ANTI-AXL ANTIBODIES AND METHODS OF USE

RELATED APPLICATIONS

[0001] This application claims priority under 35 USC § 119 to United States Provisional Application Number 61/356,508, filed June 18, 2010, the contents of which are incorporated by reference in its entirety.

SEQUENCE LISTING

[0002] The instant application contains a Sequence Listing which has been submitted in ASCII format via EFS-Web and is hereby incorporated by reference in its entirety.

FIELD OF THE INVENTION

[0003] The present invention relates to anti-Axl antibodies and methods of using the same.

BACKGROUND

[0004] Axl is a member of the TAM (Tyro3, Axl, and Mer) family of receptor tyrosine kinases (O’Bryan et al., 1991; Lai et al., 1991). It was originally identified as a transforming gene in hematological malignancies (O’Bryan et al., 1991; Janssen et al., 1991). Dysregulation of Axl or its ligand Gas6 is implicated in the pathogenesis of a variety of human cancers. Axl overexpression has been reported in a wide array of human cancers (Berclaz et al., 2001; Craven et al., 1995; Shieh et al., 2005; Sun et al., 2004; Ito et al., 1999) and is associated with invasiveness and metastasis in lung (Shieh et al., 2005), prostate (Sainaghi et al., 2005), breast (Meric et al., 2002; Zhang et al., 2008), gastric (Wu et al., 2002), and pancreatic (Koorstra et al., 2009) cancers, renal cell carcinoma (Chung et al., 2003), as well as glioblastoma (Hutterer et al., 2008). Recently, by profiling of phosphotyrosine signaling, activated Axl protein was detected in about 5% primary tumors of NSCLC (Rikova et al., 2007). Axl expression is induced by targeted and chemotherapy drugs and drug-induced Axl expression confers resistance to chemotherapy in acute myeloid leukemia (Hong et al., 2008), as well as resistance to imatinib and Lapatinib/Herceptin in gastrointestinal stromal tumors (Mehadevan, et al, 2007) and breast cancer (Liu et al, 2009), respectively. Other publications relating to Axl and anti-Axl antibodies include WO2004/039955, WO2009/063965; co-owned US application number 61/228,915 filed July 27, 2009; WO2009/062690; WO2004/008147; 5,468,634.

[0005] It is clear that there continues to be a need for agents that have clinical attributes that are optimal for development as therapeutic agents. The invention described herein meets this need and provides other benefits.

[0006] All references cited herein, including patent applications and publications, are incorporated by reference in their entirety.
SUMMARY

[0007] The invention provides anti-Axl antibodies and methods of using the same.

[0008] In one aspect, the invention provides an isolated antibody that binds to human Axl, wherein the antibody binds human Axl with an affinity of ≤ 600 pM, wherein the antibody binds mouse Axl with an affinity of ≤ 1 nM. In some embodiments, the antibody promotes Axl receptor downregulation. In some embodiments, the antibody inhibits constitutive Axl activation. In some embodiments, the antibody binds a polypeptide comprising, consisting essentially of or consisting of the following amino acid sequence:

MAWRCPMRNGRVPPLAWCLALCGWACMAPRGTQAESPFPVGNPGNITGARGLTGTLRCQ
LQVQGEPPEVHLRDGQILELADSTQTQVPLGEDEQDDWRVQSRITSLQLSDTGYQC
LVFLGHQTFVSQPQYGTVG (SEQ ID NO: 111).

[0009] In further embodiments, the antibody is a monoclonal antibody. In some embodiments, the antibody is a human, a humanized, or a chimeric antibody. In some embodiments, the antibody is an antibody fragment that binds Axl. In some embodiments, the antibody is a human antibody.

[0010] In one aspect, the invention provides an anti-Axl antibody, wherein the antibody comprises (a) HVR-H1 comprising GFXiX2X4X5X6X7H, wherein Xi is S or T; X2 is L, F or V; X3 is S, T or R; X4 is G or S; X5 is S, H, T or I; X6 is W or G; X7 is I or L (SEQ ID NO: 112), (b) HVR-H2 comprising X1X2IX3PX4SX6X7X8X9XioYYADSVKG, wherein X1 is G or A; X2 is W or G; X3 is N, S, A or P; X4 is Y, A or V; X5 is R, G, or S; X6 is G R or S; X7 is Y, S, H or Y; X8 is A, T or P (SEQ ID NO: 113) and/or HVR-H2 comprising

Xix2IX3PX4X5X6X7X8X9XioYYADSVKG, wherein X1 is G or A; X2 is W or G; X3 is N, S, A or P; X4 is Y, A or V; X5 is R, G, or S; X6 is G R or S; X7 is Y, S, H or Y; X8 is A, T, or P; X9 is any amino acid or absent (SEQ ID NO: 166); (c) HVR-H3

comprising ARXIX2X3X4X5X6X7X8X9XioXi XioYYADSVKG, wherein X1 is E or W; X2 is Y or R; X3 is S, N or P; X4 is G, D, or L; X5 is W or S; X6 is G, R, A, or S; X7 is G or S; X8 is S or absent; X9 is S, Y or absent; Xio is V, I or absent; X11 is G or absent; X12 is Y or absent; X13 is A, E or absent (SEQ ID NO: 114); (d) HVR-L1 comprising RASQXIX2X3X4X5X6X7A, wherein X1 is D, I or S; X2 is V or I; X3 is S, G or R; X4 is T, I, N or R; X5 is A or S; X6 is V or L (SEQ ID NO: 115); (e) HVR-L2 comprising X1ASX2LX3S, wherein X1 is S, A, or V; X2 is F, N or S; X3 is Y or A (SEQ ID NO: 116); and (f) HVR-L3 comprising QXIX2X3X4X5X6X7T, wherein X1 is S or A; X2 is Y, K or N; X3 is T, S, Y, M, R or A; X4 is T, N, S, or F; X5 is P or R; X6 is P, Y, S or L (SEQ ID NO: 117).

[0011] In another aspect, the invention provides an anti-Axl antibody wherein the antibody comprises (a) HVR-H1 comprising GFXiX2X3GX4XWIH, wherein Xi is T or S, X2 is F or L, X3 is
T or S, X₄ is H, S or T (SEQ ID NO: 118); (b) HVR-H2 comprising
GWIXiPYXₓ₁X₃ₓ₄ₓ₅YYADSVKG, wherein X₁ is S, N or A; X₂ is G, R or S; X₃ is G or R; X₄ is
S, Y or H; X₅ is T, A or P (SEQ ID NO: 119); (c) HVR-H3 comprising
AREYXₓ₂ₓ₃ₓ₄ₓ₅ₓ₆GYXᵧMDY, wherein X₁ is S, N or P; X₂ is G or D; X₃ is G, R, or A;
X₄ is G or S; X₅ is S or Y; X₆ is V or I; Xᵧ is A or E (SEQ ID NO: 120); and (d) HVR-L3
comprising QQSYXₓ₁ₓ₂ₓ₃ₓ₄T, wherein X₁ is T, S or Y; X₂ is T, N, S or F; X₃ is P or R; X₄ is P,
Y or S (SEQ ID NO: 121).

[0012] In another aspect, the invention provides an anti-Axl antibody comprising (a) HVR-H3
comprising the amino acid sequence of SEQ ID NO:9, (b) HVR-L3 comprising the amino acid
sequence of SEQ ID NO: 12, and (c) HVR-H2 comprising the amino acid sequence of SEQ ID
NO:8.

[0013] In another aspect, the invention provides an anti-Axl antibody comprising (a) HVR-H1
comprising the amino acid sequence of SEQ ID NO:7, (b) HVR-H2 comprising the amino acid
sequence of SEQ ID NO: 8, and (c) HVR-H3 comprising the amino acid sequence of SEQ ID
NO:9.

[0014] In another aspect, the invention provides an anti-Axl antibody comprising (a) HVR-L1
comprising the amino acid sequence of SEQ ID NO: 10; (b) HVR-L2 comprising the amino acid
sequence of SEQ ID NO: 11; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID
NO: 12.

[0015] In another aspect, the invention provides an anti-Axl antibody comprising (a) HVR-L1
comprising the amino acid sequence of SEQ ID NO: 10; (b) HVR-L2 comprising the amino acid
sequence of SEQ ID NO: 11; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID
NO: 12.

[0016] In some embodiments, the antibody further comprises a heavy chain variable domain or
light chain variable domain framework sequence shown in Figure 3A-B, 4, 5 or 6.

[0017] In one aspect, the invention provides an anti-Axl antibody comprising (a) a VH sequence
having at least 95% sequence identity to the amino acid sequence of SEQ ID NO: 103; (b) a VL
sequence having at least 95% sequence identity to the amino acid sequence of SEQ ID NO: 104;
or (c) a VH sequence as in (a) and a VL sequence as in (b). In some embodiments, the antibody
comprises a VH sequence of SEQ ID NO:103. In some embodiments, the antibody comprises a
VL sequence of SEQ ID NO: 104. In some embodiments, the antibody comprises a VH sequence
of SEQ ID NO: 103 and a VL sequence of SEQ ID NO: 104.

[0018] In some embodiments, the antibody is a full length IgGl antibody.
[0019] The invention also provides isolated nucleic acid encoding any of the antibodies of the invention.

[0020] The invention also provides host cells comprising the nucleic acids of the invention.

[0021] The invention also provides methods of producing an antibody comprising culturing the host cell of the invention so that the antibody is produced. In some embodiments, the methods further comprise recovering the antibody from the host cell.

[0022] The invention also provides an immunoconjugate comprising any of the anti-Axl antibodies of the invention and a cytotoxic agent.

[0023] The invention also provides a pharmaceutical formulation comprising comprising any of the anti-Axl antibodies of the invention and a pharmaceutically acceptable carrier. In some embodiments, the pharmaceutical formulation further comprises an additional therapeutic agent. In some embodiments, the additional therapeutic agent is selected from a VEGF antagonist, an EGFR antagonist, and a chemotherapeutic agent.

[0024] The invention also provides any of the anti-Axl antibodies described herein for use as a medicament. In some embodiments, the use is for treating cancer. In some embodiments, the use is for treating immune disorder, cardiovascular disorder, thrombosis or diabetes. In some embodiments, the use is for inhibiting cell proliferation. In some embodiments, the use is for promoting Axl downregulation. In some embodiments, the use is for inhibiting angiogenesis.

[0025] The invention also provides any of the anti-Axl antibodies described herein for use in the manufacture of a medicament. In some embodiments, the medicament is for treatment of cancer. In some embodiments, the medicament is for treatment of immune disorder, cardiovascular disorder, thrombosis or diabetes. In some embodiments, the medicament is for inhibiting cell proliferation, inhibiting angiogenesis, promoting Axl downregulation, inhibiting metastasis, inhibiting angiogenesis.

[0026] The invention also provides methods of treating an individual having cancer comprising administering to the individual an effective amount of any of the anti-Axl antibodies disclosed herein. In some embodiments, the methods further comprise administering an additional therapeutic agent to the individual. In some embodiments, the additional therapeutic agent is selected from the group consisting of a VEGF antagonist, an EGFR antagonist and a chemotherapeutic agent.

[0027] The invention also provides methods of treating an individual having immune disorder, cardiovascular disorder, thrombosis or diabetes comprising administering to the individual an effective amount of of any of the anti-Axl antibodies disclosed herein.
[0028] The invention also provides methods of inhibiting angiogenesis, inhibiting cell proliferation, promoting Axl receptor downregulation or inhibiting metastasis in an individual comprising administering to the individual an effective amount of any of the anti-Axl antibodies disclosed herein to inhibit angiogenesis, inhibit cell proliferation, promote Axl receptor downregulation or inhibit metastasis.

[0029] The invention also provides methods of inhibiting constitutive Axl activation comprising administering to the individual an effective amount of any of the anti-Axl antibodies disclosed herein, to inhibit constitutive Axl.

[0030] In one aspect, the invention provides methods for treating a subject suffering from a cancer associated with an EGFR activating mutation or an EGFR gene amplification, wherein the subject has developed a resistance to treatment with an EGFR antagonist, comprising determining whether the subject has Axl expression, an Axl activating mutation or an Axl gene amplification, and administering to those subjects having an Axl activating mutation or an Axl gene amplification an EGFR antagonist and any of the anti-Axl antibodies described herein.

[0031] In one aspect, the invention provides methods for treating a subject suffering from a cancer associated with an EGFR activating mutation or an EGFR gene amplification, comprising: (i) monitoring a subject being treated with an EGFR antagonist to determine if the subject develops Axl expression, an Axl activating mutation or an Axl gene amplification, and (ii) modifying the treatment regimen of the subject to include any of the anti-Axl antibodies described herein in addition to the EGFR antagonist where the subject has developed an Axl activating mutation or an Axl gene amplification.

[0032] In one aspect, the invention provides methods for treating a subject suffering from a cancer associated with an EGFR activating mutation or an EGFR gene amplification, comprising: (i) monitoring a subject being treated with EGFR antagonist to determine if the subject develops a resistance to the inhibitor, (ii) testing the subject to determine whether the subject has Axl expression, an Axl activating mutation or an Axl gene amplification, and (iii) modifying the treatment regimen of the subject to include any of the anti-Axl antibodies described herein in addition to the EGFR antagonist where the subject has an Axl activating mutation or an Axl gene amplification.

[0033] In one aspect, the invention provides methods for evaluating an EGFR antagonist, comprising: (i) monitoring a population of subjects being treated with an EGFR antagonist to identify those subjects that develop a resistance to the therapeutic, (ii) testing the resistant subjects to determine whether the subjects have Axl expression, an Axl activating mutation or an Axl gene amplification, and (iii) modifying the treatment regimen of the subjects to include any
of the anti-Axl antibodies described herein in addition to the EGFR antagonist where the subjects have Axl expression, an Axl activating mutation or an Axl gene amplification.

[0034] In one aspect, the invention provides methods for reducing EGFR phosphorylation in a cancer cell, wherein said cancer cell has acquired resistance to an EGFR antagonist, and wherein said cell comprises an Axl activating mutation or an Axl gene amplification, comprising the step of contacting the cell with any of the anti-Axl antibodies described herein and an EGFR antagonist.

[0035] In one aspect, the invention provides methods for reducing PI3K mediated signaling in a cancer cell, wherein said cancer cell has acquired resistance to an EGFR antagonist, and wherein said cell comprises Axl expression, an Axl activating mutation or an Axl gene amplification, comprising the step of contacting the cell with any of the anti-Axl antibodies described herein and an EGFR antagonist.

[0036] In one aspect, the invention provides methods for reducing EGFR -mediated signaling in a cancer cell, wherein said cancer cell has acquired resistance to an EGFR antagonist, and wherein said cell comprises Axl expression, an Axl activating mutation or an Axl gene amplification, comprising contacting the cell with any of the anti-Axl antibodies described herein and an EGFR antagonist.

[0037] In one aspect, the invention provides methods for restoring sensitivity of a cancer cell to an EGFR antagonist, wherein said cancer cell has acquired resistance to an EGFR antagonist, and wherein said cell comprises Axl expression, an Axl activating mutation or an Axl gene amplification, comprising contacting the cell with any of the anti-Axl antibodies described herein and an EGFR antagonist.

[0038] In one aspect, the invention provides methods for reducing growth or proliferation of a cancer cell, wherein said cancer cell has acquired resistance to an EGFR antagonist, and wherein said cell comprises Axl expression, an Axl activating mutation or an Axl gene amplification, comprising the step of contacting the cell with any of the anti-Axl antibodies described herein and an EGFR antagonist.

[0039] In one aspect, the invention provides methods for increasing apoptosis of a cancer cell, wherein said cancer cell has acquired resistance to an EGFR antagonist, and wherein said cell comprises Axl expression, an Axl activating mutation or an Axl gene amplification, comprising the step of contacting the cell with any of the anti-Axl antibodies described herein and an EGFR antagonist.

[0040] In one aspect, the invention provides methods for reducing resistance of a cancer cell to an EGFR antagonist, wherein said cancer cell has acquired resistance to an EGFR antagonist, and
wherein said cell comprises an Axl activating mutation or an Axl gene amplification, comprising the step of contacting the cell with any of the anti-Axl antibodies described herein and an EGFR antagonist.

[0041] In one aspect, the invention provides methods for treating acquired EGFR antagonist resistance in a cancer cell, wherein said cell comprises an Axl activating mutation or an Axl gene amplification, comprising contacting the cell with any of the anti-Axl antibodies described herein and an EGFR antagonist.

[0042] In some embodiments, the cancer cell is any EGFR-driven cancer. In some embodiments, the cancer cell comprises an EGFR activating mutation. In some embodiments, the cancer cell comprises an EGFR gene amplification. In some embodiments, the EGFR gene amplification is at least 2-fold. In some embodiments, the Axl amplification is at least 2-fold. In some embodiments, the cancer cell comprises an EGFR gene mutation associated with increased resistance to an EGFR antagonist. In some embodiments, the EGFR gene mutation associated with increased resistance to an EGFR antagonist is a T790M mutation of EGFR. In some embodiments, the EGFR antagonist is a small molecule therapeutic, a nucleic acid therapeutic, or a protein therapeutic. In some embodiments, the EGFR antagonist is an antibody, an antisense molecule, or a small molecule kinase inhibitor. In some embodiments, the EGFR antagonist is an EGFR kinase inhibitor selected from the group consisting of: gefitinib, erlotinib, cetuximab, panitumumab. In some embodiments, the EGFR antagonist is an anti-EGFR antibody selected from the group consisting of: cetuximab, panitumumab. In some embodiments, the nucleic acid therapeutic is a siRNA molecule.

[0043] In one aspect, the invention provides methods for identifying a subject as a candidate for treatment with an EGFR antagonist and any of the anti-Axl antibodies described herein, wherein said subject has been treated with an EGFR antagonist and suffers from cancer that has acquired resistance to said EGFR antagonist, comprising detecting Axl expression, an Axl activating mutation or Axl gene amplification in a cancer cell from said subject.

[0044] In one aspect, the invention provides methods for identifying a subject who is being treated with an EGFR antagonist and who is at risk for acquiring resistance to said EGFR antagonist, comprising detecting the presence of Axl expression, an Axl activating mutation or an Axl gene amplification in a cancer cell from said subject, wherein the presence of said Axl expression, Axl activating mutation or Axl gene amplification indicates a risk for acquiring said resistance.
In one aspect, the invention provides methods for treating a subject suffering from a cancer that is resistant to treatment with an EGFR antagonist, comprising administering to the subject an EGFR antagonist and any of the anti-Axl antibodies described herein.

In one aspect, the invention provides methods for treating a subject suffering from a cancer associated with an EGFR activating mutation or an EGFR gene amplification, wherein the subject has developed a resistance to treatment with an EGFR antagonist, comprising determining whether the subject has Axl expression, such as elevated Axl levels and/or activity, and administering to those subjects having Axl expression, such as elevated Axl activity an EGFR antagonist and any of the anti-Axl antibodies described herein.

In one aspect, the invention provides methods for treating a subject suffering from a cancer associated with an EGFR activating mutation or an EGFR gene amplification, comprising: (i) monitoring a subject being treated with an EGFR antagonist to determine if the subject develops Axl expression, such as elevated levels and/or Axl activity, and (ii) modifying the treatment regimen of the subject to include any of the anti-Axl antibodies described herein in addition to the EGFR antagonist where the subject has developed Axl expression, such as elevated Axl levels and/or activity.

In one aspect, the invention provides methods for treating a subject suffering from a cancer associated with an EGFR activating mutation or an EGFR gene amplification, comprising: (i) monitoring a subject being treated with EGFR antagonist to determine if the subject develops a resistance to the inhibitor, (ii) testing the subject to determine whether the subject has Axl expression, such as elevated Axl levels and/or activity, and (iii) modifying the treatment regimen of the subject to include any of the anti-Axl antibodies described herein in addition to the EGFR antagonist where the subject has elevated Axl levels and/or activity.

In another aspect, the invention provides a method for (i) restoring the sensitivity of a cancer cell to an EGFR antagonist, (ii) reducing resistance of a cancer cell to an EGFR antagonist, and/or (iii) treating acquired EGFR antagonist resistance in a cancer cell, by contacting the cell with an EGFR antagonist and any of the anti-Axl antibodies described herein. In exemplary embodiments, the cancer cell has acquired a resistance to an EGFR antagonist and comprises elevated levels of Axl activity and/or expression, e.g., associated with an activating mutation in the Axl gene, an Axl gene amplification, or Gas6 mediated Axl activation. The methods disclosed herein may be used to restore the sensitivity, reduce the resistance, and/or treat an acquired resistance, of a cancer cell.

In another aspect, the invention provides a method for reducing growth and/or proliferation of a cancer cell, or increasing apoptosis of a cancer cell, by contacting the cell with
an EGFR antagonist and any of the anti-Axl antibodies described herein. In exemplary embodiments, the cancer cell has acquired a resistance to an EGFR antagonist and comprises elevated Axl activity and/or expression, e.g., associated with an activating mutation in the Axl gene, an Axl gene amplification, or Gas6 mediated Axl activation.

**BRIEF DESCRIPTION OF THE FIGURES**

[0051] FIGURES 1A-F: Heavy chain and light chain HVR loop sequences of anti-FGFR3 antibodies. The figures show the heavy chain HVR sequences, HI, H2, and H3, and light chain HVR sequences, LI, L2, and L3. Amino acid positions are numbered according to the Kabat numbering system as described herein.

[0052] FIGURE 2: depict the amino acid sequences of the heavy chain variable regions and light chain variable regions of anti-Axl antibodies.

[0053] FIGURES 3A-B and 4: depict exemplary acceptor human consensus framework sequences for use in practicing the instant invention with sequence identifiers as follows:

*Variable heavy (VH) consensus framework* *(FIG. 3A-B)*

- Human VH subgroup I consensus framework minus Kabat CDRs (SEQ ID NOS: 131-133 and 125, respectively, in order of appearance)
- Human VH subgroup I consensus framework minus extended hypervariable regions (SEQ ID NOS: 134-135, 133, 125, 134-136, 125, 134-135, 137, and 125, respectively, in order of appearance)
- Human VH subgroup II consensus framework minus Kabat CDRs (SEQ ID NOS: 138-140, and 125, respectively, in order of appearance)
- Human VH subgroup II consensus framework minus extended hypervariable regions (SEQ ID NOS: 141-142, 140, 125, 141-143, 125, 141-142, 144, and 125, respectively, in order of appearance)
- Human VH subgroup II consensus framework minus extended human VH subgroup III consensus framework minus Kabat CDRs (SEQ ID NOS: 145-147 and 125, respectively, in order of appearance)
- Human VH subgroup III consensus framework minus extended hypervariable regions (SEQ ID NOS: 122-123, 147, 125, 122-123, 148, 125, and 122-125, respectively, in order of appearance)
- Human VH acceptor framework minus Kabat CDRs (SEQ ID NOS: 149, 146, 150, and 125, respectively, in order of appearance)
- Human VH acceptor framework minus extended hypervariable regions (SEQ ID NOS: 122-123, 150, 125, 122-123, 151, and 125, respectively, in order of appearance)
- Human VH acceptor 2 framework minus Kabat CDRs (SEQ ID NOS: 149, 146, 152, and 125, respectively, in order of appearance).
respectively, in order of appearance)

human VH acceptor 2 framework minus extended hypervariable regions (SEQ ID NOS: 122-123, 152, 125, 122-123, 153, 125, 122-123, 154, and 125, respectively, in order of appearance)

**Variable light (VL) consensus frameworks (FIG. 4)**

human VL kappa subgroup I consensus framework (SEQ ID NOS: 126-129, respectively, in order of appearance)

human VL kappa subgroup II consensus framework (SEQ ID NOS: 155-157 and 129, respectively, in order of appearance)

human VL kappa subgroup III consensus framework (SEQ ID NOS: 158-160 and 129, respectively, in order of appearance)

human VL kappa subgroup IV consensus framework (SEQ ID NOS: 161-163 and 129, respectively, in order of appearance)

[0054] FIGURE 5: depicts framework region sequences of huMAb4D5-8 light (SEQ ID NOS: 126-127, 164, and 129, respectively, in order of appearance) and heavy chains (SEQ ID NOS: 122-123, 154, and 125, respectively, in order of appearance). Numbers in superscript/bold indicate amino acid positions according to Kabat.

[0055] FIGURE 6: depicts modified/variant framework region sequences of huMAb4D5-8 light (SEQ ID NOS: 126-129, respectively, in order of appearance) and heavy chains (SEQ ID NOS: 122-125, respectively, in order of appearance). Numbers in superscript/bold indicate amino acid positions according to Kabat.

[0056] FIGURES 7A-H: Characterization of Axl mAb YW327.6S2. A-B. Affinity measurement of YW327.6S2 using BIAcore. Association rates (k_{a}) and dissociation rates (k_{d}) were calculated using the one-to-one Langmuir binding model. The equilibrium dissociation constant (Kd) was derived as the k_{d}/k_{a} ratio. C. Cross reactivity of YW327.6S2. YW327.6S2 cross reacts with murine and cynomolgus Axl but not with Tyro3 or Mer. Plates were coated with anti-human IgG Fc, and then incubated with human Axl, Mer, Tyro3 Fes, mouse or cynomolgus AxlFcPs. After washing, isotype control antibody or YW327.6S2 was added and followed by HRP conjugated anti-human IgG. D-E. YW327.6S2 blocks Gas6 binding to Axl. Fig. 7D: ELISA. Plates were coated with anti-human IgG Fc and incubated with human Axl-Fc. After washing, Gas6 was added with or without antibodies. Binding of Gas6 was detected by biotylated anti-Gas6 antibody and streptavidin-HRP conjugate. Fig. 7E: FACS. HUVECs were harvested and treated with YW327.6S2 or control antibody and then incubated with Gas6 for 30 minutes on ice. Binding of Gas6 to the cell surface was detected by biotylated anti-Gas6 antibody and streptavidin-PE conjugate. F. YW327.6S2 down-regulates Axl expression. A549 cells were incubated with 1
µg/ml YW327.6S2 for indicated time, and cell surface Axl expression was determined by FACS (upper panel), and total protein expression by Western Blotting analysis (lower panel). G. YW327.6S2 inhibits Gas6-induced Axl phosphorylation & signaling. H1299 cells were cultured in serum free medium over night, pre-incubated with YW327.6S2 for 4 hrs, and treated with Gas6 for 30 minutes. Phosphorylated Axl was measured by ELISA (upper panel), and phosphorylated Akt by Western Blotting analysis (lower panel). H. YW327.6S2 inhibits Baf3Axl cell growth. Baf3Axl cells were grown in medium containing 200 ng/ml Gas6, and treated with YW327.6S2 at indicated concentrations for 72 hrs. Cell viability was measured by CellTiter Glo assay.

