HERBICIDAL COMPOSITION COMPRISING CINMETHYLIN AND IMAZAMOX

The present invention relates to a herbicidal composition comprising imazamox, any of its individual isomers or agriculturally acceptable salts, esters or amides thereof. The invention also relates to methods and uses for controlling undesirable vegetation, in particular in crops.

Background of the invention

In crop protection, it is desirable, in principle, to increase the specific activity of an active compound and the reliability of the effect. It is particularly desirable for the crop protection product to control the harmful plants effectively, but at the same time to be compatible with the useful plants in question. Also desirable is a broad spectrum of activity allowing the simultaneous control of harmful plants. Frequently, this cannot be achieved using a single herbicidally active compound.

Further, cases of herbicide-resistant weeds are becoming increasingly common. These biotypes survive herbicide application at doses that usually give effective control of the species.

Resistant weed biotypes are a consequence of basic evolutionary processes. Individuals within a species that are best adapted to a particular practice are selected for and will increase in the population. Once a weed population is exposed to a herbicide to which one or more plants are naturally resistant, the herbicide kills susceptible individuals, but allows resistant individuals to survive and reproduce. With repeated herbicide use, resistant weeds that initially appear as isolated plants or patches in a field can quickly spread to dominate the population and the soil seed bank.

For example, herbicide resistance within weeds, in particular grass weeds such as, for example, *Alopecurus myosuroides* (ALOMY), *Apera spica-venti* (APESV) or *Lolium* species (LOLSS) has become a major concern for farmers, resulting in dramatic weed control problems, for example in cereal crops. Herbicides from the group of ACCase- and ALS-inhibitors are most affected by resistance evolution but also various other types of herbicides.

Thus, there is also a need to develop practices for preventing, delaying or managing herbicide resistance in weeds.

Imazamox is the common name of the herbicidal compound with the IUPAC name 2-[(RS)-4-isopropyl-4-methyl-5-oxo-2-imidazolin-2-yl]-5-methoxymethylnicotinic acid and the Chemical Abstracts name ($\pm$)-2-[4,5-dihydro-4-methyl-4-(1-methylethyl)-5-oxo-1H-imidazol-2-yl]-5-(methoxymethyl)-3-pyridinecarboxylic acid (CAS RN 114311-32-9) that is described e.g. in US 5,334,576 and the The Pesticide Manual, Fourteenth Edition, Editor: C.D.S. Tomlin, British Crop Production Council, 2006, entry 464, pages 587-589. The R-isomer of imazamox is known from e.g. US 5,972,154 or US 6,339,158 B1. The ammonium salt of imazamox (common name:

imazamox-ammonium; IUPAC name: ammonium 2-[(RS)-4-isopropyl-4-methyl-5-oxo-2-imidazolin-2-yl]-5-methoxymethylnicotinate; Chemical Abstracts name: ammonium 2-[4,5-dihydro-4-methyl-4-(1-methylethyl)-5-oxo-1H-imidazol-2-yl]-5-(methoxymethyl)-3-pyridinecarboxylate, CAS RN 247057-22-3) is also described in the The Pesticide Manual, Fourteenth Edition, Editor: C.D.S. Tomlin, British Crop Production Council, 2006, entry 464, pages 587-589.

Imazamox is an effective herbicide for the control of both terrestrial and aquatic vegetation and is a member of the imidazolinone class of herbicides. All imidazolinone herbicides share a common mechanism of herbicidal action that involves the inhibition of acetolactate synthase (ALS).

WO 2007/071655 discloses a method of controlling the aquatic weed *Hydrilla verticillata* tree by applying the herbicide imazamox or an agriculturally acceptable salt thereof to the aquatic weed and/or its aqueous habitat containing seeds or other propagating organs of said aquatic weed. Imazamox can be applied in combination with various additional herbicides, inter alia cinmethylin.

WO 2010/046268 discloses a method of controlling Chinese tallow tree by applying the herbicide imazamox or an agriculturally acceptable salt or derivative thereof to Chinese tallow tree, its seeds or other propagating organs or its habitat. Imazamox can be applied in combination with various additional herbicides, inter alia cinmethylin.

