## ISOTHIAZOLO-PYRIMIDINEDIONE DERIVATIVES AS TRPA1 MODULATORS

### Related applications

This application claims the benefit of Indian Patent Application No 665/MUM/2009 filed on March 23, 2009 and US Provisional Application No 61/171,355 filed on April 21, 2009 all of which are hereby incorporated by reference.

### Technical Field

The present patent application relates to isothiazolo[3,4-*d*] pyrimidinedione and isothiazolo[5,4-*d*] pyrimidinedione derivatives with transient receptor potential ankyrin1 (TRPA1) activity.

### Background of the Invention

The transient receptor potential (TRP) channels or receptors are pain receptors. They have been classified into seven subfamilies: TRPC (canonical), TRPV (vanilloid), TRPM (melastatin), TRPP (polycystin), TRPML (mucolipin), TRPA (ankyrin, ANKTM1) and TRPN (NOMPC) families. The TRPC family can be divided into 4 subfamilies (i) TRPC1 (ii) TRPC2 (iii) TRPC3, TRPC6, TRPC7 and (iv) TRPC4, TRPC5 based on sequence functional similarities. Currently the TRPV family has 6 members. TRPV5 and TRPV6 are more closely related to each other than to TRPV1, TRPV2, TRPV3 or TRPV4. TRPA1 is most closely related to TRPV3 and is more closely related to TRPV1 and TRPV2 than to TRPV5 and TRPV6. The TRPM family has 8 members. Constituents include the following: the founding member TRPM1 (melastatin or LTRPC1), TRPM3 (KIAA1616 or LTRPC3), TRPM7 (TRP-PLIK, ChaK(1), LTRPC7), TRPM6 (ChaK2), TRPM2 (TRPC7 or LTRPC2), TRPM8 (TRP-p8 or CMR1), TRPM5 (MTR1 or LTRPC5) and TRPM4 (FLJ20041 or LTRPC4). The TRPML family consists of the mucolipins, which include TRPML1 (mucolipin 1), TRPML2 (mucolipin 2) and TRPML3 (mucolipin 3). The TRPP family consists of two groups of channels: those predicted to have six transmembrane domains and those that have eleven. TRPP2 (PKD2), TRPP3 (PKD2L1), TRPP5 (PKD2L2) are all predicted to have six transmembrane domains. TRPP1 (PKD1, PC1), PKD-REJ and PKD-1L1 are all thought to have eleven transmembrane domains. The sole mammalian member of the TRPA family is ANKTM1.

It is believed TRPA1 is expressed in nociceptive neurons. Nociceptive neurons of the nervous system sense the peripheral damage and transmit pain signals. TRPA1 is membrane bound and most likely acts as a heterodimeric voltage gated channel. It is believed to have a particular secondary structure, its N-terminus is lined with a large number of ankyrin repeats which are believed to form a spring-like edifice. TRPA1 is activated by a variety of noxious stimuli, including cold temperatures (activated at 17°C), pungent natural compounds (e.g., mustard, cinnamon and garlic) and environmental irritants (MacPherson LJ et al, *Nature*, **2007**, 445; 541-545). Noxious compounds activate TRPA1 ion channels through covalent modification of cysteines to form covalently linked adducts. Variety of endogenous molecules produced during tissue inflammation / injury have been identified as pathological activators of TRPA1 receptor. These include hydrogen peroxide which is produced due to oxidative stress generated during inflammation, alkenyl aldehyde 4-HNE - an intracellular lipid peroxidation product and cyclopentenone prostaglandin 15dPGJ2 which is produced from PGD2 during inflammation / allergic response. TRPA1 is also activated in receptor dependant fashion by Bradykinin (BK) which is released during tissue injury at peripheral terminals

The difference between TRPA1 and other TRP receptors is that TRPA1 ligand binding persists for hours due to which the physiological response (e.g., pain) is greatly prolonged. Hence to dissociate the electrophile, an effective antagonist is required.