Figures 8A-F: YW327.6S2 attenuates A549 xenograft tumor growth and enhances the effect of anti-VEGF. A. Tumor growth curve. mAbs were administrated IP at 10 mg/kg (YW327.6S2 and isotype control antibody) or 1 mg/kg (anti-VEGF), twice a week, starting when the mean tumor size reached 100 mm³ (day 0). Error bars represent standard error of the mean (n=10 for each group in each experiment). p=0.0003 (YW327.6S2 versus control), p=10⁻¹¹ (YW327.6S2 versus combination). B. Kaplan-Meier curve of various treatment groups. Mice were removed from the study when their tumor size reached 800 mm³, and the animals remaining in each group (% remaining) were plotted. C. 12A1 I enhances the effect of anti-VEGF. 12A1 I and anti-VEGF was administrated IP at 30 mg/kg and 1 mg/kg, respectively, twice a week, starting when the mean tumor size reached 100 mm³ (day 0). Error bars represent standard error of the mean (n=10 for each group in each experiment). p=0.006 (12A1 I vs control); p=0.0001 (12A1 I vs combination). D. YW327.6S2 down-regulates Axl expression. Mice were treated with YW327.6S2 at 10 mg/kg and tumors excised at the indicated time points. Cell lysates from tumors were analyzed by Western blot for Axl expression. E. YW327.6S2 induces apoptosis. Tumors treated with control or YW327.6S2 for 2 weeks were excised and CC3 IHC was performed to measure apoptosis. F. YW327.6S2 enhances the effect of anti-VEGF in reducing intra-tumoral vascular density. Tumors from mice treated as above in D were excised at 0 and 72 hr post dosing and tumor vasculature was visualized by staining with MECA32 immunohistochemistry and quantified by image analysis (expressed as microns square).

Student's t test was performed for each pair (p<0.05 for control vs combination).

Figures 9A-B: YW327.6S2 enhances the anti-tumor effect of erlotinib and chemotherapy in A549 xenograft model. A. YW327.6S2 enhances the effect of erlotinib. Antibody administration was the same as in Fig. 2. Erlotinib was administered by oral gavage at 100 mg/kg/day. n=10 for each group. p=1.7X10⁻⁹ (YW327.6S2 versus control), p=2.3X10⁻¹⁰ (YW327.6S2 versus combination). B. YW327.6S2 enhances chemotherapy. Antibody
administration was the same as in Fig.2. Paclitaxel and carboplatin were administrated subcutaneously at 6.25 mg/kg/day for 5 days, and 100 mg/kg for a single dose at the beginning of the treatment (day 0), respectively. n=10 for each group. p=3X10^-4 (YW327.6S2 versus control), p=10^-7 (chemotherapy versus control), p=10^-5 (combination versus chemotherapy alone).

FIGURES 10A-G: YW327.6S2 attenuates MDA-MB-231 xenograft tumor growth by modulating tumor stromal functions. A & B. YW327.6S2 but not 12A1.1 reduces MDA-MB-231 tumor growth and enhances the effect of anti-VEGF. mAbs were administrated IP at 20 mg/kg (YW327.6S2 and isotype control antibody), 30 mg/kg (12A1.1) and 2 mg/kg (anti-VEGF), twice a week, starting when the mean tumor size reached 100 mm^3 (day 0). Error bars represent standard error of the mean (n=10 for each group in each experiment). p=8.5X10^-6 (YW327.6S2 versus control), p=2.8X10^-7 (YW327.6S2 versus combination), p=0.05 (12A1.1 vs control), p= 0.145 (anti-VEGF vs combination). C & D. YW327.6S2 down-regulates Axl expression. Mice bearing MDA-MB231 xenograft tumors (average size 500 mm^3) were treated with mAbs at 20 mg/kg and tumors excised at the indicated time points. Cell lysates from tumors were used in Western blot analysis for Axl expression. E. YW327.6S2 reduces the density of tumor-associated vasculature. Tumors from mice treated as above in C were excised at 0 hr and 1 week post dosing and tumor vasculature was visualized by staining with MECA32 immunohistochemistry and quantified by image analysis (expressed as microns square). Student's t test was performed for each pair (p<0.05 for YW327.6S2 vs control, anti-VEGF vs control, and anti-VEGF vs combination). F. Axl is highly expressed in infiltrating macrophages of primary human breast cancer. Immunohistochemistry was used to examine 79 primary tumors. 21% of these tumors express high levels of Axl in the infiltrating macrophages. Macrophages were identified by staining with anti-CD68, and expression of Axl on macrophages was determined by anti-Axl/CD68 dual IHC. Serial sections were used. G. YW327.6S2 inhibits inflammatory cytokine/chemokine secretion from tumor-associated macrophages. Mice bearing MDA-MB231 xenograft tumors (average size 500 mm^3) were treated with control antibody, YW327.6S2 or 12A1.1 at 20 mg/kg and tumors excised after 1 week treatment. Tumor associated macrophages were isolated by sorting for F4/80 positive cells and cultured overnight. Cytokines and chemokines secreted into the medium were measured using the Bio-Plex mouse cytokine assay kit.

FIGURES 11A-B: YW327.6S2 reduces metastasis of MDA-MB-231 breast cancer cells to the bone. A. Bioluminescence imaging 4 weeks after tail vein injection of tumor cells. Mice were injected intraperitoneally (i.p.) with 200 µl, of 25 mg/ml D-luciferin (Invitrogen) in PBS and were anesthetized during imaging using isoflurane via nose cone. Bioluminescence images were acquired on the Photon Imager (Biospace Lab, Paris, France) that has an intensified charge-
coupled device camera. B. H & E staining of the tibia sections. Tissues were collected at the end of the experiments and fixed in 4% formaldehyde, sectioned and stained with H & E. The circle in the upper panel shows tumor cells invading the bone. The lower panel shows details of neoplastic cells in the bone marrow.

DETAILED DESCRIPTION OF EMBODIMENTS OF THE INVENTION

I. DEFINITIONS

[0062] An "acceptor human framework" for the purposes herein is a framework comprising the amino acid sequence of a light chain variable domain (VL) framework or a heavy chain variable domain (VH) framework derived from a human immunoglobulin framework or a human consensus framework, as defined below. An acceptor human framework "derived from" a human immunoglobulin framework or a human consensus framework may comprise the same amino acid sequence thereof, or it may contain amino acid sequence changes. In some embodiments, the number of amino acid changes are 10 or less, 9 or less, 8 or less, 7 or less, 6 or less, 5 or less, 4 or less, 3 or less, or 2 or less. In some embodiments, the VL acceptor human framework is identical in sequence to the VL human immunoglobulin framework sequence or human consensus framework sequence.

[0063] "Affinity" refers to the strength of the sum total of noncovalent interactions between a single binding site of a molecule (e.g., an antibody) and its binding partner (e.g., an antigen). Unless indicated otherwise, as used herein, "binding affinity" refers to intrinsic binding affinity which reflects a 1:1 interaction between members of a binding pair (e.g., antibody and antigen). The affinity of a molecule X for its partner Y can generally be represented by the dissociation constant (Kd). Affinity can be measured by common methods known in the art, including those described herein. Specific illustrative and exemplary embodiments for measuring binding affinity are described in the following.

[0064] An "affinity matured" antibody refers to an antibody with one or more alterations in one or more hypervariable regions (HVRs), compared to a parent antibody which does not possess such alterations, such alterations resulting in an improvement in the affinity of the antibody for antigen.

[0065] An "angiogenic disorder" refers to any dysregulation of angiogenesis, including both non-neoplastic and neoplastic conditions. Neoplastic conditions include but are not limited those described below (see, e.g., "Cancer"). Non-neoplastic disorders include but are not limited to undesired or aberrant hypertrophy, arthritis, rheumatoid arthritis (RA), psoriasis, psoriatic...
plaques, sarcoidosis, atherosclerosis, atherosclerotic plaques, diabetic and other proliferative retinopathies including retinopathy of prematurity, retrolental fibroplasia, neovascular glaucoma, age-related macular degeneration, diabetic macular edema, corneal neovascularization, corneal graft neovascularization, corneal graft rejection, retinal/choroidal neovascularization, neovascularization of the angle (rubeosis), ocular neovascular disease, vascular restenosis, arteriovenous malformations (AVM), meningioma, hemangioma, angiofibroma, thyroid hyperplasias (including Grave's disease), corneal and other tissue transplantation, chronic inflammation, lung inflammation, acute lung injury/ARDS, sepsis, primary pulmonary hypertension, malignant pulmonary effusions, cerebral edema (e.g., associated with acute stroke/closed head injury/trauma), synovial inflammation, pannus formation in RA, myositis ossificans, hypertropic bone formation, osteoarthritis (OA), refractory ascites, polycystic ovarian disease, endometriosis, 3rd spacing of fluid diseases (pancreatitis, compartment syndrome, burns, bowel disease), uterine fibroids, premature labor, chronic inflammation such as IBD (Crohn's disease and ulcerative colitis), renal allograft rejection, inflammatory bowel disease, nephrotic syndrome, undesired or aberrant tissue mass growth (non-cancer), hemophilic joints, hypertrophic scars, inhibition of hair growth, Osier-Weber syndrome, pyogenic granuloma retrolental fibroplasias, scleroderma, trachoma, vascular adhesions, synovitis, dermatitis, preeclampsia, ascites, pericardial effusion (such as that associated with pericarditis), and pleural effusion.

[0066] An "anti-angiogenic agent" refers to a compound which blocks, or interferes with to some degree, the development of blood vessels. An anti-angiogenic agent may, for instance, be a small molecule or antibody that binds to a growth factor or growth factor receptor involved in promoting angiogenesis. In one embodiment, an anti-angiogenic agent is an antibody that binds to vascular endothelial growth factor (VEGF), such as bevacizumab (AVASTIN®).

[0067] The terms "anti-Axl antibody" and "an antibody that binds to Axl" refer to an antibody that is capable of binding Axl with sufficient affinity such that the antibody is useful as a diagnostic and/or therapeutic agent in targeting Axl. In one embodiment, the extent of binding of an anti-Axl antibody to an unrelated, non-Axl protein is less than about 10% of the binding of the antibody to Axl as measured, e.g., by a radioimmunoassay (RIA). In certain embodiments, an antibody that binds to Axl has a dissociation constant (Kd) of ≤ 1μM, ≤ 100 nM, ≤ 10 nM, ≤ 1 nM, ≤ 0.1 nM, ≤ 0.01 nM, or ≤ 0.001 nM (e.g., 10⁻⁸ M or less, e.g., from 10⁻⁸ M to 10⁻¹³ M, e.g., from 10⁻⁹ M to 10⁻¹³ M). In certain embodiments, an anti-Axl antibody binds to an epitope of Axl that is conserved among Axl from different species.

[0068] The term "antibody" herein is used in the broadest sense and encompasses various antibody structures, including but not limited to monoclonal antibodies, polyclonal antibodies,
multispecific antibodies (e.g., bispecific antibodies), and antibody fragments so long as they exhibit the desired antigen-binding activity.

[0069] An "antibody fragment" refers to a molecule other than an intact antibody that comprises a portion of an intact antibody that binds the antigen to which the intact antibody binds. Examples of antibody fragments include but are not limited to Fv, Fab, Fab', Fab'-SH, F(ab')2; diabodies; linear antibodies; single-chain antibody molecules (e.g. scFv); and multispecific antibodies formed from antibody fragments.

[0070] An "antibody that binds to the same epitope" as a reference antibody refers to an antibody that blocks binding of the reference antibody to its antigen in a competition assay by 50% or more, and conversely, the reference antibody blocks binding of the antibody to its antigen in a competition assay by 50% or more. An exemplary competition assay is provided herein.

[0071] The term "Axl," as used herein, refers to any native Axl from any vertebrate source, including mammals such as primates (e.g. humans) and rodents (e.g., mice and rats), unless otherwise indicated. The term encompasses "full-length," unprocessed Axl as well as any form of Axl that results from processing in the cell. The term also encompasses naturally occurring variants of Axl, e.g., splice variants or allelic variants. The amino acid sequence of an exemplary human Axl is shown in Figure 12.

[0072] "Axl activation" refers to activation, or phosphorylation, of the Axl receptor. Generally, Axl activation results in signal transduction (e.g. that caused by an intracellular kinase domain of an Axl receptor phosphorylating tyrosine residues in Axl or a substrate polypeptide). Axl activation may be mediated by Axl ligand (Gas6) binding to an Axl receptor of interest. Gas6 binding to Axl may activate a kinase domain of Axl and thereby result in phosphorylation of tyrosine residues in the Axl and/or phosphorylation of tyrosine residues in additional substrate polypeptides(s).

[0073] The terms "cancer" and "cancerous" refer to or describe the physiological condition in mammals that is typically characterized by unregulated cell growth/proliferation. Examples of cancer include, but are not limited to, carcinoma, lymphoma (e.g., Hodgkin's and non-Hodgkin's lymphoma), blastoma, sarcoma, and leukemia. More particular examples of such cancers include squamous cell cancer, small-cell lung cancer, non-small cell lung cancer, adenocarcinoma of the lung, squamous carcinoma of the lung, cancer of the peritoneum, hepatocellular cancer, gastrointestinal cancer, pancreatic cancer, glioma, cervical cancer, ovarian cancer, liver cancer, bladder cancer, hepatoma, breast cancer, colon cancer, colorectal cancer, endometrial or uterine carcinoma, salivary gland carcinoma, kidney cancer, liver cancer, prostate cancer, vulval cancer,
thyroid cancer, hepatic carcinoma, leukemia and other lymphoproliferative disorders, and various
types of head and neck cancer.

[0074] The terms "cell proliferative disorder" and "proliferative disorder" refer to disorders that
are associated with some degree of abnormal cell proliferation. In one embodiment, the cell
proliferative disorder is cancer.

[0075] A "chemotherapeutic agent" refers to a chemical compound useful in the treatment of
cancer. Examples of chemotherapeutic agents include alkylating agents such as thiotepa and
cyclophosphamide (CYTOXAN®); alkyl sulfonates such as busulfan, imposulfan and
pilosulfan; aziridines such as benzodopa, carboquone, meturedopa, and uredopa; ethylenimines
and methylamelines including altretamine, triethylenemelamine, triethylene phosphoramide,
triethylene thiophosphoramide and trimethylmelamine; acetogenins (especially bullatacin and
bullatacinone); delta-9-tetrahydrocannabinol (dronabinol, MARINOL®); beta-lapachone;
lapachol; colchicines; betulinic acid; a camptothecin (including the synthetic analogue topotecan
(HYCAMITN®), CPT-11 (irinotecan, CAMPTOSAR®), acetylcamptothecin, scopolactin, and 9-
aminocamptothecin); bryostatin; callystatin; CC-1065 (including its adzelesin, carzelesin and
bizelesin synthetic analogues); podophyllotoxin; podophyllinic acid; teniposide; cryptophycins
(particularly cryptophycin 1 and cryptophycin 8); dolastatin; duocarmycin (including the
synthetic analogues, KW-2189 and CB1-TM1); eleutherobin; pancratistatin; a sarcodictyin;
spongistatin; nitrogen mustards such as chlorambucil, clornaphazine, chlorphosphamide,
estramustine, ifosfamide, mechlorethamine, mecllorethamine oxide hydrochloride, melphalan,
novembchin, phenesterine, prednimustine, trofosfamide, uracil mustard; nitrosoureas such as
carmustine, chlorozotocin, fometustine, lonustine, nimustine, and ranimustine; antibiotics such
as the enediyne antibiotics (e. g., calicheamicin, especially calicheamicin gammall and
calicheamicin omegall (see, e. g., Nicolaou et al., Angew. Chem Intl. Ed. Engl., 33: 183-186
(1994)); CDP323, an oral alpha-4 integrin inhibitor; dynemicin, including dynemicin A; an
esperamicin; as well as neocarzinostatin chromophore and related chromoprotein enediyne
antibiotic chromophores), aclacinomysins, actinomycin, authramycin, azaserine, bleomycins,
cactinomycins, carabinc, carminomycin, carzinophilin, chromomycins, dactinomycin,
daunorubicin, detorubicin, 6-diazo-5-oxo-L-norleucine, doxorubicin (including
ADRIAMYCTN®, morpholino-doxorubicin, cyanomorpholino-doxorubicin, 2-pyrrolino-
doxorubicin, doxorubicin HC1 liposome injection (DOXIL®), liposomal doxorubicin TLC D-99
(MYOCET®), pegylated liposomal doxorubicin (CAELYX®), and deoxydoxorubicin),
epirubicin, esorubicin, idarubicin, marcellomycin, mitomycins such as mitomycin C,
mycophenolic acid, nogalamycin, olivomycins, peplomycin, porfiromycin, puromycin,
quelamycin, rodorubicin, streptonigrin, streptozocin, tubercidin, ubenimex, zinostatin, zorubicin; anti-metabolites such as methotrexate, gemcitabine (GEMZAR®), tegafur (UFTORAL®), capecitabine (XELODA®), an epothilone, and 5-fluorouracil (5-FU); folic acid analogues such as denopterin, methotrexate, pteropterin, trimetrexate; purine analogs such as fludarabine, 6-mercaptopurine, thiamiprine, thioguanine; pyrimidine analogs such as ancitabine, azacitidine, 6-azauridine, carmofur, cytarabine, dideoxyridine, doxifluuridine, enocitabine, floxuridine; androgens such as calusterone, dromostanolone propionate, epitiostanol, mepiotiostane, testolactone; anti-adrenals such as aminoglutethimide, mitotane, trilostane; folic acid replenisher such as frolinic acid; aceglatone; aldophosphamide glycoside; aminolevulinic acid; eniluracil; amsacrine; bestrabucil; bisantrene; edatraxate; defofamine; demecolcine; diaziquone; elfornithine; elliptinium acetate; an epothilone; etoglucid; gallium nitrate; hydroxyurea; lentinan; lonidainine; maytansinoids such as maytansine and ansamitocins; mitoguazone; mitoxantrone; mopidanmol; nitraerine; pentostatin; phenamet; pirarubicin; lsosoxantrone; 2-ethylhydrazide; procarbazine; PSK® polysaccharide complex (JHS Natural Products, Eugene, OR); razoxane; rhizoxin; sizofiran; spirogermanian; tenuazonic acid; triaziquone; 2,2',2'-trichlorotriethylamine; trichotheocenes (especially T-2 toxin, verracurin A, roridin A and anguidine); urethan; vindesine (ELDISINE®, FILDESIN®); dacarbazine; mannamustine; mitobronitol; mitolactol; pipobroman; gacytosine; arabinoside ("Ara-C"); thiotepa; taxoid, e.g., paclitaxel (TAXOL®), albumin-engineered nanoparticle formulation of paclitaxel (ABRAXANE™), and docetaxel (TAXOTERE®); chloranbucil; 6-thioguanine; mercaptopurine; methotrexate; platinum agents such as cisplatin, oxaliplatin (e.g., ELOXATIN®), and carboplatin; vincas, which prevent tubulin polymerization from forming microtubules, including vinblastine (VELBAN®), vincristine (ONCOVIN®), vindesine (ELDISINE®, FILDESIN®), and vinorelbine (NAVELBINE®); etoposide (VP-16); ifosfamide; mitoxantrone; leucovorin; novantrone; edatraxate; daunomycin; aminopterin; ibandronate; topoisomerase inhibitor RFS 2000; difluoromethylornithine (DMFO); retinoids such as retinoic acid, including bexarotene (TARGRETIN®); bisphosphonates such as clodronate (for example, BONEFOS® or OSTAC®), etidronate (DIDROCAL®), NE-58095, zoledronic acid/zoledronate (ZOMETA®), alendronate (FOSAMAX®), pamidronate (AREDIA®), tiludronate (SKELID®), or risedronate (ACTONEL®); troxacitabine (a 1,3-dioxolane nucleoside cytosine analog); antisense oligonucleotides, particularly those that inhibit expression of genes in signaling pathways implicated in aberrant cell proliferation, such as, for example, PKC-alpha, Raf, H-Ras, and epidermal growth factor receptor (EGF-R); vaccines such as THERATOPE® vaccine and gene therapy vaccines, for example, ALLOVECTIN® vaccine, LEUVECTIN® vaccine, and VAXID® vaccine; topoisomerase 1 inhibitor (e.g.,
LURTOTECAN®); rmRH (e.g., ABARELIX®); BAY439006 (sorafenib; Bayer); SU-1 1248 (sunitinib, SUTENT®, Pfizer); perifosine, COX-2 inhibitor (e.g. celecoxib or etoricoxib), proteosome inhibitor (e.g. PS341); bortezomib (VELCADE®); CCI-779; tipifarnib (R1 1577); orafenib, ABT510; Bcl-2 inhibitor such as oblimersen sodium (GENASENSE®); pixantrone; EGFR inhibitors (see definition below); tyrosine kinase inhibitors (see definition below); serine-threonine kinase inhibitors such as rapamycin (sirolimus, RAPAMUNE®); farnesyltransferase inhibitors such as lonafarnib (SCH 6636, SARASAR™); and pharmaceutically acceptable salts, acids or derivatives of any of the above; as well as combinations of two or more of the above such as CHOP, an abbreviation for a combined therapy of cyclophosphamide, doxorubicin, vincristine, and prednisolone; and FOLFOX, an abbreviation for a treatment regimen with oxaliplatin (ELOXATIN™) combined with 5-FU and leucovorin.

[0076] Chemotherapeutic agents as defined herein include "anti-hormonal agents" or "endocrine therapeutics" which act to regulate, reduce, block, or inhibit the effects of hormones that can promote the growth of cancer. They may be hormones themselves, including, but not limited to: anti-estrogens with mixed agonist/antagonist profile, including, tamoxifen (NOLVADEX®), 4-hydroxytamoxifen, toremifene (FARESTON®), idoxifene, droloxifene, raloxifene (EVISTA®), trioxifene, keoxifene, and selective estrogen receptor modulators (SERMs) such as SERM3; pure anti-estrogens without agonist properties, such as fulvestrant (FASLODEX®), and EM800 (such agents may block estrogen receptor (ER) dimerization, inhibit DNA binding, increase ER turnover, and/or suppress ER levels); aromatase inhibitors, including steroidal aromatase inhibitors such as formestane and exemestane (AROMASIN®), and nonsteroidal aromatase inhibitors such as anastrazole (ARIMIDEX®), letrozole (FEMARA®) and aminoglutethimide, and other aromatase inhibitors include vorozole (RIVISOR®), megestrol acetate (MEGASE®), fadrozole, and 4(5)-imidazoles; lutenizing hormone-releasing hormone agonists, including leuprolide (LUPRON® and ELIGARD®), goserelin, buserelin, and tripterein; sex steroids, including progestines such as megestrol acetate and medroxyprogesterone acetate, estrogens such as diethylstilbestrol and premarin, and androgens/retinoids such as fluoxymesterone, all transretionoc acid and fenretinide; onapristone; anti-progesterones; estrogen receptor down-regulators (ERDs); anti-androgens such as flutamide, nilutamide and bicalutamide; and pharmaceutically acceptable salts, acids or derivatives of any of the above; as well as combinations of two or more of the above.

[0077] The term "chimeric" antibody refers to an antibody in which a portion of the heavy and/or light chain is derived from a particular source or species, while the remainder of the heavy and/or light chain is derived from a different source or species.
The "class" of an antibody refers to the type of constant domain or constant region possessed by its heavy chain. There are five major classes of antibodies: IgA, IgD, IgE, IgG, and IgM, and several of these may be further divided into subclasses (isotypes), e.g., IgG1, IgG2, IgG3, IgG4, IgA1, and IgA2. The heavy chain constant domains that correspond to the different classes of immunoglobulins are called α, δ, ε, γ, and μ, respectively.

The term "constitutive" as used herein, as for example applied to receptor kinase activity, refers to continuous signaling activity of a receptor that is not dependent on the presence of a ligand or other activating molecules. Depending on the nature of the receptor, all of the activity may be constitutive or the activity of the receptor may be further activated by the binding of other molecules (e.g., ligands). Cellular events that lead to activation of receptors are well known among those of ordinary skill in the art. For example, activation may include oligomerization, e.g., dimerization, trimerization, etc., into higher order receptor complexes. Complexes may comprise a single species of protein, i.e., homomeric complex. Alternatively, complexes may comprise at least two different protein species, i.e., a heteromeric complex. Complex formation may be caused by, for example, overexpression of normal or mutant forms of receptor on the surface of a cell. Complex formation may also be caused by a specific mutation or mutations in a receptor.