Nevertheless, there is still room for improvement, for example regarding the activity, spectrum of activity, application rates, compatibility with useful plants and the control of resistant weed biotypes.

20

Further embodiments of the invention are evident from the description, the examples and the claims. It is to be understood that the features mentioned above and still to be illustrated below of the subject matter of the invention can be applied not only in the combination given in each particular case but also in other combinations, without leaving the scope of the invention.

25

Detailed description of the invention

Surprisingly, it has been found that the combination of (a) herbicide A and (b) imazamox, any of its individual isomers or an agriculturally acceptable salt, ester or amide thereof (herbicide B) is capable of providing a synergistic herbicidal effect.

30

Thus, in the compositions, uses and methods of this invention, the herbicide A and herbicide B are each present or applied in an amount sufficient to provide a synergistic herbicidal effect.

35

The term "synergistic herbicidal effect" refers to the herbicidal effect for a given combination of two herbicides where the herbicidal activity of the combination exceeds the total of the individual herbicidal activities of the herbicides when applied separately. For this reason, the compositions can, based on the individual components, be used at lower application rates to achieve a herbicidal effect comparable to the individual components.

40

In some embodiments of this invention, Colby's equation is applied to determine whether the combination of herbicide A and herbicide B shows a synergistic effect (see S. R. Colby, "Calculating synergistic and antagonistic responses of herbicide combinations", Weeds 1967, 15, pp. 20-22).

$$E = X + Y - (X \cdot Y / 100)$$

where X = effect in percent using herbicide A at an application rate a;
Y = effect in percent using herbicide B at application rate b;
E = expected effect (in %) of herbicide A + herbicide B at application rates a + b.

5

For three-way combinations (herbicide A + herbicide B + herbicide C) a modified Colby equation can be used:

$$E = X + Y + Z - [(X \cdot Y + X \cdot Z + Y \cdot Z) / 100] - X \cdot Y \cdot Z / 10000$$

10

where E, X and Y are as defined above and Z is the herbicidal effect in percent using a herbicide C (as defined herein) at an application rate c.

15

In Colby's equation, the value E corresponds to the effect (plant damage or injury) which is to be expected if the activity of the individual compounds is additive. If the observed effect is higher than the value E calculated according to the Colby equation, a synergistic effect is present.

20

In one embodiment of the present invention, the compositions, uses and methods disclosed herein are synergistic as determined by the Colby equation. Specifically, the synergistic herbicidal effect is determined according to the Colby equation.

25

Moreover, the compositions, uses and methods of the present invention provide excellent pre- and post-emergence control of weeds. In one embodiment, the compositions and methods are useful for controlling undesirable vegetation before their emergence (pre-emergence). In another embodiment, the compositions and methods are also useful for controlling undesirable vegetation after their emergence (post-emergence).

30

The compositions, uses and methods of the present invention also show good crop compatibility, i.e. the combined application of (a) herbicide A and (b) herbicide B in crops does not result in increased damage of the crop plants when compared to the individual application of herbicide A or herbicide B.

35

Furthermore, the compositions, uses and methods of the present invention provide effective control of herbicide resistant or tolerant weed species, in particular herbicide-resistant weed biotypes. For example, the compositions, uses and methods of the present invention can effectively control herbicide-resistant grass weeds such as, for example, Alopecurus myosuroides (ALOMY), Apera spica-venti (APESV), Phalaris species (PHASS) or Lolium species (LOLSS). The compositions, uses and methods of the present invention are also suitable for controlling herbicide-resistant broadleaf weeds such as, for example, Papaver rhoeas (PAPRH, corn poppy) which has evolved resistance, especially against ALS-inhibiting herbicides.

40

In addition, the compositions, uses and methods of the present invention can effectively control weed biotypes with target-site resistance but also weed biotypes with non-target site resistance.

