)—NH_2.

[0494] The term “aryalkyl,” as used herein, refers to an alkyl group substituted with an aryl group.

[0495] The term “aryl” as used herein include substituted or unsubstituted single-ring aromatic groups in which each atom of the ring is carbon. Preferably the ring is a 5- to 7-membered ring, more preferably a 6-membered ring. The term “aryl” also includes polycyclic ring systems having two or more cyclic rings in which two or more carbons are common to two adjoining rings wherein at least one of the rings is aromatic, e.g., the other cyclic rings can be cycloalkyls, cycloalkeny1s, cycloalkynes, aryls, heteroaryl, and/or heterocyclics. Aryl groups include benzene, naphthalene, phenanthrene, phenol, aniline, and the like.

[0496] The term “carbamate” is art-recognized and refers to a group

![carbamate group](image)

wherein R^9 and R^{15} independently represent hydrogen or a hydrocarbyl group.

[0497] The term “carboxylate” is art-recognized and refers to a group —OC(O)2—.

[0498] The term “carboxylic acid,” as used herein, refers to a group represented by the formula CO2H.

[0499] The terms “carboxylic,” “carboxyclic,” and “carbocyclic,” as used herein, refers to a non-aromatic saturated or unsaturated ring in which each atom of the ring is carbon. Preferably a carboxylic ring contains from 3 to 10 atoms, more preferably from 5 to 7 atoms.

[0500] The term “carbonyl” is art-recognized and includes such moieties as may be represented by the general formula:

![carbonyl group](image)

wherein X is a bond or represents an oxygen or a sulfur, and R_11 represents a hydrogen, an alkyl, an alkenyl, —(CH_2)_n—R_6 or a pharmaceutically acceptable salt, R_11 represents a hydrogen, an alkyl, an alkenyl or —(CH_2)_n—R_8, where m and n are as defined above. Where X is an oxygen and R_11 or R'_11 is not hydrogen, the formula represents an “ester.” Where X is an oxygen, and R_11 is as defined above, the moiety is referred to herein as a carboxyl group, and particularly when R_11 is a hydrogen, the formula represents a “carboxylic acid”. Where X is an oxygen, and R'_11 is hydrogen, the formula represents a “formate”. In general, where the oxygen atom of the above formula is replaced by sulfur, the formula represents a “thiocarbonyl” group. Where X is a sulfur and R_11 or R'_11 is not hydrogen, the formula represents a “thioestier.” Where X is a sulfur and R_11 is hydrogen, the formula represents a “thiocarboxylic acid.” Where X is a sulfur and R'_11 is hydrogen, the formula represents a “thioformate.” On the other hand, where X is a bond, and R_11 is not hydrogen, the above formula represents...
a “ketone” group. Where X is a bond, and \( R_{11} \) is hydrogen, the above formula represents an “aldehyde” group.

**[0501]** The term “cycloalkyl” refers to a saturated or partially unsaturated (e.g., cycloalkenyl) cyclic group, comprising one or several rings, preferably one or two, containing three to fourteen ring carbon atoms, preferably three to ten, preferably three, four, five, six or seven ring carbon atoms. Furthermore the term cycloalkyl refers to a group where one or more hydrogen atoms are replaced by F, Cl, Br, I, OH, \( \equiv = \) O, SH, \( \equiv = S \), NH\(_2\), –NH\(_2\), NO\(_2\), or cyclic ketones, for example cyclohexanone, 2-cyclohexenone or cyclopentanone. Examples of cycloalkyl groups are cyclopropyl, cyclobutyl, cyclopentenyl, spiro[4.5]decanyl, norbornyl, cyclohexyl, cyclopentenyl, cyclohexadienyl, decalinyl, cubanyl, bicyclo[4.3.0]nonylenyl, tetralin, cyclopentylecyclohexyl, fluor-cyclohexyl or the cyclohex-2-anyl group.

**[0502]** The term “ester”, as used herein, refers to a group –CO(\( OR \)) wherein \( R \) represents a hydrocarbyl group.

**[0503]** The term “ether”, as used herein, refers to a hydrocarbyl group linked through an oxygen to another hydrocarbyl group. Accordingly, an ether substituent of a hydrocarbyl group may be hydrocarbyl-O-\( OR \). Either may be either symmetrical or unsymmetrical. Examples of ethers include, but are not limited to, heterocycle-O-heterocycle and arylo-heterocycle. Ethers include “alkoxyalkyl” groups, which may be represented by the general formula alkyl-O-alkyl.

**[0504]** The terms “halo” and “halogen” as used herein means halogen and includes chloro, fluoro, bromo, and iodo.

**[0505]** The terms “heteroalkyl” and “heteroarylalkyl”, as used herein, refers to an alkyl group substituted with a heteroaryl group.

**[0506]** The terms “heterocycloalkyl” and “heteroaralkenyl”, as used herein, refers to an alkenyl group substituted with a heteroaryl group.

**[0507]** The term “heteroaryl” refers to a alkyl, alkenyl or alkynyl group, where several, preferably one, two or three carbon atoms are replaced by a O, N, P, B, Se, Si, or S atom, preferably O, S, N. The term heteroaryl also includes a carboxylic acid or a thereof derived group, for example acyl (alkyl-CO), acylalkyl, alkoxy-carbonyl, aclyoxy, aclyoxyalkyl, carboxyalkylamid or alkoxycarbonyloxy.

**[0508]** The terms “heterocycloalkyl”, “heterocycle”, and “heterocyclic” refer to substituted or unsubstituted non-aromatic ring structures, preferably 3- to 10-membered rings, more preferably 3- to 7-membered rings, whose ring structures include at least one heteroatom, preferably one to four heteroatoms, more preferably one or two heteroatoms. The terms “heterocycloalkyl” and “heterocyclic” also include polycyclic ring systems having two or more cyclic rings in which two or more carbons are common to two adjoining rings wherein at least one of the rings is heterocyclic, e.g., the other cyclic rings may be cycloalkyls, cycloalkenyls, cycloalkynyls, aryls, heteroaryl, or heterocyclyls. Heterocyclyl groups include, for example, piperdine, piperazine, pyrrolidin, morpholine, lactones, and the like.

**[0509]** The term “heteroalkylcycloalkyl” refers to alkylcycloalkyl groups, according to the above definition, wherein one or several, preferably one, two or three carbon atoms are replaced by O, N, Si, Se, P or S, preferably O, S, N. In certain instances a heteroalkylcycloalkyl group comprises one or two ring systems with three to ten, preferably three, four, five, six or seven ring atoms and one or two alkyl, alkenyl, alkylnyl or heteroalkyl groups with one or two to six carbon atoms. Examples of such a group are alkyheterocycloalkyl, alkyheterocycloalkenylnyl, alkenylnheterocycloalkyl, alkylnheterocycloalkyl, heterocycloalkyl-cycloalkyl, heteroalkylheterocycloalkyl and heteroalkylheterocycloalkenyl, wherein the cyclic group is saturated or partially (e.g., twofold or threefold) unsaturated.

**[0510]** The terms “heteroaryl” and “heteraryl” include substituted or unsubstituted aromatic single ring structures, preferably 5- to 7-membered rings, more preferably 5- to 6-membered rings, whose ring structures include at least one heteroatom, preferably one to four heteroatoms, more preferably one or two heteroatoms. The term “heteroaryl” also includes polycyclic ring systems having two or more cyclic rings in which two or more carbons are common to two adjoining rings wherein at least one of the rings is heteroaromatic, e.g., the other cyclic rings can be cycloalkyls, cycloalkenylnyls, aryln, heteroaryl, and/or heterocycls. Heteroaryl groups include, for example, pyrrole, furan, thiophene, imidazole, oxazole, thiazole, pyrazole, pyridine, pyrazine, pyridazine, and pyrimidine, and the like.

**[0511]** The term “heteroatom” as used herein means an atom of any element other than carbon or hydrogen. Preferred heteroatoms are nitrogen, oxygen, and sulfur.

**[0512]** The term “heterocycloalkyl” refers to the above definition of cycloalkyl, wherein one or more, preferably one, two or three ring carbon atoms are replaced by a O, N, Si, Se, P or S, preferably O or S. Preferentially a heterocycloalkyl group is composed of one or two rings comprising three to ten, preferably three, four, five, six or seven ring atoms. Moreover, the term heterocycloalkyl refers to groups where one or more hydrogen atoms are replaced by F, Cl, Br, I, OH, \( \equiv = \) O, SH, \( \equiv = S \), NH\(_2\), NO\(_2\). Examples of heterocycloalkyl are piperdyl, morpholinyl, urotropinyl, pyrrolidinyl, tetrahydrothiophenyl, tetrahydrofuranyl, oxacyclopentyl, azacyclopentyl or 2-pyrazolinyl groups as well as lactams, lactones, cyclic imides and cyclic anhydrides.

**[0513]** The terms “heterocycloalkyl”, “heterocycle”, and “heterocyclic” refer to substituted or unsubstituted aromatic ring structures, preferably 3- to 10-membered rings, more preferably 3- to 7-membered rings, whose ring structures include at least one heteroatom, preferably one to four heteroatoms, more preferably one or two heteroatoms. The terms “heterocycloalkyl” and “heterocyclic” also include polycyclic ring systems having two or more cyclic rings in which two or more carbons are common to two adjoining rings wherein at least one of the rings is heterocyclic, e.g., the other cyclic rings can be cycloalkyls, cycloalkenylnyls, cycloalkynyls, arylenylnyl, and/or heterocycls. Heterocycloalkyl groups include, for example, imidazolidinone, piperdine, piperrazine, pyrrolidin, morpholine, lactones, lactams, and the like.