The term "cytostatic agent" refers to a compound or composition which arrests growth of a cell either in vitro or in vivo. Thus, a cytostatic agent may be one which significantly reduces the percentage of cells in S phase. Further examples of cytostatic agents include agents that block cell cycle progression by inducing G0/G1 arrest or M-phase arrest. The humanized anti-Her2 antibody trastuzumab (HERCEPTIN®) is an example of a cytostatic agent that induces G0/G1 arrest. Classical M-phase blockers include the vincas (vincristine and vinblastine), taxanes, and topoisomerase II inhibitors such as doxorubicin, epirubicin, daunorubicin, etoposide, and bleomycin. Certain agents that arrest G1 also spill over into S-phase arrest, for example, DNA alkylating agents such as tamoxifen, prednisone, dacarbazine, mechlorethamine, cisplatin, methotrexate, 5-fluorouracil, and ara-C. Further information can be found in Mendelsohn and Israel, eds., The Molecular Basis of Cancer, Chapter 1, entitled "Cell cycle regulation, oncogenes, and antineoplastic drugs" by Murakami et al. (W.B. Saunders, Philadelphia, 1995), e.g., p. 13. The taxanes (paclitaxel and docetaxel) are anticancer drugs both derived from the yew tree. Docetaxel (TAXOTERE®, Rhone-Poulenc Rorer), derived from the European yew, is a semisynthetic analogue of paclitaxel (TAXOL®, Bristol-Myers Squibb). Paclitaxel and docetaxel promote the assembly of microtubules from tubulin dimers and stabilize microtubules by preventing depolymerization, which results in the inhibition of mitosis in cells.
The term "cytotoxic agent" as used herein refers to a substance that inhibits or prevents a cellular function and/or causes cell death or destruction. Cytotoxic agents include, but are not limited to, radioactive isotopes (e.g., At\textsuperscript{211}, I\textsuperscript{131}, I\textsuperscript{125}, Y\textsuperscript{90}, Re\textsuperscript{186}, Re\textsuperscript{188}, Sm\textsuperscript{153}, Bi\textsuperscript{212}, P\textsuperscript{32}, Pb\textsuperscript{212} and radioactive isotopes of Lu); chemotherapeutic agents or drugs (e.g., methotrexate, adriamycin, vinca alkaloids (vincristine, vinblastine, etoposide), doxorubicin, melphalan, mitomycin C, chlorambucil, daunorubicin or other intercalating agents); growth inhibitory agents; enzymes and fragments thereof such as nucleolytic enzymes; antibiotics; toxins such as small molecule toxins or enzymatically active toxins of bacterial, fungal, plant or animal origin, including fragments and/or variants thereof; and the various antitumor or anticancer agents disclosed below.

"Effector functions" refer to those biological activities attributable to the Fc region of an antibody, which vary with the antibody isotype. Examples of antibody effector functions include: Clq binding and complement dependent cytotoxicity (CDC); Fc receptor binding; antibody-dependent cell-mediated cytotoxicity (ADCC); phagocytosis; down regulation of cell surface receptors (e.g. B cell receptor); and B cell activation.

An "effective amount" of an agent, e.g., a pharmaceutical formulation, refers to an amount effective, at dosages and for periods of time necessary, to achieve the desired therapeutic or prophylactic result.

The term "Fc region" herein is used to define a C-terminal region of an immunoglobulin heavy chain that contains at least a portion of the constant region. The term includes native sequence Fc regions and variant Fc regions. In one embodiment, a human IgG heavy chain Fc region extends from Cys226, or from Pro230, to the carboxyl-terminus of the heavy chain. However, the C-terminal lysine (Lys447) of the Fc region may or may not be present. Unless otherwise specified herein, numbering of amino acid residues in the Fc region or constant region is according to the EU numbering system, also called the EU index, as described in Kabat et al., Sequences of Proteins of Immunological Interest, 5th Ed. Public Health Service, National Institutes of Health, Bethesda, MD, 1991.

"Framework" or "FR" refers to variable domain residues other than hypervariable region (HVR) residues. The FR of a variable domain generally consists of four FR domains: FR1, FR2, FR3, and FR4. Accordingly, the HVR and FR sequences generally appear in the following sequence in VH (or VL): FR1-H1(L1)-FR2-H2(L2)-FR3-H3(L3)-FR4.

The terms "full length antibody," "intact antibody," and "whole antibody" are used herein interchangeably to refer to an antibody having a structure substantially similar to a native antibody structure or having heavy chains that contain an Fc region as defined herein.
The terms "host cell," "host cell line," and "host cell culture" are used interchangeably and refer to cells into which exogenous nucleic acid has been introduced, including the progeny of such cells. Host cells include "transformants" and "transformed cells," which include the primary transformed cell and progeny derived therefrom without regard to the number of passages. Progeny may not be completely identical in nucleic acid content to a parent cell, but may contain mutations. Mutant progeny that have the same function or biological activity as screened or selected for in the originally transformed cell are included herein.

A "human antibody" is one which possesses an amino acid sequence which corresponds to that of an antibody produced by a human or a human cell or derived from a non-human source that utilizes human antibody repertoires or other human antibody-encoding sequences. This definition of a human antibody specifically excludes a humanized antibody comprising non-human antigen-binding residues.

A "human consensus framework" is a framework which represents the most commonly occurring amino acid residues in a selection of human immunoglobulin VL or VH framework sequences. Generally, the selection of human immunoglobulin VL or VH sequences is from a subgroup of variable domain sequences. Generally, the subgroup of sequences is a subgroup as in Kabat et al., Sequences of Proteins of Immunological Interest, Fifth Edition, NIH Publication 91-3242, Bethesda MD (1991), vols. 1-3. In one embodiment, for the VL, the subgroup is subgroup kappa I as in Kabat et al., supra. In one embodiment, for the VH, the subgroup is subgroup III as in Kabat et al., supra.

A "humanized" antibody refers to a chimeric antibody comprising amino acid residues from non-human HVRs and amino acid residues from human FRs. In certain embodiments, a humanized antibody will comprise substantially all of at least one, and typically two, variable domains, in which all or substantially all of the HVRs (e.g., CDRs) correspond to those of a non-human antibody, and all or substantially all of the FRs correspond to those of a human antibody. A humanized antibody optionally may comprise at least a portion of an antibody constant region derived from a human antibody. A "humanized form" of an antibody, e.g., a non-human antibody, refers to an antibody that has undergone humanization.

The term "hypervariable region" or "HVR," as used herein, refers to each of the regions of an antibody variable domain which are hypervariable in sequence and/or form structurally defined loops ("hypervariable loops"). Generally, native four-chain antibodies comprise six HVRs; three in the VH (H1, H2, H3), and three in the VL (L1, L2, L3). HVRs generally comprise amino acid residues from the hypervariable loops and/or from the "complementarity determining regions" (CDRs), the latter being of highest sequence variability and/or involved in antigen
recognition. Exemplary hypervariable loops occur at amino acid residues 26-32 (L1), 50-52 (L2), 91-96 (L3), 26-32 (HI), 53-55 (H2), and 96-101 (H3). (Chothia and Lesk, J. Mol. Biol. 196:901-917 (1987).) Exemplary CDRs (CDR-L1, CDR-L2, CDR-L3, CDR-H1, CDR-H2, and CDR-H3) occur at amino acid residues 24-34 of LI, 50-56 of L2, 89-97 of L3, 31-35B of HI, 50-65 of H2, and 95-102 of H3. (Kabat et al., Sequences of Proteins of Immunological Interest, 5th Ed. Public Health Service, National Institutes of Health, Bethesda, MD (1991).) With the exception of CDR1 in VH, CDRs generally comprise the amino acid residues that form the hypervariable loops. CDRs also comprise "specificity determining residues," or "SDRs," which are residues that contact antigen. SDRs are contained within regions of the CDRs called abbreviated-CDRs, or a-CDRs. Exemplary a-CDRs (a-CDR-L1, a-CDR-L2, a-CDR-L3, a-CDR-H1, a-CDR-H2, and a-CDR-H3) occur at amino acid residues 31-34 of LI, 50-55 of L2, 89-96 of L3, 31-35B of HI, 50-58 of H2, and 95-102 of H3. (See Almagro and Fransson, Front. Biosci. 13:1619-1633 (2008).) Unless otherwise indicated, HVR residues and other residues in the variable domain (e.g., FR residues) are numbered herein according to Kabat et al., supra.

0092 An "immunoconjugate" is an antibody conjugated to one or more heterologous molecule(s), including but not limited to a cytotoxic agent.

0093 An "individual" or "subject" is a mammal. Mammals include, but are not limited to, domesticated animals (e.g., cows, sheep, cats, dogs, and horses), primates (e.g., humans and non-human primates such as monkeys), rabbits, and rodents (e.g., mice and rats). In certain embodiments, the individual or subject is a human.

0094 "Inhibiting cell growth or proliferation" means decreasing a cell's growth or proliferation by at least 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90%, 95%, or 100%, and includes inducing cell death.

0095 An "isolated" antibody is one which has been separated from a component of its natural environment. In some embodiments, an antibody is purified to greater than 95% or 99% purity as determined by, for example, electrophoretic (e.g., SDS-PAGE, isoelectric focusing (IEF), capillary electrophoresis) or chromatographic (e.g., ion exchange or reverse phase HPLC). For review of methods for assessment of antibody purity, see, e.g., Flatman et al., J. Chromatogr. B 848:79-87 (2007).

0096 An "isolated" nucleic acid refers to a nucleic acid molecule that has been separated from a component of its natural environment. An isolated nucleic acid includes a nucleic acid molecule contained in cells that ordinarily contain the nucleic acid molecule, but the nucleic acid molecule is present extrachromosomally or at a chromosomal location that is different from its natural chromosomal location.
"Isolated nucleic acid encoding an anti-Axl antibody" refers to one or more nucleic acid molecules encoding antibody heavy and light chains (or fragments thereof), including such nucleic acid molecule(s) in a single vector or separate vectors, and such nucleic acid molecule(s) present at one or more locations in a host cell.

The term "ligand-independent" as used herein, as for example applied to receptor signaling activity, refers to signaling activity that is not dependent on the presence of a ligand. A receptor having ligand-independent kinase activity will not necessarily preclude the binding of ligand to that receptor to produce additional activation of the kinase activity.

The term "monoclonal antibody" as used herein refers to an antibody obtained from a population of substantially homogeneous antibodies, i.e., the individual antibodies comprising the population are identical and/or bind the same epitope, except for possible variant antibodies, e.g., containing naturally occurring mutations or arising during production of a monoclonal antibody preparation, such variants generally being present in minor amounts. In contrast to polyclonal antibody preparations, which typically include different antibodies directed against different determinants (epitopes), each monoclonal antibody of a monoclonal antibody preparation is directed against a single determinant on an antigen. Thus, the modifier "monoclonal" indicates the character of the antibody as being obtained from a substantially homogeneous population of antibodies, and is not to be construed as requiring production of the antibody by any particular method. For example, the monoclonal antibodies to be used in accordance with the present invention may be made by a variety of techniques, including but not limited to the hybridoma method, recombinant DNA methods, phage-display methods, and methods utilizing transgenic animals containing all or part of the human immunoglobulin loci, such methods and other exemplary methods for making monoclonal antibodies being described herein.

A "naked antibody" refers to an antibody that is not conjugated to a heterologous moiety (e.g., a cytotoxic moiety) or radiolabel. The naked antibody may be present in a pharmaceutical formulation.

"Native antibodies" refer to naturally occurring immunoglobulin molecules with varying structures. For example, native IgG antibodies are heterotetrameric glycoproteins of about 150,000 daltons, composed of two identical light chains and two identical heavy chains that are disulfide-bonded. From N- to C-terminus, each heavy chain has a variable region (VH), also called a variable heavy domain or a heavy chain variable domain, followed by three constant domains (CH1, CH2, and CH3). Similarly, from N- to C-terminus, each light chain has a variable region (VL), also called a variable light domain or a light chain variable domain, followed by a
constant light (CL) domain. The light chain of an antibody maybe assigned to one of two types, called kappa (κ) and lambda (λ), based on the amino acid sequence of its constant domain.

[0102] The term "package insert" is used to refer to instructions customarily included in commercial packages of therapeutic products, that contain information about the indications, usage, dosage, administration, combination therapy, contraindications and/or warnings concerning the use of such therapeutic products.

[0103] "Percent (%) amino acid sequence identity" with respect to a reference polypeptide sequence is defined as the percentage of amino acid residues in a candidate sequence that are identical with the amino acid residues in the reference polypeptide sequence, after aligning the sequences and introducing gaps, if necessary, to achieve the maximum percent sequence identity, and not considering any conservative substitutions as part of the sequence identity. Alignment for purposes of determining percent amino acid sequence identity can be achieved in various ways that are within the skill in the art, for instance, using publicly available computer software such as BLAST, BLAST-2, ALIGN or Megalign (DNASTAR) software. Those skilled in the art can determine appropriate parameters for aligning sequences, including any algorithms needed to achieve maximal alignment over the full length of the sequences being compared. For purposes herein, however, % amino acid sequence identity values are generated using the sequence comparison computer program ALIGN-2. The ALIGN-2 sequence comparison computer program was authored by Genentech, Inc., and the source code has been filed with user documentation in the U.S. Copyright Office, Washington D.C., 20559, where it is registered under U.S. Copyright Registration No. TXU5 10087. The ALIGN-2 program is publicly available from Genentech, Inc., South San Francisco, California, or maybe compiled from the source code. The ALIGN-2 program should be compiled for use on a UNIX operating system, including digital UNIX V4.0D. All sequence comparison parameters are set by the ALIGN-2 program and do not vary.

[0104] In situations where ALIGN-2 is employed for amino acid sequence comparisons, the % amino acid sequence identity of a given amino acid sequence A to, with, or against a given amino acid sequence B (which can alternatively be phrased as a given amino acid sequence A that has or comprises a certain % amino acid sequence identity to, with, or against a given amino acid sequence B) is calculated as follows:

100 times the fraction X/Y

where X is the number of amino acid residues scored as identical matches by the sequence alignment program ALIGN-2 in that program's alignment of A and B, and where Y is the total number of amino acid residues in B. It will be appreciated that where the length of amino acid
sequence A is not equal to the length of amino acid sequence B, the % amino acid sequence identity of A to B will not equal the % amino acid sequence identity of B to A. Unless specifically stated otherwise, all % amino acid sequence identity values used herein are obtained as described in the immediately preceding paragraph using the ALIGN-2 computer program.

[0105] The term "pharmaceutical formulation" refers to a preparation which is in such form as to permit the biological activity of an active ingredient contained therein to be effective, and which contains no additional components which are unacceptably toxic to a subject to which the formulation would be administered.

[0106] A "pharmaceutically acceptable carrier" refers to an ingredient in a pharmaceutical formulation, other than an active ingredient, which is nontoxic to a subject. A pharmaceutically acceptable carrier includes, but is not limited to, a buffer, excipient, stabilizer, or preservative.

[0107] As used herein, "treatment" (and grammatical variations thereof such as "treat" or "treating") refers to clinical intervention in an attempt to alter the natural course of the individual being treated, and can be performed either for prophylaxis or during the course of clinical pathology. Desirable effects of treatment include, but are not limited to, preventing occurrence or recurrence of disease, alleviation of symptoms, diminishment of any direct or indirect pathological consequences of the disease, preventing metastasis, decreasing the rate of disease progression, amelioration or palliation of the disease state, and remission or improved prognosis. In some embodiments, antibodies of the invention are used to delay development of a disease or to slow the progression of a disease.

[0108] The term "tumor" refers to all neoplastic cell growth and proliferation, whether malignant or benign, and all pre-cancerous and cancerous cells and tissues. The terms "cancer," "cancerous," "cell proliferative disorder," "proliferative disorder" and "tumor" are not mutually exclusive as referred to herein.

[0109] The term "variable region" or "variable domain" refers to the domain of an antibody heavy or light chain that is involved in binding the antibody to antigen. The variable domains of the heavy chain and light chain (VH and VL, respectively) of a native antibody generally have similar structures, with each domain comprising four conserved framework regions (FRs) and three hypervariable regions (HVRs). (See, e.g., Kindt et al. Kuby Immunology, 6th ed., W.H. Freeman and Co., page 91 (2007).) A single VH or VL domain may be sufficient to confer antigen-binding specificity. Furthermore, antibodies that bind a particular antigen may be isolated using a VH or VL domain from an antibody that binds the antigen to screen a library of complementary VL or VH domains, respectively. See, e.g., Portolano et al., J. Immunol. 150:880-887 (1993); Clarkson et al., Nature 352:624-628 (1991).
The term "vector," as used herein, refers to a nucleic acid molecule capable of propagating another nucleic acid to which it is linked. The term includes the vector as a self-replicating nucleic acid structure as well as the vector incorporated into the genome of a host cell into which it has been introduced. Certain vectors are capable of directing the expression of nucleic acids to which they are operatively linked. Such vectors are referred to herein as "expression vectors."

A "VH subgroup III consensus framework" comprises the consensus sequence obtained from the amino acid sequences in variable heavy subgroup III of Kabat et al. In one embodiment, the VH subgroup III consensus framework amino acid sequence comprises at least a portion or all of each of the following sequences: EVQLVESGGGLVQPGGSLRLSCAAS (SEQ ID NO:122)-H1-WVRQAPGKLEWV (SEQ ID NO:123)-H2-RFTISRDNSKNTLYQMNSLRAEDTAYYC (SEQ ID NO:124)-H3-WQQGTLVTVSS (SEQ ID NO: 125).

A "VL subgroup I consensus framework" comprises the consensus sequence obtained from the amino acid sequences in variable light kappa subgroup I of Kabat et al. In one embodiment, the VH subgroup I consensus framework amino acid sequence comprises at least a portion or all of each of the following sequences: DIQMTQSPSSLSASVGDRVTITC (SEQ ID NO:126)-L1-WYQQKPGKAPKLLIY (SEQ ID NO:127)-L2-GVPSRFSGSGTDTTLTISSLQPEDFATYYC (SEQ ID NO:128)-L3-FGQGTKVEIK (SEQ ID NO: 129).

II. COMPOSITIONS AND METHODS

In one aspect, the invention is based, in part, on the identification of a variety of Axl binding agents (such as antibodies and fragments thereof). Axl presents an important and advantageous therapeutic target, and the invention provides compositions and methods based on binding of the agents to Axl. Axl binding agents of the invention, as described herein, provide important therapeutic and diagnostic agents for use in targeting pathological conditions associated with expression and/or activity of the Axl signaling pathways. In certain embodiments, antibodies that bind to Axl are provided. Antibodies of the invention are useful, e.g., for the diagnosis or treatment of cancer.

A. Exemplary Anti-Axl Antibodies

In one aspect, the invention provides isolated antibodies that bind to Axl. In certain embodiments, an anti-Axl antibody binds human Axl with an affinity of \( \leq 550 \) pM, and in some embodiments, binds mouse Axl with an affinity of \( \leq 1 \) nM. In some embodiments, an anti-Axl antibody binds human and mouse Axl.
[0115] In some embodiments, an anti-Axl antibody induces down-regulation of Axl receptor expression on a cell surface (e.g., a tumor cell surface). In some embodiments, cell surface Axl expression is reduced to less than 80% of Axl cell surface expression in the absence of Axl antibody treatment. In some embodiments, cell surface expression is reduced to less than 70%, less than 60%, less than 50% or less than 40% of Axl cell surface expression in the absence of Axl antibody treatment. In some embodiments, total Axl expression in a cell (e.g., a tumor cell) is reduced to less than 80% of total Axl expression in the absence of Axl antibody treatment. In some embodiments, total Axl expression is reduced to less than 10%, less than 60%, less than 50% or less than 40% of total Axl expression in the absence of Axl antibody treatment. In some embodiments, down-regulation of Axl expression occurs rapidly and lasts for at least 24 hours.

[0116] In some embodiments, an anti-Axl antibody inhibits constitutive Axl activity.

[0117] In some embodiments, an anti-Axl antibody does not significantly cross-react with Sky or Mer. In some embodiments, an anti-Axl antibody does not significantly bind to Sky or Mer and binds human and mouse Axl.

[0118] In some embodiments, an anti-Axl antibody inhibits Axl activity.

[0119] In some embodiments, an anti-Axl antibody promotes apoptosis of a cell, e.g., a tumor cell, such as a A549 tumor cell. In some embodiments, an anti-Axl antibody inhibits Axl ligand (e.g., Gas6) binding to Axl. In some embodiments, an anti-Axl antibody inhibits Axl downstream signaling. In some embodiments, an anti-Axl antibody inhibits Gas-6 dependent cell proliferation. In some embodiments, an anti-Axl antibody inhibits inflammatory cytokine expression from tumor-associated macrophages. In some embodiments, an anti-Axl antibody inhibits tumor growth and/or metastasis by modulating tumor stromal function.

[0120] In some embodiments, an anti-Axl antibody binds a polypeptide comprising, consisting essentially of or consisting of the following amino acid sequence:

\[
\text{MAWRCPGRMGRVPLAELCCLCGWACMAPRGTQAEESPFPVGNPNGNITGARGLTGTRCQ}
\]

LQVQGEPEVHWLRDGQILELADSTQTQVPLGEDEQDDWRVVSSLRITSLQLSDTGQYQC

LVFLGHQTFVSQPGYVG (SEQ ID NO: 111).

[0121] In some embodiments, an anti-Axl antibody binds a polypeptide comprising, consisting essentially of or consisting of the following amino acid sequence:

[0122] ITVLPOQPRNLHLSRQPYTELEVAWTPGLSGYPTLTEHLQAVLSDDGMGIQAGEP

DPPEEPLTSQASVPPHQLRLGLHPHTPYHIRVACTSSQGSSWTHL (SEQ ID NO: 130).

[0123] In some embodiments, the antibody binds a polypeptide comprising, consisting essentially of or consisting of amino acid numbers 1-122 of the mature human Axl amino acid sequence.
In some embodiments, the antibody binds a polypeptide comprising, consisting essentially of or consisting of amino acid numbers 221-234 of the mature human Axl amino acid sequence.

In some embodiments, an anti-Axl antibody binds an amino acid sequence having at least 70%, 80%, 90%, 95%, 98% sequence identity or similarity with the sequence MAWRCPRMGRVPLAWCLALCGWACMAPRGTQAEESPFGNPGNITGARGLTGLRCQLQVQGEPEVHWRDQILEADSTQTQPGLGEDEQDDWTVSQRITSLQLSDTGQYQC

LVFLGHQTFVSPQGYVG (SEQ ID NO: 111).

In some embodiments, an anti-Axl antibody binds an amino acid sequence having at least 70%, 80%, 90%, 95%, 98% sequence identity or similarity with the sequence ITVPQQPRNLHVLVSQRTPELEVAWTPGLSGIYPLTHCTLQAVLSDDDGMGIQAGEPDPPEE

PLTSQASVPHRLGSLHPHTPYHIRVACTSSQGPSSWTHWL (SEQ ID NO: 130).

In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 1; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 2; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 3; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 4; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 5; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 6.

In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 7; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 8; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 9; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 10; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 11; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 12.

In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 13; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 14; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 15; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 16; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 17; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 18.

In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 19; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 20; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 21; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 22; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 23; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 24.
acid sequence of SEQ ID NO:22; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:23; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:24.

In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:25; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:26; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:27; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:28; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:29; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:30.

In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:31; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:32; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:33; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:34; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:35; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:36.

In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:37; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:38; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:39; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:40; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:41; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:42.

In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:43; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:44; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:45; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:46; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:47; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:48.

In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:49; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:50; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:51; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:52; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:53; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:54.

In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of
SEQ ID NO:55; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:56; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:57; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:58; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:59; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:60.

[0137] In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:61; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:62; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:63; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:64; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:65; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:66.

[0138] In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:67; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:68; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:69; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:70; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:71; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:72.

[0139] In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:73; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:74; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:75; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:76; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:77; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:78.

[0140] In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:79; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:80; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:81; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:82; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:83; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:84.

[0141] In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:85; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:86; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:87; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:88; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:89; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:90.
In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:91; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:92; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:93; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:94; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:95; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:96.

In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, three, four, five, or six HVRs selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:97; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:98; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:99; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:100; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:101; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:102.

In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, or all three VH HVR sequences selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:1; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:2; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:3.

In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, or all three VH HVR sequences selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:7; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:8; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:9.

In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, or all three VH HVR sequences selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:13; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:14; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:15.

In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, or all three VH HVR sequences selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:19; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:20; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:21.

In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, or all three VH HVR sequences selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:25; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:26; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:27.

In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, or all three VH HVR sequences selected from (a) HVR-H1 comprising the amino acid sequence
of SEQ ID NO:31; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:32; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:33.

[0150] In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, or all three VH HVR sequences selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:37; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:38; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:39.

[0151] In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, or all three VH HVR sequences selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:43; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:44; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:45.

[0152] In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, or all three VH HVR sequences selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:49; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:50; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:51.

[0153] In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, or all three VH HVR sequences selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:55; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:56; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:57.

[0154] In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, or all three VH HVR sequences selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:61; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:62; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:63.

[0155] In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, or all three VH HVR sequences selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:67; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:68; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:69.

[0156] In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, or all three VH HVR sequences selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:73; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:74; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:75.

[0157] In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, or all three VH HVR sequences selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:79; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:80; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:81.
In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, or all three VH HVR sequences selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:85; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:86; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:87.

In one aspect, the invention provides an anti-Axl antibody comprising at least one, two, or all three VH HVR sequences selected from (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:91; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:92; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:93.

In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:3. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:9. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:15. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:21. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:27. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:33. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:39. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:45. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:51. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:57. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:63. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:69. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:75. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:81. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:87. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:93. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:99.

In another embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:3 and HVR-L3 comprising the amino acid sequence of SEQ ID NO:6.
In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:9 and HVR-L3 comprising the amino acid sequence of SEQ ID NO:12. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:15 and HVR-L3 comprising the amino acid sequence of SEQ ID NO:18. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:21 and HVR-L3 comprising the amino acid sequence of SEQ ID NO:24. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:27 and HVR-L3 comprising the amino acid sequence of SEQ ID NO:30. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:33 and HVR-L3 comprising the amino acid sequence of SEQ ID NO:36. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:39 and HVR-L3 comprising the amino acid sequence of SEQ ID NO:42. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:45 and HVR-L3 comprising the amino acid sequence of SEQ ID NO:48. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:51 and HVR-L3 comprising the amino acid sequence of SEQ ID NO:54. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:57 and HVR-L3 comprising the amino acid sequence of SEQ ID NO:60. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:63 and HVR-L3 comprising the amino acid sequence of SEQ ID NO:66. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:69 and HVR-L3 comprising the amino acid sequence of SEQ ID NO:72. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:75 and HVR-L3 comprising the amino acid sequence of SEQ ID NO:78. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:81 and HVR-L3 comprising the amino acid sequence of SEQ ID NO:84. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:87 and HVR-L3 comprising the amino acid sequence of SEQ ID NO:90. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:93 and HVR-L3 comprising the amino acid sequence of SEQ ID NO:96. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:99 and HVR-L3 comprising the amino acid sequence of SEQ ID NO:102.