A particular advantage is that the compositions, uses and methods of the present invention also provide effective control of weed biotypes having both target-site resistance and non-target-site resistance, such as e.g. resistant populations of *Alopecurus myosuroides* (ALOMY) or *Lolium rigidum* (LOLRI).

5

"Target-site resistance", as used herein, occurs by mutation within a gene coding for an herbicide target-site enzyme (limiting the herbicide binding) or by overproduction of the target enzyme (gene overexpression or amplification).

10 "Non-target-site resistance", as used herein, involves mechanisms that minimize the amount of active herbicide reaching the target site (e.g. reduced herbicide uptake or translocation, increased herbicide sequestration, or enhanced herbicide metabolism).

15 In the compositions of the present invention the weight ratio of herbicide A (in particular ($\pm$)-2-exo-(2-Methylbenzyloxy)-1-methyl-4-isopropyl-7-oxabicyclo[2.2.1]heptane) to the herbicide B is in general in the range from 1:0.002 to 1:4, preferably in the range from 1:0.005 to 1:2 and more preferably in the range from 1:0.02 to 1:0.5.

20 In addition to the herbicide A and herbicide B, the composition of the invention may further comprise at least one herbicide C which is different from the herbicides A and B.

Thus, in one embodiment, the compositions of the present invention comprise (a) herbicide A (in particular ($\pm$)-2-exo-(2-Methylbenzyloxy)-1-methyl-4-isopropyl-7-oxabicyclo[2.2.1]heptane), (b) imazamox, any of its individual isomers or an agriculturally acceptable salt, ester or amide thereof (herbicide B) and (c) at least one herbicide C.

The compositions according to the invention are suitable as herbicides as such or as appropriately formulated agrochemical compositions. As used herein, the term "agrochemical composition" refers to a composition according to the invention further comprising one or more auxiliaries customary in crop protection.

Thus, the invention also relates to agrochemical compositions comprising a herbicidally effective amount of herbicide A, herbicide B, optionally at least one herbicide C (as defined herein), optionally at least one safener D (as defined herein) and one or more auxiliaries customary in crop protection.

The herbicide A, the herbicide B, optionally at least one herbicide C (as defined herein) and optionally at least one safener D (as defined herein) can be converted into customary types of agrochemical compositions, e. g. solutions, emulsions, suspensions, dusts, powders, pastes, granules, pressings, and mixtures thereof. These and further types of agrochemical compositions are defined in the "Catalogue of pesticide formulation types and international coding system", Technical Monograph No. 2, 6th Ed. May 2008, CropLife International.

The agrochemical compositions can be prepared in a known manner, such as described by Mollet and Grubemann, Formulation technology, Wiley VCH, Weinheim, 2001; or Knowles, New developments in crop protection product formulation, Agrow Reports DS243, T&F Informa, London, 2005.

Thus, the invention also relates to a process for preparing the composition (more specifically the agrochemical composition) as defined herein which comprises mixing herbicide A, herbicide B, optionally herbicide C and/or safener D and one or more auxiliaries customary in crop protection.

The term "auxiliaries customary in crop protection" includes but is not limited to solvents, liquid carriers, solid carriers or fillers, surfactants, dispersants, emulsifiers, wetters, adjuvants, solubilizers, penetration enhancers, protective colloids, adhesion agents, thickeners, humectants, repellents, attractants, feeding stimulants, compatibilizers, bactericides, anti-freezing agents, anti-foaming agents, colorants, tackifiers and binders.

The agrochemical compositions generally comprise between 0.01 and 95%, preferably between 0.1 and 90%, and in particular between 0.5 and 75%, by weight of active substance. The active substances are employed in a purity of from 90% to 100%, preferably from 95% to 100% (according to NMR spectrum).

Various types of oils, wetters, adjuvants, fertilizer, or micronutrients, and further pesticides (e.g. herbicides, insecticides, fungicides, growth regulators, safeners) may be added to the active substances or the compositions comprising them as premix or, if appropriate not until immediately prior to use (tank mix). These agents can be admixed with the compositions according to the invention in a weight ratio of 1:100 to 100:1, preferably 1:10 to 10:1.