**[0514]** The term “hydrocarbyl”, as used herein, refers to a group that is bonded through a carbon atom that optionally has a \( \equiv = O \) or \( \equiv = S \) substituent and typically has at least one carbon-hydrogen bond and a primarily carbon backbone, but may optionally include functional groups with heteroatoms interrupting the carbon backbone. Examples of such functional groups with interrupting heteroatoms include amino, amide, carbonate, carbamate, ether (e.g., polyethylene glycol), ester, thioester, thiourea, and urea groups. For illustrative purposes, additional examples of hydrocarbyl groups
include methyl, ethoxyethyl, 2-pyridyl, trifluoromethyl, and acetyl, but not, for example, ethoxy (which is linked through oxygen, not carbon). Additional hydrocarbyl groups include, but are not limited to aryl, heteroaryl, carbocycle, heterocycle, alkyl, alkenyl, alkynyl, and combinations thereof. Hydrocarbyl also includes corresponding divalent species (i.e., hydrocarbylene), such as alkylene, areylene, etc.

[0515] The term “hydroxalkyl,” as used herein, refers to an alkyl group substituted with a hydroxy group.

[0516] The term “lower” when used in conjunction with a chemical moiety, such as, acyl, acyloxy, alkyl, alkenyl, alkynyl, or alkoxy is meant to include groups where there are ten or fewer non-hydrogen atoms in the substituent, preferably six or fewer. A “lower alkyl,” for example, refers to an alkyl group that contains ten or fewer carbon atoms, preferably six or fewer. In certain embodiments, acyl, acyloxy, alkyl, alkenyl, alkynyl, or alkoxy substituents defined herein are respectively lower acyl, lower acyloxy, lower alkyl, lower alkenyl, lower alkynyl, or lower alkoxy, whether they appear alone or in combination with other substituents, such as in the reactions hydroxalkyl and alkaryl (in which case, for example, the atoms within the aryl group are not counted when counting the carbon atoms in the alkyl substituent).

[0517] The terms “polycycle,” “polycyclic,” and “polycyclic” refer to two or more rings (e.g., cycloalkyls, cycloalkenyls, cycloalkynyls, aryls, heteroaryl, and/or heterocycles) in which two or more atoms are common to two adjoining rings, e.g., the rings are “fused rings.” Each of the rings of the polycycle may be substituted or unsubstituted. In certain embodiments, each ring of the polycycle contains from 3 to 10 atoms in the ring, preferably from 5 to 7.

[0518] The term “sulfite” is art-recognized and refers to the group —SO$_2$H, or a pharmaceutically acceptable salt thereof.

[0519] The term “sulfonamide” is art-recognized and refers to the group represented by the general formula

\[
\begin{align*}
\text{O} & \quad \text{N} \\
\text{R} & \quad \text{R}^\text{10}
\end{align*}
\]

wherein $R^9$ and $R^{10}$ independently represent hydrogen or hydrocarbyl.

[0520] The term “sulfoxide” is art-recognized and refers to the group —SO($\text{O}$).

[0521] The term “sulfonate” is art-recognized and refers to the group SO$_2$H, or a pharmaceutically acceptable salt thereof.

[0522] The term “sulfone” is art-recognized and refers to the group —SO$_2$.

[0523] The term “thioester,” as used herein, refers to a group $-\text{C}(\text{OS})\text{R}^9$ or $-\text{SC}(\text{O})\text{R}^9$ wherein $R^9$ represents a hydrocarbyl.

[0524] The term “urea” is art-recognized and may be represented by the general formula

\[
\begin{align*}
\text{O} & \quad \text{N} \\
\text{R} & \quad \text{R}^\text{10}
\end{align*}
\]

wherein $R^9$ and $R^{10}$ independently represent hydrogen or a hydrocarbyl.

[0525] Analogous substitutions may be made to alkynyl and alkenyl groups to produce, for example, aminooalkenyls, aminooalkynyls, amidooalkenyls, amidooalkynyls, iminoalkenyls, iminoalkynyls, thioalkenyls, thioalkynyls, carbonyl-substituted alkenyls or alkynyls.

[0526] As used herein, the definition of each expression, e.g., alkyl, m, n, etc., when it occurs more than once in any structure, is intended to be independent of its definition elsewhere in the same structure.

IV. Pharmaceutical Compositions, Formulations and Dosages

[0527] In part, a biocompatible polymer composition of the present invention includes a biocompatible and optionally biodegradable polymer, such as one having the recurring monomeric units shown in one of the foregoing formulas, optionally including any other biocompatible and optionally biodegradable polymer mentioned above or known in the art. In certain embodiments, the compositions are non-pyrogenic, e.g., do not trigger elevation of a patient’s body temperature by more than a clinically acceptable amount.

[0528] The subject compositions may contain a “drug,” “therapeutic agent,” “medicament,” or “bioactive substance,” which are biologically, physiologically, or pharmacologically active substances that act locally or systemically in the human or animal body. For example, a subject composition may include any of the other compounds discussed above.

[0529] Various forms of the medicaments or biologically active materials may be used which are capable of being released from the polymer matrix into adjacent tissues or fluids. They may be hydrophobic molecules, neutral molecules, polar molecules, or molecular complexes capable of hydrogen bonding. They may be in the form of ethers, esters, amides and the like, including prodrugs which are biologically activated when injected into the human or animal body, e.g., by cleavage of an ester or amide. A therapeutic agent in a subject composition may vary widely with the purpose for the composition.

[0530] Plasticizers and stabilizing agents known in the art may be incorporated in polymers of the present invention. In certain embodiments, additives such as plasticizers and stabilizing agents are selected for their biocompatibility. In certain embodiments, the additives are lung surfactants, such as 1,2-dipalmitoylphosphatidylcholine (DPPC) and L-$\alpha$-phosphatidylcholine (PC).

[0531] A composition of this invention may further contain one or more adjuvant substances, such as fillers, thickening agents or the like. In other embodiments, materials that serve as adjuvants may be associated with the polymer matrix. Such additional materials may affect the characteristics of the polymer matrix that results.
[0532] For example, fillers, such as bovine serum albumin (BSA) or mouse serum albumin (MSA), may be associated with the polymer matrix. In certain embodiments, the amount of filler may range from about 0.1 to about 50% or more by weight of the polymer matrix, or about 2.5, 5, 10, 25, or 40 percent. Incorporation of such fillers may affect the biodegradation of the polymeric material and/or the sustained release rate of any encapsulated substance. Other fillers known to those of skill in the art, such as carbohydrates, sugars, starches, saccharides, celluloses and polysaccharides, including mannitol and sucrose, may be used in certain embodiments of the present invention.

[0533] In other embodiments, spheroporation enhancers facilitate the production of subject polymeric matrices that are generally spherical in shape. Substances such as zein, microcrystalline cellulose or microcrystalline cellulose co-processed with sodium carboxymethyl cellulose may confer plasticity to the subject compositions as well as implant strength and integrity. In particular embodiments, during spheroporation, extrudates that are rigid, but not plastic, result in the formation of dumbbell shaped implants and/or a high proportion of fines, and extrudates that are plastic, but not rigid, tend to agglomerate and form excessively large implants. In such embodiments, a balance between rigidity and flexibility is desirable. The percent of spheroporation enhancement in a formulation typically ranges from 10 to 90% (w/w).

[0534] In certain embodiments, a subject composition includes an excipient. A particular excipient may be selected based on its melting point, solubility in a selected solvent (e.g., a solvent that dissolves the polymer and/or the therapeutic agent), and the resulting characteristics of the microcrystals or nanoparticles.

[0535] Excipients may comprise a few percent, about 5%, 10%, 15%, 20%, 25%, 30%, 40%, 50%, or higher percentage of the subject compositions.

[0536] Buffers, acids and bases may be incorporated in the subject compositions to adjust their pH. Agents to increase the diffusion distance of agents released from the polymer matrix may also be included.

[0537] Disintegrants are substances that, in the presence of liquid, promote the disruption of the subject compositions. Disintegrants are most often used in implants, in which the function of the disintegrant is to counteract or neutralize the effect of any binding materials used in the subject formulation. In general, the mechanism of disintegration involves moisture absorption and swelling by an insoluble material.

[0538] Examples of disintegrants include croscarmellose sodium and crospovidone which, in certain embodiments, may be incorporated into the polymeric matrices in the range of about 1-20% of total matrix weight. In other cases, soluble fillers such as sugars (mannitol and lactose) may also be added to facilitate disintegration of implants.

[0539] Other materials may be used to advantage or to control the desired release rate of a therapeutic agent for a particular treatment protocol. For example, if the sustained release is too slow for a particular application, a pore-forming agent may be added to generate additional pores in the matrix. Any biocompatible water-soluble material may be used as the pore-forming agent. They may be capable of dissolving, diffusing or dispersing out of the formed polymer system whereupon pores and microporous channels are generated in the system. The amount of pore-forming agent (and size of dispersed particles of such pore-forming agent, if appropriate) within the composition should affect the size and number of the pores in the polymer system.