[0163] In a further embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:3, HVR-L3 comprising the amino acid sequence of SEQ ID NO:6 and
HVR-H2 comprising the amino acid sequence of SEQ ID NO:2. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:9, HVR-L3 comprising the amino acid sequence of SEQ ID NO:12 and HVR-H2 comprising the amino acid sequence of SEQ ID NO:8. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:15, HVR-L3 comprising the amino acid sequence of SEQ ID NO:18 and HVR-H2 comprising the amino acid sequence of SEQ ID NO:14. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:21, HVR-L3 comprising the amino acid sequence of SEQ ID NO:24 and HVR-H2 comprising the amino acid sequence of SEQ ID NO:20. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:27, HVR-L3 comprising the amino acid sequence of SEQ ID NO:30 and HVR-H2 comprising the amino acid sequence of SEQ ID NO:26. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:33, HVR-L3 comprising the amino acid sequence of SEQ ID NO:36 and HVR-H2 comprising the amino acid sequence of SEQ ID NO:32. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:39, HVR-L3 comprising the amino acid sequence of SEQ ID NO:42 and HVR-H2 comprising the amino acid sequence of SEQ ID NO:38. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:45, HVR-L3 comprising the amino acid sequence of SEQ ID NO:48 and HVR-H2 comprising the amino acid sequence of SEQ ID NO:44. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:51, HVR-L3 comprising the amino acid sequence of SEQ ID NO:54 and HVR-H2 comprising the amino acid sequence of SEQ ID NO:50. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:57, HVR-L3 comprising the amino acid sequence of SEQ ID NO:60 and HVR-H2 comprising the amino acid sequence of SEQ ID NO:56. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:63, HVR-L3 comprising the amino acid sequence of SEQ ID NO:66 and HVR-H2 comprising the amino acid sequence of SEQ ID NO:62. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:69, HVR-L3 comprising the amino acid sequence of SEQ ID NO:72 and HVR-H2 comprising the amino acid sequence of SEQ ID NO:68. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:75, HVR-L3 comprising the amino acid sequence of SEQ ID NO:78 and HVR-H2 comprising the amino acid sequence of SEQ ID NO:74. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:81, HVR-L3 comprising the amino acid sequence of SEQ ID NO:84 and HVR-H2
comprising the amino acid sequence of SEQ ID NO: 80. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:87, HVR-L3 comprising the amino acid sequence of SEQ ID NO:90 and HVR-H2 comprising the amino acid sequence of SEQ ID NO:86. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:93, HVR-L3 comprising the amino acid sequence of SEQ ID NO:96 and HVR-H2 comprising the amino acid sequence of SEQ ID NO:92. In one embodiment, the antibody comprises HVR-H3 comprising the amino acid sequence of SEQ ID NO:99, HVR-L3 comprising the amino acid sequence of SEQ ID NO:102 and HVR-H2 comprising the amino acid sequence of SEQ ID NO:98.

[0164] In a further embodiment, the antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 1; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:2; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:3. In a further embodiment, the antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:7; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:8; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:9. In a further embodiment, the antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:13; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:14; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:15. In a further embodiment, the antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:19; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:20; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:21. In a further embodiment, the antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:25; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:26; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:27. In a further embodiment, the antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:31; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:32; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:33. In a further embodiment, the antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:37; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:38; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:39. In a further embodiment, the antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:43; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:44; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:45. In a further embodiment, the antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:49; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:50; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:51. In a further embodiment, the
antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:55; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:56; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:57. In a further embodiment, the antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:61; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:62; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:63. In a further embodiment, the antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:67; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:68; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:69. In a further embodiment, the antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:73; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:74; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:75. In a further embodiment, the antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:79; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:80; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:81. In a further embodiment, the antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:85; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:86; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:87. In a further embodiment, the antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:91; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:92; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:93. In a further embodiment, the antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:97; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:98; and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:99.

[0165] In another aspect, the invention provides an antibody comprising at least one, at least two, or all three VL HVR sequences selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:4; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:5; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:6.

[0166] In another aspect, the invention provides an antibody comprising at least one, at least two, or all three VL HVR sequences selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:10; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:11; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:12.

[0167] In another aspect, the invention provides an antibody comprising at least one, at least two, or all three VL HVR sequences selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:16; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:17; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:18.
[0168] In another aspect, the invention provides an antibody comprising at least one, at least two, or all three VL HVR sequences selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:22; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:23; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:24.

[0169] In another aspect, the invention provides an antibody comprising at least one, at least two, or all three VL HVR sequences selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:28; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:29; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:30.

[0170] In another aspect, the invention provides an antibody comprising at least one, at least two, or all three VL HVR sequences selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:34; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:35; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:36.

[0171] In another aspect, the invention provides an antibody comprising at least one, at least two, or all three VL HVR sequences selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:40; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:41; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:42.

[0172] In another aspect, the invention provides an antibody comprising at least one, at least two, or all three VL HVR sequences selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:46; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:47; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:48.

[0173] In another aspect, the invention provides an antibody comprising at least one, at least two, or all three VL HVR sequences selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:52; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:53; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:54.

[0174] In another aspect, the invention provides an antibody comprising at least one, at least two, or all three VL HVR sequences selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:58; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:59; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:60.

[0175] In another aspect, the invention provides an antibody comprising at least one, at least two, or all three VL HVR sequences selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:64; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:65; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:66.

[0176] In another aspect, the invention provides an antibody comprising at least one, at least two, or all three VL HVR sequences selected from (a) HVR-L1 comprising the amino acid
sequence of SEQ ID NO:70; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:71; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:72.

[0177] In another aspect, the invention provides an antibody comprising at least one, at least two, or all three VL HVR sequences selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:76; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:77; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:78.

[0178] In another aspect, the invention provides an antibody comprising at least one, at least two, or all three VL HVR sequences selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:82; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:83; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:84.

[0179] In another aspect, the invention provides an antibody comprising at least one, at least two, or all three VL HVR sequences selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:88; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:89; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:90.

[0180] In another aspect, the invention provides an antibody comprising at least one, at least two, or all three VL HVR sequences selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:94; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:95; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:96.

[0181] In another aspect, the invention provides an antibody comprising at least one, at least two, or all three VL HVR sequences selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:100; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:101; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:102.

[0182] In one embodiment, the antibody comprises (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:4; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:5; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:6. In one embodiment, the antibody comprises (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:10; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:11; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:12. In one embodiment, the antibody comprises (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:16; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:17; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:18. In one embodiment, the antibody comprises (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:22; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:23; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:24. In one embodiment, the antibody comprises (a) HVR-L1 comprising the amino acid sequence of SEQ
ID NO:28; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:29; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:30. In one embodiment, the antibody comprises (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:34; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:35; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:36. In one embodiment, the antibody comprises (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:40; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:41; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:42. In one embodiment, the antibody comprises (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:46; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:47; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:48. In one embodiment, the antibody comprises (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:52; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:53; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:54. In one embodiment, the antibody comprises (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:58; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:59; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:60. In one embodiment, the antibody comprises (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:64; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:65; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:66. In one embodiment, the antibody comprises (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:70; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:71; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:72. In one embodiment, the antibody comprises (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:76; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:77; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:78. In one embodiment, the antibody comprises (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:82; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:83; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:84. In one embodiment, the antibody comprises (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:88; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:89; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:90. In one embodiment, the antibody comprises (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:94; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:95; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:96. In one embodiment, the antibody comprises (a) HVR-L1 comprising the amino acid sequence of SEQ
ID NO: 100; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 101; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 102.

[0183] In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 1, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 2, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO: 3; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 4, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 5, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 6.

[0184] In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 7, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 8, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO: 9; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 10, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 11, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 12.

[0185] In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 13, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 14, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO: 15; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 16, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 17, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 18.

[0186] In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 19, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 20, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO: 21; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 22, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 23, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 24.
In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO:25, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO:26, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO:27; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO:28, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO:29, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:30.

In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO:31, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO:32, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO:33; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO:34, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO:35, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:36.

In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO:37, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO:38, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO:39; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO:40, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO:41, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:42.

In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO:43, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO:44, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO:45; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO:46, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO:47, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:48.

In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the
amino acid sequence of SEQ ID NO:49, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO:50, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO:51; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO:52, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO:53, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:54.

[0192] In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO:55, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO:56, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO:57; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO:58, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO:59, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:60.

[0193] In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO:61, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO:62, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO:63; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO:64, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO:65, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:66.

[0194] In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO:67, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO:68, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO:69; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO:70, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO:71, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:72.

[0195] In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO:73, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO:74, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID
NO:75; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO:76, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO:77, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:78.

[0196] In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO:79, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO:80, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO:81; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO:82, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO:83, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:84.

[0197] In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO:85, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO:86, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO:87; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO:88, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO:89, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:90.

[0198] In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO:91, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO:92, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO:93; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO:94, (ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO:95, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:96.

[0199] In another aspect, an antibody of the invention comprises (a) a VH domain comprising at least one, at least two, or all three VH HVR sequences selected from (i) HVR-H1 comprising the amino acid sequence of SEQ ID NO:97, (ii) HVR-H2 comprising the amino acid sequence of SEQ ID NO:98, and (iii) HVR-H3 comprising an amino acid sequence selected from SEQ ID NO:99; and (b) a VL domain comprising at least one, at least two, or all three VL HVR sequences selected from (i) HVR-L1 comprising the amino acid sequence of SEQ ID NO:100,
(ii) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 101, and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 102.

[0200] In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 1; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 2; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 3; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 4; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 5; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 6.

[0201] In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 7; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 8; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 9; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 10; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 11; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 12.

[0202] In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 13; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 14; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 15; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 16; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 17; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 18.

[0203] In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 19; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 20; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 21; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 22; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 23; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 24.

[0204] In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 25; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 26; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 27; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 28; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 29; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 30.

[0205] In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 31; (b) HVR-H2 comprising the amino acid sequence of
SEQ ID NO:32; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:33; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:34; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:35; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:36.

[0206] In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:37; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:38; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:39; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:40; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:41; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:42.

[0207] In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:43; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:44; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:45; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:46; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:47; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:48.

[0208] In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:49; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:50; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:51; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:52; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:53; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:54.

[0209] In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:55; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:56; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:57; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:58; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:59; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:60.

[0210] In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:61; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:62; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:63; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:64; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:65; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:66.
In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:67; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:68; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:69; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:70; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:71; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:72.

In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:73; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:74; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:75; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:76; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:77; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:78.

In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:79; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:80; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:81; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:82; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:83; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:84.

In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:85; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:86; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:87; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:88; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:89; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:90.

In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:91; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:92; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:93; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:94; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:95; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:96.

In another aspect, the invention provides an antibody comprising (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:97; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:98; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:99; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO:100; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO:101; (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO:102; (g) HVR-L4 comprising the amino acid sequence of SEQ ID NO:103; (h) HVR-L5 comprising the amino acid sequence of SEQ ID NO:104; (i) HVR-L6 comprising the amino acid sequence of SEQ ID NO:105; (j) HVR-L7 comprising the amino acid sequence of SEQ ID NO:106; (k) HVR-L8 comprising the amino acid sequence of SEQ ID NO:107; (l) HVR-L9 comprising the amino acid sequence of SEQ ID NO:108.
acid sequence of SEQ ID NO: 101; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 102.

[0217] In certain embodiments, any one or more amino acids of an anti-Axl antibody as provided above are substituted or absent at the following HVR positions:
- in HVR-H1 (SEQ ID NO:7): positions 2, 3, 4, 5, 6, 7, 8, 9, and 10;
- in HVR-H2 (SEQ ID NO:8): positions 1, 2, 4, 6, 7, 8, 9, and 10;
- in HVR-H3 (SEQ ID NO:9): positions 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, or 15;
- in HVR-L1 (SEQ ID NO:10): positions 5, 6, 7, 8, 9, and 10;
- in HVR-L2 (SEQ ID NO:11): positions 1, 4, and 6;
- in HVR-L3 (SEQ ID NO:12): positions 3, 4, 5, 6, 7, and 8.

[0218] In certain embodiments, the substitutions are conservative substitutions, as provided herein. In certain embodiments, any one or more of the following substitutions may be made in any combination:
- in HVR-H1 (SEQ ID NO:7): S28T; L29F or V: S30T or R; G31S; S32H, T or I; W33G; I34L;
- in HVR-H2 (SEQ ID NO:8): G49A; W50G; N52S, A, or P; Y53A or V; R54G or S; G55S or R; Y56S or H; A57T or P;
- in HVR-H3 (SEQ ID NO:9): E95W; Y96R; S97N or P; G98D or L; W99S; G100R, A, or S; G100S; S100b absent; S100cY absent; V100dI or absent; G100e or absent; Y100f or absent, A110G or absent;
- in HVR-L1 (SEQ ID NO:10): D28I or S; V29I; S30G or R; T31I, N or R; A32S; V33L;
- in HVR-L2 (SEQ ID NO:11): S50A or V; F53N or S; Y55A;
- in HVR-L3 (SEQ ID NO:12): S91A; Y92K or N; T93S, Y, M, R, or A; T94N, F, or S; P95R; P96Y, S, or L.

[0219] In certain embodiments, any one or more of the following substitutions may be made in any combination:
- in HVR-H1 (SEQ ID NO:7): S28T; L29F or V: S30T or R; G31S; S32H, T or I;
- in HVR-H2 (SEQ ID NO:8): N52S, or A; R54G or S; G55R; Y56S, or H; A57T or P;
- in HVR-H3 (SEQ ID NO:9): S97N or P; G98D; G100S;
- in HVR-L3 (SEQ ID NO:12): T93S, or Y; T94N, F, or S.

[0220] All possible combinations of the above substitutions are encompassed by the consensus sequences:
- HVR-H1 (SEQ ID NO:112): GFX 2 X 2 X 3 X 4 X 5 X 6 X 7 H, wherein XI is S or T; X 2 is L, F or V; X 3 is S, T, or R; X 4 is G or S; X 5 is S, H, or T or I; X 6 is W or G; X 7 is I or L;
- HVR-H2 (SEQ ID NO:113): X 1 P 2 X 3 P X 4 X 5 X 6 X 7 X 8 YYADSVKG, wherein X 1 is G or A; X 2
is W or G; X₃ is N, S, A or P; X₄ is Y, A or V; X₅ is R, G, or S; X₆ is G R or S; X₇ is Y, S, H or Y; X₈ is A, T, or P; and/or (SEQ ID NO: 166): X1X2IX3PX4X5X6X7X8 X9X10YYADSVKG,
wherein X₁ is G or A; X₂ is W or G; X₃ is N, S, A or P; X₄ is Y, A or V; X₅ is R, G, or S; X₆ is G R or S; X₇ is Y, S, H or Y; X₈ is A, T, or P; X₉ is any amino acid or absent; X₁₀ is any amino acid or absent;
in HVR-H3 (SEQ ID NO: 114): ARX₁₂X₃₄X₅₆X₇₈X₉₁X₁₁X₁₂X₁₃MDY, wherein X₁ is E or W; X₂ is Y or R; X₃ is S, N or P; X₄ is G, D, or L; X₅ is W or S; X₆ is G, R, A, or S; X₇ is G or S; X₈ is S or absent; X₉ is Y, S or absent; X₁₀ is V, I or absent; X₁₁ is G or absent; X₁₂ is Y or absent; X₁₃ is A, E or absent;
in HVR-L1 (SEQ ID NO: 115): RASQXIX₂₃X₄₅X₆₇X₈₁X₁₀₁X₁₁₃MDY, wherein X₁ is D, I or S; X₂ is V or I; X₃ is S, G or R; X₄ is T, I, N or R; X₅ is A or S; X₆ is V or L;
in HVR-L2 (SEQ ID NO: 116): XiASX₂₃X₄₅, wherein X₁ is S, A, or V; X₂ is F, N or S; X₃ is Y or A;
in HVR-L3 (SEQ ID NO: 117): QQX₁₂X₃₄X₅₆X₇₈₉₁X₁₀₁X₁₁₃MDY, wherein X₁ is S or A; X₂ is Y, K or N; X₃ is T, S, Y, M, R or A; X₄ is T, N, S, or F; X₅ is P or R; X₆ is P, Y, S or L.

[0221] In some embodiments, the following consensus sequences are provided:
in HVR-H1 (SEQ ID NO: 118): GFX₁X₂₃X₄₅₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋₋ゆっくり

[0222] In another aspect, an anti-Axl antibody comprises a heavy chain variable domain (VH) sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99%, or 100% sequence identity to the amino acid sequence of SEQ ID NO: 103, 105, 107 or 109. In certain embodiments, a VH sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity contains substitutions (e.g., conservative substitutions), insertions, or deletions relative to the reference sequence, but an anti-Axl antibody comprising that sequence retains the ability to bind to Axl. In certain embodiments, a total of 1 to 10 amino acids have been substituted, inserted and/or deleted in SEQ ID NO: 103, 105, 107 or 109. In certain embodiments, substitutions, insertions, or deletions occur in regions outside the HVRs (i.e., in the FRs).
Optionally, the anti-Axl antibody comprises the VH sequence in SEQ ID NO: 103, 105, 107 or
109, including post-translational modifications of that sequence. In a particular embodiment, the VH comprises one, two or three HVRs selected from: (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:1, 7, 13, 19, 25, 31, 37, 43, 49, 55, 61, 67, 73, 79, 85, 91, or 97, (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:2, 8, 14, 20, 26, 32, 38, 44, 50, 56, 62, 68, 74, 80, 86, 92, or 98, and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:3, 9, 15, 21, 27, 33, 39, 45, 51, 57, 63, 69, 75, 81, 87, 93 or 99. In a particular embodiment, the VH comprises one, two or three HVRs selected from: (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO:7, (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO:8, and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO:9.

[0223] In another aspect, an anti-Axl antibody is provided, wherein the antibody comprises a light chain variable domain (VL) having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99%, or 100% sequence identity to the amino acid sequence of SEQ ID NO:104, 106, 108 or 110. In certain embodiments, a VL sequence having at least 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% identity contains substitutions (e.g., conservative substitutions), insertions, or deletions relative to the reference sequence, but an anti-Axl antibody comprising that sequence retains the ability to bind to PRO. In certain embodiments, a total of 1 to 10 amino acids have been substituted, inserted and/or deleted in SEQ ID NO:104, 106, 108 or 110. In certain embodiments, the substitutions, insertions, or deletions occur in regions outside the HVRs (i.e., in the FRs). Optionally, the anti-Axl antibody comprises the VL sequence in SEQ ID NO:104, 106, 108 or 110, including post-translational modifications of that sequence. In a particular embodiment, the VL comprises one, two or three HVRs selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:4, 10, 16, 22, 28, 34, 40, 46, 52, 58, 64, 70, 76, 82, 88, 94, or 100; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:5, 11, 17, 23, 29, 35, 41, 47, 53, 59, 65, 77, 83, 89, 95, or 101; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:6, 12, 18, 24, 30, 36, 42, 48, 54, 60, 66, 72, 78, 84, 90, 96 or 102. In a particular embodiment, the VL comprises one, two or three HVRs selected from (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO:10; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO:11; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO:12.

[0224] In another aspect, an anti-Axl antibody is provided, wherein the antibody comprises a VH as in any of the embodiments provided above. In some embodiments, the antibody further comprises a VL. In one embodiments, the antibody comprises the VH sequence in SEQ ID NO:103. In one embodiments, the antibody comprises the VH sequence in SEQ ID NO:105. In
one embodiments, the antibody comprises the VH sequence in SEQ ID NO: 107. In one embodiments, the antibody comprises the VH sequence in SEQ ID NO: 109.

[0225] In another aspect, an anti-Axl antibody is provided, wherein the antibody comprises a VL as in any of the embodiments provided above. In some embodiments, the antibody further comprises a VH. In one embodiments, the antibody comprises the VL sequence in SEQ ID NO: 104. In one embodiments, the antibody comprises the VL sequence in SEQ ID NO: 106. In one embodiments, the antibody comprises the VL sequence in SEQ ID NO: 108. In one embodiments, the antibody comprises the VL sequence in SEQ ID NO: 110.

[0226] In another aspect, an anti-Axl antibody is provided, wherein the antibody comprises a VH as in any of the embodiments provided above, and a VL as in any of the embodiments provided above. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 103 and SEQ ID NO: 104, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 105 and SEQ ID NO: 106, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 107 and SEQ ID NO: 108, respectively, including post-translational modifications of those sequences. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 109 and SEQ ID NO: 110, respectively, including post-translational modifications of those sequences.

[0227] The antibodies of the invention can comprise any suitable framework variable domain sequence, provided binding activity to Axl is substantially retained. For example, in some embodiments, antibodies of the invention comprise a human subgroup III heavy chain framework consensus sequence. In one embodiment of these antibodies, the framework consensus sequence comprises a substitution at position 71, 73, and/or 78. In some embodiments of these antibodies, position 71 is A, 73 is T and/or 78 is A. In one embodiment, these antibodies comprise heavy chain variable domain framework sequences of huMAb4D5-8 (HERCEPTIN®, Genentech, Inc., South San Francisco, CA, USA) (also referred to in U.S. Patent Nos. 6,407,213 & 5,821,337, and Lee et al., J. Mol. Biol. (2004), 340(5): 1073-1093). In one embodiment, these antibodies further comprise a human κ light chain framework consensus sequence. In a particular embodiment, these antibodies comprise light chain HVR sequences of huMAb4D5-8 as described in U.S. Patent Nos. 6,407,213 & 5,821,337.) In one embodiment, these antibodies comprise light chain variable domain sequences of huMAb4D5-8 (HERCEPTIN®, Genentech, Inc., South San Francisco, CA, USA) (also referred to in U.S. Patent Nos. 6,407,213 & 5,821,337, and Lee et al., J. Mol. Biol. (2004), 340(5): 1073-1093). In one embodiment, an anti-Axl antibody comprises
HVRs as in any of the above embodiments, and further comprises a VH and/or VL comprising a FR1, FR2, FR3 or FR4 sequence shown in Figures 2, 3A-B, 4, 5 or 6.

In a further aspect, the invention provides an antibody that binds to the same epitope as an anti-Axl antibody provided herein. For example, in certain embodiments, an antibody is provided that binds to the same epitope as an anti-Axl antibody comprising a VH sequence of SEQ ID NO: 103 and a VL sequence of SEQ ID NO: 104. In certain embodiments, an antibody is provided that binds to the same epitope as an anti-Axl antibody comprising a VH sequence of SEQ ID NO: 107 and a VL sequence of SEQ ID NO: 108. In certain embodiments, an antibody is provided that binds to an epitope within a fragment of Axl consisting of amino acids

MAWRCPRMGRVPLAWCLALCGWACMAPRGTQAEESPFVGNPNGITGARGLTGLRG
LQVQGEPPVHWLDRGQIELADSTQTQVPLGEDEQDDWVVSQRLITSLQLSDTGQYQC
LVFLGHQTFVSQPQYGVG (SEQ ID NO: 111). In certain embodiments, an antibody is provided that binds to an epitope within a fragment of Axl consisting of amino acids

ITVLPQQPRNLHLSRQPTELEVAWTPGLSIIYPLTHCTLQAVLSDDGMGIGAGEPDPPEE
PLTSQASVPHPQLRLGSLHPHTPYHIRVACTSSQPSPSWTHL (SEQ ID NO: 130).

In a further aspect, the invention provides an antibody that competes for binding to human Axl with an anti-Axl antibody comprising a VH sequence of SEQ ID NO: 103 and a VL sequence of SEQ ID NO: 104. In certain embodiments, an antibody is provided that competes for binding to human Axl with an anti-Axl antibody comprising a VH sequence of SEQ ID NO: 107 and a VL sequence of SEQ ID NO: 108.

In a further aspect of the invention, an anti-Axl antibody according to any of the above embodiments is a monoclonal antibody, including a chimeric, humanized or human antibody. In one embodiment, an anti-Axl antibody is an antibody fragment, e.g., a Fv, Fab, Fab’, scFv, diabody, or F(ab’)2 fragment. In another embodiment, the antibody is a full length antibody, e.g., an intact IgG antibody or other antibody class or isotype as defined herein.

In a further aspect, an anti-Axl antibody according to any of the above embodiments may incorporate any of the features, singly or in combination, as described in Sections 1-7 below:

1. Antibody Affinity

In certain embodiments, an antibody provided herein has a dissociation constant (Kd) of ≤ 10 μM, ≤ 10 nM, ≤ 1 nM, ≤ 0.1 nM, ≤ 0.01 nM, or ≤ 0.001 nM (e.g., 10^-8 M or less, e.g., from 10^-8 M to 10^-13 M, e.g., from 10^-9 M to 10^-13 M).