WO 2009/158719, WO 2009/002933, WO 2008/0949099, WO 2007/073505, WO 2004/055054 and WO 2005/089206 describe the TRP channels as the targets for the treatment of pain and related conditions.

In efforts to discover better analgesics for the treatment of both acute and chronic pain and to develop treatments for various neuropathic and nociceptive pain states, there exists a need for a more effective and safe therapeutic treatment of diseases, conditions and/or disorders modulated by TRPA1.

The various stereoisomeric forms of the compounds of the present invention may be separated from one another by methods known in the art or a given isomer may be obtained by stereospecific or asymmetric synthesis. Tautomeric forms and mixtures of compounds described herein are also contemplated.

#### Methods of Treatment

The compounds and pharmaceutical compositions of the present invention can be administered to treat any disorder, condition, or disease treatable by inhibition of TRPA1. For instance, the compounds and pharmaceutical compositions of the present invention are suitable for treatment or prophylaxis of the following diseases, conditions and disorders mediated or associated with the activity of TRPA1 receptors: pain, chronic pain, complex regional pain syndrome, neuropathic pain, postoperative pain, rheumatoid arthritic pain, osteoarthritic pain, back pain, visceral pain, cancer pain, algesia, neuralgia, migraine, neuropathies, chemotherapy – induced neuropathies, eye – irritation, bronchial – irritation, skin – irritation (atopic dermatitis), Frost – bites (cold – bite), spasticity, catatonia, catalepsy, parkinsons, diabetic neuropathy, sciatica, HIV-related neuropathy, post-herpetic neuralgia, fibromyalgia, nerve injury, ischaemia, neurodegeneration, stroke, post stroke pain, multiple sclerosis, respiratory diseases, asthma, cough, COPD, inflammatory disorders, oesophagitis, gastroesophageal reflux disorder (GERD), irritable bowel syndrome, inflammatory bowel disease, pelvic hypersensitivity, urinary incontinence, cystitis, burns, psoriasis, eczema, emesis, stomach duodenal ulcer and pruritus. The connection between therapeutic effect and inhibition of TRPA1 is illustrated, for example, in Story, G. M. et al. *Cell*, **2003**, 112, 819-829; McMahon, S.B. and Wood, J. N., *Cell*, **2006**, 124, 1123-1125; Voorhoeve, P. M. et al. *Cell*, **2006**, 124, 1169-1181; Wissenbach, U, Niemeyer, B. A. and Flockerzi, V. *Biology of the Cell*, **2004**, 96, 47-54; and the references cited therein.

Pain can be acute or chronic. While acute pain is usually self-limiting, chronic pain persists for 3 months or longer and can lead to significant changes in a patient's personality; lifestyle, functional ability and overall quality of life (K. M. Foley, *Pain*, in Cecil Textbook of Medicine; J. C. Bennett & F. Plum (eds.), 20th ed., **1996**, 100-107). The sensation of pain can be triggered by any number of physical or chemical stimuli and the sensory neurons which mediate the response to this harmful stimulus are termed as “nociceptors”. Nociceptors are primary sensory afferent (C and A $\delta$  fibers) neurons that are activated by a wide variety of noxious stimuli including chemical, mechanical,

thermal and proton ( $\text{pH} < 6$ ) modalities. Nociceptors are the nerves which sense and respond to parts of the body which suffer from damage. They signal tissue irritation, impending injury, or actual injury. When activated, they transmit pain signals (via the peripheral nerves as well as the spinal cord) to the brain.

Chronic pain can be classified as either nociceptive or neuropathic. Nociceptive pain includes tissue injury-induced pain and inflammatory pain such as that associated with arthritis. Neuropathic pain is caused by damage to the sensory nerves of the peripheral or central nervous system and is maintained by aberrant somatosensory processing. The pain is typically well localized, constant and often with an aching or throbbing quality. Visceral pain is the subtype of nociceptive pain that involves the internal organs. It tends to be episodic and poorly localized. Nociceptive pain is usually time limited, meaning when the tissue damage heals, the pain typically resolves (arthritis is a notable exception in that it is not time limited).

