METHODS TO TREAT LYMPHOPLASMACYTIC LYMPHOMA

[0001] The present application claims priority under 35 U.S.C. § 119(e) to U.S. provisional patent applications, U.S.S.N. 62/036,934, filed August 13, 2014 and U.S.S.N. 61/915,684, filed December 13, 2013, the entire contents of which are incorporated herein by reference.

GOVERNMENT SUPPORT

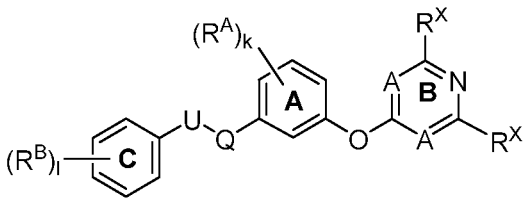
[0002] This invention was made with U.S. Government support under grants 5R01CA130876-05, 5P50CA090578-10, 5R01CA136851-04, 2R01CA136851-05, and 1R01CA172592-01A1 awarded by the National Cancer Institute. The U.S. Government has certain rights in the invention.

BACKGROUND OF THE INVENTION

[0003] Waldenström's macroglobulinemia (WM) is a distinct clinicopathological entity resulting from the accumulation, predominantly in the bone marrow, of clonally related lymphoplasmacytic cells which secrete a monoclonal IgM protein. This condition is considered to correspond to lymphoplasmacytic lymphoma (LPL) as defined by the World Health Organization classification system. WM is a rare disorder, with fewer than 1,500 cases occurring in the United States annually. There is a 2- to 3-fold risk increase of developing WM in people with a personal history of autoimmune diseases with autoantibodies and particularly elevated risks associated with hepatitis, human immunodeficiency virus, and rickettsiosis (*Arch. Intern. Med.*, **2008**, *168*(17), 1903-9). There is no single accepted treatment for WM, and there can be a marked variation in clinical outcome. Objective response rates are high (>80%) but complete response rates are low (0-15%) (*Clin. Adv. Hematol. Oncol.*, **2009**, *7*(10), 677-81, 687-90). Thus, there is a need for effective treatment of WM.

SUMMARY OF THE INVENTION

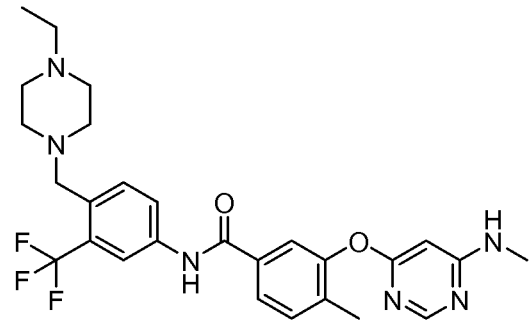
[0004] The present invention is based, at least in part, on the discovery of compounds of the Formula (**A**):



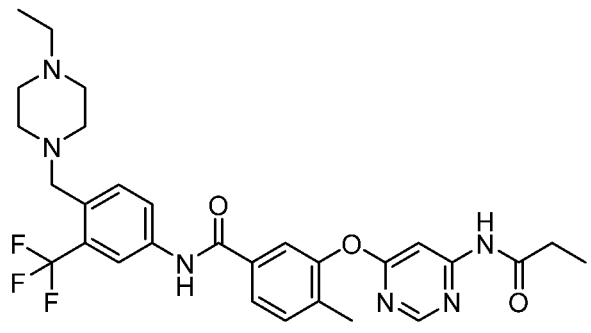
(**A**)

or a pharmaceutically acceptable salt thereof, wherein Q, U, R^A, R^B, R^X, k, and l are defined herein, for the treatment of Waldenström's macroglobulinemia. The activity of these compounds was established by *in vitro* screening against several kinases (*e.g.*, BTK, HCK, TAK1, HPK1).

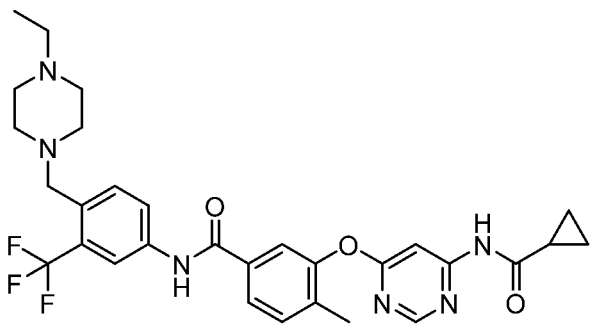
[0005] In certain embodiments, compounds of Formula (**A**) are of formula:



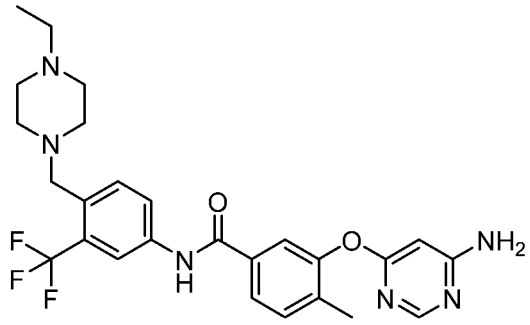
(**A-1**),



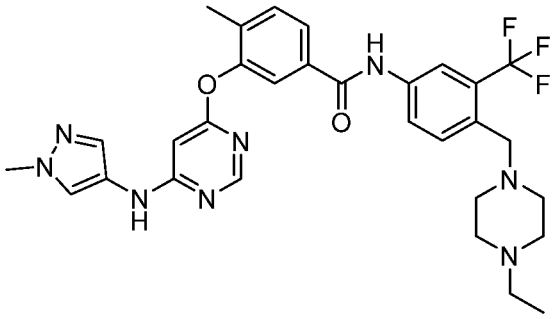
(**A-2**),



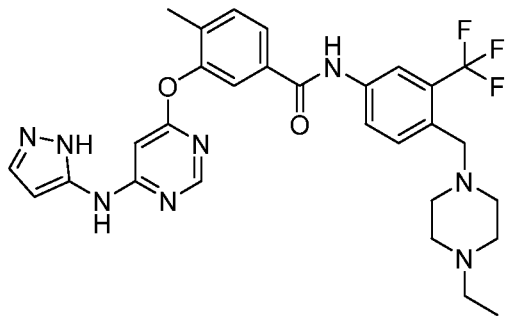
(**A-3**),



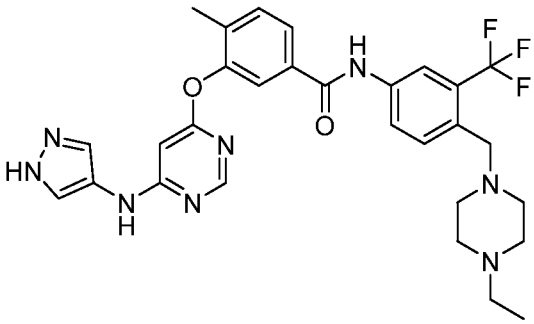
(**A-4**),



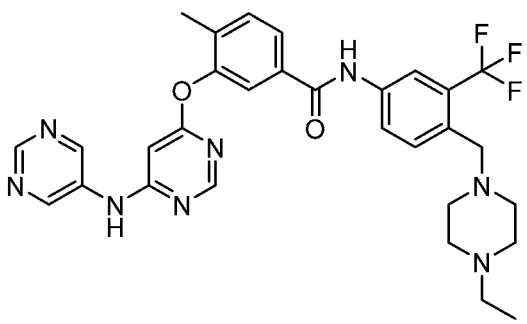
(**A-5**),



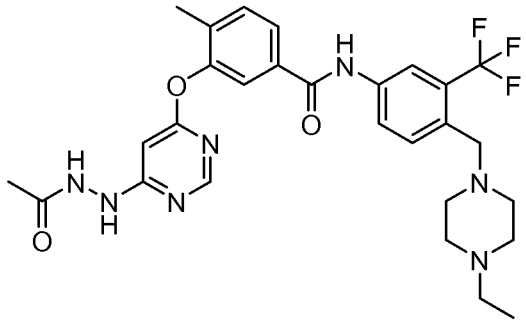
(**A-6**),



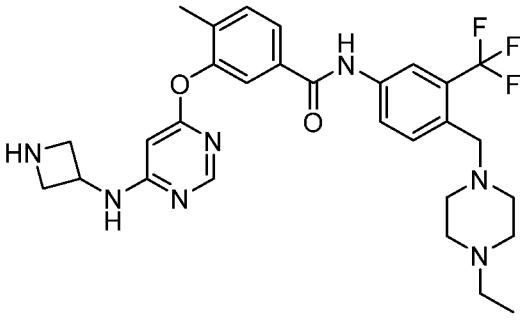
(**A-7**),



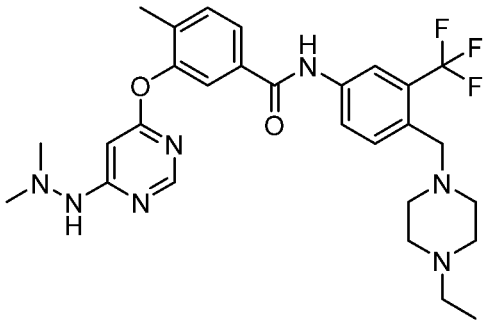
(**A-8**),



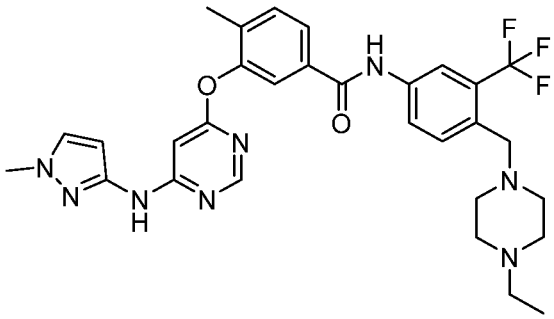
(**A-9**),



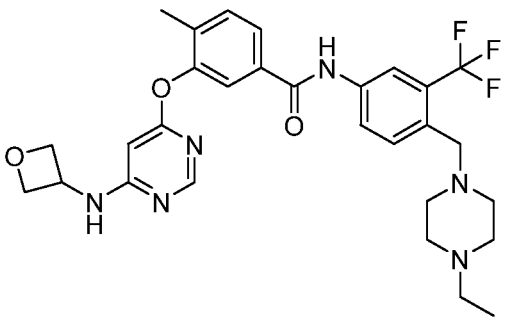
(**A-10**),



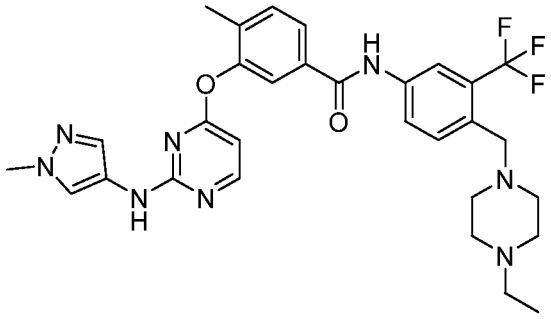
(**A-11**),



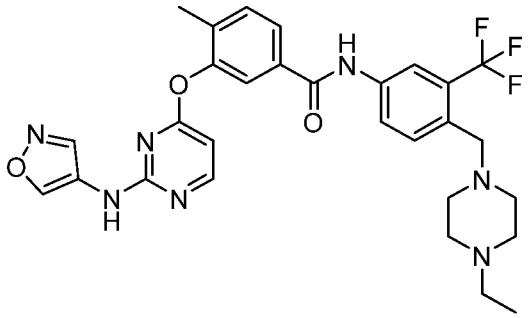
(**A-12**),



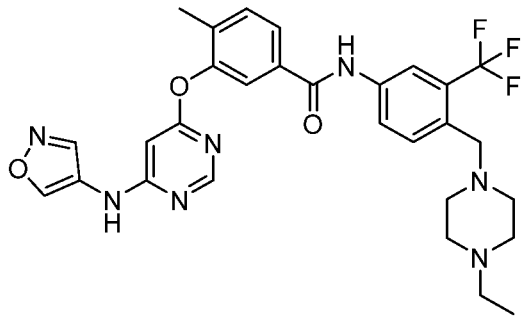
(**A-13**),



(**A-14**),



(**A-15**),



(**A-16**),

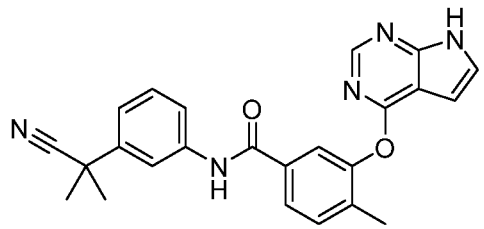
and pharmaceutically acceptable salts thereof.

[0006] Another aspect of the invention relates to the compound of Formula (**I-11**):



(**I-11**),

and pharmaceutically acceptable salts thereof.

[0007] The present invention also provides compounds of Formula (**II**) or (**V**):

[0008] The present invention is also based, at least in part, on the discovery that Waldenström's macroglobulinemia may be treated by administration of a compound of the invention to a subject in need thereof. The activity of these compounds was established by *in vitro* screening against several kinases (*e.g.*, BTK, HCK, TAK1, HPK1) that are involved in the regulation of aberrant cell growth, as well as cell-based screening against several cell lines (*e.g.*, BCWM.1, MWCL-1) that are disease state models of Waldenström's macroglobulinemia (Ditzel et al. *Exp Hematol.* 2007 Sep;35(9):1366-75; Hodge et al. *Blood.* 2011 May 12;117(19)).

[0009] The methods of treatment utilizing a compound of the invention also apply to B cell neoplasms of the group consisting of Hodgkin's lymphomas and most non-Hodgkin's lymphomas, such as diffuse large B cell lymphoma, Follicular lymphoma, mucosa-associated

lymphatic tissue lymphoma (MALT), small cell lymphocytic lymphoma (overlaps with chronic lymphocytic leukemia), mantle cell lymphoma (MCL), Burkitt lymphoma, mediastinal large B cell lymphoma, nodal marginal zone B cell lymphoma (NMZL), splenic marginal zone lymphoma (SMZL), Intravascular large B-cell lymphoma, Primary effusion lymphoma, and Lymphomatoid granulomatosis.