In one embodiment, Kd is measured by a radiolabeled antigen binding assay (RIA) performed with the Fab version of an antibody of interest and its antigen as described by the following assay. Solution binding affinity of Fabs for antigen is measured by equilibrating Fab
with a minimal concentration of \(^{(125\text{I})}\)-labeled antigen in the presence of a titration series of unlabeled antigen, then capturing bound antigen with an anti-Fab antibody-coated plate (see, e.g., Chen et al., *J. Mol. Biol.* 293:865-881 (1999)). To establish conditions for the assay, MICROTITER® multi-well plates (Thermo Scientific) are coated overnight with 5 µg/ml of a capturing anti-Fab antibody (Cappel Labs) in 50 mM sodium carbonate (pH 9.6), and subsequently blocked with 2% (w/v) bovine serum albumin in PBS for two to five hours at room temperature (approximately 23°C). In a non-adsorbent plate (Nunc #269620), 100 pM or 26 pM \(^{(125\text{I})}\)-antigen are mixed with serial dilutions of a Fab of interest (e.g., consistent with assessment of the anti-VEGF antibody, Fab-12, in Presta et al., Cancer Res. 57:4593-4599 (1997)). The Fab of interest is then incubated overnight; however, the incubation may continue for a longer period (e.g., about 65 hours) to ensure that equilibrium is reached. Thereafter, the mixtures are transferred to the capture plate for incubation at room temperature (e.g., for one hour). The solution is then removed and the plate washed eight times with 0.1% polysorbate 20 (TWEEN-20®) in PBS. When the plates have dried, 150 µl/well of scintillant (MICROSCINT-20™; Packard) is added, and the plates are counted on a TOPCOUNT™ gamma counter (Packard) for ten minutes. Concentrations of each Fab that give less than or equal to 20% of maximal binding are chosen for use in competitive binding assays.

**[0234]** According to another embodiment, Kd is measured using surface plasmon resonance assays using a BIACORE®.2000 or a BIACORE®.3000 (BIAcore, Inc., Piscataway, NJ) at 25°C with immobilized antigen CM5 chips at -10 response units (RU). Briefly, carboxymethylated dextran biosensor chips (CM5, BIACORE, Inc.) are activated with N-ethyl-N'- (3-dimethylaminopropyl)-carbo diimide hydrochloride (EDC) and N-hydroxysuccinimide (NHS) according to the supplier’s instructions. Antigen is diluted with 10 mM sodium acetate, pH 4.8, to 5 µg/ml (-0.2 µM) before injection at a flow rate of 5 µl/minute to achieve approximately 10 response units (RU) of coupled protein. Following the injection of antigen, 1 M ethanolamine is injected to block unreacted groups. For kinetics measurements, two-fold serial dilutions of Fab (0.78 nM to 500 nM) are injected in PBS with 0.05% polysorbate 20 (TWEEN-20™) surfactant (PBST) at 25°C at a flow rate of approximately 25 µl/min. Association rates (k\(_{\text{on}}\)) and dissociation rates (k\(_{\text{off}}\)) are calculated using a simple one-to-one Langmuir binding model (BIACORE® Evaluation Software version 3.2) by simultaneously fitting the association and dissociation sensorgrams. The equilibrium dissociation constant (Kd) is calculated as the ratio k\(_{\text{off}}\)/k\(_{\text{on}}\). See, e.g., Chen et al., *J. Mol. Biol.* 293:865-881 (1999). If the on-rate exceeds 10\(^6\) M\(^{-1}\) s\(^{-1}\) by the surface plasmon resonance assay above, then the on-rate can be determined by using a fluorescent quenching technique that measures the increase or decrease in fluorescence emission.
intensity (excitation = 295 nm; emission = 340 nm, 16 nm band-pass) at 25°C of a 20 nM anti-
antigen antibody (Fab form) in PBS, pH 7.2, in the presence of increasing concentrations of
antigen as measured in a spectrometer, such as a stop-flow equipped spectrophotometer (Aviv
Instruments) or a 8000-series SLM-AMINCO™ spectrophotometer (ThermoSpectronic) with a
stirred cuvette.

2. Antibody Fragments

[0235] In certain embodiments, an antibody provided herein is an antibody fragment. Antibody
fragments include, but are not limited to, Fab, Fab', Fab'-SH, F(ab')2, Fv, and scFv fragments,
and other fragments described below. For a review of certain antibody fragments, see Hudson et
al. Nat. Med. 9:129-134 (2003). For a review of scFv fragments, see, e.g., Pluckthun, in The
Pharmacology of Monoclonal Antibodies, vol. 113, Rosenberg and Moore eds., (Springer-Verlag,
New York), pp. 269-315 (1994); see also WO 93/16185; and U.S. Patent Nos. 5,571,894 and
5,587,458. For discussion of Fab and F(ab')2 fragments comprising salvage receptor binding
epitope residues and having increased in vivo half-life, see U.S. Patent No. 5,869,046.

[0236] Diabodies are antibody fragments with two antigen-binding sites that may be bivalent or
bispecific. See, for example, EP 404,097; WO 1993/01 161; Hudson et al., Nat. Med. 9:129-134
tetraabodies are also described in Hudson et al., Nat. Med. 9:129-134 (2003).

[0237] Single-domain antibodies are antibody fragments comprising all or a portion of the heavy
chain variable domain or all or a portion of the light chain variable domain of an antibody.
In certain embodiments, a single-domain antibody is a human single-domain antibody (Domantis,
Inc., Waltham, MA; see, e.g., U.S. Patent No. 6,248,516 Bl).

[0238] Antibody fragments can be made by various techniques, including but not limited to
proteolytic digestion of an intact antibody as well as production by recombinant host cells (e.g. E.
coli or phage), as described herein.

3. Chimeric and Humanized Antibodies

[0239] In certain embodiments, an antibody provided herein is a chimeric antibody. Certain
chimeric antibodies are described, e.g., in U.S. Patent No. 4,816,567; and Morrison et al., Proc.
Natl. Acad. Sci. USA, 81:6851-6855 (1984)). In one example, a chimeric antibody comprises a
non-human variable region (e.g., a variable region derived from a mouse, rat, hamster, rabbit, or
non-human primate, such as a monkey) and a human constant region. In a further example, a
chimeric antibody is a "class switched" antibody in which the class or subclass has been changed
from that of the parent antibody. Chimeric antibodies include antigen-binding fragments thereof.
[0240] In certain embodiments, a chimeric antibody is a humanized antibody. Typically, a non-human antibody is humanized to reduce immunogenicity to humans, while retaining the specificity and affinity of the parental non-human antibody. Generally, a humanized antibody comprises one or more variable domains in which HVRs, e.g., CDRs, (or portions thereof) are derived from a non-human antibody, and FRs (or portions thereof) are derived from human antibody sequences. A humanized antibody optionally will also comprise at least a portion of a human constant region. In some embodiments, some FR residues in a humanized antibody are substituted with corresponding residues from a non-human antibody (e.g., the antibody from which the HVR residues are derived), e.g., to restore or improve antibody specificity or affinity.

4. Human Antibodies

[0243] In certain embodiments, an antibody provided herein is a human antibody. Human antibodies can be produced using various techniques known in the art. Human antibodies are described generally in van Dijk and van de Winkel, Curr. Opin. Pharmacol. 5: 368-74 (2001) and Lonberg, Curr. Opin. Immunol. 20:450-459 (2008).

[0244] Human antibodies may be prepared by administering an immunogen to a transgenic animal that has been modified to produce intact human antibodies or intact antibodies with human variable regions in response to antigenic challenge. Such animals typically contain all or a
portion of the human immunoglobulin loci, which replace the endogenous immunoglobulin loci, or which are present extrachromosomally or integrated randomly into the animal's chromosomes. In such transgenic mice, the endogenous immunoglobulin loci have generally been inactivated. For review of methods for obtaining human antibodies from transgenic animals, see Lonberg, Nat. Biotech. 23:1 117-1 125 (2005). See also, e.g., U.S. Patent Nos. 6,075,181 and 6,150,584 describing XENOMOUSE™ technology; U.S. Patent No. 5,770,429 describing HUMAB® technology; U.S. Patent No. 7,041,870 describing K-M MOUSE® technology, and U.S. Patent Application Publication No. US 2007/0061900, describing VELOCIMOUSE® technology). Human variable regions from intact antibodies generated by such animals maybe further modified, e.g., by combining with a different human constant region.

Human antibodies may also be generated by isolating Fv clone variable domain sequences selected from human-derived phage display libraries. Such variable domain sequences may then be combined with a desired human constant domain. Techniques for selecting human antibodies from antibody libraries are described below.

5. **Library-Derived Antibodies**

Antibodies of the invention may be isolated by screening combinatorial libraries for antibodies with the desired activity or activities. For example, a variety of methods are known in the art for generating phage display libraries and screening such libraries for antibodies possessing the desired binding characteristics. Such methods are reviewed, e.g., in Hoogenboom et al. in Methods in Molecular Biology 178:1-37 (O’Brien et al., ed., Human Press, Totowa, NJ, 2001) and further described, e.g., in the McCafferty et al., Nature 348:552-554; Clackson et al., Nature 352: 624-628 (1991); Marks et al., J. Mol. Biol. 222: 581-597 (1992); Marks and

[0248] In certain phage display methods, repertoires of VH and VL genes are separately cloned by polymerase chain reaction (PCR) and recombined randomly in phage libraries, which can then be screened for antigen-binding phage as described in Winter et al., Ann. Rev. Immunol., 12: 433-455 (1994). Phage typically display antibody fragments, either as single-chain Fv (scFv) fragments or as Fab fragments. Libraries from immunized sources provide high-affinity antibodies to the immunogen without the requirement of constructing hybridomas. Alternatively, the naive repertoire can be cloned (e.g., from human) to provide a single source of antibodies to a wide range of non-self and also self antigens without any immunization as described by Griffiths et al., EMBO J. 12: 725-734 (1993). Finally, naive libraries can also be made synthetically by cloning unrearranged V-gene segments from stem cells, and using PCR primers containing random sequence to encode the highly variable CDR3 regions and to accomplish rearrangement in vitro, as described by Hoogenboom and Winter, J. Mol. Biol., 227: 381-388 (1992). Patent publications describing human antibody phage libraries include, for example: US Patent No. 5,750,373, and US Patent Publication Nos. 2005/0079574, 2005/01 19455, 2005/0266000, 2007/01 17126, 2007/0160598, 2007/0237764, 2007/0292936, and 2009/0002360.

[0249] Antibodies or antibody fragments isolated from human antibody libraries are considered human antibodies or human antibody fragments herein.

6. MULTISPECIFIC ANTIBODIES

[0250] In certain embodiments, an antibody provided herein is a multispecific antibody, e.g. a bispecific antibody. Multispecific antibodies are monoclonal antibodies that have binding specificities for at least two different sites. In certain embodiments, one of the binding specificities is for Axl and the other is for any other antigen. In certain embodiments, bispecific antibodies may bind to two different epitopes of Axl. Bispecific antibodies may also be used to localize cytotoxic agents to cells which express Axl. Bispecific antibodies can be prepared as full length antibodies or antibody fragments.

[0251] Techniques for making multispecific antibodies include, but are not limited to, recombinant co-expression of two immunoglobulin heavy chain-light chain pairs having different specificities (see Milstein and Cuello, Nature 305: 537 (1983)), WO 93/08829, and Traunecker et al., EMBO J. 10: 3655 (1991)), and "knob-in-hole" engineering (see, e.g., U.S. Patent No. 5,731,168). Multi-specific antibodies may also be made by engineering electrostatic steering

[0252] Engineered antibodies with three or more functional antigen binding sites, including "Octopus antibodies," are also included herein (see, e.g. US 2006/0025576A1).

[0253] The antibody or fragment herein also includes a "Dual Acting FAb" or "DAF" comprising an antigen binding site that binds to Axl as well as another, different antigen (see, US 2008/0069820, for example).

7. Antibody Variants

[0254] In certain embodiments, amino acid sequence variants of the antibodies provided herein are contemplated. For example, it may be desirable to improve the binding affinity and/or other biological properties of the antibody. Amino acid sequence variants of an antibody may be prepared by introducing appropriate modifications into the nucleotide sequence encoding the antibody, or by peptide synthesis. Such modifications include, for example, deletions from, and/or insertions into and/or substitutions of residues within the amino acid sequences of the antibody. Any combination of deletion, insertion, and substitution can be made to arrive at the final construct, provided that the final construct possesses the desired characteristics, e.g., antigen-binding.

a) Substitution, Insertion, and Deletion Variants

[0255] In certain embodiments, antibody variants having one or more amino acid substitutions are provided. Sites of interest for substitutional mutagenesis include the HVRs and FRs. Conservative substitutions are shown in Table 1 under the heading of "conservative substitutions." More substantial changes are provided in Table 1 under the heading of "exemplary substitutions," and as further described below in reference to amino acid side chain classes. Amino acid substitutions may be introduced into an antibody of interest and the products screened for a desired activity, e.g., retained/improved antigen binding, decreased immunogenicity, or improved ADCC or CDC.

</table>

Amino acids may be grouped according to common side-chain properties:

1. hydrophobic: Norleucine, Met, Ala, Val, Leu, Ile;
2. neutral hydrophilic: Cys, Ser, Thr, Asn, Gin;
3. acidic: Asp, Glu;
4. basic: His, Lys, Arg;
5. residues that influence chain orientation: Gly, Pro;
6. aromatic: Trp, Tyr, Phe.

Non-conservative substitutions will entail exchanging a member of one of these classes for another class.
One type of substitutional variant involves substituting one or more hypervariable region residues of a parent antibody (e.g. a humanized or human antibody). Generally, the resulting variant(s) selected for further study will have modifications (e.g., improvements) in certain biological properties (e.g., increased affinity, reduced immunogenicity) relative to the parent antibody and/or will have substantially retained certain biological properties of the parent antibody. An exemplary substitutional variant is an affinity matured antibody, which may be conveniently generated, e.g., using phage display-based affinity maturation techniques such as those described herein. Briefly, one or more HVR residues are mutated and the variant antibodies displayed on phage and screened for a particular biological activity (e.g. binding affinity).

Alterations (e.g., substitutions) maybe made in HVRs, e.g., to improve antibody affinity. Such alterations may be made in HVR "hotspots," i.e., residues encoded by codons that undergo mutation at high frequency during the somatic maturation process (see, e.g., Chowdhury, Methods Mol. Biol. 207:179-196 (2008)), and/or SDRs (a-CDRs), with the resulting variant VH or VL being tested for binding affinity. Affinity maturation by constructing and reselecting from secondary libraries has been described, e.g., in Hoogenboom et al. in Methods in Molecular Biology 178:1-37 (O'Brien et al., ed., Human Press, Totowa, NJ, (2001.). In some embodiments of affinity maturation, diversity is introduced into the variable genes chosen for maturation by any of a variety of methods (e.g., error-prone PCR, chain shuffling, or oligonucleotide-directed mutagenesis). A secondary library is then created. The library is then screened to identify any antibody variants with the desired affinity. Another method to introduce diversity involves HVR-directed approaches, in which several HVR residues (e.g., 4-6 residues at a time) are randomized. HVR residues involved in antigen binding maybe specifically identified, e.g., using alanine scanning mutagenesis or modeling. CDR-H3 and CDR-L3 in particular are often targeted.

In certain embodiments, substitutions, insertions, or deletions may occur within one or more HVRs so long as such alterations do not substantially reduce the ability of the antibody to bind antigen. For example, conservative alterations (e.g., conservative substitutions as provided herein) that do not substantially reduce binding affinity may be made in HVRs. Such alterations maybe outside of HVR "hotspots" or SDRs. In certain embodiments of the variant VH and VL sequences provided above, each HVR either is unaltered, or contains no more than one, two or three amino acid substitutions.

A useful method for identification of residues or regions of an antibody that may be targeted for mutagenesis is called "alanine scanning mutagenesis" as described by Cunningham and Wells (1989) Science, 244: 1081-1085. In this method, a residue or group of target residues (e.g., charged residues such as arg, asp, his, lys, and glu) are identified and replaced by a neutral
or negatively charged amino acid (e.g., alanine or polyalanine) to determine whether the interaction of the antibody with antigen is affected. Further substitutions may be introduced at the amino acid locations demonstrating functional sensitivity to the initial substitutions. Alternatively, or additionally, a crystal structure of an antigen-antibody complex to identify contact points between the antibody and antigen. Such contact residues and neighboring residues may be targeted or eliminated as candidates for substitution. Variants may be screened to determine whether they contain the desired properties.

[0262] Amino acid sequence insertions include amino- and/or carboxyl-terminal fusions ranging in length from one residue to polypeptides containing a hundred or more residues, as well as intrasequence insertions of single or multiple amino acid residues. Examples of terminal insertions include an antibody with an N-terminal methionyl residue. Other insertional variants of the antibody molecule include the fusion to the N- or C-terminus of the antibody to an enzyme (e.g. for ADEPT) or a polypeptide which increases the serum half-life of the antibody.

b) Glycosylation variants

[0263] In certain embodiments, an antibody provided herein is altered to increase or decrease the extent to which the antibody is glycosylated. Addition or deletion of glycosylation sites to an antibody may be conveniently accomplished by altering the amino acid sequence such that one or more glycosylation sites is created or removed.

[0264] Where the antibody comprises an Fc region, the carbohydrate attached thereto may be altered. Native antibodies produced by mammalian cells typically comprise a branched, biantennary oligosaccharide that is generally attached by anN-linkage to Asn297 of the CH2 domain of the Fc region. See, e.g., Wright et al. TIBTECH 15:26-32 (1997). The oligosaccharide may include various carbohydrates, e.g., mannose, N-acetyl glucosamine (GlcNAc), galactose, and sialic acid, as well as a fucose attached to a GlcNAc in the "stem" of the biantennary oligosaccharide structure. In some embodiments, modifications of the oligosaccharide in an antibody of the invention may be made in order to create antibody variants with certain improved properties.

[0265] In one embodiment, antibody variants are provided having a carbohydrate structure that lacks fucose attached (directly or indirectly) to an Fc region. For example, the amount of fucose in such antibody may be from 1% to 80%, from 1% to 65%, from 5% to 65%, or from 20% to 40%. The amount of fucose is determined by calculating the average amount of fucose within the sugar chain at Asn297, relative to the sum of all glycostructures attached to Asn 297 (e.g., complex, hybrid and high mannose structures) as measured by MALDI-TOF mass spectrometry, as described in WO 2008/077546, for example. Asn297 refers to the asparagine residue located at

[0266] Antibodies variants are further provided with bisected oligosaccharides, e.g., in which a biantennary oligosaccharide attached to the Fc region of the antibody is bisected by GlcNAc. Such antibody variants may have reduced fucosylation and/or improved ADCC function. Examples of such antibody variants are described, e.g., in WO 2003/01 1878 (Jean-Mairet et al.); US Patent No. 6,602,684 (Umana et al.); and US 2005/0123546 (Umana et al.). Antibody variants with at least one galactose residue in the oligosaccharide attached to the Fc region are also provided. Such antibody variants may have improved CDC function. Such antibody variants are described, e.g., in WO 1997/30087 (Patel et al.); WO 1998/58964 (Raju, S.); and WO 1999/22764 (Raju, S.).

c) Fc region variants

[0267] In certain embodiments, one or more amino acid modifications may be introduced into the Fc region of an antibody provided herein, thereby generating an Fc region variant. The Fc region variant may comprise a human Fc region sequence (e.g., a human IgGl, IgG2, IgG3 or IgG4 Fc region) comprising an amino acid modification (e.g. a substitution) at one or more amino acid positions.

[0268] In certain embodiments, the invention contemplates an antibody variant that possesses some but not all effector functions, which make it a desirable candidate for applications in which the half life of the antibody in vivo is important yet certain effector functions (such as
complement and ADCC) are unnecessary or deleterious. In vitro and/or in vivo cytotoxicity assays can be conducted to confirm the reduction/depletion of CDC and/or ADCC activities. For example, Fc receptor (FcR) binding assays can be conducted to ensure that the antibody lacks FcγR binding (hence lacking ADCC activity), but retains FcγRn binding ability. The primary cells for mediating ADCC, NK cells, express FcγRII only, whereas monocytes express FcγRI, FcγRII and FcγRIII. FcγR expression on hematopoietic cells is summarized in Table 3 on page 464 of Ravetch and Kinet, Annu. Rev. Immunol. 9:457-492 (1991). Non-limiting examples of in vitro assays to assess ADCC activity of a molecule of interest is described in U.S. Patent No. 5,500,356 (see, e.g. Hellstrom, I. et al. Proc. Nat'l Acad. Sci. USA 83:7059-7063 (1986)) and Hellstrom, I et al., Proc. Nat'l Acad. Sci. USA 82:1499-1502 (1985); 5,821,337 (see Bruggemann, M. et al., J. Exp. Med. 166:1351-1361 (1987)). Alternatively, non-radioactive assays methods may be employed (see, for example, ACTI™ non-radioactive cytotoxicity assay for flow cytometry (CellTechnology, Inc. Mountain View, CA; and CytoTox 96™ non-radioactive cytotoxicity assay (Promega, Madison, WI). Useful effector cells for such assays include peripheral blood mononuclear cells (PBMC) and Natural Killer (NK) cells. Alternatively, or additionally, ADCC activity of the molecule of interest may be assessed in vivo, e.g., in a animal model such as that disclosed in Clynes et al. Proc. Nat'l Acad. Sci. USA 95:652-656 (1998). Clq binding assays may also be carried out to confirm that the antibody is unable to bind Clq and hence lacks CDC activity. See, e.g., Clq and C3c binding ELISA in WO 2006/029879 and WO 2005/100402. To assess complement activation, a CDC assay may be performed (see, for example, Gazzano-Santoro et al., J. Immunol. Methods 202:163 (1996); Cragg, M.S. et al., Blood 101:1045-1052 (2003); and Cragg, M.S. and M.J. Glennie, Blood 103:2738-2743 (2004)). FcγRn binding and in vivo clearance/half life determinations can also be performed using methods known in the art (see, e.g., Petkova, S.B. et al., Int'l. Immunol. 18(12): 1759-1769 (2006)).

[0269] Antibodies with reduced effector function include those with substitution of one or more of Fc region residues 238, 265, 269, 270, 297, 327 and 329 (U.S. Patent No. 6,737,056). Such Fc mutants include Fc mutants with substitutions at two or more of amino acid positions 265, 269, 270, 297 and 327, including the so-called "DANA" Fc mutant with substitution of residues 265 and 297 to alanine (US Patent No. 7,332,581).

[0270] Certain antibody variants with improved or diminished binding to FcRs are described. (See, e.g., U.S. Patent No. 6,737,056; WO 2004/056312, and Shields et al., J. Biol. Chem. 9(2): 6591-6604 (2001).)
[0271] In certain embodiments, an antibody variant comprises an Fc region with one or more amino acid substitutions which improve ADCC, e.g., substitutions at positions 298, 333, and/or 334 of the Fc region (EU numbering of residues).

[0272] In some embodiments, alterations are made in the Fc region that result in altered (i.e., either improved or diminished) Clq binding and/or Complement Dependent Cytotoxicity (CDC), e.g., as described in US Patent No. 6,194,551,WO 99/51642, and Iduisogic et al. J. Immunol. 164: 4178-4184 (2000).

[0273] Antibodies with increased half lives and improved binding to the neonatal Fc receptor (FcRn), which is responsible for the transfer of maternal IgGs to the fetus (Guyer et al., J. Immunol. 117:587 (1976) and Kim et al., J. Immunol. 24:249 (1994)), are described in US2005/0014934A1 (Hinton et al.). Those antibodies comprise an Fc region with one or more substitutions therein which improve binding of the Fc region to FcRn. Such Fc variants include those with substitutions at one or more of Fc region residues: 238, 256, 265, 272, 286, 303, 305, 307, 311, 312, 317, 340, 356, 360, 362, 376, 378, 380, 382, 413, 424 or 434, e.g., substitution of Fc region residue 434 (US Patent No. 7,371,826).

d) Cysteine engineered antibody variants

[0275] In certain embodiments, it may be desirable to create cysteine engineered antibodies, e.g., "thioMAbs," in which one or more residues of an antibody are substituted with cysteine residues. In particular embodiments, the substituted residues occur at accessible sites of the antibody. By substituting those residues with cysteine, reactive thiol groups are thereby positioned at accessible sites of the antibody and may be used to conjugate the antibody to other moieties, such as drug moieties or linker-drug moieties, to create an immunoconjugate, as described further herein. In certain embodiments, any one or more of the following residues may be substituted with cysteine: V205 (Kabat numbering) of the light chain; A118 (EU numbering) of the heavy chain; and S400 (EU numbering) of the heavy chain Fc region. Cysteine engineered antibodies may be generated as described, e.g., in U.S. Patent No. 7,521,541.

e) Antibody Derivatives

[0276] In certain embodiments, an antibody provided herein may be further modified to contain additional nonproteinaceous moieties that are known in the art and readily available. The moieties suitable for derivatization of the antibody include but are not limited to water soluble polymers. Non-limiting examples of water soluble polymers include, but are not limited to, polyethylene glycol (PEG), copolymers of ethylene glycol/propylene glycol,
carboxymethylcellulose, dextran, polyvinyl alcohol, polyvinyl pyrrolidone, poly-1, 3-dioxolane, poly-1,3,6-trioxane, ethylene/maleic anhydride copolymer, polyaminoacids (either homopolymers or random copolymers), and dextran or poly(n-vinyl pyrrolidone)polyethylene glycol, propylene glycol homopolymers, polypropylene oxide/ethylene oxide co-polymers, polyoxyethylated polyols (e.g., glycerol), polyvinyl alcohol, and mixtures thereof. Polyethylene glycol propionaldehyde may have advantages in manufacturing due to its stability in water. The polymer may be of any molecular weight, and may be branched or unbranched. The number of polymers attached to the antibody may vary, and if more than one polymer are attached, they can be the same or different molecules. In general, the number and/or type of polymers used for derivatization can be determined based on considerations including, but not limited to, the particular properties or functions of the antibody to be improved, whether the antibody derivative will be used in a therapy under defined conditions, etc.

[0277] In another embodiment, conjugates of an antibody and nonproteinaceous moiety that may be selectively heated by exposure to radiation are provided. In one embodiment, the nonproteinaceous moiety is a carbon nanotube (Kam et al., Proc. Natl. Acad. Sci. USA 102:11600-1 1605 (2005)). The radiation may be of any wavelength, and includes, but is not limited to, wavelengths that do not harm ordinary cells, but which heat the nonproteinaceous moiety to a temperature at which cells proximal to the antibody-nonproteinaceous moiety are killed.