The user applies the agrochemical composition according to the invention usually from a predosage device, a knapsack sprayer, a spray tank, a spray plane, or an irrigation system. Usually, the agrochemical composition is made up with water, buffer, and/or further auxiliaries to the desired application concentration and the ready-to-use spray liquor or the agrochemical composition according to the invention is thus obtained. Usually, 20 to 2000 liters, preferably 50 to 400 liters, of the ready-to-use spray liquor are applied per hectare of useful agricultural area.

According to one embodiment, either individual components of the agrochemical composition

according to the invention or partially premixed components, e. g. agrochemical components comprising herbicide A, herbicide B, optionally at least one herbicide C (as defined herein) and optionally at least one safener D (as defined herein) may be mixed by the user in a spray tank and further auxiliaries and additives may be added, if appropriate.

- 5 In another embodiment, individual components of the agrochemical composition according to the invention such as parts of a kit or parts of a binary or ternary mixture may be mixed by the user himself in a spray tank and further auxiliaries may be added, if appropriate.

In another embodiment, either individual components of the agrochemical composition according to the invention or partially premixed components, e. g. components comprising
10 herbicide A, herbicide B, optionally at least one herbicide C (as defined herein) and optionally at least one safener D (as defined herein) can be applied jointly (e.g. after tank mixing) or consecutively.

Accordingly, the agrochemical composition may be provided in the form of a single package
15 formulation comprising herbicide A, herbicide B, optionally at least one herbicide C (as defined herein) and optionally at least one safener D (as defined herein) together with liquid and/or solid carriers, and, if desired, one or more surfactants and, if desired, one or more further auxiliaries customary in crop protection. The formulation may be provided in the form of a two package
20 formulation, wherein one package comprises a formulation of herbicide A and herbicide B while the other package comprises a formulation comprising at least one herbicide C and/or safener D, and wherein both formulations comprise at least one carrier material, if desired, one or more surfactants and, if desired, one or more further auxiliaries customary in crop protection. The
25 formulation may also be provided in the form of a two package formulation, wherein one package comprises a formulation of herbicide A and herbicide B and optionally the safener D, while the other package comprises a formulation of the at least one herbicide C, and wherein both formulations comprises at least one carrier material, if desired, one or more surfactants
30 and, if desired, one or more further auxiliaries customary in crop protection. In the case of two package formulations the two formulations are preferably mixed prior to application. Preferably the mixing is performed as a tank mix, i.e. the formulations are mixed immediately prior or upon dilution with water.

The compositions according to the invention control vegetation on non-crop areas very efficiently, especially at high rates of application. They act against broad-leaved weeds and grass weeds in crops such as wheat, barley, rice, corn, oilseed rape, canola, sunflowers,
35 soybeans and cotton without causing any significant damage to the crop plants. This effect is mainly observed at low rates of application.

The compositions according to the invention are applied to the plants mainly by spraying. Here, the application can be carried out using, for example, water as carrier by customary spraying
40 techniques using spray liquor amounts of from about 50 to 1000 l/ha (for example from 300 to 400 l/ha). The herbicidal compositions may also be applied by the low-volume or the ultra-low-volume method, or in the form of microgranules.

The herbicidal compositions according to the present invention can be applied pre- or post-emergence or together with the seed of a crop plant. It is also possible to apply the compounds and compositions by applying seed, pretreated with a composition of the invention, of a crop plant. If the herbicides A and B and, if appropriate, herbicide C, are less well tolerated by certain crop plants, application techniques may be used in which the herbicidal compositions are sprayed, with the aid of the spraying equipment, in such a way that as far as possible they do not come into contact with the leaves of the sensitive crop plants, while the active compounds reach the leaves of undesirable plants growing underneath, or the bare soil surface (post-directed, lay-by).

In a further embodiment, the composition according to the invention can be applied by treating seed. The treatment of seed comprises essentially all procedures familiar to the person skilled in the art (seed dressing, seed coating, seed dusting, seed soaking, seed film coating, seed multilayer coating, seed encrusting, seed dripping and seed pelleting) based on compositions according to the invention. Here, the herbicidal compositions can be applied diluted or undiluted.