[0010] The present invention is also based, at least in part, on pharmaceutical compositions comprising a compound of the invention (*e.g.*, a compound of Formula (**A**), (**I-11**), (**II**), or (**V**) (*e.g.*, compounds of Formula (**A-1**)-(**A-18**))) and a pharmaceutically acceptable excipient. In certain embodiments, the pharmaceutical composition may be useful for modulating the activity of a kinase *in vitro* or in a subject in need thereof, and/or for treating and/or preventing in a subject in need thereof a condition associated with aberrant activity of a kinase (*e.g.*, a proliferative disease). In certain embodiments, the pharmaceutical composition may be useful for treatment of Waldenström's macroglobulinemia in a subject in need thereof.

[0011] The present invention also provides kits comprising a container with a compound of the invention (*e.g.*, a compound of Formula (**A**), (**I-11**), (**II**), or (**V**) (*e.g.*, compounds of Formula (**A-1**)-(**A-18**))), or a pharmaceutical composition thereof. The kits may include a single dose or multiple doses of a compound described herein or a pharmaceutical composition thereof. The kits may be useful for modulating the activity of a kinase in a subject in need thereof. The kits may also be useful for treating and/or preventing in a subject in need thereof a condition associated with aberrant activity of a kinase. In certain embodiments, the kits further include instructions for using the kit (*e.g.*, for administering a compound described herein, or a pharmaceutical composition thereof).

[0012] The details of particular embodiments of the invention are set forth herein. Other features, objects, and advantages of the invention will be apparent from the Detailed Description, the Figures, the Examples, and the Claims.

DEFINITIONS

Chemical Definitions

[0013] Definitions of specific functional groups and chemical terms are described in more detail below. The chemical elements are identified in accordance with the Periodic Table of the Elements, CAS version, Handbook of Chemistry and Physics, 75th Ed., inside cover, and specific functional groups are generally defined as described therein. Additionally, general principles of organic chemistry, as well as specific functional moieties and reactivity, are

described in *Organic Chemistry*, Thomas Sorrell, University Science Books, Sausalito, 1999; Smith and March *March's Advanced Organic Chemistry*, 5th Edition, John Wiley & Sons, Inc., New York, 2001; Larock, *Comprehensive Organic Transformations*, VCH Publishers, Inc., New York, 1989; and Carruthers, *Some Modern Methods of Organic Synthesis*, 3rd Edition, Cambridge University Press, Cambridge, 1987.

[0014] Compounds described herein can comprise one or more asymmetric centers, and thus can exist in various stereoisomeric forms, *e.g.*, enantiomers and/or diastereomers. For example, the compounds described herein can be in the form of an individual enantiomer, diastereomer or geometric isomer, or can be in the form of a mixture of stereoisomers, including racemic mixtures and mixtures enriched in one or more stereoisomer. Isomers can be isolated from mixtures by methods known to those skilled in the art, including chiral high pressure liquid chromatography (HPLC) and the formation and crystallization of chiral salts; or preferred isomers can be prepared by asymmetric syntheses. See, for example, Jacques *et al.*, *Enantiomers, Racemates and Resolutions* (Wiley Interscience, New York, 1981); Wilen *et al.*, *Tetrahedron* 33:2725 (1977); Eliel, E.L. *Stereochemistry of Carbon Compounds* (McGraw–Hill, NY, 1962); and Wilen, S.H. *Tables of Resolving Agents and Optical Resolutions* p. 268 (E.L. Sulfur protecting groups are well known in the art and include those described in detail in *Protecting Groups in Organic Synthesis*, T. W. Greene and P. G. M. Wuts, 3rd edition, John Wiley & Sons, 1999, incorporated herein by reference.

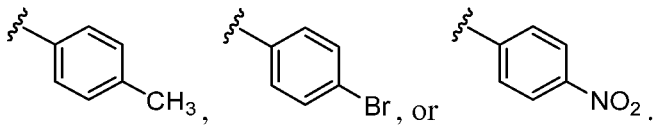
[0049] As used herein, a "leaving group", or "LG", is a term understood in the art to refere to a molecular fragment that departs with a pair of electrons upon heterolytic bond cleavage, wherein the molecular fragment is an anion or neutral molecule. See, for example, Smith, March *Advanced Organic Chemistry* 6th ed. (501–502). Examples of suitable leaving groups include, but are not limited to, halides (such as chloride, bromide, or iodide), alkoxycarbonyloxy, aryloxycarbonyloxy, alkanesulfonyloxy, arenesulfonyloxy, alkyl-carbonyloxy (*e.g.*, acetoxy), arylcarbonyloxy, aryloxy, methoxy, N,O-dimethylhydroxylamino, pixyl, haloformates, $-NO_2$, trialkylammonium, and aryliodonium salts. In certain embodiments, the leaving group is a sulfonic acid ester. In certain embodiments, the sulfonic acid ester comprises the formula $-OSO_2R^{LG1}$ wherein R^{LG1} is selected from the group consisting alkyl optionally, alkenyl optionally substituted, heteroalkyl optionally substituted, aryl optionally substituted, heteroaryl optionally substituted, arylalkyl optionally substituted, and heterarylalkyl optionally substituted. In

certain embodiments, R^{LG1} is substituted or unsubstituted C_1-C_6 alkyl. In certain embodiments, R^{LG1} is methyl. In certain embodiments, R^{LG1} is $-CF_3$. In certain embodiments, R^{LG1} is substituted or unsubstituted aryl. In certain embodiments, R^{LG1} is substituted or unsubstituted phenyl. In certain embodiments R^{LG1} is:



[0050] In some cases, the leaving group is toluenesulfonate (tosylate, Ts), methanesulfonate (mesylate, Ms), *p*-bromobenzenesulfonyl (brosylate, Bs), or trifluoromethanesulfonate (triflate, Tf). In some cases, the leaving group is a brosylate (*p*-bromobenzenesulfonyl). In some cases, the leaving group is a nosylate (2-nitrobenzenesulfonyl). In certain embodiments, the leaving group is a sulfonate-containing group. In certain embodiments, the leaving group is a tosylate group. The leaving group may also be a phosphineoxide (*e.g.*, formed during a Mitsunobu reaction) or an internal leaving group such as an epoxide or cyclic sulfate.

[0051] These and other exemplary substituents are described in more detail in the Detailed Description, Figures, Examples, and Claims. The invention is not intended to be limited in any manner by the above exemplary listing of substituents.

Other Definitions

[0052] The following definitions are more general terms used throughout the present application.