B. Recombinant Methods and Compositions

[0278] Antibodies may be produced using recombinant methods and compositions, e.g., as described in U.S. Patent No. 4,816,567. In one embodiment, isolated nucleic acid encoding an anti-Axl antibody described herein is provided. Such nucleic acid may encode an amino acid sequence comprising the VL and/or an amino acid sequence comprising the VH of the antibody (e.g., the light and/or heavy chains of the antibody). In a further embodiment, one or more vectors (e.g., expression vectors) comprising such nucleic acid are provided. In a further embodiment, a host cell comprising such nucleic acid is provided. In one such embodiment, a host cell comprises (e.g., has been transformed with): (1) a vector comprising a nucleic acid that encodes an amino acid sequence comprising the VL of the antibody and an amino acid sequence comprising the VH of the antibody, or (2) a first vector comprising a nucleic acid that encodes an amino acid sequence comprising the VL of the antibody and a second vector comprising a nucleic acid that encodes an amino acid sequence comprising the VH of the antibody. In one embodiment, the host cell is eukaryotic, e.g. a Chinese Hamster Ovary (CHO) cell or lymphoid cell (e.g., Y0, NS0, Sp20 cell). In one embodiment, a method of making an anti-Axl antibody is provided, wherein the method comprises culturing a host cell comprising a nucleic acid encoding
the antibody, as provided above, under conditions suitable for expression of the antibody, and optionally recovering the antibody from the host cell (or host cell culture medium).

[0279] For recombinant production of an anti-Axl antibody, nucleic acid encoding an antibody, e.g., as described above, is isolated and inserted into one or more vectors for further cloning and/or expression in a host cell. Such nucleic acid may be readily isolated and sequenced using conventional procedures (e.g., by using oligonucleotide probes that are capable of binding specifically to genes encoding the heavy and light chains of the antibody).

[0280] Suitable host cells for cloning or expression of antibody-encoding vectors include prokaryotic or eukaryotic cells described herein. For example, antibodies may be produced in bacteria, in particular when glycosylation and Fc effector function are not needed. For expression of antibody fragments and polypeptides in bacteria, see, e.g., U.S. Patent Nos. 5,648,237, 5,789,199, and 5,840,523. (See also Charlton, Methods in Molecular Biology, Vol. 248 (B.K.C. Lo, ed., Humana Press, Totowa, NJ, 2003), pp. 245-254, describing expression of antibody fragments in E. coli.) After expression, the antibody may be isolated from the bacterial cell paste in a soluble fraction and can be further purified.

[0281] In addition to prokaryotes, eukaryotic microbes such as filamentous fungi or yeast are suitable cloning or expression hosts for antibody-encoding vectors, including fungi and yeast strains whose glycosylation pathways have been "humanized," resulting in the production of an antibody with a partially or fully human glycosylation pattern. See Gerngross, Nat. Biotech. 22:1409-1414 (2004), and Li et al., Nat. Biotech. 24:210-215 (2006).

[0282] Suitable host cells for the expression of glycosylated antibody are also derived from multicellular organisms (invertebrates and vertebrates). Examples of invertebrate cells include plant and insect cells. Numerous baculoviral strains have been identified which may be used in conjunction with insect cells, particularly for transfection of Spodoptera frugiperda cells.

[0283] Plant cell cultures can also be utilized as hosts. See, e.g., US Patent Nos. 5,959,177, 6,040,498, 6,420,548, 7,125,978, and 6,417,429 (describing PLANTIBODIES™ technology for producing antibodies in transgenic plants).

[0284] Vertebrate cells may also be used as hosts. For example, mammalian cell lines that are adapted to grow in suspension may be useful. Other examples of useful mammalian host cell lines are monkey kidney CV1 line transformed by SV40 (COS-7); human embryonic kidney line (293 or 293 cells as described, e.g., in Graham et al., J. Gen Virol. 36:59 (1977)); baby hamster kidney cells (BHK); mouse Sertoli cells (TM4 cells as described, e.g., in Mather, Biol. Reprod. 23:243-251 (1980)); monkey kidney cells (CV1); African green monkey kidney cells (VERO-76); human cervical carcinoma cells (HELA); canine kidney cells (MDCK; buffalo rat liver cells
(BRL 3A); human lung cells (W138); human liver cells (Hep G2); mouse mammary tumor
(MMT 060562); TRI cells, as described, e.g., in Mather et al., *Annals N.Y. Acad. Sci.* 383:44-68
(1982); MRC 5 cells; and FS4 cells. Other useful mammalian host cell lines include Chinese
hamster ovary (CHO) cells, including DHFR CHO cells (Urlaub et al., *Proc. Natl. Acad. Sci.
USA* 77:4216 (1980)); and myeloma cell lines such as Y0, NS0 and Sp2/0. For a review of
certain mammalian host cell lines suitable for antibody production, see, e.g., Yazaki and Wu,
268 (2003).

C. Assays

[0285] Anti-Axl antibodies provided herein may be identified, screened for, or characterized for
their physical/chemical properties and/or biological activities by various assays known in the art.

1. Binding assays and other assays

[0286] In one aspect, an antibody of the invention is tested for its antigen binding activity, e.g.,
by known methods such as ELISA, Western blot, etc.

[0287] In another aspect, competition assays may be used to identify an antibody that competes
with one or more of antibodies 327.6, 327.6.S2, 327.6.S1 1. 327.6.S50, 327.6.S52, 327.6.S65,
327.42, 327.42.S8, 327.42.S31, 327.42.S13, 327.42.S43, 327.42.S52, 327.42.S63, 327.42.S73,
327.42.H2, 327.42.H4, and/or 327.42.H20 for binding to Axl. In certain embodiments, such a
competing antibody binds to the same epitope (e.g., a linear or a conformational epitope) that is
bound by 327.6, 327.6.S2, 327.6.S1 1. 327.6.S50, 327.6.S52, 327.6.S65, 327.42, 327.42.S8,
327.42.S31, 327.42.S13, 327.42.S43, 327.42.S52, 327.42.S63, 327.42.S73, 327.42.H2,
327.42.H4, and/or 327.42.H20. Detailed exemplary methods for mapping an epitope to which an
antibody binds are provided in Morris (1996) "Epitope Mapping Protocols," in Methods in
Molecular Biology vol. 66 (Humana Press, Totowa, NJ).

[0288] In an exemplary competition assay, immobilized Axl is incubated in a solution
comprising a first labeled antibody that binds to Axl (e.g., 327.6, 327.6.S2, 327.6.S1 1. 327.6.S50,
327.6.S52, 327.6.S65, 327.42, 327.42.S8, 327.42.S31, 327.42.S13, 327.42.S43, 327.42.S52,
327.42.S63, 327.42.S73, 327.42.H2, 327.42.H4, and/or 327.42.H20) and a second unlabeled
antibody that is being tested for its ability to compete with the first antibody for binding to Axl.
The second antibody may be present in a hybridoma supernatant. As a control, immobilized Axl
is incubated in a solution comprising the first labeled antibody but not the second unlabeled
antibody. After incubation under conditions permissive for binding of the first antibody to Axl,
excess unbound antibody is removed, and the amount of label associated with immobilized Axl is
measured. If the amount of label associated with immobilized Axl is substantially reduced in the
test sample relative to the control sample, then that indicates that the second antibody is
competing with the first antibody for binding to Axl. See Harlow and Lane (1988) Antibodies: A

2. Activity assays

[0289] In one aspect, assays are provided for identifying anti-Axl antibodies thereof having
biological activity. Biological activity may include, e.g., inhibition of Gas6 binding to Axl,
inhibition of Axl activation, inhibition of Axl downstream molecular signaling, inhibition of Axl
expression [e.g., Axl cell surface expression or total Axl expression in a cell, such as a tumor
cell], inhibition of inflammatory cytokine secretion, promotion of apoptosis [e.g., by inhibiting
Gas6-mediated inhibition of apoptosis], inhibition of intratumoral vasculature, inhibition of
tumor stromal Axl activity and/or expression and/or inhibition of metastasis. Antibodies having
such biological activity in vivo and/or in vitro are also provided.

[0290] In certain embodiments, an antibody of the invention is tested for such biological activity.
In certain embodiments, an antibody is tested for its ability to promote apoptosis in vitro [e.g.,
apoptosis of a tumor cell]. Exemplary methods for determining cell growth and/or proliferation
and/or apoptosis include, for example, BrdU incorporation assay, MTT, [3H]-thymidine
incorporation [e.g., TopCount assay (PerkinElmer)], cell viability assays [e.g., CellTiter-Glo
(Promega)], DNA fragmentation assays, caspase activation assays, trypan blue exclusion,
chromatin morphology assays and the like.

[0291] In certain embodiments, an antibody is tested for inhibition of Axl expression, e.g., using
methods described and exemplified herein. In one embodiment, anti-Axl antibody is incubated
with suitable test cells, e.g., NSCLC cells A549 and after a suitable period of time, cell lysates
are harvested and examined for total Axl levels. FACS analysis may also be used to examine
surface Axl receptor levels following incubation with candidate anti-Axl antibodies. In one
embodiment, a tumor sample is examined for Axl expression following treatment with anti-Axl
antibody.

[0292] In certain embodiments, an antibody of the invention is tested for its ability to inhibit
inflammatory cytokine section, e.g., as described exemplified herein.

[0293] In certain embodiments, an antibody of the invention is tested for its ability to reduce
intratumoral vasculature and/or inhibit tumor stromal Axl activity and/or expression, e.g., as
exemplified herein. In some embodiments, tumor stromal Axl activity is metastasis or
development of intratumor vasculature.

[0294] In certain embodiments, an antibody of the invention is tested for its ability to inhibit cell
growth or proliferation in vitro. Assays for inhibition of cell growth or proliferation are well
known in the art. Certain assays for cell proliferation, exemplified by the "cell killing" assays described herein, measure cell viability. One such assay is the CellTiter-Glo™ Luminescent Cell Viability Assay, which is commercially available from Promega (Madison, WI). That assay determines the number of viable cells in culture based on quantitation of ATP present, which is an indication of metabolically active cells. See Crouch et al (1993) J. Immunol. Meth. 160:81-88, US Pat. No. 6602677. The assay may be conducted in 96- or 384-well format, making it amenable to automated high-throughput screening (HTS). See Cree et al (1995) Anticancer Drugs 6:398-404. The assay procedure involves adding a single reagent (CellTiter-Glo® Reagent) directly to cultured cells. This results in cell lysis and generation of a luminescent signal produced by a luciferase reaction. The luminescent signal is proportional to the amount of ATP present, which is directly proportional to the number of viable cells present in culture. Data can be recorded by luminometer or CCD camera imaging device. The luminescence output is expressed as relative light units (RLU).

Another assay for cell proliferation is the "MTT" assay, a colorimetric assay that measures the oxidation of 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide to formazan by mitochondrial reductase. Like the CellTiter-Glo™ assay, this assay indicates the number of metabolically active cells present in a cell culture. See, e.g., Mosmann (1983) J. Immunol. Meth. 65:55-63, and Zhang et al. (2005) Cancer Res. 65:3877-3882.

Cells for use in any of the above in vitro assays include cells or cell lines that naturally express Axl or that have been engineered to express Axl. Such cells include tumor cells that overexpress Axl relative to normal cells of the same tissue origin. Such cells also include cell lines (including tumor cell lines) that express Axl and cell lines that do not normally express Axl but have been transfected with nucleic acid encoding Axl. Exemplary cell lines provided herein for use in any of the above in vitro assays include NSCLC cell line A549, NSCLC cell line H1299, and breast cancer cell line MDA-MB231.

In one aspect, an anti-Axl antibody thereof is tested for its ability to inhibit cell growth or proliferation in vivo. In certain embodiments, an anti-Axl antibody thereof is tested for its ability to inhibit tumor growth in vivo. In vivo model systems, such as xenograft models, can be used for such testing. In an exemplary xenograft system, human tumor cells are introduced into a suitably immunocompromised non-human animal, e.g., an athymic "nude" mouse. An antibody of the invention is administered to the animal. The ability of the antibody to inhibit or decrease tumor growth is measured. In certain embodiments of the above xenograft system, the human tumor cells are tumor cells from a human patient. Such xenograft models are commercially available from OncoTest GmbH (Frieberg, Germany). In certain embodiments, the human tumor cells are
cells from a human tumor cell line, such as MDA-MB-231 breast cancer cells or A549 non-small cell lung cancer cells. In certain embodiments, the human tumor cells are introduced into a suitably immunocompromised non-human animal by subcutaneous injection or by transplantation into a suitable site, such as a mammary fat pad.

[0298] It is understood that any of the above assays may be carried out using an immunoconjugate of the invention in place of or in addition to an anti-Axl antibody.

[0299] It is understood that any of the above assays may be carried out using anti-Axl antibody and an additional therapeutic agent, such as a VEGF antagonist and/or an EGFR antagonist and/or a chemotherapeutic agent.

D. Immunoconjugates

[0300] The invention also provides immunoconjugates comprising an anti-Axl antibody herein conjugated to one or more cytotoxic agents, such as chemotherapeutic agents or drugs, growth inhibitory agents, toxins (e.g., protein toxins, enzymatically active toxins of bacterial, fungal, plant, or animal origin, or fragments thereof), or radioactive isotopes.

[0301] In one embodiment, an immunoconjugate is an antibody-drug conjugate (ADC) in which an antibody is conjugated to one or more drugs, including but not limited to a maytansinoid (see U.S. Patent Nos. 5,208,020, 5,416,064 and European Patent EP 0 425 235 B1); an auristatin such as monomethylauristatin drug moieties DE and DF (MMAE and MMAF) (see U.S. Patent Nos. 5,635,483 and 5,780,588, and 7,498,298); a dolastatin; a calicheamicin or derivative thereof (see U.S. Patent Nos. 5,712,374, 5,714,586, 5,739,116, 5,767,285, 5,770,701, 5,770,710, 5,773,001, and 5,877,296; Hinman et al., Cancer Res. 53:3336-3342 (1993); and Lode et al., Cancer Res. 58:2925-2928 (1998)); an anthracycline such as daunomycin or doxorubicin (see Kratz et al., Current Med. Chem. 13:477-523 (2006); Jeffrey et al., Bioorganic & Med. Chem. Letters 16:358-362 (2006); Torgov et al., Bioconj. Chem. 16:717-721 (2005); Nagy et al., Proc. Natl. Acad. Sci. USA 97:829-834 (2000); Dubowchik et al., Bioorg. & Med. Chem. Letters 12:1529-1532 (2002); King et al., J. Med. Chem. 45:4336-4343 (2002); and U.S. Patent No. 6,630,579); methotrexate; vindesine; a taxane such as docetaxel, paclitaxel, larataxel, tesetaxel, and ortataxel; a trichothecene; and CC1065.

[0302] In another embodiment, an immunoconjugate comprises an antibody as described herein conjugated to an enzymatically active toxin or fragment thereof, including but not limited to diphtheria A chain, nonbinding active fragments of diphtheria toxin, exotoxin A chain (from Pseudomonas aeruginosa), ricin A chain, abrin A chain, modeccin A chain, alpha-sarcin, Aleurites fordii proteins, dianthin proteins, Phytolaca americana proteins (PAPI, PAPII, and
PAP-S), momordica charantia inhibitor, curcin, crotin, sapaonaria officinalis inhibitor, gelonin, mitogellin, restrictocin, phenomycin, enomycin, and the tricothecenes.

[0303] In another embodiment, an immunoconjugate comprises an antibody as described herein conjugated to a radioactive atom to form a radioconjugate. A variety of radioactive isotopes are available for the production of radioconjugates. Examples include At$^{211}$, I$^{131}$, I$^{125}$, Y$^{90}$, Re$^{186}$, Re$^{188}$, Sm$^{153}$, Bi$^{212}$, P$^{32}$, Pb$^{212}$ and radioactive isotopes of Lu. When the radioconjugate is used for detection, it may comprise a radioactive atom for scintigraphic studies, for example tc$^{99m}$ or 1123, or a spin label for nuclear magnetic resonance (NMR) imaging (also known as magnetic resonance imaging, MRI), such as iodine-123 again, iodine-131, indium-111, fluorine-19, carbon-13, nitrogen-15, oxygen-17, gadolinium, manganese or iron.

[0304] Conjugates of an antibody and cytotoxic agent may be made using a variety of bifunctional protein coupling agents such as N-succinimidyl-3-(2-pyridyldithio) propionate (SPDP), succinimidyl-4-(N-maleimidomethyl) cyclohexane-1-carboxylate (SMCC), iminolithiolane (IT), bifunctional derivatives of imidoesters (such as dimethyl adipimidate HCl), active esters (such as disuccinimidyl suberate), aldehydes (such as glutaraldehyde), bis-azido compounds (such as bis (p-azidobenzoyl) hexanediamine), bis-diazonium derivatives (such as bis-(p-diazoniumbenzoyl)-ethylenediamine), diisocyanates (such as toluene-2,6-diisocyanate), and bis-active fluorine compounds (such as 1,5-difluoro-2,4-dinitrobenzene). For example, a ricin immunotoxin can be prepared as described in Vitetta et al., Science 238:1098 (1987). Carbon-14-labeled l-isothiocyanatobenzyl-3-methylid ethylene triaminepentaacetic acid (MX-DTPA) is an exemplary chelating agent for conjugation of radionucleotide to the antibody. See WO94/1026. The linker may be a "cleavable linker” facilitating release of a cytotoxic drug in the cell. For example, an acid-labile linker, peptidase-sensitive linker, photolabile linker, dimethyl linker or disulfide-containing linker (Chari et al., Cancer Res. 52:127-131 (1992); U.S. Patent No. 5,208,020) may be used.

[0305] The immunoconjugates or ADCs herein expressly contemplate, but are not limited to such conjugates prepared with cross-linker reagents including, but not limited to, BMPS, EMCS, GMBS, HBVS, LC-SMCC, MBS, MPBH, SBAP, SIA, SIAB, SMCC, SMPB, SMPH, sulfo-EMCS, sulfo-GMBS, sulfo-KMUS, sulfo-MBS, sulfo-SIAB, sulfo-SMCC, and sulfo-SMPB, and SVSB (succinimidyl-(4-vinylsulfone)benzoate) which are commercially available (e.g., from Pierce Biotechnology, Inc., Rockford, IL., U.S.A).

E. Methods and Compositions for Diagnostics and Detection

[0306] In certain embodiments, any of the anti-Axl antibodies provided herein is useful for detecting the presence of Axl in a biological sample. The term "detecting” as used herein
encompasses quantitative or qualitative detection. In certain embodiments, a biological sample comprises a cell or tissue, such as breast, pancreas, esophagus, lung and/or brain.

[0307] In one embodiment, an anti-Axl antibody for use in a method of diagnosis or detection is provided. In a further aspect, a method of detecting the presence of Axl in a biological sample is provided. In certain embodiments, the method comprises contacting the biological sample with an anti-Axl antibody as described herein under conditions permissive for binding of the anti-Axl antibody to Axl, and detecting whether a complex is formed between the anti-Axl antibody and Axl. Such method may be an in vitro or in vivo method. In one embodiment, an anti-Axl antibody is used to select subjects eligible for therapy with an anti-Axl antibody, e.g. where Axl is a biomarker for selection of patients.

[0308] Exemplary disorders that may be diagnosed using an antibody of the invention include cancer (for example, cancer of the breast, lung, pancreas, brain, kidney, ovary, stomach, leukemia, uterine endometrium, colon, prostate, thyroid, liver, osteosarcoma, and/or melanoma).

[0309] In certain embodiments, labeled anti-Axl antibodies are provided. Labels include, but are not limited to, labels or moieties that are detected directly (such as fluorescent, chromophoric, electron-dense, chemiluminescent, and radioactive labels), as well as moieties, such as enzymes or ligands, that are detected indirectly, e.g., through an enzymatic reaction or molecular interaction. Exemplary labels include, but are not limited to, the radioisotopes $^{32}$P, $^{14}$C, $^{125}$I, $^{3}$H, and $^{13}$I, fluorophores such as rare earth chelates or fluorescein and its derivatives, rhodamine and its derivatives, dansyl, umbelliferone, luciferases, e.g., firefly luciferase and bacterial luciferase (U.S. Patent No. 4,737,456), luciferin, 2,3-dihydrophthalazinediones, horseradish peroxidase (HRP), alkaline phosphatase, β-galactosidase, glucoamylase, lysozyme, saccharide oxidases, e.g., glucose oxidase, galactose oxidase, and glucose-6-phosphate dehydrogenase, heterocyclic oxidases such as uricase and xanthine oxidase, coupled with an enzyme that employs hydrogen peroxide to oxidize a dye precursor such as HRP, lactoperoxidase, or microperoxidase, biotin/avidin, spin labels, bacteriophage labels, stable free radicals, and the like.

F. Pharmaceutical Formulations

[0310] Pharmaceutical formulations of an anti-Axl antibody as described herein are prepared by mixing such antibody having the desired degree of purity with one or more optional pharmaceutically acceptable carriers (Remington's Pharmaceutical Sciences 16th edition, Osol, A. Ed. (1980)), in the form of lyophilized formulations or aqueous solutions. Pharmaceutically acceptable carriers are generally nontoxic to recipients at the dosages and concentrations employed, and include, but are not limited to: buffers such as phosphate, citrate, and other organic acids; antioxidants including ascorbic acid and methionine; preservatives (such as...
octadecyldimethylbenzyl ammonium chloride; hexamethonium chloride; benzalkonium chloride; benzethonium chloride; phenol, butyl or benzyl alcohol; alkyl parabens such as methyl or propyl paraben; catechol; resorcinol; cyclohexanol; 3-pentanol; and m-cresol); low molecular weight (less than about 10 residues) polypeptides; proteins, such as serum albumin, gelatin, or immunoglobulins; hydrophilic polymers such as polyvinylpyrrolidone; amino acids such as glycine, glutamine, asparagine, histidine, arginine, or lysine; monosaccharides, disaccharides, and other carbohydrates including glucose, mannose, or dextrins; chelating agents such as EDTA; sugars such as sucrose, mannitol, trehalose or sorbitol; salt-forming counter-ions such as sodium; metal complexes (e.g. Zn-protein complexes); and/or non-ionic surfactants such as polyethylene glycol (PEG). Exemplary pharmaceutically acceptable carriers herein further include interstitial drug dispersion agents such as soluble neutral-active hyaluronidase glycoproteins (sHASEGP), for example, human soluble PH-20 hyaluronidase glycoproteins, such as rHuPH20 (HYLENE®, Baxter International, Inc.). Certain exemplary sHASEGPs and methods of use, including rHuPH20, are described in US Patent Publication Nos. 2005/0260186 and 2006/0104968. In one aspect, a sHASEGP is combined with one or more additional glycosaminoglycanases such as chondroitinases.

[0311] Exemplary lyophilized antibody formulations are described in US Patent No. 6,267,958. Aqueous antibody formulations include those described in US Patent No. 6,171,586 and WO2006/044908, the latter formulations including a histidine-acetate buffer.

[0312] The formulation herein may also contain more than one active ingredients as necessary for the particular indication being treated, preferably those with complementary activities that do not adversely affect each other. For example, it may be desirable to further provide an EGFR antagonist (such as erlotinib), an anti-angiogenic agent (such as VEGF antagonist, such as an anti-VEGF antibody) or a chemotherapeutic agent (such as a taxoid or a platinum agent). Such active ingredients are suitably present in combination in amounts that are effective for the purpose intended.

[0313] Active ingredients may be entrapped in microcapsules prepared, for example, by coacervation techniques or by interfacial polymerization, for example, hydroxymethylcellulose or gelatin-microcapsules and poly-(methylmethacrylate) microcapsules, respectively, in colloidal drug delivery systems (for example, liposomes, albumin microspheres, microemulsions, nanoparticles and nanocapsules) or in macroemulsions. Such techniques are disclosed in Remington's Pharmaceutical Sciences 16th edition, Osol, A. Ed. (1980).
Sustained-release preparations may be prepared. Suitable examples of sustained-release preparations include semipermeable matrices of solid hydrophobic polymers containing the antibody, which matrices are in the form of shaped articles, e.g. films, or microcapsules.

The formulations to be used for in vivo administration are generally sterile. Sterility may be readily accomplished, e.g., by filtration through sterile filtration membranes.

G. Therapeutic Methods and Compositions

Any of the anti-Axl antibodies provided herein may be used in therapeutic methods.

In one aspect, an anti-Axl antibody for use as a medicament is provided. In further aspects, an anti-Axl antibody for use in treating cancer (e.g., breast cancer, non-small cell lung cancer, pancreatic cancer, brain cancer, cancer of pancreas, brain, kidney, ovary, stomach, leukemia, uterine endometrium, colon, prostate, thyroid, liver, osteosarcoma, and/or melanoma) is provided. In certain embodiments, an anti-Axl antibody for use in a method of treatment is provided. In certain embodiments, the invention provides an anti-Axl antibody for use in a method of treating an individual having cancer comprising administering to the individual an effective amount of the anti-Axl antibody. In certain embodiments, the invention provides an anti-Axl antibody for use in a method of treating an individual having an immune disorder (e.g., an autoimmune disorder), a cardiovascular disorder (e.g., atherosclerosis, hypertension, thrombosis), an infectious disease (e.g., Ebola virus, Marburg virus) or diabetes, comprising administering to the individual an effective amount of the anti-Axl antibody. In one such embodiment, the method further comprises administering to the individual an effective amount of at least one additional therapeutic agent, e.g., as described below. In further embodiments, the invention provides an anti-Axl antibody for use in inhibiting angiogenesis, inhibiting cell proliferation, inhibiting immune function, inhibiting inflammatory cytokine secretion (e.g., from tumor-associated macrophages), inhibiting tumor vasculature (e.g., intratumoral vasculature or tumor-associated vasculature), and/or inhibiting tumor stromal function.