The term "seed" comprises seed of all types, such as, for example, corns, seeds, fruits, tubers, seedlings and similar forms. Here, preferably, the term seed describes corns and seeds. The seed used can be the seed of the useful plants mentioned above, but also the seed of transgenic plants or plants obtained by customary breeding methods.

Moreover, it may be advantageous to apply the compositions of the present invention on their own or jointly in combination with other crop protection agents, for example with agents for controlling pests or phytopathogenic fungi or bacteria or with groups of active compounds which regulate growth. Also of interest is the miscibility with mineral salt solutions which are employed for treating nutritional and trace element deficiencies. Non-phytotoxic oils and oil concentrates can also be added.

When employed in plant protection, the amounts of active substances applied, i.e. herbicides A and B and, if appropriate, herbicide C, without formulation auxiliaries, are, depending on the kind of effect desired, from 0.1 to 10000 grams per hectare (g/ha), preferably from 10 to 7500 g/ha, more preferably from 25 to 5000 g/ha and in particular from 50 to 3000 g/ha.

In the methods and uses of the invention, the application rate of the herbicide A is generally from 0.1 to 2000 g/ha, preferably 10 to 1000 g/ha, more preferably 10 to 750 g/ha and in particular 10 to 500 g/ha. In another embodiment, the application rate of the herbicide A is from 50 to 1000 g/ha, preferably 75 to 750 g/ha and more preferably 100 to 500 g/ha.

In the methods and uses of the invention, the application rate of the herbicide B (preferably imazamox (B.1), the R-isomer of imazamox (B.2) or imazamox-ammonium (B.3)) is generally from 0.1 to 1000 g/ha, preferably 2 to 200 g/ha, more preferably 2 to 150 g/ha and in particular 2 to 50 g/ha. In another embodiment, the application rate of the herbicide B (preferably

imazamox (B.1), the R-isomer of imazamox (B.2) or imazamox-ammonium (B.3)) is from 5 to 150 g/ha, preferably 10 to 50 g/ha.

5 In the methods and uses of the invention, the application rate of the herbicide C (in case of salts calculated as the acid) is generally from 0.1 to 10000 g/ha, preferably from 2 to 6000 g/ha.

10 In another embodiment, the application rate of the herbicide C (in case of salts calculated as the acid) is from 20 to 3000 g/ha. The aforementioned application rate is particularly suitable for use in oilseed rape.

In another embodiment, the application rate of the herbicide C (in case of salts calculated as the acid) is from 2 to 3000 g/ha. The aforementioned application rate is particularly suitable for use in sunflower.

15 In another embodiment, the application rate of the herbicide C (in case of salts calculated as the acid) is from 2 to 1800 g/ha. The aforementioned application rate is particularly suitable for use in cereals (in particular wheat).

20 In another embodiment, the application rate of the herbicide C (in case of salts calculated as the acid) is from 2 to 1800 g/ha. The aforementioned application rate is particularly suitable for use in legumes and rice.

25 In the methods and uses of the invention, the application rate of the safener D (in case of salts calculated as the acid) is generally from 1 to 2500 g/ha, preferably 2 to 2000 g/ha and more preferably 5 to 1500 g/ha.

30 In treatment of plant propagation materials such as seeds, e. g. by dusting, coating or drenching seed, amounts of active substance of from 0.1 to 5000 g, preferably from 5 to 2500 g, more preferably from 50 to 2000 g and in particular from 100 to 1500 g, per 100 kilogram of plant propagation material (preferably seeds) are generally required.

35 In another embodiment of the invention, to treat the seed, the amounts of active substances applied, i.e. herbicides A and B and, if appropriate, herbicide C are generally employed in amounts of from 0.001 to 10 kg per 100 kg of seed.