[0053] As used herein, the term "pharmaceutically acceptable salt" refers to those salts which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and lower animals without undue toxicity, irritation, allergic response, and the like, and are commensurate with a reasonable benefit/risk ratio. Pharmaceutically acceptable salts are well known in the art. For example, Berge *et al.* describe pharmaceutically acceptable salts in detail in *J. Pharmaceutical Sciences*, 1977, 66, 1–19, incorporated herein by reference. Pharmaceutically acceptable salts of the compounds of this invention include those derived from suitable inorganic and organic acids and bases. Examples of pharmaceutically acceptable, nontoxic acid addition salts are salts of an amino group formed with inorganic acids, such as hydrochloric acid, hydrobromic acid, phosphoric acid, sulfuric acid, and perchloric acid or with organic acids, such as acetic acid, oxalic acid, maleic acid, tartaric acid, citric acid, succinic acid, or malonic acid or by using other methods

known in the art such as ion exchange. Other pharmaceutically acceptable salts include adipate, alginate, ascorbate, aspartate, benzenesulfonate, benzoate, bisulfate, borate, butyrate, camphorate, camphorsulfonate, citrate, cyclopentanepropionate, digluconate, dodecylsulfate, ethanesulfonate, formate, fumarate, glucoheptonate, glycerophosphate, gluconate, hemisulfate, heptanoate, hexanoate, hydroiodide, 2–hydroxy–ethanesulfonate, lactobionate, lactate, laurate, lauryl sulfate, malate, maleate, malonate, methanesulfonate, 2–naphthalenesulfonate, nicotinate, nitrate, oleate, oxalate, palmitate, pamoate, pectinate, persulfate, 3–phenylpropionate, phosphate, picrate, pivalate, propionate, stearate, succinate, sulfate, tartrate, thiocyanate, p-toluenesulfonate, undecanoate, valerate salts, and the like. Salts derived from appropriate bases include alkali metal, alkaline earth metal, ammonium, and $N^+(C_{1-4}\ alkyl)_4^-$ salts. Representative alkali or alkaline earth metal salts include sodium, lithium, potassium, calcium, magnesium, and the like. Further pharmaceutically acceptable salts include, when appropriate, nontoxic ammonium, quaternary ammonium, and amine cations formed using counterions such as halide, hydroxide, carboxylate, sulfate, phosphate, nitrate, lower alkyl sulfonate, and aryl sulfonate.

[0054] The term "solvate" refers to forms of the compound, or a salt thereof, that are associated with a solvent, usually by a solvolysis reaction. This physical association may include hydrogen bonding. Conventional solvents include water, methanol, ethanol, acetic acid, DMSO, THF, diethyl ether, and the like. Compounds of the invention may be prepared, *e.g.*, in crystalline form, and may be solvated. Suitable solvates include pharmaceutically acceptable solvates and further include both stoichiometric solvates and non-stoichiometric solvates. In certain instances, the solvate will be capable of isolation, for example, when one or more solvent molecules are incorporated in the crystal lattice of a crystalline solid. "Solvate" encompasses both solution-phase and isolable solvates. Representative solvates include hydrates, ethanolates, and methanolates.

[0055] The term "hydrate" refers to a compound that is associated with water. Typically, the number of the water molecules contained in a hydrate of a compound is in a definite ratio to the number of the compound molecules in the hydrate. Therefore, a hydrate of a compound may be represented, for example, by the general formula $R{\cdot}x\ H_2O$, wherein R is the compound and wherein x is a number greater than 0. A given compound may form more than one type of hydrates, including, *e.g.*, monohydrates (x is 1), lower hydrates (x is a number greater than 0 and smaller than 1, *e.g.*, hemihydrates ($R{\cdot}0.5\ H_2O$)), and polyhydrates (x is a number greater than 1, *e.g.*, dihydrates ($R{\cdot}2\ H_2O$) and hexahydrates ($R{\cdot}6\ H_2O$)).

[0056] The term "tautomers" refer to compounds that are interchangeable forms of a particular compound structure, and that vary in the displacement of hydrogen atoms and electrons. Thus, two structures may be in equilibrium through the movement of π electrons and an atom (usually H). For example, enols and ketones are tautomers because they are rapidly interconverted by treatment with either acid or base. Another example of tautomerism is the aci- and nitro- forms of phenylnitromethane, that are likewise formed by treatment with acid or base. Tautomeric forms may be relevant to the attainment of the optimal chemical reactivity and biological activity of a compound of interest.

[0057] It is also to be understood that compounds that have the same molecular formula but differ in the nature or sequence of bonding of their atoms or the arrangement of their atoms in space are termed "isomers." Isomers that differ in the arrangement of their atoms in space are termed "stereoisomers".

[0058] Stereoisomers that are not mirror images of one another are termed "diastereomers" and those that are non-superimposable mirror images of each other are termed "enantiomers". When a compound has an asymmetric center, for example, it is bonded to four different groups, a pair of enantiomers is possible. An enantiomer can be characterized by the absolute configuration of its asymmetric center and is described by the R- and S-sequencing rules of Cahn and Prelog, or by the manner in which the molecule rotates the plane of polarized light and designated as dextrorotatory or levorotatory (*i.e.*, as (+) or (-)-isomers respectively). A chiral compound can exist as either individual enantiomer or as a mixture thereof. A mixture containing equal proportions of the enantiomers is called a "racemic mixture".

[0059] The term "polymorphs" refers to a crystalline form of a compound (or a salt, hydrate, or solvate thereof). All polymorphs have the same elemental composition. Different crystalline forms usually have different X-ray diffraction patterns, infrared spectra, melting points, density, hardness, crystal shape, optical and electrical properties, stability, and solubility. Recrystallization solvent, rate of crystallization, storage temperature, and other factors may cause one crystal form to dominate. Various polymorphs of a compound can be prepared by crystallization under different conditions.

[0060] The term "prodrugs" refers to compounds that have cleavable groups and become by solvolysis or under physiological conditions the compounds of the invention, which are pharmaceutically active *in vivo*. Such examples include, but are not limited to, choline ester derivatives and the like, N-alkylmorpholine esters and the like. Other derivatives of the compounds of this invention have activity in both their acid and acid derivative forms, but in

the acid sensitive form often offers advantages of solubility, tissue compatibility, or delayed release in the mammalian organism (see, Bundgard, H., *Design of Prodrugs*, pp. 7-9, 21-24, Elsevier, Amsterdam 1985). Prodrugs include acid derivatives well known to practitioners of the art, such as, for example, esters prepared by reaction of the parent acid with a suitable alcohol, or amides prepared by reaction of the parent acid compound with a substituted or unsubstituted amine, or acid anhydrides, or mixed anhydrides. Simple aliphatic or aromatic esters, amides and anhydrides derived from acidic groups pendant on the compounds of this invention are particular prodrugs. In some cases it is desirable to prepare double ester type prodrugs such as (acyloxy)alkyl esters or ((alkoxycarbonyl)oxy)alkylesters. Particularly the C_1-C_8 alkyl, C_2-C_8 alkenyl, C_2-C_8 alkynyl, aryl, C_7-C_{12} substituted aryl, and C_7-C_{12} arylalkyl esters of the compounds of the invention (*e.g.*, the compounds of Formula (**A**), (**I-11**), (**II**), or (**V**)).

[0061] *Figure 1* shows isobolograms demonstrating the synergy between compound (**A-17**) and a BTK inhibitor. Points below the 1 to 1 line connecting the X and Y axes are 'synergistic', points near the line are 'additive', and points above it are antagonistic.

DETAILED DESCRIPTION OF THE INVENTION

[0062] In an effort to identify novel treatments for Waldenström's macroglobulinemia, *in vitro* screens were carried out against several kinases (*e.g.*, BTK, HCK, TAK1, HPK1). These kinases are involved in the regulation of aberrant cell growth associated with this condition. Cell-based screening was also carried out in several disease state model lines of Waldenström's macroglobulinemia (*e.g.*, BCWM.1, MWCL-1). Based on these screening efforts and subsequent lead optimization, compounds of any one of Formulae (**A**), (**I-11**), (**II**), and (**V**) (*e.g.*, compounds of Formula (**A-1**)-(**A-18**)) were identified.