[0540] Pore-forming agents include any pharmaceutically acceptable organic or inorganic substance that is substantially miscible in water and body fluids and will dissipate from the forming and formed matrix into aqueous medium or body fluids or water-immiscible substances that rapidly degrade to water-soluble substances.

[0541] Suitable pore-forming agents include, for example, sugars such as sucrose and dextrose, salts such as sodium chloride and sodium carbonate, and polymers such as hydroxypropylcellulose, carboxymethylcellulose, polyethylene glycol, and PVP. The size and extent of the pores may be varied over a wide range by changing the molecular weight and percentage of pore-forming agent incorporated into the polymer system.

[0542] The charge, lipophilicity or hydrophilicity of any subject polymeric matrix may be modified by attaching in some fashion an appropriate compound to the surface of the matrix. For example, surfactants may be used to enhance wettability of poorly soluble or hydrophobic compositions. Examples of suitable surfactants include dextran, polysorbates and sodium lauryl sulfate. In general, surfactants are used in low concentrations, generally less than about 5%.

[0543] Binders are adhesive materials that may be incorporated in polymeric formulations to bind and maintain matrix integrity. Binders may be added as dry powder or as solution. Sugars and natural and synthetic polymers may act as binders.

[0544] Materials added specifically as binders are generally included in the range of about 0.5%-15% w/w of the matrix formulation. Certain materials, such as microcrystalline cellulose, also used as a spheroporation enhancer, also have additional binding properties.

[0545] Various coatings may be applied to modify the properties of the matrices.

[0546] Three exemplary types of coatings are seal, gloss and enteric coatings. Other types of coatings having various dissolution or erosion properties may be used to further modify subject matrices behavior, and such coatings are readily known to one of ordinary skill in the art.

[0547] The seal coat may prevent excess moisture uptake by the matrices during the application of aqueous based enteric coatings. The gloss coat generally improves the handling of the finished matrices. Water-soluble materials such as hydroxypropylcellulose may be used to seal coat and gloss coat implants. The seal coat and gloss coat are generally sprayed onto the matrices until an increase in weight between about 0.5% and about 5%, often about 1% for a seal coat and about 3% for a gloss coat, has been obtained.

[0548] Enteric coatings consist of polymers which are insoluble in the low pH (less than 3.0) of the stomach, but are soluble in the elevated pH (greater than 4.0) of the small intestine. Polymers such as EUDRAGIT™, RohnTech, Inc., Maked, Mass., and AQUATERIC™, FMC Corp., Philadelphia, Pa., may be used and are layered as thin membranes onto the implants from aqueous solution or suspension or by a spray drying method. The enteric coat is generally sprayed to a weight increase of about 1% to about 30%, preferably about 10 to about 15% and may contain coating adjuvants such as plasticizers, surfactants, separating agents that reduce the tackiness of the implants during coating, and coating permeability adjusters.
The present compositions may additionally contain one or more optional additives such as fibrous reinforcement, colorants, perfumes, rubber modifiers, modifying agents, etc. In practice, each of these optional additives should be compatible with the resulting polymer and its intended use. Examples of suitable fibrous reinforcement include PGA microfibers, collagen microfibers, cellulose microfibers, and olefinic microfibers. The amount of each of these optional additives employed in the composition is an amount necessary to achieve the desired effect.

The therapeutic polymer conjugates as described herein can be administered in various pharmaceutical formulations, depending on the disorder to be treated and the age, condition and body weight of the patient, as is well known in the art. For example, where the compounds are to be administered orally, they may be formulated as tablets, capsules, granules, powders or syrups; or for parenteral administration, they may be formulated as injections (intravenous, intramuscular or subcutaneous), drop infusion preparations or suppositories. For application by the ophthalmic mucous membrane route, they may be formulated as eye drops or eye ointments. These formulations can be prepared by conventional means, and, if desired, the active ingredient may be mixed with any conventional additive, such as an excipient, a binder, a disintegrating agent, a lubricant, a corrigent, a solubilizing agent, a suspension aid, an emulsifying agent or a coating agent. Although the dosage will vary depending on the symptoms, age and body weight of the patient, the nature and severity of the disorder to be treated or prevented, the route of administration and the form of the drug, in general, a daily dosage of from 0.01 to 2000 mg of the therapeutic agent is recommended for an adult human patient, and this may be administered in a single dose or in divided doses.

The precise time of administration and/or amount of therapeutic polymer conjugate that will yield the most effective results in terms of efficacy of treatment in a given patient will depend upon the activity, pharmacokinetics, and bioavailability of a particular compound, physiological condition of the patient (including age, sex, disease type and stage, general physical condition, responsiveness to a given dosage and type of medication), route of administration, etc. However, the above guidelines can be used as the basis for fine-tuning the treatment, e.g., determining the optimum time and/or amount of administration, which will require no more than routine experimentation consisting of monitoring the subject and adjusting the dosage and/or timing.

The phrase “pharmacologically acceptable” is employed herein to refer to those therapeutic polymer conjugates, materials, compositions, and/or dosage forms which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of human beings and animals without excessive toxicity, irritation, allergic response, or other problem or complication, commensurate with a reasonable benefit/risk ratio.

The phrase “pharmacologically acceptable carrier” as used herein means a pharmaceutically acceptable material, composition or vehicle, such as a liquid or solid filler, diluent, excipient, solvent or encapsulating material. Each carrier must be “acceptable” in the sense of being compatible with the other ingredients of the formulation and not injurious to the patient. Some examples of materials which can serve as pharmaceutically acceptable carriers include: (1) sugars, such as lactose, glucose and sucrose; (2) starches, such as corn starch and potato starch; (3) cellulose, and its derivatives, such as sodium carboxymethyl cellulose, ethyl cellulose and cellulose acetate; (4) powdered tragacanth; (5) malt; (6) gelatin; (7) tafe; (8) excipients, such as cocoa butter and suppository waxes; (9) oils, such as peanut oil, cottonseed oil, safflower oil, sesame oil, olive oil, corn oil and soybean oil; (10) glycols, such as propylene glycol; (11) polyols, such as glycerin, sorbitol, mannitol and polyethylene glycol; (12) esters, such as ethyl oleate and ethyl laurate; (13) agar; (14) buffering agents, such as magnesium hydroxide and aluminum hydroxide; (15) alginic acid; (16) pyrogen-free water; (17) isotonic saline; (18) Ringer’s solution; (19) ethyl alcohol; (20) phosphate buffer solutions; and (21) other non-toxic compatible substances employed in pharmaceutical formulations.

The term “pharmacologically acceptable salts” refers to the relatively non-toxic, inorganic and organic acid addition salts of the therapeutic polymer conjugates. These salts can be prepared in situ during the final isolation and purification of the therapeutic polymer conjugates, or by separately reacting a purified polymer in its free base form with a suitable organic or inorganic acid, and isolating the salt thus formed. Representative salts include the hydrobromide, hydrochloride, sulfate, bisulfate, phosphate, nitrate, acetate, valerate, oleate, palmitate, stearate, laurate, benzoate, lactate, phosphate, tosylate, citrate, maleate, fumarate, succinate, tartrate, naphthylate, mesylate, glucuronate, lactobionate, and laurylsulfonate salts and the like. (See, for example, Berge et al. (1977) “Pharmaceutical Salts”, J. Pharm. Sci. 66:1-19)

In other cases, the therapeutic polymer conjugates useful in the methods of the present invention may contain one or more acidic functional groups and, thus, are capable of forming pharmaceutically acceptable salts with pharmaceutically acceptable bases. The term “pharmaceutically acceptable salts” in these instances refers to the relatively non-toxic, inorganic and organic base addition salts of the polymer(s). These salts can likewise be prepared in situ during the final isolation and purification of the polymer(s), or by separately reacting the purified polymer(s) in its free acid form with a suitable base, such as the hydroxide, carbonate or bicarbonate of a pharmaceutically acceptable metal cation, with ammonia, or with a pharmaceutically acceptable organic primary, secondary or tertiary amine. Representative alkali or alkaline earth salts include the lithium, sodium, potassium, calcium, magnesium, and aluminum salts and the like. Representative organic amines useful for the formation of base addition salts include ethylenediamine, diethylenetriamine, ethanolamine, diethanolamine, piperazine and the like (see, for example, Berge et al., supra).

Wetting agents, emulsifiers and lubricants, such as sodium lauryl sulfate and magnesium stearate, as well as coloring agents, release agents, coating agents, sweetening, flavoring and perfuming agents, preservatives and antioxidants can also be present in the compositions.

Examples of pharmaceutically acceptable antioxidants include: (1) water soluble antioxidants, such as ascorbic acid, cysteine hydrochloride, sodium bisulfate, sodium metabisulfite, sodium sulfite and the like; (2) oil-soluble antioxidants, such as ascorbyl palmitate, butylated hydroxyanisole (BHA), butylated hydroxytoluene (BHT), tocopherols, propyl gallate, alpha-tocopherol, and the like; and (3) metal
chelating agents, such as citric acid, ethylenediamine tetraacetic acid (EDTA), sorbitol, tartaric acid, phosphoric acid, and the like.