In certain embodiments, the invention provides an anti-Axl antibody for use in a method of inhibiting angiogenesis, inhibiting cell proliferation, inhibiting immune function, inhibiting inflammatory cytokine secretion (e.g., from tumor-associated macrophages), inhibiting tumor vasculature (e.g., intratumoral vasculature or tumor-associated vasculature), and/or inhibiting tumor stromal function in an individual comprising administering to the individual an effective of the anti-Axl antibody to inhibit angiogenesis, inhibit cell proliferation, inhibit immune function, inhibit inflammatory cytokine secretion (e.g., from tumor-associated macrophages), inhibit tumor vasculature development (e.g., intratumoral vasculature or tumor-associated vasculature), and/or...
inhibit tumor stromal function. An "individual" according to any of the above embodiments is preferably a human.

[0319] In a further aspect, the invention provides for the use of an anti-Axl antibody in the manufacture or preparation of a medicament. In one embodiment, the medicament is for treatment of cancer (in some embodiments, breast cancer, non-small cell lung cancer, pancreatic cancer, brain cancer, cancer of the pancreas, brain, kidney, ovary, stomach, leukemia, uterine endometrium, colon, prostate, thyroid, liver, osteosarcoma, and/or melanoma). In a further embodiment, the medicament is for use in a method of treating cancer comprising administering to an individual having cancer an effective amount of the medicament. In a further embodiment, the medicament is for use in a method of treating an immune disorder (e.g., an autoimmune disorder), a cardiovascular disorder (e.g., atherosclerosis, hypertension, thrombosis), an infectious disease (e.g., Ebola virus, Marburg virus) or diabetes, comprising administering to the individual an effective amount of the anti-Axl antibody. In one such embodiment, the method further comprises administering to the individual an effective amount of at least one additional therapeutic agent, e.g., as described below. In a further embodiment, the medicament is for inhibiting angiogenesis, inhibiting cell proliferation, inhibiting immune function, inhibiting inflammatory cytokine secretion (e.g., from tumor-associated macrophages), inhibiting tumor vasculature (e.g., intratumoral vasculature or tumor-associated vasculature), and/or inhibiting tumor stromal function. In a further embodiment, the medicament is for use in a method of inhibiting angiogenesis, inhibiting cell proliferation, inhibiting immune function, inhibiting inflammatory cytokine secretion (e.g., from tumor-associated macrophages), inhibiting tumor vasculature (e.g., intratumoral vasculature or tumor-associated vasculature), and/or inhibiting tumor stromal function in an individual comprising administering to the individual an amount effective of the medicament to inhibit angiogenesis, inhibit cell proliferation, promote immune function, induce inflammatory cytokine secretion (e.g., from tumor-associated macrophages), inhibit tumor vasculature development (e.g., intratumoral vasculature or tumor-associated vasculature), and/or inhibit tumor stromal function. An "individual" according to any of the above embodiments may be a human.

[0320] In a further aspect, the invention provides a method for treating a cancer. In one embodiment, the method comprises administering to an individual having such cancer an effective amount of an anti-Axl antibody. In one such embodiment, the method further comprises administering to the individual an effective amount of at least one additional therapeutic agent, as described below. An "individual" according to any of the above embodiments may be a human.
In a further aspect, the invention provides a method for treating an immune disorder (e.g., an autoimmune disorder), a cardiovascular disorder (e.g., atherosclerosis, hypertension, thrombosis), an infectious disease (e.g., Ebola virus, Marburg virus) or diabetes. In one such embodiment, the method further comprises administering to the individual an effective amount of at least one additional therapeutic agent, as described below. An "individual" according to any of the above embodiments may be a human.

In a further aspect, the invention provides a method for inhibiting angiogenesis, inhibiting cell proliferation, inhibiting immune function, inhibiting inflammatory cytokine secretion (e.g., from tumor-associated macrophages), inhibiting tumor vasculature (e.g., intratumoral vasculature or tumor-associated vasculature), and/or inhibiting tumor stromal function in an individual. In one embodiment, the method comprises administering to the individual an effective amount of an anti-Axl antibody to inhibit angiogenesis, inhibit cell proliferation, promote immune function, induce inflammatory cytokine secretion (e.g., from tumor-associated macrophages), inhibit tumor vasculature development (e.g., intratumoral vasculature or tumor-associated vasculature), and/or inhibit tumor stromal function. In one embodiment, an "individual" is a human.

In a further aspect, the invention provides pharmaceutical formulations comprising any of the anti-Axl antibodies provided herein, e.g., for use in any of the above therapeutic methods. In one embodiment, a pharmaceutical formulation comprises any of the anti-Axl antibodies provided herein and a pharmaceutically acceptable carrier. In another embodiment, a pharmaceutical formulation comprises any of the anti-Axl antibodies provided herein and at least one additional therapeutic agent, e.g., as described below.

Antibodies of the invention can be used either alone or in combination with other agents in a therapy. For instance, an antibody of the invention may be co-administered with at least one additional therapeutic agent. In certain embodiments, an additional therapeutic agent is an anti-angiogenic agent. In certain embodiments, an additional therapeutic agent is a VEGF antagonist (in some embodiments, an anti-VEGF antibody, for example bevacizumab). In certain embodiments, an additional therapeutic agent is an EGFR antagonist (in some embodiment, erlotinib). In certain embodiments, an additional therapeutic agent is a chemotherapeutic agent and/or a cytostatic agent. In certain embodiments, an additional therapeutic agent is a taxoid (e.g., paclitaxel) and/or a platinum agent (e.g., carboplatinum).

Such combination therapies noted above encompass combined administration (where two or more therapeutic agents are included in the same or separate formulations), and separate administration, in which case, administration of the antibody of the invention can occur prior to,
simultaneously, and/or following, administration of the additional therapeutic agent and/or adjuvant. Antibodies of the invention can also be used in combination with radiation therapy. [0326] An antibody of the invention (and any additional therapeutic agent) can be administered by any suitable means, including parenteral, intrapulmonary, and intranasal, and, if desired for local treatment, intralesional administration. Parenteral infusions include intramuscular, intravenous, intraarterial, intraperitoneal, or subcutaneous administration. Dosing can be by any suitable route, e.g. by injections, such as intravenous or subcutaneous injections, depending in part on whether the administration is brief or chronic. Various dosing schedules including but not limited to single or multiple administrations over various time-points, bolus administration, and pulse infusion are contemplated herein.

[0327] Antibodies of the invention would be formulated, dosed, and administered in a fashion consistent with good medical practice. Factors for consideration in this context include the particular disorder being treated, the particular mammal being treated, the clinical condition of the individual patient, the cause of the disorder, the site of delivery of the agent, the method of administration, the scheduling of administration, and other factors known to medical practitioners. The antibody need not be, but is optionally formulated with one or more agents currently used to prevent or treat the disorder in question. The effective amount of such other agents depends on the amount of antibody present in the formulation, the type of disorder or treatment, and other factors discussed above. These are generally used in the same dosages and with administration routes as described herein, or about from 1 to 99% of the dosages described herein, or in any dosage and by any route that is empirically/clinically determined to be appropriate.

[0328] For the prevention or treatment of disease, the appropriate dosage of an antibody of the invention (when used alone or in combination with one or more other additional therapeutic agents) will depend on the type of disease to be treated, the type of antibody, the severity and course of the disease, whether the antibody is administered for preventive or therapeutic purposes, previous therapy, the patient's clinical history and response to the antibody, and the discretion of the attending physician. The antibody is suitably administered to the patient at one time or over a series of treatments. Depending on the type and severity of the disease, about 1 µg/kg to 40 mg/kg of antibody can be an initial candidate dosage for administration to the patient, whether, for example, by one or more separate administrations, or by continuous infusion. One typical daily dosage might range from about 1 µg/kg to 100 mg/kg or more, depending on the factors mentioned above. For repeated administrations over several days or longer, depending on the condition, the treatment would generally be sustained until a desired
suppression of disease symptoms occurs. Such doses may be administered intermittently, e.g. every week or every three weeks (e.g. such that the patient receives from about two to about twenty, or e.g. about six doses of the antibody). An initial higher loading dose, followed by one or more lower doses may be administered. However, other dosage regimens may be useful. The progress of this therapy is easily monitored by conventional techniques and assays.

[0329] It is understood that any of the above formulations or therapeutic methods may be carried out using an immunoconjugate of the invention in place of or in addition to an anti-Axl antibody.

H. Articles of Manufacture

[0330] In another aspect of the invention, an article of manufacture containing materials useful for the treatment, prevention and/or diagnosis of the disorders described above is provided. The article of manufacture comprises a container and a label or package insert on or associated with the container. Suitable containers include, for example, bottles, vials, syringes, IV solution bags, etc. The containers may be formed from a variety of materials such as glass or plastic. The container holds a composition which is by itself or combined with another composition effective for treating, preventing and/or diagnosing the condition and may have a sterile access port (for example the container may be an intravenous solution bag or a vial having a stopper pierceable by a hypodermic injection needle). At least one active agent in the composition is an antibody of the invention. The label or package insert indicates that the composition is used for treating the condition of choice. Moreover, the article of manufacture may comprise (a) a first container with a composition contained therein, wherein the composition comprises an antibody of the invention; and (b) a second container with a composition contained therein, wherein the composition comprises a further cytotoxic or otherwise therapeutic agent. The article of manufacture in this embodiment of the invention may further comprise a package insert indicating that the compositions can be used to treat a particular condition. Alternatively, or additionally, the article of manufacture may further comprise a second (or third) container comprising a pharmaceutically-acceptable buffer, such as bacteriostatic water for injection (BWFI), phosphate-buffered saline, Ringer's solution and dextrose solution. It may further include other materials desirable from a commercial and user standpoint, including other buffers, diluents, filters, needles, and syringes.

[0331] It is understood that any of the above articles of manufacture may include an immunoconjugate of the invention in place of or in addition to an anti-Axl antibody.
III. EXAMPLES
Materials and Methods

[0332] Antibodies and cell lines. Antibodies were obtained from the following suppliers: Mouse monoclonal antibody (mAb) against human Axl (Abnova, Taiwan), phospho-Akt mouse mAb and Akt polyclonal antibody (Cell Signaling). Mouse recombinant Gas6 and ELISA kit for phospho-Axl were purchased from R&D System. Human carcinoma cell lines were obtained from ATCC, and cultured in PRMI1640 medium supplemented with 10% FBS. Hybridoma anti-human Axl monoclonal antibodies 12A1 1 and 3G9 were provided by Genentech (see Li (2009)).

[0333] Generation of phage anti-Axl monoclonal antibodies. For antibody generation, human phage antibody libraries with synthetic diversities in the selected complementary determining regions (HI, H2, H3), mimicking the natural diversity of human IgG repertoire were used for panning. Fab fragments were displayed bivalently on the surface of M13 bacteriophage particles (Lee et al, 2004). The phage antibody libraries were panned against human and murine Axl ECD in alternative rounds. Phage antibodies that bound to human Axl ECD-His and murine Axl ECD-Fc fusion protein were identified by ELISA and DNA sequencing, and antibody clones were reformatted to express full-length IgGs (Liang et al, 2007). Individual clones were transiently expressed in mammalian cells and purified with protein A columns (Carter et al, 1992).

[0334] Phage clones were screened for their ability to inhibit Gas6-dependent proliferation of Baf3-Axl cells. Two clones that exhibited highest potency in inhibition of Baf3Axl cell proliferation were chosen for affinity maturation.

[0335] For affinity maturation, phagemid displaying monovalent Fab on the surface of M13 bacteriophage (Liang et al, 2007) served as the library template for grafting light chain (VL) and heavy chain (VH) variable domains of the phage Ab. A soft randomization strategy was adopted for affinity maturation as described (Liang et al, 2007), and a high-throughput single-point competitive phage ELISA was used to rapidly screen for high-affinity clones as described (Sidhu et al, 2004).

[0336] Affinity Measurement of anti-Axl antibodies. For binding affinity determinations of anti-Axl antibodies, surface Plasmon Resonance (SRP) measurement with a BIAcore™-3000 instrument was used. To measure the affinity between anti-Axl antibodies and human Axl ECD-His protein, Anti-Axl human IgG was captured by CM5 biosensor chips coated with mouse anti-human IgG to achieve approximately 250 response units (RU). For kinetics measurements, two-fold serial dilutions of human Axl ECD-His (440nM - 28nM) were injected in PBT buffer (PBS with 0.05% Tween 20) at 25°C with a flow rate of 30μl/min. Association rates (k_{on}) and dissociation rates (k_{off}) were calculated using a simple one-to-one Langmuir binding model.

79
(BIAcore Evaluation Software version 3.2). The equilibrium dissociation constant (K_D) was calculated as the k_{off}/k_{on} ratio. To measure the affinity of anti-Axl antibodies to murine Axl ECD-Fc fusion protein, murine Axl ECD human IgG fusion protein was captured by CM5 biosensor chips coated mouse anti-human IgG to achieve approximately 150 response units (RU). For kinetics measurements, two-fold serial dilutions of the anti-Axl Fab fragment (200nM - 12nM) were injected in PBST buffer (PBS with 0.05% Tween 20) at 25°C with a flow rate of 30µm/η/η. [0337] **Cell proliferation assay.** Cells were seeded at 5000 cells/well in 96-well plates and treated with Axl mAb at various concentrations for 72 hours. Cell proliferation was measured using CellTiter-Glo Luminescent Cell Viability Assay (Promega) according to manufacturer's instructions.

[0338] **ELISA and Fluorescence-activated cell sorting (FACS).** ELISA assays were performed as follows: goat anti-human IgG Fc coated plates were blocking with 0.5% BSA, PBS, 0.05% Tween 20 (PBST). For cross reaction assay, coated plates were incubated with human AxlFc, mouse AxlFc or human MerFc, Tyro-3Fc for 1 hr at room temperature, washed four times in PBST, incubated with anti-Axl mAbs and HRP-conjugated anti-mouse Ig. For binding assay, coated plates were incubated with human AxlFc for 1 hr at room temperature, washed four times in PBST, incubated with rmGas 6 and anti-Axl mAbs for 1 hr at room temperature. Plates were washed four times in PBST, incubated with biotinylated anti-mGas6 and strepavidin-HRP. Secreted Ang-2 and DKK3 was measured using R&D ELISA kit, according to the manufacturer's instruction. Axl expression on cell surface was determined by FACS using standard techniques. Briefly, cells were harvested, stained with anti-Axl mAb (12A1 1, 10ug/ml) for 30 mins on ice, washed twice in PBS, and then staining with PE-conjugated second antibody. To determine antibodies blocking of Gas6 binding to Axl on cell surface, cells were harvested, stained with anti-Axl mAbs for 30-mins and incubated with rmGas6 for 30-mins on ice. They were washed twice in PBS, and stained with biotinylated anti-Gas6 and PE-conjugated strepavidin. Samples were analyzed on BD FACScalibur Flow Cytometer.

[0339] **Xenograft experiments.** All studies were conducted in accordance with the "Guide for the Care and Use of Laboratory Animals" (NIH), and approved by the Institutional Animal Care and Used Committee (IACUC). A total of 5X10^6 (A549) or 10^7 cells in matrigel (MDA-MB-231) were implanted subcutaneously into right flank of nude (A549) or SCID mice (MDA-MB-231), respectively. When the average tumor sized reached 100 mm^3, mice were randomized and divided into different treatment groups (n=10 for each group). Anti-Axl or control IgGl antibodies were at administrated at 10-30 mg/kg, anti-VEGF at 1-2 mg/kg, via intraperitoneal injection (IP), twice weekly. Erlotinib was administrated by oral gavage at 100 mg/kg/day.
Paclitaxel and carboplatin were administrated subcutaneously at 6.25 mg/kg/day for 5 days, and 100 mg/kg for a single dose, respectively, at the beginning of the treatment. Statistic analyses were performed using Anova two-way for comparison of tumor growth in different treatment groups.

For pharmacodynamic (PD) studies, mice were treated with antibodies for 0, 24, 72 and 168 hours. At each time point, tumors were excised, processed for immunohistochemical staining and image analysis, and used to generate cell lysates for Western blot analysis.

For metastasis studies, 5X10^5 MDA-MB-231 cells stably transfected with a luciferase reporter gene (Li et al, 2009) were implanted into SCID mice via tail vein injection. Metastasis of tumor cells to various organs was monitored by bioluminescence detection as described (Li et al, 2009).

**Immunohistochemistry.** Xenograft tumor samples were fixed in 10% neutral buffered formalin, processed, embedded in paraffin, and sectioned at 4 µm. Thin sections were then treated with primary antibodies for Ki67, cleaved caspase 3 and MECA32, followed by biotinylated secondary antibodies and the DAB chromagen.

Primary human breast cancer tissue microarray was obtained from Cureline Inc, including ductal and metastatic adenocarcinomas. Axl IHC was performed using anti-Axl monoclonal antibody described previously (Li et al, 2009), and macrophages were stained using CD68. For dual Axl/CD68 IHC, Axl staining was performed first at 2 µg/ml using Vector ABC Elite HRP reagents and DAB substrate. CD68 staining was run sequentially at 0.5 µg/ml, also using ABC Elite-HRP reagents but Vector SG chromogen (Blue/Grey) instead. A second target antigen retrieval step was performed in between the two complexes to elute off the first complex in order to avoid the cross reactivity of the two markers.

**Vascular density measurement and data analysis.** Tumor samples were stained with MECA32, a pan endothelial cell marker. Images were acquired by the Ariol SL-50 automated slide scanning platform (Genetix Ltd.; Hampshire, UK) at 100x final magnification. Tumor-specific areas were exported for analysis in the Metamorph software package (MDS Analytical Technologies; Ontario, Canada) as individual 8-bit images. The brown DAB-specific staining was isolated from the Hematoxylin counterstain using a blue-normalization algorithm as described (Brey et al, 2003). A segmentation algorithm identified vessels, and removed noise based on size and shape. Cells were identified as either tumor or non-tumor based on size, shape, and density of Hematoxylin staining. Non-tumor areas were identified by the density of non-tumor cells versus tumor cells. After analysis was complete, images were reviewed manually to remove artifacts identified incorrectly as vessels or tumor areas. Area measurements were
recorded for individual vessels, as well as the tumor and non-tumor areas in each image. Raw values based on image analysis were analyzed using the JMP 8.0 software (SAS Institute, Inc. North Carolina, USA). A student’s t test was performed to compare each pair of means, with p < 0.05.

[0345] **Isolation of tumor-associated macrophages (TAM) and detection of secreted cytokines.** Tumors were dissected, chopped into small pieces and incubated in RPMI1640 medium with 2.5% FBS, 0.2 units/ml Liberase Blendzymes II and 5 units/ml DNsasel, (Roche). Tumor cells were disassociated using MACS Dissociator (Miltenyi Biotec) and maintained for 20 minutes at room temperature. EDTA (final concentration 0.002%) was added to stop the reaction. Single cell suspensions were prepared, and red blood cells were removed using RBC lysis buffer (eBioscience). Cells were resuspended at 10^7 cells/ml in PBS containing 1% FBS and incubated with 20 g/ml FcRII, III and IV for 20 minutes. Anti-F4/80-PE (eBioscience) and anti-CD 11c-APC (BD Pharmingen) (0.2 µg/10^6 cells) were added and incubated for 30 minutes on ice. F4/80 and CD11c positive cells were sorted by FACS Aria (BD Biosciences). A total of 2x10^5 F4/80 and CD11c positive cells were seeded in 96-well plate and cultured overnight. Cultured media was collected and the levels of cytokines and chemokines were determined using Bio-Plex mouse cytokine assays (Bio-Rad) according to manufacturer's instructions.

[0346] **Epitope Mapping**

[0347] Axl-2 (PRK HuAxl(l-134Aa)/HuIgGlFc), Axl-3 (PRK HuAxl(l-221Aa)/HuIgGlFc), Axl-4 (PRK HuAxl(l-324Aa)/HuIgGlFc), and Axl-5 (PRK HuAxl(l-435Aa)/HuIgGlFc) plasmid constructs were made by standard molecular-biology techniques. All plasmids were confirmed by direct sequencing and/or restriction digestion. Plasmids encoding various portion of Axl extracellular domain (aal-134, aal-221, aal-324, aal-435) were in vitro transcribed and translated using Promega L2080 TNT SP6 Quick transcription/translation system kit and were used as antigens in ELISA. Axl portions used in these experiments included: Amino acids 1-134 of human Axl (comprising Ig1 of Axl):

MAWRCPRMGRVPLAWCLALCGWACMAPRGTQAEESPFGNPGNTGARGLTGTLR
CQLQVQGEPEPVHLRDGQILELADSTQTQPLGDEEQDDWIWSQLRITSLQSDTGQY
QCLVFLGHQTFVSQPGYVG (SEQ ID NO: 111), and amino acids 221-324 of human Axl (comprising Axl fibronectin domain):

ITVLPPQPRNHLVSRQPTELEVAWTPGLSGIYPLTHCTLQAVLSDD
GMGIGAGEPDPPEEPLTSQASVPHQLRLGSLHPHTPYHIVACTSSQGPSSWTHWL (SEQ ID NO: 130).
[0348] **Antibody competition experiments.** To determine whether phage anti-Axl mabs YW327.6 or YW327.42 competed with hybridoma anti-Axl mAbs 12A1 and 3G9, A549 cells were co-stained with an anti-Axl phage antibody (each at 50 µg/ml) and a hybridoma anti-Axl antibody (each at 10 µg/ml) for 30 minutes. Cells were washed twice in PBS, and stained with anti-mouse Ig-PE. Samples were analyzed on BD FACScalibur Flow Cytometer (BD Biosciences) as described above for FACS analysis.

**Results**

[0349] **Generation of a phage derived monoclonal antibody that blocks Axl function.** To identify antibodies that cross-react with murine and human Axl, we employed phage-displayed antibody libraries with synthetic diversities in the selected complementary determining regions, mimicking the natural diversity of human IgG antibodies (Lee et al, 2004). Phage antibodies that bound to both human and murine Axl ECD were identified by ELISA and DNA sequencing, and antibody clones were reformatted to express full-length IgGs (Liang et al, 2007). A panel of full length IgGs was then screened for their ability to inhibit Gas6-dependent growth of Baf3Axl cells (Li et al, 2009), and one of the clones YW327.6 was affinity matured and purified.

[0350] Affinity matured Axl mAb YW327.6S2 binds to both human and murine Axl with high affinity, with a Kd of about 1 nM, and 545 pM, respectively (Fig. 7A-B). Specifically, Ka was 1.7 X 10^5, kd was 1.7 X 10^4, and KD was 9.9 X 10^-10. This antibody also binds to cynomolgus Axl, but it does not cross-react with related receptors Tyro3 and Mer (Fig. 7C). YW327.6S2 blocks binding of ligand Gas6 to Axl as demonstrated in both a cell free ELISA and on cell surface by FACS, in a dose-dependent manner (Fig. 7D-E).

[0351] Affinity matured Axl Mabs YW327.6S1, YW327.42S8 and YW327.42S31 were also characterized. YW327.6S1, YW327.42S8 and YW327.42S31 bind both human and murine Axl with high affinity. For example, biaxore analysis of antibody binding to human Axl resulted in the following:

<table>
<thead>
<tr>
<th>Hu Axl</th>
<th>Ka</th>
<th>kd</th>
<th>KD</th>
</tr>
</thead>
<tbody>
<tr>
<td>YW327.6S1</td>
<td>1.7 X 10^5</td>
<td>1.7 X 10^4</td>
<td>1.3 X 10^9</td>
</tr>
<tr>
<td>YW327.42S8</td>
<td>5.2 X 10^4</td>
<td>1.3X 10^4</td>
<td>2.5 X 10^9</td>
</tr>
<tr>
<td>YW327.42S31</td>
<td>6.3 X 10^4</td>
<td>1.5 X10^4</td>
<td>2.4 X 10^9</td>
</tr>
</tbody>
</table>

[0352] These antibodies do not cross-react with Tyro3 and Mer. YW327.6S2 (and parent antibody YW 327.6) blocks binding of ligand Gas6 to Axl, while YW327.42S8 and YW327.42S31 (and parent Mab YW327.42) do not block binding of ligand Gas6 to Axl.

[0353] **Axl epitope analysis.** Axl antibody binding to various portions of human Axl extracellular domain was analyzed using ELISA. The results were obtained.
Axl2 (aal-134) +
Axl-3 (aa 1-221) +
Axl-4 (aal-324) + +

[0354] YW327.6 bound to Axl-Fc fusions comprising amino acids 1-134 of human Axl. By contrast, YW327.42 bound an Axl-Fc fusion comprising amino acids 1-324 of human Axl, but did not bind Axl FC fusions comprising amino acids 1-134, and 1-221. Thus, we concluded that YW327.6 binds a polypeptide consisting of amino acids 1-134 of human Axl, and that human Axl amino acids 222-234 was required for YW327.42 binding. Amino acids 1-134 contains Axl Ig1 domain, and amino acids 222-234 contain Axl fibronectin domain.

[0355] Competition experiments with anti-Axl hybridoma antibodies. We determined whether antibodies YW326.6 and YW327.42 could compete for human Axl binding with anti-Axl hybridoma antibodies 12A1 I and 3G9 (Li, (2009), US patent application number 61/228,915 filed July 27, 2009). In antibody competition binding experiments to human Axl, Antibody YW327.6 did not compete for human Axl binding with either of hybridoma antibodies 12A1 I or 3G9, demonstrating that these antibodies do not recognize the same epitopes. Antibody YW327.42 competed for human Axl binding with hybridoma antibody 12A1 I, but did not compete for human Axl binding with hybridoma antibody 3G9.

[0356] YW327.6S2 down regulates Axl expression, inhibits its activation, signaling and Gas6-dependent BaDAxl cell proliferation. To test whether YW327.6S2 affects Axl biological functions, we first evaluated its effect on Axl expression and signaling. Treatment of NSCLC cell line A549 with YW327.6S2 resulted in rapid down-regulation of Axl expression on cell surface (Fig. 7F, upper panel) and this down regulation is sustained for 24 hrs (Fig. 7F, lower panel). Gas6 treatment of H1299 NSCLC cells induces Axl phosphorylation that was inhibited when cells were pre-incubated with YW327.6S2 (Fig. 7G, upper panel). Consequently, pre-incubation of H1299 cells with YW327.6S2 blocks Gas6-induced phosphorylation of the down-stream signaling molecule Akt (Fig. 7G, lower panel). Down-regulation of Axl expression and inactivation of its signaling by YW327.6S2 potently inhibited Gas6-dependent growth of Baf3Axl cells, with an IC50 of 340 ng/ml (Fig. 7H).