[0066] Waldenstrom's macroglobulinemia (WM) is a distinct clinicopathological entity resulting from the accumulation, predominantly in the bone marrow, of clonally related lymphoplasmacytic cells which secrete a monoclonal IgM protein. This condition is considered to correspond to lymphoplasmacytic lymphoma (LPL) as defined by the World Health Organization classification system. Genetic factors play an important role in the pathogenesis of WM, with 25% of patients demonstrating a family history. IgM monoclonal gammopathy of unknown significance (MGUS) often precedes the development of WM.

Classical Hodgkin's lymphoma (HL) includes various subtypes such as Nodular sclerosing HL, Mixed-cellularity subtype, Lymphocyte-rich or Lymphocytic predominance and Lymphocyte depleted. Examples of B cell non-Hodgkin's lymphomas include, but are not limited to, Waldenström's macroglobulinemia, diffuse large B cell lymphoma, follicular lymphoma, mucosa-associated lymphatic tissue lymphoma (MALT), small cell lymphocytic lymphoma (overlaps with chronic lymphocytic leukemia), mantle cell lymphoma (MCL), Burkitt lymphoma, mediastinal large B cell lymphoma, nodal marginal zone B cell lymphoma (NMZL), splenic marginal zone lymphoma (SMZL), intravascular large B-cell lymphoma, primary effusion lymphoma, and lymphomatoid granulomatosis.

In certain embodiment, a compound of the invention is a compound of Formula (**I-11**), or a

In certain embodiment, a compound of the invention is a compound of Formula (**II**), or a pharmaceutically acceptable salt, solvate, hydrate, polymorph, co-crystal, tautomer, stereoisomer, isotopically labeled derivative, or prodrug thereof. In certain embodiment, a compound of the invention is a compound of Formula (**II**), or a pharmaceutically acceptable salt thereof. In certain embodiment, a compound of the invention is a compound of Formula (**V**), or a pharmaceutically acceptable salt, solvate, hydrate, polymorph, co-crystal, tautomer, stereoisomer, isotopically labeled derivative, or prodrug thereof. In certain embodiment, a compound of the invention is a compound of Formula (**V**), or a pharmaceutically acceptable salt thereof.

[00192] In certain embodiments, compounds of the present invention include those which:

- exhibit kinase inhibitory activity,
- exhibit the ability to inhibit transforming growth factor b-activated kinase-1 (TAK1), hemopoietic cell kinase (HCK) or both TAK1 and HCK,
- exhibit the ability to inhibit hematopoietic progenitor kinase 1 (HPK1, also known as mitogen-activated protein kinase kinase kinase kinase 1 or MAP4K1),
- exhibit the ability to inhibit Bruton's tyrosine kinase (BTK), v-src sarcoma (Schmidt-Ruppin A-2) viral oncogene homolog (SRC) family of kinases or both BTK and SRC,
- exhibit cytotoxic or growth inhibitory effect on WM cell lines maintained *in vitro* or in animal studies using a scientifically acceptable cancer cell xenograft model; and/or
- exhibit a therapeutic profile (*e.g.*, optimum safety and curative effect) that is superior to existing chemotherapeutic agents.

[00193] As used herein "kinase" refers to a large class of enzymes which catalyze the transfer of the γ-phosphate from ATP to the hydroxyl group on the side chain of Ser/Thr or Tyr in proteins and peptides and are intimately involved in the control of various important cell functions, perhaps most notably: signal transduction, differentiation and proliferation. There are estimated to be about 2,000 distinct protein kinases in the human body and although each of these phosphorylates particular protein/peptide substrates, they all bind the same second substrate ATP in a highly conserved pocket. About 50% of the known oncogene products are protein tyrosine kinases PTKs and their kinase activity has been shown to lead to cell transformation.

[00194] In certain embodiments, the kinase to be inhibited is involved in the myeloid differentiation primary response gene (88) (MYD88) signaling pathway. For example, the kinase is Transforming growth factor b-activated kinase-1 (TAK1) or Hemopoietic cell

kinase (HCK). In certain embodiments, the compound of the invention inhibits TAK1, HCK, or both TAK1 and HCK.

[00195] Myeloid differentiation primary response gene (88) (MYD88) L265P is a widely expressed somatic mutation in WM patients that supports NF- NFκB signaling through stimulation of BTK, IRAK1/4, TAK1. MYD88 is an adaptor molecule for Toll-like receptors (TLR) with the exception of TLR-3 and interleukin-1 receptor (IL-1R) signaling. Following TLR or IL-1R stimulation, MYD88 is recruited to the activated receptor complex as a homodimer which then complexes with interleukin-1 receptor-associated kinase 4 (IRAK4) and activates IRAK1 and IRAK2. Tumor necrosis factor receptor associated factor 6 (TRAF6) is then activated by IRAK1 leading to NFκB activation *via* IκBα phosphorylation and TAK1 activation.

[00196] Transforming growth factor b-activated kinase-1 (TAK1; also known as MAP3K7) is a member of the serine/threonine protein kinase family. This kinase mediates the signaling transduction induced by TGF beta and morphogenetic protein (BMP), and controls a variety of cell functions including transcription regulation and apoptosis. TAK1 knockout is embryonic lethal to mice. Conditional knock-down of TAK1 in adult mice results in systemic inflammation, spenomegaly, degeneration in heart, kidneys and liver and increased proliferation and differentiation of myeloid progenitor cells. TAK1 is located downstream of Myd88, Bruton's tyrosine kinase (BTK), and interleukin-1 receptor-associated kinase (IRAK), and is being investigated for its role in innate immunity, inflammatory response, and Ras-dependent cancers.

[00197] Hemopoietic cell kinase (HCK) is a non-receptor tyrosine-protein kinase found in hematopoietic cells and is known to interact with Bruton's tyrosine kinase (BTK) upon activation by B cell receptors (*Proc. Natl. Acad. Sci. USA.* **1994**, *91*(17), 8152–55). HCK transmits signals from cell surface receptors and plays an important role in the regulation of innate immune responses, including neutrophil, monocyte, macrophage and mast cell functions, phagocytosis, cell survival and proliferation, cell adhesion and migration. It acts downstream of receptors that bind the Fc region of immunoglobulins, such as FCGR1A and FCGR2A, but also CSF3R, PLAUR, the receptors for IFNG, IL2, IL6 and IL8, and integrins, such as ITGB1 and ITGB2. During the phagocytic process, it mediates mobilization of secretory lysosomes, degranulation, and activation of NADPH oxidase to bring about the respiratory burst. It also plays a role in the release of inflammatory molecules, promotes reorganization of the actin cytoskeleton and actin polymerization, and formation of podosomes and cell protrusions.