Methods of preparing these formulations or compositions include the step of bringing into association a therapeutic polymer conjugate(s) with the carrier and, optionally, one or more accessory ingredients. In general, the formulations are prepared by uniformly and intimately bringing into association a therapeutic polymer conjugate with liquid carriers, or finely divided solid carriers, or both, and then, if necessary, shaping the product.

Formulations suitable for oral administration may be in the form of capsules, cachets, pills, tablets, gums, lozenges (using a flavored base, usually sucrose and acacia or tragacanth), powders, granules, or as a solution or a suspension in an aqueous or non-aqueous liquid, or as an oil-in-water or water-in-oil liquid emulsion, or as an elixir or syrup, or as pastilles (using an inert base, such as gelatin and glycerin, sucrose and acacia) and/or as mouthwashes and the like, each containing a predetermined amount of a therapeutic polymer conjugate(s) as an active ingredient. A compound may also be administered as a bolus, electuary or paste.

A tablet may be made by compression or molding, optionally with one or more accessory ingredients. Compressed tablets may be prepared using binder (for example, gelatin or hydroxypropylmethyl cellulose), lubricant, inert diluent, preservative, disintegrant (for example, sodium starch glycolate or croscarmellose sodium), surface-active or dispersing agent. Molded tablets may be made by molding in a suitable machine a mixture of the powdered peptide or peptidomimetic moistened with an inert liquid diluent.

Tablets, and other solid dosage forms, such as dragees, capsules, pills and granules, may optionally be scored or prepared with coatings and shells, such as enteric coatings and other coatings well known in the pharmaceutical-formulating art. They may also be formulated so as to provide slow or controlled release of the active ingredient therein using, for example, hydroxypropylmethyl cellulose in varying proportions to provide the desired release profile, other polymer matrices, liposomes and/or microspheres. They may be sterilized by, for example, filtration through a bacteria-retaining filter, or by incorporating sterilizing agents in the form of sterile solid compositions which can be dissolved in sterile water, or some other sterile injectable medium immediately before use. These compositions may also optionally contain opacifying agents and may be of a composition that they release the active ingredient(s) only, or preferentially, in a certain portion of the gastrointestinal tract, optionally, in a delayed manner. Examples of embedding compositions which can be used include polymeric substances and waxes. The active ingredient can also be in micro-encapsulated form, if appropriate, with one or more of the above-described excipients.

Liquid dosage forms for oral administration include pharmaceutically acceptable emulsions, microemulsions, solutions, suspensions, syrups and elixirs. In addition to the active ingredient, the liquid dosage forms may contain inert diluents commonly used in the art, such as, for example, water or other solvents, solubilizing agents and emulsifiers, such as ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butanediol, glycerol, propylene glycol, oil (in particular, cottonseed, groundnut, corn, germ, olive, castor and sesame oils), glycerol, tetrahydrofurfuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan, and mixtures thereof.

Besides inert diluents, the oral compositions may also include adjuvants such as wetting agents, emulsifying and suspending agents, sweetening, flavoring, coloring, perfuming and preservative agents.

Suspensions, in addition to the active therapeutic polymer conjugates may contain suspending agents as, for example, ethoxylated isostearyl alcohols, polyoxyethylene sorbitol and sorbitan esters, microcrystalline cellulose, aluminum metaphosphate, bentonite, agar-agar and tragacanth, and mixtures thereof.

Formulations for rectal or vaginal administration may be presented as a suppository, which may be prepared by mixing one or more therapeutic polymer conjugates with one or more suitable nonirritating excipients or carriers comprising for example, cocoa butter, polyethylene glycol, a suppository wax or a salicylate, and which is solid at room temperature, but liquid at body temperature and, therefore, will melt in the rectum or vaginal cavity and release the active agent.

Formulations which are suitable for vaginal administration also include pessaries, tampons, creams, gels, pastes, foams or spray formulations containing such carriers as are known in the art to be appropriate.

Dosage forms for the topical or transdermal administration of a therapeutic polymer conjugate(s) include powders, sprays, ointments, pastes, creams, lotions, gels, solutions, patches and inhalants. The active component may be mixed under sterile conditions with a pharmaceutically acceptable carrier, and with any preservatives, buffers, or propellants which may be required.

The ointments, pastes, creams and gels may contain, in addition to ligand(s), excipients, such as animal and vegetable fats, oils, waxes, paraffins, starch, tragacanth, cellulose derivatives, polyethylene glycols, silicones, benzenes, silicic acid, tallow and zinc oxide, or mixtures thereof.

Powders and sprays can contain, in addition to a therapeutic polymer conjugate(s), excipients such as lactose, tallow, silicic acid, aluminum hydroxide, calcium silicates and polyamides powder, or mixtures of these substances. Sprays can additionally contain customary propellants, such as chlorofluorohydrocarbons and volatile unsubstituted hydrocarbons, such as butane and propane.
The therapeutic polymer conjugate(s) can be alternatively administered by aerosol. This is accomplished by preparing an aqueous aerosol, liposomal preparation or solid particles containing the compound. A nonaqueous (e.g., fluorocarbon propellant) suspension could be used. Sonic nebulizers are preferred because they minimize exposing the agent to shear, which can result in degradation of the compound.

Ordinarily, an aqueous aerosol is made by formulating an aqueous solution or suspension of the agent together with conventional pharmaceutically acceptable carriers and stabilizers. The carriers and stabilizers vary with the requirements of the particular compound, but typically include nonionic surfactants (Tweens, Pluronic, or polyethyleneglycol), innocuous proteins like serum albumin, sorbitan esters, oleic acid, lecithin, amino acids such as glycine, buffers, salts, sugars or sugar alcohols. Aerosols generally are prepared from isotonic solutions.

Transdermal patches have the added advantage of providing controlled delivery of a therapeutic polymer conjugate(s) to the body. Such dosage forms can be made by dissolving or dispersing the agent in the proper medium. Absorption enhancers can also be used to increase the flux of the ligand across the skin. The rate of such flux can be controlled by either providing a rate controlling membrane or dispersing the peptidomimetic in a polymer matrix or gel.

Ophthalmic formulations, eye ointments, powders, solutions and the like, are also contemplated as being within the scope of this invention.

Pharmaceutical compositions of this invention suitable for parenteral administration comprise one or more therapeutic polymer conjugate(s) in combination with one or more pharmaceutically acceptable sterile isotonic aqueous or nonaqueous solutions, dispersions, suspensions or emulsions, or sterile powders which may be reconstituted into sterile injectable solutions or dispersions just prior to use, which may contain antioxidants, buffers, bacteriostats, solutes which render the formulation isotonic with the blood of the intended recipient or suspending or thickening agents.

Examples of suitable aqueous and nonaqueous carriers which may be employed in the pharmaceutical compositions of the invention include water, ethanol, polysols (such as glycerol, propylene glycol, polyethylene glycol, and the like), and suitable mixtures thereof; vegetable oils, such as olive oil, and injectable organic esters, such as ethyl oleate. Proper fluidity can be maintained, for example, by the use of coating materials, such as lecithin, by the maintenance of the required particle size in the case of dispersions, and by the use of surfactants.

These compositions may also contain adjuvants such as preservatives, wetting agents, emulsifying agents and dispersing agents. Prevention of the action of microorganisms may be ensured by the inclusion of various antibacterial and antifungal agents, for example, paraben, chlorobutanol, phenol sorbic acid, and the like. It may also be desirable to include isotonic agents, such as sugars, sodium chloride, and the like into the compositions. In addition, prolonged absorption of the injectable pharmaceutical form may be brought about by the inclusion of agents which delay absorption such as aluminum monostearate and gelatin.

In some cases, in order to prolong the effect of a drug, it is desirable to slow the absorption of the drug from subcutaneous or intramuscular injection. This may be accomplished by the use of a liquid suspension of crystalline or amorphous material having poor water solubility. The rate of absorption of the drug then depends upon the rate of dissolution which, in turn, may depend upon crystal size and crystalline form. Alternatively, delayed absorption of a parenterally administered drug form is accomplished by dissolving or suspending the drug in an oil vehicle.

Injectable depot forms are made by forming microencapsulate matrices of therapeutic polymer conjugate(s) in biodegradable polymers such as polylactide-polyglycolide. Depending on the ratio of drug to polymer, and the nature of the particular polymer employed, the rate of drug release can be controlled. Examples of other biodegradable polymers include poly(orthoesters) and poly(anhydrides). Depot injectable formulations are also prepared by entrapping the drug in liposomes or microemulsions which are compatible with body tissue.

When the therapeutic polymer conjugate(s) of the present invention are administered as pharmaceuticals, to humans and animals, they can be given per se or as a pharmaceutical composition containing, for example, 0.1 to 99.5% (more preferably, 0.5 to 90%) of active ingredient in combination with a pharmaceutically acceptable carrier.

The preparations of agents may be given orally, parenterally, topically, or rectally. They are of course given by forms suitable for each administration route. For example, they are administered in tablets or capsule form, by injection, inhalation, eye lotion, ointment, suppository, infusion; topically by lotion or ointment; and rectally by suppositories. Oral administration is preferred.

The phrases “parenteral administration” and “administered parenterally” as used herein means modes of administration other than enteral and topical administration, usually by injection, and includes, without limitation, intravenous, intramuscular, intraarterial, intrathecal, intracapsular, intraorbital, intracardiac, intradermal, intraperitoneal, transtracheal, subcutaneous, subcuticular, intraarticular, subcapsular, subarachnoid, intraspinal and intrasternal injection and infusion.