#### General Methods of Preparation

The compounds described herein, including compounds of general formula (I), (Ia), (Ib) and (Ic) and specific examples, can be prepared by techniques known to one in the art, for example, through the reaction scheme depicted in Schemes 1-10. Furthermore, in the following scheme, where specific acids, bases, reagents, coupling agents, solvents etc. are mentioned, it is understood that other suitable acids, bases, reagents, coupling agents etc. may be used and are included within the scope of the present invention. Modifications to reaction conditions, for example, temperature, duration of the reaction or combinations thereof are envisioned as part of the present invention. The compounds obtained by using the general reaction scheme may be of insufficient purity. These compounds can be purified by any of the methods for purification of organic compounds known in the art, for example, crystallization or silica gel or alumina column chromatography using different solvents in suitable ratios. All possible stereo isomers are envisioned within the scope of this invention.

A general approach for the synthesis of isothiazolo pyrimidinyl acetamides of the general formula (I), wherein Y, Z,  $\text{R}^1$ ,  $\text{R}^2$ ,  $\text{R}^3$ , U, V and L are as defined above in the general description can be prepared as described in Scheme 1. Coupling reaction of a carboxylic acid of the formula (1) with amines of the general formula (2) in the presence of a suitable coupling agent such as 1-ethyl-3-(3'-dimethylaminopropyl)carbodiimide hydrochloride (EDCI) using a suitable base and solvent gives compounds of the formula

(3). The selective *N*-alkylation of the compounds of the formula (3) with suitable alkylating agent of the formula (4) in the presence of base and solvent gives compounds of the general formula (I).

Scheme 1

An approach for the synthesis of isothiazolo[3,4-*d*]pyrimidinyl acetamides of the formula (Ia), wherein R<sup>1</sup>, R<sup>2</sup>, U and V are as defined above is prepared as depicted in Scheme 2. 6-Amino-1,3-dialkyl uracil-5-carbodithioate (6) is obtained by the reaction of 6-amino-1,3-dialkyl uracil (5) with carbon disulphide and dimethyl sulfate in the presence of suitable base as reported by Kobayashi G. *et al. Yakugaku Zasshi*, **1979**, 515-520. Oxidative cyclisation of compounds of the formula (6) using iodine in the presence of suitable solvent gives 3-methylsulfanylisothiazolo[3,4-*d*]pyrimidinedione (7) according to the procedure described by Kobayashi G. *et al. Yakugaku Zasshi*, **1979**, 989-992 and Kobayashi, G. *et al. Heterocycles*, **1979**, 485-488. The oxidation of methylsulfanyl isothiazole (7) using oxone in the presence of a suitable solvent furnished the expected sulphone derivative (8) in good yield. Reaction of sulphone (8) with dialkyl malonoate (9) in the presence of suitable base such as sodium hydride in a suitable solvent gives the diester of the formula (10) (wherein R is alkyl). Dealkoxycarbonylation of diester (10) using suitable base such as sodium hydride afforded desired isothiazolo[3,4-*d*]pyrimidinyl ester (11). Hydrolysis of the ester (11) with aqueous acid gives compounds of the formula (12). The carboxylic acid of formula (12) is coupled with an amine of the general formula (2) in the presence of a suitable coupling agent such as EDCI to give compounds represented by the general formula (Ia).

## Scheme 2

Another approach for the synthesis of isothiazolo[3,4-*d*]pyrimidinyl acetamides of the formula (Ia) is as shown in Scheme 3. Displacement of methylsulfonyl group of intermediate (8) with an active ester of the formula (13) (wherein R is alkyl) in the presence of a suitable base gives compounds of the formula (14). Dealkoxycarbonylation of (14) in the presence of suitable base and solvent gives the compounds of the general formula (Ia).