[00198] Hematopoietic progenitor kinase 1 (HPK1) is a hematopoietic cell-restricted member of the Ste20 serine/threonine kinase super family. HPK1 is also known as mitogen-activated protein kinase kinase kinase kinase 1 (MAP4K1). HPK1 is a tissue-specific upstream activator of the MEKK/JNK/SAPK signaling pathway. HPK1 diminishes T cell receptor (TCR) signaling activity and T cell proliferation by phosphorylating the adaptor protein SLP-76. Cytosolic HPK1 is recruited to the TCR complex, and its kinase activity is induced upon the engagement of the TCR. Overexpression of HPK1 suppresses TCR-induced activation of AP-1-dependent gene transcription in a kinase-dependent manner, suggesting that the kinase activity of HPK1 is required to inhibit the Erk MAPK pathway. This blockage of the Erk MAPK pathway is thought to be the inhibitory mechanism that negatively regulates TCR-induced IL-2 gene transcription (*Immunol. Res.* **2012**, *54*(1-3), 262-65). In certain embodiments, the compounds of the invention, such as the compounds of Formula (**A**), (**I-11**), (**II**), or (**V**) (*e.g.*, compounds of Formula (**A-1**)-(**A-18**)), inhibit HPK1.

[00199] In certain embodiments, the compounds of the invention are selective inhibitors of TAK1, HCK, or HPK1. The term "selective inhibitor" as used herein is understood to mean that in contrast to many kinase inhibitors of the prior art, the compounds do not act on a variety of kinases but act specifically on TAK1, HCK, or HPK1. In certain embodiments, the compounds of the invention inhibit one or more kinases in additon to TAK1, HCK, or HPK1 such as BTK or the SRC family of kinases. In certain embodiments of the invention, the specificity of the inhibitors is given by the IC_{50} value. In some embodiments, the IC_{50} value for a selective inhibitor is < 100 μM for TAK1, HCK, or HPK1, but >100 μM for other kinases.

[00200] The IC_{50} value is defined as the concentration of inhibitor required to inhibit 50% of the kinase activity. In certain embodiments, the compounds of the invention may exhibit IC_{50} values < 100 μM. In certain other embodiments, the compounds exhibit IC_{50} values < 50 μM. In certain other embodiments, the compounds exhibit IC_{50} values < 40 μM. In certain other embodiments, the compounds exhibit IC_{50} values < 30 μM. In certain other embodiments, the compounds exhibit IC_{50} values < 20 μM. In certain other embodiments, the compounds exhibit IC_{50} values < 10 μM. In certain other embodiments, the compounds exhibit IC_{50} values < 7.5 μM. In certain embodiments, the compounds exhibit IC_{50} values < 5 μM. In certain other embodiments, the compounds exhibit IC_{50} values < 2.5 μM. In certain embodiments, the compounds exhibit IC_{50} values < 1 μM. In certain embodiments, the compounds exhibit IC_{50} values < 0.75 μM. In certain embodiments, the compounds exhibit IC_{50} values < 0.5 μM. In certain embodiments, the compounds exhibit IC_{50} values < 0.25 μM.

In other embodiments, the compounds exhibit IC_{50} values < 5 nM.

In certain embodiments, the compounds of the invention (*e.g.*, the compounds of Formula (**A**), (**I-11**), (**II**), or (**V**)) inhibit TAK1 selectively. A non-limiting example of a selective TAK1 inhibitor is:

(**A-14**).

[00204] Also, provided are methods to treat B cell neoplasms using compounds of the ivention in combination with inhibitors of Bruton's tyrosine kinase (BTK), interleukin-1 receptor-associated kinase 1 (IRAK1), interleukin-1 receptor-associated kinase 4 (IRAK4), bone marrow on X chromosome kinase (BMX), phosphoinositide 3-kinase (PI3K), transforming growth factor b-activated kinase-1 (TAK1), and/or a Src family kinase. In certain embodiments, one or more compounds of the invention are used in combination with an inhibitor of the phosphoinositide 3-kinase delta isoform (PI3Kδ). In certain embodiments, combinations of 2, 3, 4, 5, 6,7, 8, 9, 10, or more of the agents described herein are used for treating WM. In certain embodiments, the agents described herein are used in combination with inhibitors of Bruton's tyrosine kinase (BTK), interleukin-1 receptor-associated kinase 1 (IRAK1), interleukin-1 receptor-associated kinase 4 (IRAK4), bone marrow on X chromosome kinase (BMX), phosphoinositide 3-kinase (PI3K), transforming growth factor b-activated kinase-1 (TAK1), and/or a Src family kinase.

[00205] Bruton's tyrosine kinase (BTK) is a key signaling enzyme expressed in all hematopoietic cells types except T lymphocytes and natural killer cells. BTK plays an essential role in the B cell signaling pathway linking cell surface B cell receptor BCR stimulation to downstream intracellular responses. BTK is a key regulator of B cell development activation signaling and survival (Kurosaki, *Curr. Op. Imm.*, **2000**, 276-281; Schaeffer and Schwartzberg, *Curr. Op. Imm.*, **2000**, 282-288). In addition BTK plays a role in a number of other hematopoietic cell signaling pathways, *e.g.*, Toll like receptor (TLR) and cytokine receptor-mediated TNF-α production in macrophages, IgE receptor (FcepsilonRI) signaling in mast cells, inhibition of Fas/APO-1 apoptotic signaling in B-lineage lymphoid cells, and collagen stimulated platelet aggregation. See *e.g.*, C.A. Jeffries, *et al.*, *J. Biol. Chem.*, **2003**, *278*, 26258-26264; N.J. Horwood, *et al.*, *J. Exp. Med.*, **2003**, *197*, 1603-1611;

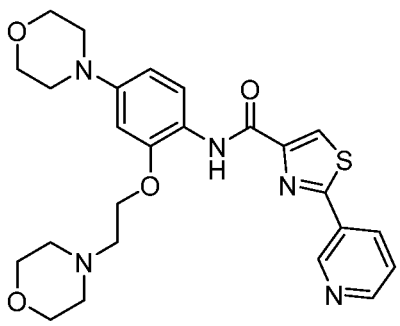
Iwaki *et al.*, *J. Biol. Chem.*, **2005**, *280*(48), 40261-40270; Vassilev *et al.*, *J. Biol. Chem.*, **1999**, *274*(3),1646-1656; and Quek *et al.*, *Curr. Biol.*, **1998**, *8*(20),1137-1140. Activated Btk interacts with MyD88 and TRIF, promoting the activation of MyD88-dependent and TRIF-dependent pathways (*Nature Immunology*, **2011**, *12*, 416–424).

[00206] BTK inhibitors are well-known in the art, and include, for example, ibrutinib and benzonaphthyridinones (see U.S. provisional patent application U.S.S.N. 61/716,273, filed October 19, 2012). Additional non-limiting examples of BTK inhibitors are disclosed in WO 1999/054286, WO 2013/010380, WO 2009/137596, WO 2011/029043, WO 2010/056875, WO 2000/056737, and WO 2013/067277.

[00207] IRAK1 and 4 are serine/threonine-protein kinases that play a critical role in initiating innate immune response against foreign pathogens. They are involved in Toll-like receptor (TLR) and IL-1R signaling pathways, and are rapidly recruited by MYD88 to the receptor-signaling complex upon TLR activation. Association with MYD88 leads to IRAK1 phosphorylation by IRAK4 and subsequent autophosphorylation and kinase activation of IRAK1 (*Immunity*, **1997**, *7*(6), 837-47). IRAK4-/- mice have abolished cellular responses to various IL-1 and TLR ligands and are severely impaired in their response to viral and bacterial challenges. IRAK1-/- mice show a similar but partial response.