The phrases “systemic administration,” “administered systemically,” “administered peripherally” and “administered peripherally” as used herein mean the administration of a therapeutic polymer conjugate, drug or other material other than directly into the central nervous system, such that it enters the patient’s system and, thus, is subject to metabolism and other like processes, for example, subcutaneous administration.

The present therapeutic polymer conjugate(s) may be administered to humans and other animals for therapy by any suitable route of administration, including orally, nasally, as by, for example, a spray, rectally, intravenously, parenterally, intramuscularly and topically, as by powders, ointments or drops, including buccally and sublingually.

Regardless of the route of administration selected, the therapeutic polymer conjugate(s), which may be used in a suitable hydrated form, and/or the pharmaceutical compositions of the present invention, are formulated into pharmaceutically acceptable dosage forms by conventional methods known to those of skill in the art.

Actual dosage levels of the active ingredients in the pharmaceutical compositions of this invention may be varied so as to obtain an amount of the active ingredient which is effective to achieve the desired therapeutic response for a particular patient, composition, and mode of administration, without being toxic to the patient.
V. Physical Structures of the Subject Compositions

[0587] The subject polymers may be formed in a variety of shapes. For example, in certain embodiments, subject polymer matrices may be presented in the form of microparticles or nanoparticles. Microspheres typically comprise a biodegradable polymer matrix incorporating a drug. Microspheres can be formed by a wide variety of techniques known to those of skill in the art. Examples of microsphere forming techniques include, but are not limited to, (a) separation by emulsification and subsequent organic solvent evaporation (including complex emulsion methods such as oil in water emulsions, water in oil emulsions and water-oil-water emulsions); (b) coacervation-phase separation; (c) melt dispersion; (d) interfacial deposition; (e) in situ polymerization; (f) spray drying and spray coagulation; (g) air suspension coating; and (h) pan and spray coating. These methods, as well as properties and characteristics of microspheres are disclosed in, for example, U.S. Pat. No. 4,438,253; U.S. Pat. No. 4,652,441; U.S. Pat. No. 5,100,669; U.S. Pat. No. 5,330,768; U.S. Pat. No. 4,526,938; U.S. Pat. No. 5,889,110; U.S. Pat. No. 6,034,175; and European Patent 0258780, the entire disclosures of which are incorporated by reference herein in their entireties.

[0588] To prepare microspheres of the present invention, several methods can be employed depending upon the desired application of the delivery vehicles. Suitable methods include, but are not limited to, spray drying, freeze drying, air drying, vacuum drying, fluidized-bed drying, milling, co-precipitation and critical fluid extraction. In the case of spray drying, freeze drying, air drying, vacuum drying, fluidized-bed drying and critical fluid extraction, the components (stabilizing polyol, bioactive material, buffers, etc.) are first dissolved or suspended in aqueous conditions. In the case of milling, the components are mixed in the dried form and milled by any method known in the art. In the case of co-precipitation, the components are mixed in organic conditions and processed as described below. Spray drying can be used to load the stabilizing polyol with the bioactive material. The components are mixed under aqueous conditions and dried using precision nozzles to produce extremely uniform droplets in a drying chamber. Suitable spray drying machines include, but are not limited to, Buchi, NIK, APV and Lab-plant spray driers used according to the manufacturer’s instructions.

[0589] The shape of microparticles and nanoparticles may be determined by scanning electron microscopy. Spherically shaped nanoparticles are used in certain embodiments, for circulation through the bloodstream. If desired, the particles may be fabricated using known techniques into other shapes that are more useful for a specific application.

[0590] In addition to intracellular delivery of a therapeutic agent, it also possible that particles of the subject compositions, such as microparticles or nanoparticles, may undergo endocytosis, thereby obtaining access to the cell. The frequency of such an endocytosis process will likely depend on the size of any particle.

[0591] In certain embodiments, solid articles useful in defining shape and providing rigidity and structural strength to the polymeric matrices may be used. For example, a polymer may be formed on a mesh or other weave for implantation. A polymer may also be fabricated as a stent or as a shunt, adapted for holding open areas within body tissues or for draining fluid from one body cavity or body lumen into another. Further, a polymer may be fabricated as a drain or a tube suitable for removing fluid from a post-operative site, and in some embodiments adaptable for use with closed section drainage systems such as Jackson-Pratt drains and the like as are familiar in the art.

[0592] The mechanical properties of the polymer may be important for the processability of making molded or pressed articles for implantation. For example, the glass transition temperature may vary widely but must be sufficiently lower than the temperature of decomposition to accommodate conventional fabrication techniques, such as compression molding, extrusion, or injection molding.

VI. Biodegradability and Release Characteristics

[0593] In certain embodiments, the polymers and blends of the present invention, upon contact with body fluids, undergo gradual degradation. The life of a biodegradable polymer in vivo depends upon, among other things, its molecular weight, crystallinity, biostability, and the degree of crosslinking. In general, the greater the molecular weight, the higher the degree of crystallinity, and the greater the biostability, the slower biodegradation will be.

[0594] If a subject composition is formulated with a therapeutic agent or other material, release of such an agent or other material for a sustained or extended period as compared to the release from an isotonic saline solution generally results. Such release profile may result in prolonged delivery (over, about 1 to about 2,000 hours, or alternatively about 2 to about 800 hours) of effective amounts (e.g., about 0.001 mg/kg/hour to about 10 mg/kg/hour) of the agent or any other material associated with the polymer.

[0595] A variety of factors may affect the desired rate of hydrolysis of polymers of the subject invention, the desired softness and flexibility of the resulting solid matrix, rate and extent of bioactive material release. Some of such factors include the selection/identity of the various subunits, the enantiomeric or diastereomeric purity of the monomeric subunits, homogeneity of subunits found in the polymer, and the length of the polymer. For instance, the present invention contemplates heteropolymers with varying linkages, and/or the inclusion of other monomeric elements in the polymer, in order to control, for example, the rate of biodegradation of the matrix.

[0596] To illustrate further, a wide range of degradation rates may be obtained by adjusting the hydrophilicities of the backbones or side chains of the polymers while still maintaining sufficient biodegradability for the use intended for any such polymer. Such a result may be achieved by varying the various functional groups of the polymer. For example, the combination of a hydrophobic backbone and a hydrophilic linkage produces heterogeneous degradation because cleavage is encouraged whereas water penetration is resisted.

[0597] One protocol generally accepted in the field that may be used to determine the release rate of any therapeutic agent or other material loaded in the polymer matrices of the present invention involves degradation of any such matrix in a 0.1 M PBS solution (pH 7.4) at 37°C, an assay known in the art. For purposes of the present invention, the term “PBS protocol” is used herein to refer to such protocol.

[0598] In certain instances, the release rates of different polymer systems of the present invention may be compared by subjecting them to such a protocol. In certain instances, it may be necessary to process polymeric systems in the same fashion to allow direct and relatively accurate comparisons of different systems to be made. For example, the present invention teaches several different means of formulating the polymeric, matrices of the present invention. Such
comparisons may indicate that any one polymeric system releases incorporated material at a rate from about 2 or less to about 1000 or more times faster than another polymeric system.  

Alternatively, a comparison may reveal a rate difference of about 3, 5, 7, 10, 25, 50, 100, 250, 500 or 750 times. Even higher rate differences are contemplated by the present invention and release rate protocols.

In certain embodiments, when formulated in a certain manner, the release rate for polymer systems of the present invention may present as mono- or bi-phasic.

Release of any material incorporated into the polymer matrix, which is often provided as a microsphere, may be characterized in certain instances by an initial increased release rate, which may release from about 5 to about 50% or more of any incorporated material, or alternatively about 10, about 15, about 20, about 25, about 30 or about 40%, followed by a release rate of lesser magnitude.

The release rate of any incorporated material may also be characterized by the amount of such material released per day per mg of polymer matrix. For example, in certain embodiments, the release rate may vary from about 1 ng or less of any incorporated material per day per mg of polymeric system to about 500 or more ng/day/mg. Alternatively, the release rate may be about 0.05, 0.5, 5, 10, 25, 50, 75, 100, 125, 150, 175, 200, 250, 300, 350, 400, 450, or 500 ng/day/mg. In still other embodiments, the release rate of any incorporated material may be about 10,000 ng/day/mg or greater. In certain instances, materials incorporated and characterized by such release rate protocols may include therapeutic agents, fillers, and other substances.

In another aspect, the rate of release of any material from any polymer matrix of the present invention may be presented as the half-life of such material in the matrix.

In addition to the embodiment involving protocols for in vitro determination of release rates, in vivo protocols, whereby in certain instances release rates for polymeric systems may be determined in vivo, are also contemplated by the present invention. Other assays useful for determining the release of any material from the polymers of the present system are known in the art.

VII. Implants and Delivery Systems

In its simplest form, a biodegradable delivery system for a therapeutic agent consists of a dispersion of such a therapeutic agent in a polymer matrix. In other embodiments, an article is used for implantation, injection, or otherwise placed totally or partially within the body, the article comprising the subject compositions. It is particularly important that such an article result in minimal tissue irritation when implanted or injected into vasculated tissue.