## Scheme 3

An alternative approach for the synthesis isothiazolo[3,4-*d*]pyrimidinyl acetamides of the formula (Ia) is as described in Scheme 4. Compounds of the formula (15) can be prepared from commercially available 6-aminouracil of the formula (5) in two steps according to reported procedure (Hirota, K. *et al. Tetrahedron*, **1996**, 52, 9971-9978). Cyclisation of compounds of the formula (15) using lead tetraacetate in suitable solvent gives fused isothiazole derivative of the formula (16), which on halogenation using *N*-bromosuccinimide or *N*-iodosuccinimide in BF<sub>3</sub>-etherate or trifluoromethanesulphonic acid gives compounds of the formula (17). This conversion is

according to procedure reported by George, O. L. *et al. J. Am. Chem.*, **2004**, 126, 15770-15776. The halide (17) can be transformed to the corresponding allyl isothiazole derivative of the formula (19) by a Suzuki-Miyaura coupling reaction with allyl boronic acids of formula (18) in the presence of Pd (0) using a procedure similar to the Suzuki-Miyaura coupling reaction described by Kotha *et al. Synlett* **2005**, 12, 1877-1890. Compound of the formula (19) is transformed to the carboxylic acid (12) using oxidative cleavage of the terminal olefin by methods well known in the literature. The coupling of compounds of formula (11) with an amine of the general formula (2) by using a standard amide coupling method gives compounds of general formula (Ia).

Scheme 4

A general approach for the synthesis of isothiazolo[5,4-*d*]pyrimidinyl acetamides of the formula (Ib) wherein, R<sup>1</sup>, R<sup>2</sup>, U and V are as defined above is shown in Scheme 5. The known 6-chloro-1,3-dimethyluracil (20) is prepared according to the reported procedure from commercially available 1,3-dialkylbarbituric acid. The reaction of 6-chloro-1,3-dialkyluracil (20) with sodium hydrosulphide hydrate in the presence of a suitable solvent gives 6-mercapto-1,3-dialkyluracil of the formula (21) (this is similar to procedure reported by Itoh, T. *et al. Chem. Pharma. Bull.* 1981, 29 (4), 1039-1043). The cyclisation of 6-mercapto-1,3-dialkyluracil (21) with malonic acid in the presence of acetic anhydride and acetic acid gives 5-hydroxythiopyrano[2,3-*d*]pyrimidinetrione (22). The Posner reaction of compounds of the formula (22) using hydroxylamine hydrochloride in the presence of suitable base such as triethylamine or sodium alkoxide in a suitable solvent gives the expected isothiazolo[5,4-*d*]pyrimidinyl acetic acid (23). (This is according to procedure reported by Posner, T. *et al. Chem. Ber.*, **1913**, 46, 3816 and Giannella, M. *et al. Phytochemistry* **1971**, 10, 539 – 544). The coupling reaction of compounds of formula (23) with respective amines of the general formula (2) by using a

standard amide coupling methods gives compounds of general formula (Ib). Alternatively, isothiazolo[5,4-*d*]pyrimidinyl acetic acid (23) can also be converted to the corresponding ester (24) by using well known esterification methods. Sodium hydride mediated coupling reaction of (24) with various amines of the general formula (2) gives amides of the general formula (Ib).