30 The compositions, uses and methods according to the invention can also be used in genetically modified plants. The term "genetically modified plants" is to be understood as plants whose genetic material has been modified by the use of recombinant DNA techniques to include an inserted sequence of DNA that is not native to that plant species' genome or to exhibit a deletion of DNA that was native to that species' genome, wherein the modification(s) cannot readily be
35 obtained by cross breeding, mutagenesis or natural recombination alone. Often, a particular genetically modified plant will be one that has obtained its genetic modification(s) by inheritance through a natural breeding or propagation process from an ancestral plant whose genome was the one directly treated by use of a recombinant DNA technique. Typically, one or more genes have been integrated into the genetic material of a genetically modified plant in order to improve
40 certain properties of the plant. Such genetic modifications also include but are not limited to targeted post-translational modification of protein(s), oligo- or polypeptides. e. g., by inclusion therein of amino acid mutation(s) that permit, decrease, or promote glycosylation or polymer additions such as prenylation, acetylation farnesylation, or PEG moiety attachment.

Plants that have been modified by breeding, mutagenesis or genetic engineering, e.g. have been rendered tolerant to applications of specific classes of herbicides, such as auxinic herbicides such as dicamba or 2,4-D; bleacher herbicides such as 4-hydroxyphenylpyruvate dioxygenase (HPPD) inhibitors or phytoene desaturase (PDS) inhibitors; acetolactate synthase (ALS) inhibitors such as sulfonylureas or imidazolinones; enolpyruvyl shikimate 3-phosphate synthase (EPSP) inhibitors such as glyphosate; glutamine synthetase (GS) inhibitors such as glufosinate; protoporphyrinogen-IX oxidase inhibitors; lipid biosynthesis inhibitors such as acetylCoA carboxylase (ACCase) inhibitors; or oxynil (i. e. bromoxynil or ioxynil) herbicides as a result of conventional methods of breeding or genetic engineering; furthermore, plants have been made resistant to multiple classes of herbicides through multiple genetic modifications, such as resistance to both glyphosate and glufosinate or to both glyphosate and a herbicide from another class such as ALS inhibitors, HPPD inhibitors, auxinic herbicides, or ACCase inhibitors. These herbicide resistance technologies are, for example, described in Pest Management Science 61, 2005, 246; 61, 2005, 258; 61, 2005, 277; 61, 2005, 269; 61, 2005, 286; 64, 2008, 326; 64, 2008, 332; Weed Science 57, 2009, 108; Australian Journal of Agricultural Research 58, 2007, 708; Science 316, 2007, 1185; and references quoted therein. Several cultivated plants have been rendered tolerant to herbicides by mutagenesis and conventional methods of breeding, e. g., Clearfield® summer rape (Canola, BASF SE, Germany) being tolerant to imidazolinones, e. g., imazamox, or ExpressSun® sunflowers (DuPont, USA) being tolerant to sulfonyl ureas, e. g., tribenuron. Genetic engineering methods have been used to render cultivated plants such as soybean, cotton, corn, beets and rape, tolerant to herbicides such as glyphosate, imidazolinones and glufosinate, some of which are under development or commercially available under the brands or trade names RoundupReady® (glyphosate tolerant, Monsanto, USA), Cultivance® (imidazolinone tolerant, BASF SE, Germany) and LibertyLink® (glufosinate tolerant, Bayer CropScience, Germany).