Biodegradable delivery systems, and articles thereof, may be prepared in a variety of ways known in the art. The subject polymer may be melt-processed using conventional extrusion or injection molding techniques, or these products may be prepared by dissolving in an appropriate solvent, followed by formation of the device, and subsequent removal of the solvent by evaporation or extraction.

Once a system or implant article is in place, it should remain in at least partial contact with a biological fluid, such as blood, internal organ secretions, mucus membranes, cerebrospinal fluid, and the like to allow for sustained release of any encapsulated therapeutic agent.

VIII. Methods and Uses

In certain situations, the present polymer conjugates can be used in the treatment of one or more diseases, such as those exhibiting abnormal cellular proliferation, such as cancer, for example, breast, lung, colon, and ovarian cancer. When employed in the treatment of cancers, the subject polymer conjugates in some cases comprise one or more therapeutic agents including, but not limited to, salicylic acid, acetaminophen, morphine, etoposide, a tubulysin (preferably tubulysin A, tubulysin B, or tubulysin C), an epothilone, camptothecin, or vincristine, or an analog or derivative thereof, particularly a tubulysin, an epothilone or an analog or derivative thereof.

EXEMPLIFICATION

Example 1: Synthesis of CDP-PEG-GFLG-MEDA-ETOP

Synthesis of FMOC-PEG-GFLG-MEDA
[0612] Fmoc-PEG-aceticacid (5.7 g, 13 mmol), HBTU (4.9 g, 13 mmol), HOBT (2.0 g, 13 mmol), and DIPEA (3.4 g, 26 mmol) were dissolved in DMF (25 mL). GFLG-MEDA-Z (5.1 g, 8.8 mmol) was dissolved in DMF (13 mL) and DIPEA (3.7 g, 29 mmol) and added to the previous solution prepared. The reaction mixture was stirred for 1.5 h at room temperature. DMF was removed under reduced pressure and the obtained residue was dissolved in 200 mL CH₂Cl₂, the solution was washed twice with 0.1 N HCl (200 mL) and followed by washing with water (200 mL). It was then dried over MgSO₄ and CH₂Cl₂ was removed under vacuum to yield crude product. It was then purified by flash column chromatography to yield white solid product, Fmoc-PEG-GFLG-MEDA-Z (6.2 g, 72%).

[0613] Fmoc-PEG-GFLG-MEDA-Z (3.0 g, 3.0 mmol) was dissolved in CH₂Cl₂ (60 mL) of 0.2 M 2-Bromo-1,3,2-benzodioxaborole (2.4 g, 12 mmol). The reaction mixture was stirred overnight at room temperature. The reaction was stopped by the addition of MeOH (10 mL). Solvents were removed under vacuum. The obtained residue was dissolved in a small volume of methanol and precipitated in cool diethyl ether to yield the product (2.6 g, >99%). ESI/MS (m/z) expected 860.01; found 882.76 [M+Na].

Synthesis of PEG-GFLG-MEDA-ETOP

[0614]
Example 2: Synthesis of CDP-Carbamate-S-S-Etoposide

[0615] FMOPEG-GFLG-MEDA (2.6 g, 2.8 mmol), Etop-NP (2.7 g, 3.6 mmol), DIPEA (0.70 g, 5.5 mmol) and DMAP (34 mg, 0.28 mmol) were dissolved in DMF (60 mL) and stirred for 1.5 h at 60°C. DMF was removed under vacuum. The obtained residue was dissolved in CH₂Cl₂ (150 mL). It was then washed twice with 0.1 N HCl (150 mL) and followed by washing with water (150 mL). It was dried over MgSO₄ and reduced under vacuum to yield the crude product. The crude product was purified by flash column chromatography to yield the product, FMOPEG-GFLG-MEDA-ETOP (3.2 g, 80%). ESI/MS (m/z) expected 1474.6; found 1497.16 [M+Na].

[0616] FMOPEG-GFLG-MEDA-ETOP (100 mg, 0.068 mmol) was dissolved in 1.2 mL of 20% piperidine in DMF. The reaction mixture was stirred for 3 min at room temperature. The product was precipitated in diethyl ether (50 mL) and washed with to yield the product (60 mg, 70%). ESI/MS (m/z) expected 1252.32; found 1274.87 [M+Na].

Synthesis of CDP-PEG-GFLG-MEDA-ETOP

[0617]

[0618] Cyclodextrin-based polymer (CDP) (1.8 g, 0.36 mmol) was dissolved in dry DMF (35 mL). The mixture was stirred until completely dissolved. DIPEA (0.94 g, 7.3 mmol), EDC (0.70 g, 3.6 mmol), and NHS (420 mg, 3.6 mmol) were added into the above solution. PEG-GFLG-MEDA-ETOP (1.4 g, 1.1 mmol) was dissolved in DMF (10 mL) and added to the polymer solution. The solution was stirred for 4 h, and then the polymer was precipitated in ethylacetate (150 mL). The precipitate was dissolved in DMF (15 mL) and precipitated in acetone (75 mL). The precipitated product was dissolved in pH 4 water (80 mL). The solution was dialyzed using 25K MWCO membrane (Spectra/Por 7) for 24 h. It was filtered through 0.2 μm filters (Nalgene) and lyophilized to yield white solid (1.1 g, 61%). Loading of etoposide was determined to be 10% w/w by UV-Vis Spectroscopy at 283 nm.
[0620] In a dry 100 mL round bottom flask, etoposide (1.0 g, 1.7 mmol) and TEA (2.5 g, 25 mmol) were dissolved in anhydrous THF (35 mL) under argon. To that solution, 4-nitrophenyl chloroformate (0.39 g, 1.95 mmol) in anhydrous THF (15 mL) was added dropwise over 30 min. The reaction mixture was stirred for additional 2 h at RT. The mixture was filtered and concentrated under reduced pressure to yield yellow solid. The solid was purified by flash column chromatography to yield light yellow solid (0.75 g, 59%).

Synthesis of 4-pyridylthiol Cysteamine Carbamate of Etoposide

[0622] Synthesis of Cystamine Carbamate of Etoposide

[0623] In a 10 mL round bottom flask, 4-pyridylthiol cysteamine carbamate of etoposide (50 mg, 0.0625 mmol) and cysteamine hydrochloride (6.4 mg, 0.057 mmol) were dissolved in MeOH (2 mL). The mixture was stirred for 1 h at room temperature. The solution was concentrated under vacuum and diethyl ether (5 mL) was added to precipitate out white solid. The solid was filtered and redissolved in MeOH (0.5 mL) and precipitated in CH₂Cl₂ (15 mL). The solid was filtered and dried under vacuum to yield a white solid. It was then purified by Prep HPLC to yield white solid (19 mg, 38%). ESI/MS (m/z) expected 767.84; found 767.29 [M]+.

Synthesis of CDP-Carbamate-S-S-Etoposide

[0624]
CDP (96 mg, 0.020 mmol) was dissolved in dry N,N-dimethylformamide (2 mL). The mixture was stirred for 20 min. Cystamine carbamate of etoposide (35 mg, 0.044 mmol), N,N-Diisopropylethylamine (5.6 mg, 0.044 mmol), N-(3-Dimethylaminopropyl)-N'-ethylcarbodiimide hydrochloride (11 mg, 0.059 mmol), and N-Hydroxysuccinimide (5.0 mg, 0.044 mmol) were added to the polymer solution and stirred for 4 h. The polymer was precipitated with ethyl acetate (50 mL). The precipitate was dissolved in deionized water (10 mL). The solution was dialyzed using 25K MWCO membrane (Spectra/Por 7) for 27 h. It was filtered through 0.2 μm filters (Nalgene) and lyophilized to yield white solid (57 mg, 59%). Loading of etoposide was determined to be 12.5% w/w by UV-Vis Spectroscopy at 283 nm.

Example 3: Synthesis of CDP-EDA-Phosphoester-Etoposide

In a 100 mL round bottom flask, etopophospate (720 mg, 1.1 mmol), N,N'-disopropylcarbodiimide (96 mg, 0.72 mmol), N-hydroxysuccinimide (83 mg, 0.72 mmol) and N,N-Diisopropylthlylamine (140 mg, 2.3 mmol) were dissolved in anhydrous DMF (10 mL). The solution was stirred for 45 min at room temperature. EDA functionalized CDP (1.5 g, 0.60 mmol) and N,N-Diisopropylthlylamine (160 mg, 2.3 mmol) were dissolved in anhydrous DMF (10 mL) on a separate 100 mL round bottom flask. This reaction mixture was added to the previous mixture at room temperature and stirred for 4 h at room temperature. The mixture was concentrated to 10 mL and precipitated out in ethyl acetate (500 mL). The polymer was dissolved in deionized water (150 mL) and it was dialyzed using 25K MWCO membrane (Spectra/Por 7) for 26 h. It was then filtered through 0.2 μm filters (Nalgene) and lyophilized to yield white solid (1.1 g, 73%). Loading of etoposide was determined to be 8.3% w/w by UV-Vis Spectroscopy at 283 nm.