Scheme 5

Another approach for the synthesis of isothiazolo[5,4-*d*]pyrimidinyl acetamides of the formula (Ib) is as shown in Scheme 6. Synthesis starts from readily available barbituric acid of the formula (25). The known 6-chloro-5-formyluracil of the formula (26) is prepared according to the reported procedure (Singh, J. S. *et al*, *Synthesis* **1988**, 342-344). The reaction of 6-chloro-5-formyl-1,3-dialkyluracil (26) with hydroxylamine in methanol followed by dehydration with phosphorous oxychloride gives 6-chloro-5-cyano-1,3-dialkyluracil of the formula (27). 6-Chloro-5-cyano-1,3-dialkyluracil of the formula (27) can be converted to 6-mercapto-5-cyanouracil derivative (28) by its reaction with sodium hydrosulphide hydrate. The cyclisation of 6-mercapto-5-cyano derivative (28) using chloramines in the presence of suitable solvent gives aminoisothiazole (29). The aminoisothiazole (29) on diazotization followed by halide substitution with copper halide (such as copper bromide or copper iodide) gives a halide derivative of the formula (30). The halide (30) can be transformed into allyl isothiazole of the formula (31) by Suzuki-Miyaura coupling reaction with allyl boronic acid pinacol ester of the formula (18) as described in Scheme 4. Allyl isothiazole of the formula (31) can be converted to isothiazolo[5,4-*d*]pyrimidinylacetic acid of the formula (23) by oxidative cleavage of the

terminal double bond using an appropriate oxidizing agent in a suitable solvent. The coupling of compounds of formula (23) with an amine of the general formula (2) by using a standard amide coupling method gives compounds of general formula (Ib).

Scheme 6

General approach for the synthesis of compound of formula (Ic) (wherein  $\text{R}^1$ ,  $\text{R}^2$ ,  $\text{R}^4$ ,  $\text{R}^5$ ,  $\text{R}^6$ ,  $\text{R}^7$ ,  $\text{R}^8$  and  $\text{R}^9$  are as defined above) is depicted in scheme 7. Direct coupling of compounds of the general formula (11) with appropriate amines of formula (37) by using suitable base (e.g., sodium hydride) and in suitable solvent (e.g. toluene, xylene) gives compounds of the general formula (Ic). Alternatively, compounds of the general formula (Ic) can be prepared in two steps by hydrolysis of (11) under acidic conditions to give the carboxylic acid (12) followed by coupling with amine of the general formula (37) using a suitable coupling agents [e.g., *N*-ethyl-*N'*-(3-dimethylaminopropyl) carbodiimide hydrochloride (EDCI), benzotriazol-1-yloxytris (dimethylamino) phosphonium hexafluorophosphate [BOP]] in suitable solvent or mixture of solvents to give compounds of the general formula (Ic).

Scheme 7

General approach for the synthesis of compound of formula (Id) (wherein R<sup>1</sup>, R<sup>2</sup>, R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup>, R<sup>7</sup>, R<sup>8</sup> and R<sup>9</sup> are as defined above) is depicted in scheme 8. Direct coupling of compounds of the general formula (23) with appropriate amines of formula (37) by using suitable coupling agents [e.g., *N*-ethyl-*N'*-(3-dimethylaminopropyl) carbodiimide hydrochloride (EDCI), benzotriazol-1-yloxytris (dimethylamino) phosphonium hexafluorophosphate [BOP]] in suitable solvent or mixture of solvents gives compounds of the general formula (Id). Alternatively, compounds of the general formula (Id) can also be prepared in two steps by esterification of (23) to give the corresponding ester of the formula (24) followed by its coupling with amine of the general formula (37) using a suitable base (e.g., sodium hydride) and in suitable solvent (e.g. toluene, xylene) to give compounds of the general formula (Id).

Scheme 8

Scheme 9 depicts synthesis of 2-amino-4-aryl thiazoles of the formula (37) (wherein  $R^4$ ,  $R^5$ ,  $R^6$ ,  $R^7$ ,  $R^8$  and  $R^9$  are as defined above in description) which is prepared from acetophenones of the formula (36) using known approaches. Certain di- and tri-substituted acetophenones were not commercially available and they were prepared from the corresponding benzoic acid derivative of formula (32) in three steps. Thus, acid of formula (32) was converted to the corresponding acid chloride of formula (33) using oxalyl chloride in the presence of catalytic amounts of DMF in dry dichloromethane. The acid chloride of formula (33) was converted to corresponding Weinreb amide of formula (35) by treating with *N,O*-dimethylhydroxylamine hydrochloride of formula (34) in the presence of a suitable base such as triethylamine. The addition of methyl magnesium iodide to Weinreb amide of formula (35) afforded acetophenone derivative of formula (36).