Furthermore, plants are also covered that are by the use of recombinant DNA techniques capable to synthesize one or more insecticidal proteins, especially those known from the bacterial genus *Bacillus*, particularly from *Bacillus thuringiensis*, such as delta-endotoxins, e. g., CryIA(b), CryIA(c), CryIF, CryIF(a2), CryIIA(b), CryIIIA, CryIIIB(b1) or Cry9c; vegetative insecticidal proteins (VIP), e. g., VIP1, VIP2, VIP3 or VIP3A; insecticidal proteins of bacteria colonizing nematodes, e. g., *Photorhabdus* spp. or *Xenorhabdus* spp.; toxins produced by animals, such as scorpion toxins, arachnid toxins, wasp toxins, or other insect-specific neurotoxins; toxins produced by fungi, such as *Streptomyces* toxins, plant lectins, such as pea or barley lectins; agglutinins; proteinase inhibitors, such as trypsin inhibitors, serine protease inhibitors, patatin, cystatin or papain inhibitors; ribosome-inactivating proteins (RIP), such as ricin, maize-RIP, abrin, luffin, saporin or bryodin; steroid metabolism enzymes, such as 3-hydroxy-steroid oxidase, ecdysteroid-IDP-glycosyl-transferase, cholesterol oxidases, ecdysone inhibitors or HMG-CoA-reductase; ion channel blockers, such as blockers of sodium or calcium channels; juvenile hormone esterase; diuretic hormone receptors (helicokinin receptors); stilbene synthase, bibenzyl synthase, chitinases or glucanases. In the context of the present invention these insecticidal proteins or toxins are to be understood expressly also as including

pre-toxins, hybrid proteins, truncated or otherwise modified proteins. Hybrid proteins are characterized by a new combination of protein domains, (see, e. g., WO 02/015701). Further examples of such toxins or genetically modified plants capable of synthesizing such toxins are disclosed, e. g., in EP-A 374 753, WO 93/007278, WO 95/34656, EP-A 427 529, EP-A 451 878, 5 WO 03/18810 und WO 03/52073. The methods for producing such genetically modified plants are generally known to the person skilled in the art and are described, e. g., in the publications mentioned above. These insecticidal proteins contained in the genetically modified plants impart to the plants producing these proteins tolerance to harmful pests from all taxonomic groups of arthropods, especially to beetles (Coleoptera), two-winged insects (Diptera), and moths 10 (Lepidoptera) and to nematodes (Nematoda). Genetically modified plants capable to synthesize one or more insecticidal proteins are, e. g., described in the publications mentioned above, and some of which are commercially available such as YieldGard® (corn cultivars producing the Cry1Ab toxin), YieldGard® Plus (corn cultivars producing Cry1Ab and Cry3Bb1 toxins), Starlink® (corn cultivars producing the Cry9c toxin), Herculex® RW (corn cultivars producing 15 Cry34Ab1, Cry35Ab1 and the enzyme Phosphinothricin-N-Acetyltransferase [PAT]); NuCOTN® 33B (cotton cultivars producing the Cry1Ac toxin), Bollgard® I (cotton cultivars producing the Cry1Ac toxin), Bollgard® II (cotton cultivars producing Cry1Ac and Cry2Ab2 toxins); VIPCOT® (cotton cultivars producing a VIP-toxin); NewLeaf® (potato cultivars producing the Cry3A toxin); Bt-Xtra®, NatureGard®, KnockOut®, BiteGard®, Protecta®, Bt11 (e. g., Agrisure® CB) and 20 Bt176 from Syngenta Seeds SAS, France, (corn cultivars producing the Cry1Ab toxin and PAT enzyme), MIR604 from Syngenta Seeds SAS, France (corn cultivars producing a modified version of the Cry3A toxin, c.f. WO 03/018810), MON 863 from Monsanto Europe S.A., Belgium (corn cultivars producing the Cry3Bb1 toxin), IPC 531 from Monsanto Europe S.A., Belgium (cotton cultivars producing a modified version of the Cry1Ac toxin) and 1507 from Pioneer 25 Overseas Corporation, Belgium (corn cultivars producing the Cry1F toxin and PAT enzyme).

Furthermore, plants are also covered that are by the use of recombinant DNA techniques capable to synthesize one or more proteins to increase the resistance or tolerance of those plants to bacterial, viral or fungal pathogens. Examples of such proteins are the so-called 30 "pathogenesis-related proteins" (PR proteins, see, e.g., EP-A 392 225), plant disease resistance genes (e. g., potato culti-vars, which express resistance genes acting against *Phytophthora infestans* derived from the Mexican wild potato, *Solanum bulbocastanum*) or T4-lyso-zym (e.g., potato cultivars capable of synthesizing these proteins with increased resistance against bacteria such as *Erwinia amylovora*). The methods for producing such genetically modified 35 plants are generally known to the person skilled in the art and are described, e.g., in the publications mentioned above.