Example 4: CDP-PEG-SS-Tubulysin

Synthesis of CDP-PEG-SS-Py

A mixture of CDP-PEG (2 g, 0.43 mmole), which was synthesized according to a published procedure (Bioconjugate Chem. 2003, 14, 1007), pyridine diethylthlylamine hydrochloric salt (384 mg, 1.73 mmole), EDC (333 mg, 1.73 mmole), and NHS (198 mg, 1.73 mmole) was dried overnight in a 200 mL round bottom flask under vacuum. Anhydrous DMF (40 mL) was then added, followed by DIEA (0.3 mL, 1.73 mmole). The reaction mixture was stirred under argon at room temperature for 4 h. Diethyl ether (300 mL) was then added into the mixture to precipitate the polymer. The crude product was dissolved in H2O (400 mL), and the solution was dialyzed using a 25K MWCO membrane (Spectra/Por 7) against water. The dialysis water was changed twice over a period of 24 h, after which the polymer containing solution was filtered through a 0.2 μm filter membrane and lyophilized to yield 1.64 g of CDP-PEG-SS-Py (82% yield) as a white solid.

Synthesis of CDP-PEG-SH

To a PBS (6.8 mL) solution of CDP-PEG-SS-Py (155 mg, 0.032 mmole) was added a water (1 mL) solution
of DTT, which gave rise to 20 mg/mL of the concentration of polymer. The reaction mixture was stirred at room temperature for 3 h and then dialyzed by a 25K MWCO membrane in degassed EDTA (1 mM, 2 L) water solution. The dialysis water was changed once over a period of 24 h. After filtration with 0.2 μm filter membrane, the solution was lyophilized to produce a white solid (109 mg) in quantitative yield.

Synthesis of Tubulysin-SS-Py

To a solution of pyridine dithioethylamine hydrochloric salt (15.8 mg, 0.071 mmole) in anhydrous DMF (1.5 mL) was added DIEA (25 μL, 0.142 mmole) followed by a solution of tubulysin A (40 mg, 0.047 mmole) in anhydrous DMF (0.5 mL). The reaction mixture was stirred under argon at room temperature for 2 h. The mixture was then evaporated under vacuum. The crude product was purified by silica gel column chromatography (CH₂Cl₂/MeOH, 15/1) to afford white solid (54 mg) in quantitative yield.

Synthesis of CDP-PEG-SS-Tubulysin (“CDP-S-S-Tub”)

CDP-PEG-SS-Py (43 mg, 0.0094 mmole) was dissolved in degassed MeOH (1.8 mL), into which was added a methanol solution (0.35 mL) of Tub-S-S-pyr (9.5 mg, 0.0094 mmole) to bring the total reaction volume of 2.15 mL. The resulting yellow mixture was stirred under argon at room temperature for 4 h. N-ethyl maleimide (118 mg, 0.94 mmole) was then added to quench the reaction resulting in a clear, colorless solution. This solution was dialyzed using a 25K MWCO membrane, and the dialysis water was changed once over a period of 24 h. The solution was then filtered through 0.2 μm filter membrane and lyophilized to afford target polymer (27 mg, 45% yield) as a white solid.
Example 5: In Vitro Studies of Etoposide Derivatives

The cytotoxicity of drug-polymer conjugates and linker-drug precursors was determined in the human ovarian carcinoma cell line A2780. Cells were grown in RPMI 1640 media containing 10% fetal bovine serum (FBS). 10,000 cells per well were seeded in a 96-well plate and incubated at 37°C for 24 hours, at which time drug was added to triplicate wells at various concentrations. After 72 hours of incubation at 37°C, in the presence of drug, cells were washed with PBS, incubated for 1 hour with an MTS solution, and analyzed according to manufacturer’s instructions (CellTiter 96 one solution cell proliferation assay, Promega, Madison, Wis.). The concentration of drug to kill 50% of cells (IC50) was determined using a 4-parameter fit (see Table 1).

Example 7: Maximum Tolerated Dose (MTD) Studies of CDP-S-S-Tub

HRLN female nu/nu mice were set up and dosing solutions were prepared. Body weight was determined biweekly until the end of the study. The endpoint was where mean weight loss exceeded 20% or >10% of animals in a group died, dosing was immediately stopped. Moribund animals were euthanized following PRC SOP. All animals were euthanized 14 days post final dose.

Example 6: In Vitro Studies of CDP-PEG-SS-Tubulysin

The antiproliferative activity of CDP-PEG-SS-Tubulysin (CDP-S-S-Tub) was evaluated in vitro in multiple human cancer cell lines (NCI-H1299 lung cancer, HT-29 colon cancer, and A2780 ovarian cancer) and compared with Tubulysin A (Tub A) and the sulfur derivatized Tubulysin A (Tub-SH) (Table 2). The data shows that the conjugate maintains high antiproliferative activity.

Example 8: Efficacy Studies of CDP-S-S-Tub

**General Procedure**

Subcutaneous Human Tumor Xenografts.

The HT29 colon cancer cell line was maintained in nude mice. Then 1 mm³ HT29 tumor fragments were implanted s.c. into the right flank of HRLN female nu/nu mice.

Tumors were measured in two dimensions with calipers bi-weekly to the end of the study. Tumor volume was calculated based on the formula: tumor volume = (length × width)². Tumor weight was obtained from tumor volume assuming 1 mm³ is equal to 1 mg of tumor in weight. When tumors reach an average size of 80-120 mg, a pair match was done to sort mice into groups of ten each and then treatments were started (day 1).

All of the treatments were given by i.v. The endpoint of the experiment was a tumor volume of 1 gm or 90 days. When tumor reached the endpoint the mouse was euthanized and endpoint tumor growth delay was calculated consequently. End-point tumor size was chosen to maximize the number of tumor doublings within the exponential growth phase in the control animals. It was set at 1900 mm³ for HT29.

**Determination of Treatment Efficacy.**

Treatment efficacy was determined by the time which took a specific tumor to reach the predetermined endpoint size (1000 mm³ for HT29). The time to endpoint (TTE) for each mouse was calculated from the equation $\text{TTE} = \log(\text{endpoint}) - b/m$, where $b$ was the intercept and $m$ was the slope of the line obtained by linear regression of a log-transformed tumor growth data set, which consisted of the first observation that exceeded the study endpoint volume and the three consecutive observations that immediately preceded the attainment of the endpoint volume. TTE values equal to the last day of the study were assigned to those mice whose tumor volume did not reach the endpoint size. A TTE value equal to the day of death was assigned to a mouse whose death was classified as treatment-related death. The mice whose deaths were classed as non-treatment-related deaths were excluded from TTE calculations. Tumor growth delay (TGD) is defined as the difference
between the median TTE for a treatment group and the median TTE of the control group (TGD = T - C). It is expressed in days and as a percentage of the median TTE of the control group: % TGD = [(T - C)/C]×100, where T equals the median TTE for a treatment group and C equals the median TTE for control.

[0643] Treatment may cause partial regression or complete regression of the tumor in an animal. Partial regression response is defined as the tumor volume's being ±50% of its day 1 volume for three consecutive measurements during the course of the study and ≥13.5 mm³ for one or more of these three measurements. Complete regression response is defined as the tumor volume is <13.5 mm³ for three consecutive measurements during the course of the study. A tumor-free survivor is an animal with a complete regression response at the end of the study.

[0644] Determination of Tolerability.

[0645] Animals were weighed daily on days 1 to 5, then twice per week until the completion of the study. The mice were examined for overt signs of any adverse drug-related side effects. Acceptable toxicity for the maximum tolerated dose was defined as group mean weight loss less than 20% or no more than 10% of animals in a group die from toxicity.

Efficacy Studies

[0646] Efficacy was evaluated in nude mice bearing subcutaneously implanted HT-29 colorectal carcinoma xenografts. HRLN female nu/nu mice were set up with 1 mm³ HT-29 tumor fragments s.c. in the flank. The pair match was then done when the tumors reached an average size of 80 to 120 mg and was followed by beginning treatment. Dosing solutions were prepared daily and body weight was determined bi-weekly until the end of the study. Caliper measurements were taken bi-weekly to the end of the study. Animals were monitored individually, and the endpoint of the experiment was a tumor volume of 1 g or 90 days, whichever came first. Responders were followed longer. When the endpoint was reached, the animals were euthanized.

[0647] CDP-PEG-SS-Tubulysin (CDP-S-S-Tub) was administered as a solution in 100% water. Tubulysin A was administered as a solution in 10% DMSO:1% Tween 80:89% Saline. The vehicle was 10% DMSO:1% Tween 80:89% Saline. Vinblastine was administered as a solution in 100% Saline. The dosing volume was 10 ml/kg (0.200 ml/20 g mouse) adjusted for body weight.

[0648] Treatment with CDP-PEG-SS-Tubulysin (CDP-S-S-Tub) was well tolerated, with no mortality or significant antitumor effect. It was better tolerated than vinblastine and Tubulysin A. Treatment with CDP-PEG-SS-Tubulysin resulted in a higher number of regressions and a significant increase in tumor growth delay compared to Vinblastine. Treatment with Tubulysin A was proven to be toxic for the mice, causing 50% mortality and 26.8% maximum body weight loss on day 26 (Table 4 and FIGS. 1-2).