Conversion of acetophenone derivative of formula (36) to 2-amino-4-substituted aryl thiazole of the formula (37) can be effected by two approaches as described in Scheme 9. In the first case acetophenone was converted to the corresponding phenacyl bromide, which in turn was reacted with thiourea in a suitable solvent such as tetrahydrofuran at refluxing condition. Alternatively, acetophenone derivative of formula (36) can be converted to 2-amino-4-aryl thiazole (37) in one step by its reaction with thiourea and iodine in refluxing ethanol (Carroll, K. *et al. J. Am. Chem. Soc.*, **1950**, 3722 and Naik, S. J.; Halkar, U. P., *ARKIVOC*, **2005**, xiii, 141-149).

Scheme 9

3-Amino-1-arylpyrazole was prepared as shown in Scheme 10. Reaction of phenylhydrazine derivative of formula (38) (wherein  $R^4$ ,  $R^5$ ,  $R^6$ ,  $R^7$  and  $R^8$  are as defined

above in description) with acrylonitrile in the presence of a suitable base such as sodium ethoxide or sodium methoxide in refluxing ethanol affords the dihydro derivative of compound of formula (39). Intermediate (39) on oxidation with *N*-bromosuccinimide as reported by Duffin, G. F. et al, *J. Chem. Soc.*, **1954**, 408-415, gives 3-amino-1-arylpyrazoles derivative of formula (40).

Scheme 10

The intermediates and examples described in the present invention are prepared using the procedure described below. However, it is understood that these intermediates and examples can be prepared by alternate approaches which are within the scope of the present invention.

General procedure for the preparation of 2-amino-4-aryl thiazoles:

Method 1:

A solution of acetophenone derivative (1.0 equiv.) in glacial acetic acid (5 vol) was added liquid bromine (1.0 equiv.) at  $0^\circ\text{C}$  and reaction mixture was stirred at room temperature for 2h. The reaction mixture was diluted with water and extracted with ethyl acetate, washed with brine and dried over  $\text{Na}_2\text{SO}_4$ . The crude product obtained upon concentration was dissolved in dry THF (10 vol) and thiourea (2.0 equiv.) was added and refluxed for overnight. The reaction mixture was diluted with ethyl acetate, washed with sodium thiosulfate solution and organic layer was treated with 1N HCl to result salt formation of the amine. The precipitated salt was collected by filtration. The salt was then treated with saturated solution of  $\text{NaHCO}_3$  to re-generate the amine. The mixture was extracted with dichloromethane (2 x 50 ml) and the combined organic extracts were washed with water and brine. The solvent was evaporated under reduced pressure to afford the 2-amino-4-aryl-thiazole derivative.

Method 2:

A solution of acetophenone derivative (1.0 equiv.), thiourea (2.0 equiv.) and iodine (1.0 equiv.) in dry ethanol (5 vol) was refluxed for 24 h. The reaction mixture was diluted with ethyl acetate and the layers were separated. The organic layer was washed with sodium thiosulfate solution to remove iodine. The ethyl acetate solution was treated with 1N HCl and precipitated salt was collected by filtration. The free amine was re-generated as described in Method 1 given above.

All the 2-amino-4-aryl-thiazole derivatives were prepared by either Method 1 or Method 2 starting from appropriate aryl alkyl ketones. Structure information and characterization data for selected intermediates are given in Table 1.