[00208] IRAK1 and IRAK4 inhibitors are well-known in the art, and include, for example, those disclosed in WO 2003/030902, WO 2012/007375, G.M. Buckely *et al.*, *Biorg. Med. Chem. Lett.*, **2008**, *18*, 3211-3214, and G.M. Buckely *et al.*, *Biorg. Med. Chem. Lett.*, **2008**, *18*, 3656-3660, WO2013/074986, and U.S. provisional patent application, U.S.S.N. 61/727,640, filed November 16, 2012.

[00209] In certain embodiments, the IRAK4 inhibitor is of formula:



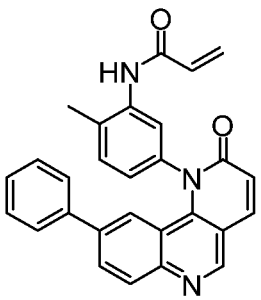
JH-IV-96-01
IRAK4 IC50 = 20nm

or an analog thereof.

"Bone Marrow on X chromosome" kinase (BMX, also termed ETK) is a non-receptor tyrosine kinase and is activated downstream of phosphatidylinositol-3 kinase (PI-

3K) and v-src sarcoma (Schmidt-Ruppin A-2) viral oncogene homolog (SRC), but its substrates are unknown. Positional scanning peptide library screening revealed a marked preference for a priming phosphotyrosine (pY) in the -1 position. Potential substrates include multiple tyrosine kinases with kinase domain pYpY sites required for full activity. BMX has been found to phosphorylate residue Y577 of focal adhesion kinase (FAK) subsequent to Y576 phosphorylation by SRC. In addition, BMX loss by RNA interference and mouse embryonic fibroblasts (MEFs) from *Bmx* negative (*Bmx*$^-$) mice displayed impaired FAK signaling. Insulin receptor (IR) phosphorylation similarly was decreased by BMX loss, as was hepatic IR phosphorylation in *Bmx*$^-$ mice. However, glucose tolerance was increased, reflecting a marked compensatory decrease in the activity of the AKT phosphatase PHLPP. These findings reveal a mechanism through which BMX functions as a central regulator of multiple kinase pathways.

BMX inhibitors are well-known in the art, and include, for example, those disclosed in U.S.S.N. 61/716,273 and 61/717,345, the contents of both of which are incorporated herein by reference. In certain embodiments, the BMX inhibitor is of formula:



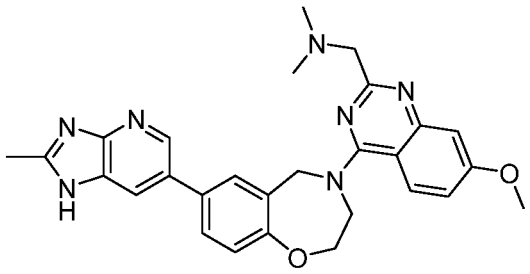
BMX IC_{50} = 16 nM

or an analog thereof.

[00210] Phosphatidylinositol 3-kinases (PI3-kinases or PI3Ks) are a family of enzymes involved in cellular functions such as cell growth, proliferation, differentiation, motility, survival and intracellular trafficking, which in turn are involved in cancer. PI3Ks are a family of related intracellular signal transducer enzymes capable of phosphorylating the 3 position hydroxyl group of the inositol ring of phosphatidylinositol (Ptdlns). Phosphatidylinositol 3-kinase is composed of an 85 kDa regulatory subunit and a 110 kDa catalytic subunit. The protein encoded by PI3KCA gene represents the catalytic subunit, which uses ATP to phosphorylate phosphatidylinositols (Ptdlns), Ptdlns4P and Ptdlns(4,5)P2. Of particular interest is the PI3K delta isoform, which is expressed in white blood cells and is mainly involved in the signaling, development, and survival of B cells.

[00211] PI3K inhibitors are well-known in the art, and include, for example, those disclosed in International PCT PublicationsWO 2013/088404, WO 2012/068096, and WO 2013/052699, which are incorporated herein by reference.

[00212] In certain embodiments, the PI3K inhibitor is



PI3Kα IC_{50} = 3 nM

or its analogs.

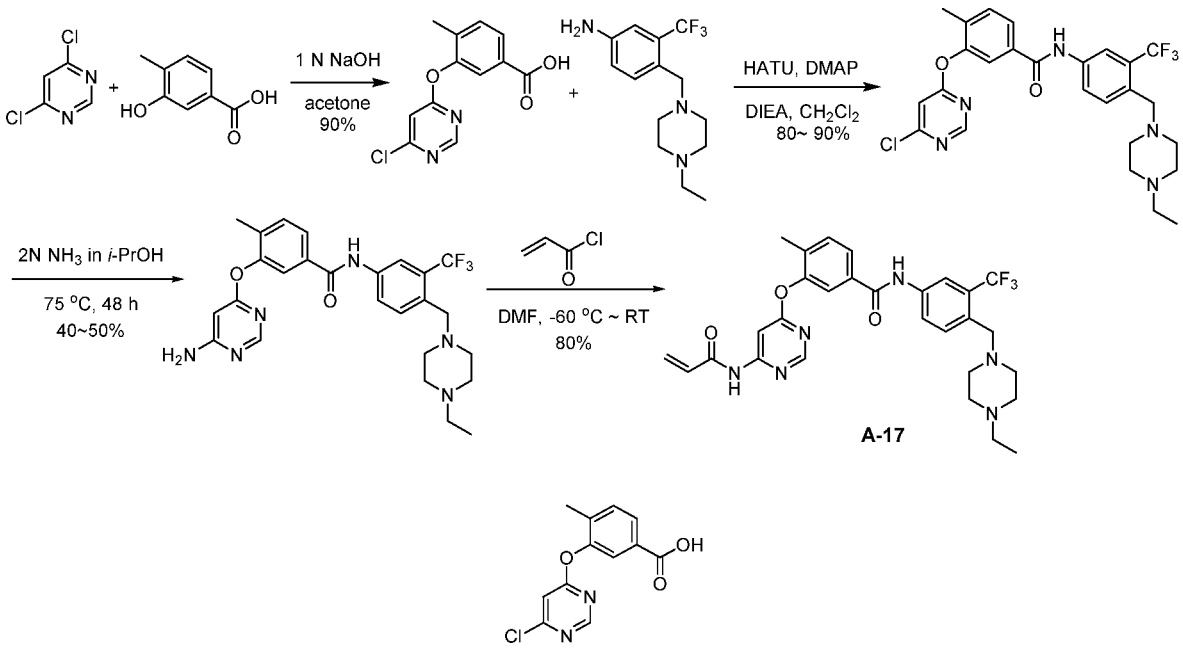
The solution was filtered to remove solids, concentrated and purified with column chromatography (dichloromethane : methanol = 10:1) to afford 455 mg of product as a colorless oil. To the solution of the obtained oil in

CH_2Cl_2 (5 mL) was added TFA (0.5 mL) and the resulting mixture was stirred at room temperature for 5 hours. The solution was concentrated and dried with vacuum, then dissolved in THF (4 mL) and 1 N NaOH solution (4 mL). The reaction mixture was stirred for 24 h and extracted with ethyl acetate. The combined organic phase was washed with brine and dried with Na_2SO_4, then filtered and concentrated, and purified by reverse phase HPLC to give 185 mg (90%) of title compound as a white solid.

