[57] **ABSTRACT**

A perennial hybrid *Gazania* groundcover which is distinguished by the deep orange color of its flowers and its green trailing foliage. In addition, the invention plant is floriferous, vigorous, and disease and frost tolerant.

1 Drawing Sheet

1

BACKGROUND OF THE INVENTION

The present invention relates to a new and distinctive cultivar of *Gazania* plant botanically known as *Gazania rigens* hybrid and referred to commercially by the culti-
var name 'Moorpark Orange'. *Gazania rigens* 'Moor-
park Orange' was discovered in the mother stock field
of Mitsuwa Nursery in Moorpark, Calif. It originated as
a natural hybrid. Its exact parents are unknown, but are
in the *Gazania rigens* and *Gazania rigens* var. *leucoleana*
groups.

BRIEF DESCRIPTION OF THE INVENTION

Gazania rigens 'Moorpark Orange' is a perennial trail-
ing groundcover with good vigor, hardiness, deep
green leaves and deep orange flowers that bloom from
February to December in Southern California. The
dark orange color of the flowers is unique in the trailing
green leaf *Gazania* groundcovers and is believed to be
a substantial step forward in the groundcover industry.

DESCRIPTION OF THE DRAWING

The accompanying color photograph, forming a part
of this disclosure, was taken in Summer 1988 in a green-
house in Moorpark, Calif., and shows a close-up of
Gazania rigens 'Moorpark Orange' growing in a flat; the
view being more or less straight down onto the plants.
The photograph shows the typical flower and foliage
form and color as true as is reasonably possible in this
type of color photograph.

Comparison of *Gazania rigens* 'Moorpark Orange' with
other Commercial Orange *Gazania* Groundcovers

The primary distinguishing feature of *Gazania rigens*
'Moorpark Orange' is the deep orange color of its flow-
ers. This color is new to the green leaf trailing *Gazania*
groundcovers. That is, to the inventors' knowledge,
Gazania rigens 'Moorpark Orange' is the first *Gazania*
with deep orange flowers, green leaves, and a trailing
habit. There are other deep orange flowering *Gazania*
groundcovers but they have grey foliage and/or clump-
ing habits.

To the inventors' knowledge, the only other orange
flowering *Gazania* with a trailing habit and green fo-

2

liage has light orange flowers. This is *Gazania rigens*
'Mitsuwa Orange', 'Mitsuwa Orange' is described and
claimed in U.S. Plant Pat. No. 5,796, issued Nov. 4,
1986, and owned in common with the present invention.

Compared to *Gazania rigens* 'Mitsuwa Orange', *Ga-
zania rigens* 'Moorpark Orange' is more vigorous and its
leaves are a deeper green. The flower heads are larger,
with a darker orange color, and with a black ring
around the flower center. Both are very floriferous.
Gazania rigens 'Moorpark Orange' is more frost hardy.

DETAILED DESCRIPTION

The following is detailed description of *Gazania ri-
gens* 'Moorpark Orange' based on plants produced
under commercial practices outdoors at Mitsuwa Nurs-
ery, Moorpark, Calif. Color references are made to The
Royal Horticultural Society Colour Chart except
where the context indicates a term having its ordinary
dictionary meaning.

Parentage: A natural hybrid within the *Gazania rigens*
and the *Gazania rigens* var. *leucoleana* groups.

Plant form: Plants are a vigorous growing, trailing
groundcover.

Habit of growth: Plants are decumbent, spreading rap-
idly to approximately 1 meter in diameter. Plants
form a dense carpet to approximately 13 cm in height.

Foliage: Foliage is a medium green with simple alter-
nate leaves.

(1) *Size.*—Mature leaves are approximately 6-10
cm in length and 1 cm in width at the widest
point.

(2) *Shape.*—Oblanceolate.

(3) *Texture.*—The top side of the leaf is glabrous,
the bottom side is densely white tomentose.

(4) *Margin.*—Subrevolute.

(5) *Color.*—Young foliage, top side — 137 C.
Young foliage, underside — 155 D. Mature foli-
age, top side — 137 A & B. Mature foliage,
underside — 155 D.

FLOWERING DESCRIPTION

- 1. General: The flowers are a deep orange with a black ring around the flower center at the base. The plants are very floriferous.
- 2. Habit: The flower heads arise from leaf axils on peduncles to approximately 15 cm in length.
- 3. Season of bloom: Varies with the climate. In Moorpark, Calif., heavy bloom occurs from approximately late February to early December.
- 4. Flower Parts: (a) Flower heads measures 5-6 cm across. (b) Ray petals measure up to 4 cm. in length. The base of each petal has a black oval shaped spot measuring approximately 3 mm across with 3 white dots in the middle. This black oval shaped spot forms the band or ring at the flower base. The underside of each ray petal has a dark section down the center between the two main veins. (c) There are 18-22 ray petals per flower head.
- 5. Color:
 - Disc flower (closed).*—25 B.
 - Ray petal, topside tip.*—23 A.
 - Ray petal, middle to spot.*—25 A.
 - Ray petal, spot.*—202 A.
 - Ray petal, bottomside edges.*—24 A.

Ray petal, bottomside dark section.—117 A.

Disease Resistance: No disease problems noted. In the fields at Mitsuwa Nursery, *Gazania rigens* 'Moorpark Orange' has proven to be disease tolerant.

5 Hardiness: In the winter of 1987 the *Gazania* trial fields in Moorpark, Calif. were badly frost damaged. Many of the *Gazania* varieties died and most died back. Almost all had leaf burn. *Gazania rigens* 'Moorpark Orange' had no foliage die back and minimal leaf burn; it fared much better than other *Gazania* varieties in the same field. It is much hardier than Mitsuwa Yellow, Mitsuwa Orange, and Mitsuwa White, all of which has some foliage die back.

15 Propagation: Asexual reproduction by stem cuttings has shown that the unique features of this new *Gazania* are stable and are reproduced true to type in successive propagations. *Gazania rigens* 'Moorpark Orange' roots in 2-4 weeks under warm conditions.

20 We claim:

1. A new and distinct cultivar of *Gazania* as described and illustrated, particularly characterized by its floriferous showy deep orange flowers, green foliage, vigorous growth, and trailing habit.