### **EXAMPLES**

#### General procedure for the preparation of Examples

##### Method A:

To a stirred solution of carboxylic acid derivative (1.0 equiv.) in 1,2-dichloroethane was added EDCI (1.2 equiv.), HOBt (0.3 equiv.) and 4-dimethylaminopyridine (0.1 equiv.) and the mixture was stirred at room temperature for 10-15 min. An appropriate amine (1.0 equiv.) was then added and mixture was stirred under nitrogen atmosphere at the same temperature for 48 h or heated at reflux temperature for 24 h. The solvent was evaporated under reduced pressure and the residue obtained was diluted with methanol and stirred at room temperature for 30 min. The solid separated out was collected by filtration. The solid product was further purified by recrystallisation from isopropanol or methanol to give the desired products.

##### Method B:

To a stirred solution of appropriate thiazole amine (1.2 equiv.) in dry toluene was added sodium hydride and the mixture was stirred at room temperature for 30 min. Isothiazole acetic acid ester (1.0 equiv.) was added and the mixture was heated to reflux under nitrogen atmosphere for 24 h. The mixture was cooled and acidified to pH 6.0 by addition of 2 N hydrochloric acid. The solid precipitated out was collected by filtration. The product was further purified by crystallization or by silica gel column chromatography using a mixture of methanol and chloroform.

#### Pharmacological activity

The illustrative examples of the present invention are screened for TRPA1 activity according to a modified procedure described in (a) Tóth, A. *et al. Life Sciences*, **2003**, 73, 487-498. (b) McNamara C, R. *et al, Proc. Natl. Acad. Sci. U.S.A.*, 2007, **104**, 13525-13530. The screening of the compounds can be carried out by other methods and procedures known to persons skilled in the art.

#### Screening for TRPA1 antagonist using the <sup>45</sup>Calcium uptake assay:

The inhibition of TRPA1 receptor activation was measured as inhibition of allyl isothiocyanate (AITC) induced cellular uptake of radioactive calcium.

Test compounds were dissolved in 100% DMSO to prepare 10 mM stock and then diluted using plain medium with 0.1% BSA and 1.8 mM CaCl<sub>2</sub> to get the desired concentration. The final concentration of DMSO in the reaction was 0.5% (v/v). Human TRPA1 expressing CHO cells were grown in F-12 DMEM medium with 10% FBS, 1% penicillin-streptomycin solution, and 400 µg / ml of G-418. Rat TRPA1 expressing CHO cells were grown in F-12 DMEM medium with 10% FBS, 1% penicillin-streptomycin solution, and 400 µg / ml of Zeocin. Cells were seeded 24 h prior to the assay in 96 well plates so as to get ~ 50,000 cells per well on the day of experiment. Cells were treated with the test compounds for 10 minutes followed by the addition of AITC at a final concentration of 30 µM (for human TRPA1) and / or 10 µM (for rat TRPA1) and 5 µCi/ml <sup>45</sup>Ca<sup>+2</sup> for 3 minutes. Cells were washed and lysed using a buffer containing 1% Triton X-100, 0.1 % deoxycholate and 0.1% SDS. Radioactivity in the lysate was

measured in a Packard TopCount after addition of liquid scintillant. (Toth et al, *Life Sciences* (2003) 73, 487-498; McNamara CR et al, *Proceedings of the National Academy of Sciences*, (2007) 104, 13525-13530).

Concentration response curves were plotted as a % of maximal response obtained in the absence of test antagonist. IC<sub>50</sub> values can be calculated from concentration response curve by nonlinear regression analysis using GraphPad PRISM software.

The compounds prepared were tested using the above assay procedure and the results obtained are given in Table 4. Percentage inhibition at concentrations of 1.0  $\mu$ M and 10.0  $\mu$ M are given in the table along with IC<sub>50</sub> (nM) details for selected examples. The IC<sub>50</sub> (nM) values of the compounds are set forth in Table 4 wherein wherein "A" refers to an IC<sub>50</sub> value of less than 50 nM, "B" refers to IC<sub>50</sub> value in range of 50.01 to 100.0 nM and "C" refers to an IC<sub>50</sub> values above 100.0 nM.