Preparation of A-17



[00235] 3-((6-chloropyrimidin-4-yl)oxy)-4-methylbenzoic acid: Sodium hydroxide (2 ml of a 1N solution) was added to a solution of 4,6-dichloropyrimidine (150 mg, 1.0 mmol) and 3-hydroxy-4-methylbenzoic acid (152 mg, 1.0 mmol) in acetone (2 mL) and the reaction mixture as stirred at room temperature for 1 hour at which point LC-MS analysis indicated complete consumption of starting material. The reaction mixture was extracted with ethyl acetate. The combined organic phase was washed with brine and dried with Na_2SO_4, then filtered and concentrated, and purified by column chromatography to yield 250 mg of product as a white solid. MS (ESI) m/z 265 $(M+H)^+$.

[00242] CellTiter-Glo® Luminescent cell viability assay (Promega) was used to assess cell survival following treatment with the compounds described. Cells were seeded into 384 well plates with the EL406 Combination Washer Dispenser (BioTek Instruments, Inc.) and the

compounds were injected into the cells culture media with the JANUS Automated Workstation (PerkinElmer Inc.). Cells were treated with a series diluted inhibitors (20~0.04 μM) for 72 hours at 37° C. Luminescent measurement is performed using the 2104 Envision® Multilabel Reader (PerkinElmer Inc.).

Apoptosis analysis for primary patient bone marrow tumor cells

[00243] WM cells were treated with and without the compounds described herein. Cells were incubated at 37° C with 0.01~4 uM of the compounds described herein. Apoptosis analysis was performed using Annexin V/Propidium iodide staining with the Apoptosis Detection Kit I (BD Pharmingen). 1×106/well cells were treated in 24 well plates for ~ 24 hours with inhibitors or corresponding controls. A minimum of 10,000 events were acquired using a BD™ FACSCanto II flow cytometer and analyzed with BD FACS DIVA Software.

Kinome Scan

[00245] Compounds (**A-2**) and (**A-17**) were run in the Kinome Scan™ (DiscoverRx) assay to determine the inhibition against a broad panel of known kinases.

Results

[00246] *Table 3* shows the KinomeScan (an active site-directed competition binding assay to measure interactions between test compounds and individual kinases) data of each compound, **II-1** and **I-13**. Lower values indicate a greater inhibition for a given kinase by the test compound. As is shown, **II-1** and **I-13** inhibited several other kinases include LOK, DDR1, JNK2, ZAK, IKK-alpha, BLK, p38-alpha, ABL1, LYN, and STK36 along with the key target HCK.

Kinative

[00247] The kinase selectivity of compounds (**A-5**) and (**A-14**) were evaluated using a

chemical proteomic approach named KiNativ which detects 260 kinases in A375 cells (ActivX Biosciences). To probe the intracellular targets of the compounds, A375 cells were incubated with the inhibitor at 1 μM final concentration and then looked for protection of labeling by an ATP-biotin probe that non-specifically labels conserved lysines on kinases and other nucleotide-dependent enzymes.

Results

[00248] *Table 4* shows that compound (**A-5**) inhibits a number of kinases at 1 μM, including Abl (>90%), FYN (71.2%), LYN (87.8%), and ZAK (75.7%). *Table 5* shows that compound (**A-14**) inhibits a number of kinases at 1 μM, including Abl (>90%), FYN (88.2%), LYN (85.7%), and ZAK (75.8%).

Example 3. p-BTK and p-Hck inhibition

Protocol for PhosFlow Studies

[00249] PhosFlow was performed to detect levels of phosphorylation for BTK-pY223 (BD Biosciences) and Hck-pY410 (Abcam) in BCWM.1 cells, in BCWM cells that stably overexpress HCK (BCWM.1_HCK-wt) and in BCWM.1 cells that stably overexpress the T338M mutant of HCK (BCWM.1_HCK-mu).. Cells were fixed with BD Phosflow Fix Buffer I (BD Biosciences) at 37ºC for 10 min, then washed twice with BD Phosflow Perm/Wash Buffer I (BD Biosciences). Cells were suspended in BD Phosflow Perm/Wash Buffer I at 10 million/ml and antibodies aliquoted to flow tubes with 100μl cells. Cells were incubated at room temperature for 30 min in the dark. Cells were washed twice with BD Phosflow Perm/Wash Buffer I before performing flow analysis using a BD™ FACSCanto II flow cytometer.

Protocol for apoptosis analysis

[00250] Apoptosis analysis of WM patient primary lymphoplasmacytic cells (LPCs) was preformed following A-5 and A-14 treatment of Bone marrow mononuclear cells (BMMC) from WM patients for 24 hours. Apoptosis analysis was performed using Annexin V/ Propidium iodide staining with the Apoptosis Detection Kit I (BD Pharmingen) in CD19-APC-cy7 antibody (BD Pharmingen) gated LPCs population.

Results

[00251] PhosFlow studies indicate both A-5 and A-14 inhibit Hck and BTK phosphorylation in BCWM.1 cells and BCWM.1 cells with genetic engineered expression of Hck wild type (-wt) and T338M gatekeeper mutant (-mu) with both 0.5μM and 0.1μM doses (shown by *Table 6* and *Table 7*, respectively). In addition, the expression of Hck-wt or Hck-mu increased the resistance to the inhibition of both Hck and BTK phosphorylations by A-5 and A-14, with more resistance presented in Hck-mu expressing BCWM.1 cells. Both A-5 and A-14 induced significant apoptosis in WM patient primary LPCs compared with DMSO control, as shown in *Table 8*.

EQUIVALENTS AND SCOPE

[00252] In the claims articles such as "a," "an," and "the" may mean one or more than one unless indicated to the contrary or otherwise evident from the context. Claims or descriptions that include "or" between one or more members of a group are considered satisfied if one, more than one, or all of the group members are present in, employed in, or otherwise relevant to a given product or process unless indicated to the contrary or otherwise evident from the

context. The invention includes embodiments in which exactly one member of the group is present in, employed in, or otherwise relevant to a given product or process. It is also noted that the terms "comprising" and "containing" are intended to be open and permits the inclusion of additional elements or steps. Where ranges are given, endpoints are included. Furthermore, unless otherwise indicated or otherwise evident from the context and understanding of one of ordinary skill in the art, values that are expressed as ranges can assume any specific value or sub–range within the stated ranges in different embodiments of the invention, to the tenth of the unit of the lower limit of the range, unless the context clearly dictates otherwise.

[00254] This application refers to various issued patents, published patent applications, journal articles, and other publications, all of which are incorporated herein by reference. If there is a conflict between any of the incorporated references and the instant specification, the specification shall control. In addition, any particular embodiment of the present invention that falls within the prior art may be explicitly excluded from any one or more of the claims. Because such embodiments are deemed to be known to one of ordinary skill in the art, they may be excluded even if the exclusion is not set forth explicitly herein. Any particular embodiment of the invention can be excluded from any claim, for any reason, whether or not related to the existence of prior art.