A polymer-tubulysin conjugate CDP-PEG-SS-Tubulysin was synthesized and found to be highly soluble in water. The conjugate showed strong antiproliferative activity in multiple human cancer cell lines. The MTD of CDP-PEG-SS-Tubulysin was determined to be between 3 and 10 mg/kg while the free drug Tubulysin A was severely toxic even at 0.1 mg/kg. Efficacy studies of CDP-PEG-SS-Tubulysin at 3 mg/kg showed that it was well-tolerated and produced substantial antitumor activity during a 90-day study. By contrast, the free drug Tubulysin A showed excessive toxicity, causing 50% mortality. Vinblastine, a vinca alkaloid that inhibits tubulin polymerization by binding to the same binding site as Tubulysin A, was significantly less effective as an antitumor agent compared to CDP-PEG-SS-Tubulysin. These results demonstrate that conjugation to a cyclodextrin-based polymer can improve the solubility, tolerability, and preclinical antitumor activity of antitumor drugs such as Tubulysin A.

Example 9: Characterization and Release Studies of CDP-PEG-SS-Tubulysin

Loading was determined by HPLC to be 12%. The particle size of the parent polymer was measured to be 9-10 nm while CDP-PEG-SS-Tubulysin self-assembled into nanoparticles with a particle size of 127 nm. The solubility of Tubulysin A in water was determined to be 0.1 mg/mL at a neutral pH while that of CDP-PEG-SS-Tubulysin was found to be 100 times higher.

Release studies were performed by incubating CDP-PEG-SS-Tubulysin in both PBS and human plasma. Release kinetics of tubulysin from the polymer conjugate at 24 h showed 4.5% release in PBS at pH 5.5, 48% release in PBS at pH 7.4 and 75% release in human plasma at pH 7.5. At 48 h, release kinetics were determined to be 9.2% release in PBS at pH 5.5, 68% release in PBS at pH 7.4 and 82% release in human plasma at pH 7.5.

Example 10: Enhanced Uptake of Cyclodextrin-Based Polymer Nanoparticles by Targeting with LHRH Peptide

To increase the cellular uptake of cyclodextrin-based polymer (CDP) in cancer cells, luteinizing hormone-releasing hormone (LHRH) was used as a targeting ligand and the receptor-mediated endocytosis of the nanoparticles investigated in several human cancer cell lines.

LHRH-PEG-maleimide and rhodamine (Rho)-maleimide were conjugated to CDP to form LHRH targeted nanoparticulate polymers (7.1% w/w LHRH, 11.3% w/w Rho). Table 5 lists properties of the prepared CDP nanoparticles.

*Polymer dispersity determined by light scattering techniques.

To assess comparative cellular uptake of CDP-Rho systems, MCF-7 Cells were incubated with LHRH targeted, sLHRH targeted or non-targeted CDP-Rho conjugates at a concentration of 30 μM (Rhodamine equivalent) for 3 h at 37°C or 4°C. Cells in parallel wells were incubated with mixture of CDP-Rho and LinH. Cells were then assayed for fluorescence by using a spectrophotometer (FIG. 3). Each column in FIG. 3 represents the mean of three measurements with error bars representing the standard deviation.

The distribution of CDP-Rho systems following dosing was determined. MCF-7 Cells were pulsed with targeted (LHRH-CDP-Rho) or non-targeted CDP-Rho conjugates a concentration of 30 μM for 3 h at 4°C and then chased at 37°C for 2 h in fresh medium. The chased medium was assayed as dissociated and/or recycling polymer. The amount of cell surface bound polymer conjugates was determined by trypsin treatment. Finally, the lysed cell was assayed as cellular uptake. Data were interpreted as percentage of initially binding conjugates (FIG. 4). Each column in FIG. 4 represents the mean of three measurements.

Comparison of cellular uptake of CDP-Rho vs. LHRH-CDP-Rho was also determined by flow cytometry (FIG. 5). MCF-7 Cells were incubated with polymer conjugates at a concentration of 30 μM (Rhodamine equivalent) for 3 h at 37°C. Cells were then collected, washed and analyzed by flow cytometry.

Pulse chase studies were also conducted (FIG. 6). MCF-7 cells were coincubated with 1 μM LysoTracker Green DND-26 and 2.3 μM LHRH-CDP-Rho (Rhodamine equivalent) for 1 h at 37°C. In FIG. 6, panel (a) shows localization of LHRH-CDP-Rho; panel (b) shows localization of LysoTracker Green DND-26; panel (c) shows epifluorescence image of MCF cells; and panel (d) shows superposition of (a) and (b), which allows for detection of colocalization of LHRH-CDP-Rho and LysoTracker Green DND-26.
Results

[0659] Cellular uptake of LHRH targeted polymer nanoparticle was 40-60 times higher than that of non-targeted polymer nanoparticles in various cancer cell lines (FIGS. 3-4). A mixture of CDP-Rho with LHRH did not increase the cellular uptake of the CDP-Rho; the cellular uptake of the polymeric nanoparticles was largely decreased when scrambled LHRH was conjugated to polymer compared with LHRH-CDP-Rho; and the increased cellular uptake of LHRH targeted polymer was inhibited at 4°C (FIG. 3).

[0660] The percentage cellular uptake and cell surface binding was much greater for LHRH-CDP-Rho than for CDP-Rho, while disassociation and/or recycling was reduced (FIG. 4).

[0661] Cytometry further showed that cells treated with LHRH targeted CDP nanoparticles showed higher uptake than non-targeted nanoparticles (FIG. 5).

[0662] Pulse chase studies demonstrated that the internalization of LHRH-CDP-Rho was temperature dependent. Substantial colocalization of LHRH-CDP-Rho with Lysotracker green was observed by confocal microscopy (FIG. 6).

CONCLUSIONS

[0663] The cellular uptake of the examined CDP nanoparticles was greatly enhanced by conjugation with LHRH. In this particular embodiment, the increase in uptake was observed with covalent attachment of LHRH to the polymer nanoparticles and specific binding between LHRH and LHRH-receptor. Also, the internalization process was temperature dependent, and the LHRH targeted polymer nanoparticles localized into the endocytic pathway. These results indicate that hormones, such as LHRH, can be used to increase the intracellular concentration of CDP polymer microparticles or nanoparticles in cells that express the corresponding hormone receptor, such as the LHRH receptor.

EQUIVALENTS

[0664] Those skilled in the art will recognize, or be able to ascertain using no more than routine experimentation, numerous equivalents to the compounds and methods of use thereof described herein. Such equivalents are considered to be within the scope of this invention and are covered by the following claims.

1. A linear, cycloexodextrin containing polymer conjugate, comprising a therapeutic agent covalently attached to a polymer through a tether, wherein the tether comprises a self-cyclizing moiety.
2. The polymer conjugate of claim 1, wherein the tether further comprises a selectivity-determining moiety.
3. The polymer conjugate of claim 2, wherein the selectivity-determining moiety is attached via a bond to the self-cyclizing moiety between the self-cyclizing moiety and the polymer.
4. The polymer conjugate of claim 3, wherein the bond between the selectivity-determining moiety and the self-cyclizing moiety is selected from the group consisting of an amide, a carbamate, a carbonate, an ester, a thioester, an amide bond, and a disulfide bond.
5. The polymer conjugate of claim 3, wherein the bond between the selectivity-determining moiety and the self-cyclizing moiety is an ester bond.
6. The polymer conjugate of claim 3, wherein cleavage of the bond between the selectivity-determining moiety and the self-cyclizing moiety results in cyclization of the self-cyclizing moiety, thereby releasing the therapeutic agent from the polymer.
7. The polymer conjugate of claim 6, wherein cyclization of the self-cyclizing moiety forms a five- or six-membered ring.
8. The polymer conjugate of claim 7, wherein the five- or six-membered ring is a heterocycle comprising at least one heteroatom selected from the group consisting of a nitrogen, an oxygen, and a sulfur.
9. The polymer conjugate of claim 6, wherein the cyclization of the self-cyclizing moiety forms a five-membered ring.
10. The polymer conjugate of claim 9, wherein the five-membered ring comprises two heteroatoms selected from the group consisting of a nitrogen, an oxygen, and a sulfur.
11. The polymer conjugate of claim 9, wherein the five-membered ring comprises two oxygen atoms.
12. The polymer conjugate of claim 1, wherein the cycloexodextrin containing polymer comprises a copolymer comprising cyclodextrin moieties and linker groups that do not comprise cycloexodextrin moieties.
13. The polymer conjugate of claim 12, wherein the cycloexodextrin moieties and the linker groups alternate in the copolymer.
14. The polymer conjugate of claim 12, wherein each linker group independently comprises an alkyl chain, a polyethylene glycol (PEG) chain, polysaccharide anhydride, poly-L-glutamic acid, poly(ethyleneimine), an oligosaccharide, or an amino acid chain.
15. The polymer conjugate of claim 12, wherein each linker group comprises PEG.
16. The polymer conjugate of claim 1, wherein the cycloexodextrin is alpha-, beta-, or gamma-cyclodextrin, e.g., beta-cycloexodextrin.
17. The polymer conjugate of claim 1, wherein the therapeutic agent is a small molecule, a peptide, a protein, a nucleotide, a polynucleotide, or a polymer that has therapeutic function.
18. The polymer conjugate of claim 1, wherein the therapeutic agent is an anti-cancer, anti-fungal, anti-bacterial, anti-mycotic, or anti-viral therapeutic.
19. The polymer conjugate of claim 1, wherein the therapeutic agent is a protease inhibitor.
20. The polymer conjugate of claim 1, wherein the therapeutic agent comprises an amino, hydroxyl, or thiol group.
21-31. (canceled)