[0357] YW327.6S2 reduces A549 xenograft growth and enhances the effect of Anti-VEGF. In a previous study, we showed that inhibition of Axl by either RNAi or treatment with anti-human Axl hybridoma monoclonal antibodies significantly attenuated A549 NSCLC tumor growth (Li et al, 2009). We therefore first tested the effect of YW327.6S2 on tumor growth in this model. YW327.6S2 alone at 10 mg/kg, twice a week dosing regimen significantly reduced
A549 tumor growth (Fig. 8A), and this inhibitory effect is comparable to that of anti-human Axl hybridoma antibodies (Fig. 8C).

[0358] Axl is expressed on endothelial cells and enhances VEGF-induced endothelial tubule formation (Li et al, 2009; Holland et al, 2005); we tested whether anti-Axl mAb could enhance the anti-tumor growth property of anti-VEGF (Liang et al, 2006). Anti-VEGF antibody alone and YW327.6S2 alone had similar effects on A549 tumor growth (Fig. 8A). Combination of the two antibodies together resulted in enhanced tumor growth inhibition compared with either antibody alone, with 30% inhibition by single agent versus 60% inhibition by the combination treatment (Fig. 8A).

[0359] Animals in this study were dosed twice weekly for 60 days and followed to day 85 to examine the delay in tumor growth (animals were removed from the study when tumor sizes exceeded 800 mm³; no animals were removed as a result of toxicity). YW327.6S2 in combination with anti-VEGF significantly delayed tumor growth as compared to a single agent (Fig. 8A). There was no tumor re-growth in the combination treatment group during the time elapsed from the last dose to the end of the experiment (day 85), which lead to the survival of all the animals in this group at the end of the experiment as shown in the Kaplan-Meier plot (Fig. 8B).

[0360] The anti-human Axl hybridoma monoclonal antibody 12A1 1, which does not cross-react with murine Axl, significantly attenuated A549 xenograft tumor growth (Li et al, 2009), it also enhances the effect of anti-VEGF as shown in Fig. 8C. This is expected, since 12A1 1 directly inhibits tumor cell growth and anti-VEGF affects tumor vasculature.

[0361] YW327.6S2 down-regulates receptor expression and induces apoptosis of A549 tumor cells. To begin to understand the mechanisms that mediate YW327.6S2 effect on reducing tumor growth, we performed a pharmacodynamic study. A549 tumor bearing mice was treated with YW327.6S2, and tumors were excised at 0, 24, 72, and 168 hrs post dosing. Western blotting analysis of tumor lysates showed that Axl expression was down-regulated 24hr after antibody administration and sustained over 168 hrs (Fig. 8D), suggesting that the anti-tumor growth effect of YW327.6S2 is mediated in part by down regulation of Axl expression.

[0362] To determine whether YW327.6S2 has direct effect on tumor cell proliferation and apoptosis, A549 xenograft tumors treated with control or YW327.6S2 for two weeks were excised and cleaved caspase 3 (CC3) and Ki67 IHC were performed. Tumors treated with YW327.6S2 exhibited increased CC3 compared with the control (Fig. 8E), suggesting that YW327.6S2 induces apoptosis of tumor cells. There was no significant difference in Ki67
positive nuclei between control and YW327.6S2 treated tumors, suggesting that YW327.6S2 does not directly affect tumor cell proliferation.

[0363] To investigate whether YW327.6S2 affects tumor-associated vasculature, we treated A549 tumor bearing mice with YW327.6S2 alone or in combination with anti-VEGF. Tumors were excised and stained with MECA32, a pan endothelial marker, to examine the intratumoral vascular density. YW327.6S2 alone did not significantly reduced vascular density compared with control but combination with anti-VEGF resulted in significant decrease of the tumor associated vascular density (Fig. 8F). In contrast, 12A1 1 has no significant effect on intratumoral vascular density by itself or in combination with anti-VEGF.

[0364] YW327.6S2 enhances the effect of erlotinib and chemotherapy. To test whether YW327.6S2 could enhance the therapeutic index of standard care for NSCLC, we performed combination treatment of YW327.6S2 with EGFR small molecule inhibitor (SMI) erlotinib and chemotherapy.

[0365] A549 contains wild type EGFR and is only moderately sensitive to erlotinib (Yauch et al, 2005); we therefore investigated whether anti-Axl mAb can sensitize these cells to EGFR SMI. YW327.6S2 and erlotinib when administrated as a single agent resulted in 30% reduction in tumor growth but in combination reduced the tumor growth rate by more than 50% (Fig. 9A), suggesting that anti-Axl mAb enhances the anti-tumor growth effect of erlotinib.

[0366] We then investigated whether anti-Axl mAb was able to enhance the therapeutic index of standard chemotherapy for NSCLC. Mice bearing A549 xenografts were treated with one cycle of chemotherapy consisting paclitaxel (6.25 mg/kg/day, 5 days) and carboplatin (100 mg/kg, one dose) administrated at the beginning of the treatment (day 0, Fig. 9B). Chemotherapy alone has similar effect on tumor growth as YW327.6S2 administrated alone, and combination of the two resulted in enhanced inhibition of tumor growth (Fig. 9B).

[0367] YW327.6S2 reduces vascular density and inhibits inflammatory cytokine secretion from tumor-associated macrophages in MDA-MB-231 breast cancer xenograft model. Since Axl knockdown by shRNA has only moderate effect on MDA-MB-231 xenograft tumor growth (Li et al, 2009), we asked whether YW327.6S2 is efficacious in this model. YW327.6S2 alone was able to reduce tumor growth (25%), and had similar effect to anti-VEGF used as a single agent in this model (Fig. 10A). The combination therapy leads to a 50% reduction in tumor growth, suggesting that YW327.6S2 potentiates the effect of anti-VEGF (Fig. 10A). In contrast, the anti-Axl hybridoma antibody 12A1 1 (Li et al, 2009) which does not cross-react with murine Axl, has no significant effect on tumor growth as a single agent in this model, nor does affects anti-VEGF (Fig. 10B). Western blot analysis showed that both YW327.6S2 and 12A1 1 down-
regulate Axl expression in tumors (Fig. IOC & D). These results suggest that the anti-tumor growth effect of YW327.6S2 might be mediated by modulation of tumor stromal functions.  

[0368] To investigate further how YW327.6S2 might modulate tumor stromal functions, we treated MDA-MB-231 tumor bearing mice with YW327.6S2 alone or in combination with anti-VEGF. At various time points after administration of the antibodies, tumors were excised and stained with MECA32 to examine the intra-tumoral vascular density. Both YW327.6S2 and anti-VEGF significantly reduced vascular density compared with control (Fig. 10E). And combination of the two antibodies resulted in further reduction of the tumor associated vascular density. These results suggest that YW327.6S2 reduces MDA-MB-231 tumor growth in part by altering vascular functions.

[0369] In primary human breast cancer specimens, we found that Axl protein is strongly expressed in infiltrating macrophages (Fig. 10F) and therefore asked whether Axl mAb YW327.6S2 might affect tumor associate macrophages (TAMs) functions. MDA-MB-231 xenograft tumors were treated for one week with YW327.6S2, 12A1 l or control antibody, and TAMs were isolated by sorting for F4/80 positive cells. Cells were cultured in serum free media overnight, and the supernatant was collected and assayed for the presence of various cytokines and chemokines. TAMs from tumors treated with YW327.6S2 and 12A1 l produced much lower levels of inflammatory cytokines and chemokines compared with TAMs treated with control antibody (Fig. 10G). Treatment with either Axl-mAb does not affect Axl expression levels on TAMs (data not shown) in contrast to down-regulation of Axl expression on tumor cells by theses antibodies (Fig IOC & D). These results suggest that Axl mAbs most likely modulate inflammatory cytokine/chemokine secretion from TAMs in an indirect manner, perhaps by blocking the crosstalk between tumor and stromal cells.

[0370] YW327.6S2 reduces MDA-MB-231 breast cancer cells metastasis to the bone. In a previous study we showed that Axl knockdown by shRNA inhibits metastasis of MDA-MB-231 breast cancer cells to the lung in an orthotopic model (Li et al, 2009), we therefore tested whether YW327.6S2 affects metastasis of these cells. MDA-MB-231 cells stably expressing the luciferase reporter gene (20) were injected via tail vein into SCID mice. Four weeks after injection, strong luminescent signals were detected at craniofacial region, tibia and femur of all five animals in the control antibody treated group. The sites detected by bioluminescence in control groups are 5, 5, 4, 3 and 1 in each animal, with a total of 18 (Fig. 11A). In mice treated with YW327.6S2, the sites detected by bioluminescence were significantly reduced, with 0, 1, 2, 3, and 1 sites in each animal and a total of 7 for the entire group (Fig. 11A). The presence of metastatic foci in bone
was verified by histological analysis (Fig. 1IB). These results suggest that YW327.6S2 is able to reduce MDA-MB-231 breast cancer cells metastasis to distant organs.

Discussion

We have developed and characterized a human anti-Axl monoclonal antibody (YW327.6S2) that exhibits cross-species reactivity and blocks various functions of Axl in tumorigenesis. Besides being the first reported fully humanized blocking antibody for Axl, YW327.6S2 not only serves as a powerful tool to dissect out the impact of Axl activation/signaling in multiple aspects of cancer development and progression, but also represents a potential therapeutic for treatment of various cancers.

Our results show that YW327.6S2 blocks Axl functions by down-regulation of Axl expression as well as inhibition of ligand Gas6 binding to the receptor, leading to inactivation of Axl and its down-stream signaling (Fig. 7). The ability of YW327.6S2 to down-regulate Axl expression in cancer cells represents an important mechanism for its inhibitory effects, since many cancers express constitutively activated Axl and are no longer responsive to exogenous Gas6 (Li et al, 2009).

In the A549 NSCLC model, YW327.6S2 significantly attenuated tumor growth when administrated as a single agent (Fig. 8A). This inhibitory effect is comparable to that of anti-Axl hybridoma antibodies in this model (Li et al, 2009; Fig. 8C). YW327.6S2 rapidly down-regulates Axl expression in xenografts (Fig. 8D), and induces apoptosis of tumor cells (Fig. 8E), which is likely one of the mechanisms that mediates its inhibitory effect on tumor growth. Our previous findings that Axl modulates endothelial cell functions by regulating the DKK3 and angiopoietin/Tie2 pathways (Li et al, 2009) raised the possibility that anti-Axl mAb could enhance the effect of anti-VEGF in reducing tumor growth. Our results (Fig. 8A & F) are consistent with this hypothesis, in that YW327.6S2 impacts tumor vasculature by enhancing the effect of anti-VEGF to reduce intra-tumoral vascular density. Indeed, co-administration of YW327.6S2 and anti-VEGF in A549 model resulted in tumor stasis that was maintained for at least 4 weeks after treatment cessation (Fig. 8B). The hybridoma antibody 12A1 also enhances the anti-tumor effect of anti-VEGF in this model (Fig. 8C). However, unlike YW327.6S2, 12A1 does not have direct effect on tumor vasculature; rather it directly inhibits tumor cell proliferation and induces apoptosis (Li et al, 2009). The effect of 12A1 on tumor growth and the anti-VEGF on tumor vasculature resulted in an increased effect when the two agents are used together.

EGFR small molecule inhibitors such as erlotinib are efficacious in treatment of NSCLC tumors that harbor EGFR mutations or amplification (Lynch et al, 2004; Paez et al, 2004; Eberhard et al, 2005; Giaccone et al, 2005; Tsao et al, 2005). It is also known that treatment of
breast cancer cells with Her2/EGFR small molecules inhibitor Lapatinib or anti-Her2 antibody Herceptin leads to induction of Axl expression and consequently results in resistance of cancer cells to these therapies (Liu et al, 2009). We have found recently that Axl expression is induced in HCC827 NSCLC (a cell line that harbors both EGFR mutation and amplification) cells that have acquired resistance to erlotinib and Axl knockdown in resistant cells restores their sensitivity to erlotinib, suggesting that Axl may play a role in erlotinib resistance in NSCLC. Since A549 cells contains wild type EGFR and are only moderately sensitive to EGFR inhibition in vitro (Yauch et al, 2005), we asked whether anti-Axl mAb would sensitize these cells to erlotinib. Our results showed that YW327.6S2 potentiates the effect of erlotinib in reducing tumor growth (Fig. 9A), suggesting that anti-Axl mAb may enhance the efficacy of EGFR inhibitors in tumors that are refractory to EGFR inhibition alone, perhaps by directly reducing Axl expression in tumor cells.

Systemic chemotherapy plays the largest part in the treatment paradigms for NSCLC. For recurrent or advanced disease, patients treated with chemotherapy that consists of carboplatin/paclitaxel have a response rate of 15% and median survival of 10.3 months (Sandley et al, 2006). Our results in A549 NSCLC model showed that YW327.6S2 is able to enhance the anti-tumor efficacy of carboplatin/paclitaxel (Fig. 9B), suggesting blocking Axl functions might improve therapeutic index of chemotherapy in this disease. Our results are consistent with a recent report demonstrating an Axl small molecule inhibitor synergized with cisplatin to suppress liver micrometastasis in 4T1 breast cancer orthotopic model (Holland et al, 2010).

In the MDA-MB-231 breast cancer model, YW327.6S2 alone is able to significantly attenuate tumor growth (Fig. 10A). The anti-Axl hybridoma antibody, which does not cross react with murine Axl and therefore would only affect tumor cells, has no significant effect on tumor growth in this model (Fig. 10B). These results suggest that YW327.6S2 is likely to exert its anti-tumor effect through its actions on tumor stroma. Our results show that YW327.6S2 reduces intra-tumoral vascular density (Fig. 10E) and enhances the effect of anti-VEGF. Through its effect on tumor vasculature, YW327.6S2 may impact on tumor growth.

An association between the development of cancer and inflammation has long been appreciated (Balkwill & Mantovani, 2001; Coussens & Werb, 2002). The chronic inflammation associated with infection and irritation may lead to environments that foster genomic lesions and tumor initiation. There is increasing evidence that TAMs have causal roles in tumor progression including promotion of angiogenesis and matrix remodeling (Balkwill et al, 2005; Pollard, 2004). The signals responsible for this are thought to be inflammatory cytokines, including tumor necrosis factor-a (TNF-a), interleukin 6 (IL-6) and a plethora of chemokines. These cytokines
and chemokines not only recruit immune cells to the specific sites that stimulate tumor progression, but it has been shown that their receptors are expressed on tumor cells where they can increase tumor growth and migration (Haghnegahdar et al, 2000). In primary human breast cancer, Axl protein is expressed at high levels on tumor associated macrophages (TAMs) (Fig. 10F). We provide evidence here that anti-Axl mAbs could modulate the functions of these cells through an indirect mechanism. Our data showed that treatment of MDA-MB-231 xenografts with either YW327.6S2 or 12A11 (which does not cross react with murine Axl and therefore should not have direct effect on TAMs) inhibits secretion of inflammatory cytokines and chemokines from TAMs (Fig. 10G). Since Axl-mAbs do not seem to have significant effect on Axl expression on TAMs but down-regulate receptor expression on tumor cells, it is likely that anti-Axl-mAbs modulate cytokine/chemokine secretion from TAMs by blocking the crosstalk between tumor and stromal cells. These results are consistent with the recent reports that tumor cells could promote their growth by educating infiltrating leukocytes to induce expression of Gas6 (Loges et al, 2010); and a small molecule inhibitor of Axl reduced GM-CSF expression in 4T1 breast tumor cells (Holland et al, 2010).

Previous studies have established the role of Axl in promoting tumor cell migration, invasion and metastasis (Zhang et al, 2008; Li et al, 2009; Tai et al, 2008; Vajkoczy et al, 2006; Gjerdrum et al, 2010). Here we showed that YW327.6S2 is able to reduce metastasis of MDA-MB-231 breast cancer cells to the bone. These results are consistent with our previous data that Axl silencing by RNAi in breast cancer cells inhibits their metastasis to the lung in an orthotropic model (Li et al, 2009; Gjerdrum et al, 2010), suggesting that this anti-Axl antibody could have therapeutic potential not only in treatment of primary tumor but also in metastatic disease.

In conclusion, we have developed a human monoclonal antibody that blocks Axl functions. This anti-Axl mAb exerts its anti-tumor effect through multiple mechanisms including induction of tumor cell apoptosis, regulation of angiogenesis and modulation of tumor associated immune cells functions. Additionally, this anti-Axl mAb enhances the anti-tumor efficacy of anti-VEGF, EGFR SMI as well as chemotherapy, may therefore represent a novel therapeutic approach in clinical settings where these therapies are standard care.

**Partial Reference List**

Although the foregoing invention has been described in some detail by way of illustration and example for purposes of clarity of understanding, the descriptions and examples should not be construed as limiting the scope of the invention. The disclosures of all patent and scientific literature cited herein are expressly incorporated in their entirety by reference.
WHAT IS CLAIMED IS:

1. An isolated antibody that binds to human Axl, wherein the antibody binds human Axl with an affinity of ≤ 600 pM, wherein the antibody binds mouse Axl with an affinity of ≤ 1 nM.

2. The antibody of claim 1, wherein the antibody promotes Axl receptor downregulation and/or inhibits constitutive Axl activation.

3. The antibody of any one of claims 1-2, wherein the antibody binds a polypeptide comprising, consisting essentially of or consisting of the following amino acid sequence SEQ ID NO:1 11.

4. The antibody of any one of claims 1-3, which is a monoclonal antibody.

5. The antibody of any one of claims 1-4, which is a full length IgGl antibody.

6. The antibody of any one of claims 1-5, which is a human antibody, humanized antibody, chimeric antibody, or antibody fragment that binds Axl.

7. The antibody of any one of claims 1-6, wherein the antibody comprises (a) HVR-H1 comprising GFX1X2X3X4X5X6X7H, wherein X1 is S or T; X2 is L, F or V; X3 is S, T, or R; X4 is G or S; X5 is S, H, T or I; X6 is W or G; X7 is I or L (SEQ ID NO: 112), (b) HVR-H2 comprising X1X2IX3PX4X5X6X7X8YYADSVKG, wherein X1 is G or A; X2 is W or G; X3 is N, S, A or P; X4 is Y, A or V; X5 is R, G, or S; X6 is G R or S; X7 is Y, S, H or Y; X8 is A, T, or P (SEQ ID NO:1 13); (c) HVR-H3 comprising ARX1X2X3X4X5X6X7X8X9XioXi iXi2Xi 3MDY, wherein X1 is E or W; X2 is Y or R; X3 is S, N or P; X4 is G, D, or L; X5 is W or S; X6 is G, R, A, or S; X7 is G or S; X8 is S or absent; X9 is S, Y or absent; X10 is V, I or absent; X11 is G or absent; X12 is Y or absent; X13 is A, E or absent (SEQ ID NO: 114); (d) HVR-L1 comprising RASQXiX2X3X4X5X6X7A, wherein X1 is D, I or S; X2 is V or I; X3 is S, G or R; X4 is T, I, N or R; X5 is A or S; X6 is V or L (SEQ ID NO: 115); (e) HVR-L2 comprising X1ASX2LX3S, wherein X1 is S, A, or V; X2 is F, N or S; X3 is Y or A (SEQ ID NO: 116); and (f) HVR-L3 comprising QQXiX2X3X4X5X6X7T, wherein X1 is S or A; X2 is Y, K or N; X3 is T, S, Y, M, R or A; X4 is T, N, S, or F; X5 is P or R; X6 is P, Y, S or L (SEQ ID NO:1 17).

8. The antibody of any one of claims 1-7, wherein the antibody comprises (a) HVR-H1 comprising GFX1X2X3X4X5X6X7H, wherein X1 is T or S, X2 is F or L; X3 is T or S, X4 is H, S or T (SEQ ID NO:1 18); (b) HVR-H2 comprising GWLX1PYX2X3X4X5YYADSVKG, wherein X1 is S, N or A; X2 is G, R or S; X3 is G or R; X4 is S, Y or H; X5 is T, A or P (SEQ ID NO: 119); (c) HVR-H3 comprising AREYXiX2WX3X4X5X6GYX7MDY, wherein X1 is S, N or P; X2 is G or D; X3 is G, R, or A; X4 is G or S; X5 is S or Y; X6 is V or I; X7 is A or E (SEQ ID NO: 120); and
HVR-L3 comprising QQSYX_iX_2X_3X_4T, wherein X_1 is T, S or Y; X_2 is T, N, S or F; X_3 is P or R; X_4 is P, Y or S (SEQ ID NO: 121).

9. The antibody of any one of claims 1-8, wherein the antibody comprises (a) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 9, (b) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 12, and (c) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 8.

10. The antibody of any one of claims 1-9, wherein the antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 7, (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 8, and (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 9.

11. The antibody of any one of claims 1-10, further comprising (a) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 10; (b) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 11; and (c) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 12.

12. The antibody of any one of claims 1-11, further comprising a heavy chain variable domain or light chain variable domain framework sequence shown in Figure 3A-B, 4, 5 or 6.

13. The antibody of any one of claims 1-12, comprising (a) a VH sequence having at least 95% sequence identity to the amino acid sequence of SEQ ID NO: 103; (b) a VL sequence having at least 95% sequence identity to the amino acid sequence of SEQ ID NO: 104; or (c) a VH sequence as in (a) and a VL sequence as in (b).

14. The antibody of claim 13, comprising a VH sequence of SEQ ID NO: 103 and/or a VL sequence of SEQ ID NO: 104.

15. Isolated nucleic acid encoding the antibody of any one of claims 1-14.

16. A host cell comprising the nucleic acid of claim 15.

17. A method of producing an antibody comprising culturing the host cell of claim 16 so that the antibody is produced

18. The method of claim 17, further comprising recovering the antibody from the host cell.

19. An immunoconjugate comprising the antibody of any one of claims 1-14 and a cytotoxic agent.

20. A pharmaceutical formulation comprising the antibody of any one of claims 1-14 and a pharmaceutically acceptable carrier.
21. The pharmaceutical formulation of claim 20, further comprising an additional therapeutic agent.

22. The pharmaceutical formulation of claim 21, wherein the additional therapeutic agent is selected from a VEGF antagonist, an EGFR antagonist, and a chemotherapeutic agent.

23. The antibody of any one of claims 1-14 for use as a medicament.

24. The antibody of any one of claims 1-14 for use in treating cancer, immune disorder, cardiovascular disorder, thrombosis, or diabetes.

25. The antibody of any one of claims 1-14 for use in inhibiting cell proliferation, promoting Axl downregulation, inhibiting metastasis, and/or inhibiting angiogenesis.

26. Use of the antibody of any one of claims 1-14 in the manufacture of a medicament.

27. The use of claim 26, wherein the medicament is for treatment of cancer, immune disorder, cardiovascular disorder, thrombosis, or diabetes.

28. The use of claim 26, wherein the medicament is for inhibiting cell proliferation, inhibiting angiogenesis, promoting Axl downregulation, and/or inhibiting metastasis.

29. A method of treating an individual having cancer comprising administering to the individual an effective amount of the antibody of any one of claims 1-14.

30. The method of claim 29 further comprising administering an additional therapeutic agent to the individual.

31. The method of claim 30, wherein the additional therapeutic agent is selected from the group consisting of a VEGF antagonist, an EGFR antagonist and a chemotherapeutic agent.

32. A method of treating an individual having immune disorder, cardiovascular disorder, thrombosis or diabetes comprising administering to the individual an effective amount of the antibody of any one of claims 1-14.

33. A method of inhibiting angiogenesis, inhibiting cell proliferation, promoting Axl receptor downregulation or inhibiting metastasis in an individual comprising administering to the individual an effective amount of the antibody of any one of claims 1-14 to inhibit angiogenesis, inhibit cell proliferation, promote Axl receptor downregulation or inhibit metastasis.

34. A method of inhibiting constitutive Axl activation comprising administering to the individual an effective amount of the antibody of any one of claims 1-14 to inhibit constitutive Axl.

INTERNATIONAL SEARCH REPORT

A. CLASSIFICATION OF SUBJECT MATTER

Int. Cl.

C07K 16/46 (2006.01) A61P 9/00 (2006.01) A61P 37/00 (2006.01)
A61K 39/395 (2006.01) A61P 35/00 (2006.01) C07K 16/30 (2006.01)

According to International Patent Classification (IPC) or to both national classification and IPC.

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic database consulted during the international search (name of database and, where practicable, search terms used)

WPI, EPDOC, MEDLINE: anti-Axl, Axl antibody, Axl immunoglobulin

GenomeQuest: SEQ ID Nos (7, 8, 9); (10, 11, 12); 103; 104; (112, 113, 114); (115, 116, 117); (118, 119, 120); 121

PatentScope, PubMed: Author search, Axl and antibody

INTERNATIONAL SEARCH REPORT

Box No. II  Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.:
   because they relate to subject matter not required to be searched by this Authority, namely:

2.  Claims Nos.: 12
   because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

   The claims do not comply with Rule 6.2(a) because they rely on references to the description and/or drawings.

3.  Claims Nos.:
   because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a)

Box No. III  Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1.  As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2.  As all searchable claims could be searched without effort justifying additional fees, this Authority did not invite payment of additional fees.

3.  As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4.  No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest  

☐ The additional search fees were accompanied by the applicant's protest and, where applicable, the payment of a protest fee.

☒ The additional search fees were accompanied by the applicant's protest but the applicable protest fee was not paid within the time limit specified in the invitation.

☒ No protest accompanied the payment of additional search fees.
This Annex lists the known "A" publication level patent family members relating to the patent documents cited in the above-mentioned international search report. The Australian Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