Furthermore, plants are also covered that are by the use of recombinant DNA techniques capable to synthesize one or more proteins to increase the productivity (e.g., bio-mass 40 production, grain yield, starch content, oil content or protein content), tolerance to drought, salinity or other growth-limiting environmental factors or tolerance to pests and fungal, bacterial or viral pathogens of those plants.

Furthermore, plants are also covered that contain by the use of recombinant DNA techniques a modified amount of ingredients or new ingredients, specifically to improve human or animal nutrition, e. g., oil crops that produce health-promoting long-chain omega-3 fatty acids or unsaturated omega-9 fatty acids (e. g., Nexera® rape, Dow AgroSciences, Canada).

5

Furthermore, plants are also covered that contain by the use of recombinant DNA techniques a modified amount of ingredients or new ingredients, specifically to improve raw material production, e.g., potatoes that produce increased amounts of amylopectin (e.g. Amflora® potato, BASF SE, Germany).

10

The following examples serve to illustrate the invention.

Examples

15 The effect of the herbicidal compositions according to the invention of herbicides A and B on the growth of undesirable plants compared to the herbicidally active compounds alone was demonstrated by the following greenhouse experiments:

20 The test plants have been seeded, separately for each species, in plastic containers in sandy loamy soil containing 5% of organic matter.

For the pre-emergence treatment, the active compounds, suspended or emulsified in water, were applied directly after sowing by means of finely distributing nozzles. The containers were irrigated gently to promote germination and growth and subsequently covered with transparent
25 plastic hoods until the plants had rooted. This cover caused uniform germination of the test plants unless this was adversely affected by the active compounds.

For the post emergence treatment, the plants were first grown to the 2 leaf station (GS 12). Here, the herbicidal compositions were suspended or emulsified in water as distribution medium
30 and sprayed using finely distributing nozzels.

The plants have been cultivated due to their individual requirements at 10 - 25°C and 20 - 35°C. The plants were irrigated due to their necessity.

35 The racemic mixture ($\pm$)-2-exo-(2-Methylbenzyloxy)-1-methyl-4-isopropyl-7-oxabicyclo[2.2.1]heptane was used as herbicide A and formulated as emulsifiable concentrates with an active ingredient concentration of 50g/l, 100 g/l or 750 g/l respectively.

Imazamox (herbicide B.1) was used as a water dispersible granule (70% WG).

40

In the following experiments, the herbicidal activity for the individual herbicidal compositions (solo and mixture applications) was assessed 20 days after treatment (DAT).

The evaluation for the damage on undesired weeds caused by the chemical compositions was carried out using a scale from 0 to 100%, compared to the untreated control plants. Here, 0 means no damage and 100 means complete destruction of the plants.

- Colby's equation was applied to determine whether the combination of herbicide A and herbicide B shows a synergistic effect (see S. R. Colby, "Calculating synergistic and antagonistic responses of herbicide combinations", Weeds 1967, 15, pp. 20-22).

$$E = X + Y - (X \cdot Y / 100)$$

- where X = effect in percent using herbicide A at an application rate a;
 15 Y = effect in percent using herbicide B at application rate b;
 E = expected effect (in %) of herbicide A + herbicide B at application rates a + b.

- The value E corresponds to the effect (plant damage or injury) which is to be expected if the activity of the individual compounds is additive. If the observed effect is higher than the value E calculated according to the Colby equation, a synergistic effect is present.

- Tables 1 to 2 below relate to the herbicidal activity, in greenhouse trials, of the individual actives and the combinations applied at different rates and ratios, in pre- and post-emergence application at 20 days after treatment (DAT).

As can be seen from the data in Tables 1 to 2, the combination of herbicide A and herbicide B exhibits an unexpected synergistic effect in that the herbicidal activity against various weed species in a pre- and post-emergence treatment is significantly higher than would be predicted based on the values for each of the compounds individually.
